32.8 Most informal adoptions were of children who had been boarded out for a number of years and the foster family then agreed to keep them. Sometimes this happened after they were with the family for about three years and sometimes
when the children reached the upper age limit for boarding out (15 or 16). The rules about boarding out are set out in detail in Chapter 11.

32.9 Bethany did directly organise informal adoptions. The Protestant Adoption Society (PACT) provided the Commission with an example of the surrender agreement used when making these arrangements. The birth mother was asked to provide written consent:

I, […] of […] in the county […] being the mother to the infant […] do hereby surrender the said infant to Mrs […] of […], and do renounce absolutely and forever all rights of whatever kind over the said infant and I understand that I shall make no claim upon the body or effects of the said infant at any time hereafter. Signed this [date] nineteen hundred and forty nine by me […] in the presence of the Reverend […]

signature:

witness […], Clerk, The Rectory.

32.10 Such consent was taken shortly before placement. The preselected couple would then come to the home and take the child, while the mother took her leave.¹ A blind was drawn between the parties, with minimum exchange of information. Where background information was supplied to foster parents, it often omitted salient points such as previous pregnancy, incest and relationships.²

32.11 A number of other voluntary agencies also organised the placing of children in foster families temporarily and for informal adoptions, for example, the Catholic Protection and Rescue Society of Ireland (CPRSI), St Patrick’s Guild, Rotunda Girls’ Aid Society and the Catholic Women’s Aid Society, Cork. Generally, they had formal written agreements with the birth mother and the foster parents. Cúnamh,³ (formerly the CPRSI) provided the Commission with examples of the written agreements used by them for the initial placement with the family and for informal adoption.

32.12 The essential elements of a 1926 agreement with a mother headed ‘Monthly Agreement - Mother’ were:

---

¹ Information provided by PACT.
² Eileen Farrelly-Conway, Search and Reunion in the Adoption Triangle (Dublin, 1993).
³ Cúnamh ceased to operate in 2019 and its records are held by the Adoption Authority of Ireland. The Commission is grateful for the assistance given by its staff in 2018; it was not being investigated.
The mother, ‘being unable to give the time and care necessary for the proper care, maintenance and support’ of the child had applied to the society to assist her by making arrangements for the child’s care.

The society ‘will entrust’ the child to the care of a foster mother approved of by it and ‘who shall be in all respects subject to the direction and supervision of the Society’.

The society undertook to ensure that the foster mother ‘shall maintain and bring up the child in a proper manner’.

The mother undertook not to remove the child from the custody of the foster mother without having obtained consent in writing from the society, unless the child was at least seven years old.

The mother accepted the rule which precluded her from knowing the name and address of the foster mother.

The society agreed to arrange to bring the child to its offices from time to time in order that the child could be inspected by the mother.

32.13 The agreement was signed by the mother in the presence of a witness. There is no evidence that this witness had to be a person who was not associated with the society.

The agreement included a clause whereby the mother agreed to pay an amount to the society. In the particular 1926 agreement seen by the Commission, this clause was crossed out. A 1933 agreement was the same as the 1926 agreement but the example seen by the Commission included a clause whereby the mother agreed to pay 10s a month to the society. A 1952 monthly agreement with the birth mother was worded in the same way as the earlier agreements but the payment by her was now 15s a month.

32.14 A 1936 agreement with a mother, headed ‘Agreement for Adoption of Child’, stated:

the said [mother’s name] having insufficient means to enable her to maintain and bring up in a suitable manner her said child has applied to the Society for assistance, and has agreed to relinquish all her rights as guardian of the said child in favour of the Society, which has agreed to adopt the said [name of child].
32.15 The CPRSI agreed to adopt the child and ‘will at its own cost and expense maintain, board, lodge, cloth and educate him or her in a suitable manner, and in particular will have the child educated and brought up in the Catholic Faith’. There was a clause which stated that the mother paid some money but this is deleted in the agreement seen by the Commission.

32.16 The printed form examined by the Commission stated that the mother ‘hereby appoints the Society to be the Guardian of the said child ‘until he or she attains the age of…years’; however this latter part was crossed out and ‘for ever’ was added in handwriting.

32.17 The mother agreed that as long as the society continued to maintain the child, she would not ‘revoke the appointment as guardian or appoint any other person as guardian nor ‘will she take any proceedings for the appointment of any other such person or persons or for the recovery of the custody’ of the child. The mother also agreed that, as long as the guardianship continued, she ‘will not, nor will any person with her authority, consent or privity in any manner interfere with the training of management of [the child] or as to her moral or intellectual education or institution’.

32.18 A 1952 agreement for the surrender of a child read:

I […] desire that my child…should be taken care of and brought up a Catholic. I willingly and freely give my child to the care of the Catholic Protection and Rescue Society of Ireland for this purpose, and I agree never to claim […] back from the Society.

In the example seen, the mother agreed to pay the society £15 towards the cost of maintaining the child.

32.19 The 1932 agreement with the foster mother identified the society as the guardian of the child. It agreed to pay the foster mother £1 10s a month until the child reached the age of nine. The foster mother agreed that, as long as the payments were paid punctually, she would ‘maintain, clothe and support’ the child ‘according to the directions and instructions which she may receive from time to time’ from the society. The foster mother also agreed to notify the dispensary doctor without delay if the child became ill; she also would notify the society and she would hand over the child to the society if the society so demanded. The society had the right to inspect the child and could end the agreement at any time without notice. A
1933 agreement was in similar terms but was for the period until the child reached the age of five. A 1952 agreement was in similar terms and the payment to the foster mother was £3 a month.

32.20 A 1933 ‘adoption’ agreement with a foster mother identifies the society as the child’s guardian. The ‘adoptive’ mother agreed that she would ‘adopt’ the child and would ‘at her own cost and expense, maintain, board, lodge, clothe and educate him (or her) in a suitable manner, and in particular will have the child educated and brought up in the Catholic Faith’. The ‘adoptive’ mother also agreed that she would not ‘part with the possession or custody’ of the child without the written consent of the society and that she would allow the society to inspect the child at all reasonable times. She agreed to hand over the child to the society in the event that the society was dissatisfied with the condition of the child or the manner in which the child was being brought up or educated. A further handwritten condition was added - she had to hand over the child if the society was called on to hand over the child to his birth mother.

32.21 The ‘adoption’ agreement with the foster parents had changed quite a bit by 1951. This read:

We […] being practising Catholics, agree to keep and look after […] born on […] and baptised on […] at […] as our own child and to carefully bring her/him up in the knowledge and practice of the Catholic Religion and to educate him/her at a Catholic School. We promise that we shall never part with the child to any other foster parents or place her/him in any orphanage or industrial school or like institution without the consent in writing of the Catholic Protection and Rescue Society of Ireland. We further agree that should the Society be dissatisfied at any time with the manner in which the child is being cared for or brought up and particularly the manner in which the child’s religious welfare is being attended to the Society may remove […] from us and we shall cease to be his/her parents.

32.22 There was a footnote which stipulated that the foster-parents must immediately inform the CPRSI if the child should become seriously ill or if their financial position should deteriorate to such an extent that they would be unable to provide properly for the child. They were also obliged to inform the society of any change of address.
Agreements made by the Nursery Rescue and Protestant Children's Aid Society were similar but the foster parents agreed to raise the child as a Protestant.

Little is known about the level of vetting of prospective 'adoptive' parents carried out by the voluntary organisations. In 1947, Miss Litster of the Department of Local Government and Public Health (DLGPH) was critical of informal adoptions:

Some of the societies have been found to be careless in the matter of placing children for adoption. A certificate of character from a clergyman is usually the sole requirement and no investigation need be made into means, environment, motives, or any of the conditions bearing on the suitability or otherwise of the home.

Cases have come to light of children adopted into homes utterly unsuitable. It is probable that an investigation into adoption secured by societies would discover conditions which would not be permitted under a system of legalised adoption.  

There seems little doubt that the mothers who surrendered their children to the public assistance authorities or the voluntary agencies had no real choice because they were unable to look after their children themselves. It is likely that they would have been successful in reclaiming their children if they tried to do so. The Commission has not seen much evidence of attempts to do so. There are a few examples in the Department of Health files but they generally involved reclaiming older children who could be put to work.

B: Legal adoption

Legal adoption is the process by which a parent/child relationship is established between persons unrelated by birth whereby the child and the adoptive parents assume the same rights and duties as children and parents in 'birth families' and the birth mother relinquishes her rights over the child. Among common law countries, Ireland was relatively late in introducing formal legal adoption. In the USA, the state of Massachusetts was probably the first legal system to introduce a child-centred adoption system in 1851. Other US states, such as New York and California, followed. Other common law states and countries followed: Tasmania and British Columbia each introduced adoption in 1920 and they were followed by England and Wales in 1926, Northern Ireland in 1929 and Scotland in 1930.

4 Department of Health, RM/INA/0/505478.
32.27 The introduction of legal adoption in Ireland was delayed by the reluctance of the Irish government to introduce legislation on the issue which was not fully backed by the Catholic church. However, once it was introduced by the Adoption Act 1952 which came into effect on 1 January 1953, it quickly became the most likely outcome for ‘illegitimate’ children and the most significant exit pathway for children in the institutions being investigated by the Commission. For a time, particularly in the 1960s, virtually all ‘illegitimate’ children born in Ireland were adopted. While it might be an exaggeration to say that it was ‘official policy’ to encourage the adoption of ‘illegitimate’ children, adoption was undoubtedly promoted as the best option by the families of unmarried mothers, by the mother and baby homes and by religious and civil authorities. It was seen as the best option for the children and for their mothers and it was also seen as desirable for married couples who did not have biological children.

Background to the introduction of legal adoption in Ireland

32.28 The discussions within government, within the Catholic church, between government and the church and the public debate are all very informative about the attitudes to adoption and cast light on how issues such as the welfare of the children and the requirement for mothers’ consents were seen immediately before the introduction of legal adoption.

32.29 The main sources of information for this section are

- National Archives of Ireland files, JUS/90/93/17; JUS/90/93/18; JUS/90/93/19; JUS/90/93/20.
- Dáil reports
- J H Whyte, Church and State in Modern Ireland 1923-1970 (Dublin, 1971)
32.30 The issue of providing for legal adoption had been on the agenda for more than 20 years before the Adoption Bill 1952 was introduced. The English Adoption of Children Act 1926 was a catalyst for many who thought Ireland should have its own adoption law. The Department of Justice was regarded as the relevant department to take responsibility for any such legislation. There does not seem to have been any discussion about, for example, giving the DLGPH this responsibility. The debates on the issue have been analysed in some detail by a number of historians. While the welfare of the children was considered, the debate was dominated by the issue of their religious upbringing. The rights of the mother were recognised but very often the greater emphasis was on the needs of the adoptive parents.

32.31 The Department of Justice showed considerable reluctance to legislate for adoption. Initially, that reluctance did not seem to be related to what became the most significant issue in the debate, that is, the question of the religion of the child. In April 1933, following an enquiry from a member of the public who had a child he wished to adopt, a Department of Justice official said ‘that the proposed legislation would do very little good or harm’. He went on to set out the Department of Justice’s attitude to proposed adoption legislation:

The view we have always taken, departmentally, is that we should not advise the Minister to make himself responsible for legislation unless there is something really urgent and important at stake, and that he should not be too ready, even then, to accept responsibility for matters not clearly within the scope of the Department’s functions. By all these tests, the present proposal fails. It is not urgent, it affects a very limited number of parents, and does not affect them very profoundly, there has been no public demand for it, and it has no connection with the statutory duties of the Department of Justice as set out in the Ministers and Secretaries’ Act, 1924.

32.32 In 1934, the matter was raised again. This time the enquiry was considered by the Office of the President of the Executive Council, Éamon de Valera. In January 1934, Mr de Valera wrote to the secretary of the Department of Justice stating that he felt that the suggestion regarding a proposal to legalise adoption deserved ‘sympathetic consideration’. This enquiry did provoke some response from the Department of Justice in that it generated a query to ascertain statistics in regard to the operation of the English law on adoption. The secretary of the Department of Justice wrote to his counterpart in the Department of External Affairs (DEA),
stating that representations had been made to his minister in favour of introducing legislation on the lines of the British legislation. He went on to say ‘that the main result of the Act is to confer full parental powers on the person adopting a child in the prescribed manner to the exclusion of the actual parents; the prima facie objection to promoting such legislation here is that there is no indication of any general demand for it’. He also asked if enquiries could be made as to the extent to which the relevant legislation had been availed of in England. The British Registrar General supplied the relevant statistics.

32.33 However, nothing of significance happened and an enquiry in April 1938 from the American Consul General, on whether or not a child under the laws of Ireland could be adopted was met with the response from the DEA that no such laws existed in Ireland.

32.34 In August 1938 in an unattributed memorandum entitled ‘Adoption of Children’, the Department of Justice set out its objections to any proposed legislation on adoption as follows:

- No real cases so far being put forward. It may be that people who advocate the passing of such a bill are moved by a vague feeling that in failing to pass such a measure the Oireachtas is in some way falling behind in social matters the British Parliament.
- The bill would confer little advantage on a child who was adopted by desirable people except the slight one that in the matter of death duties the child would be in the same position as lineal issue. Legalised adoption might on the other hand be a serious disadvantage to a child in the event of the circumstances of adoptive parents disimproving. Legalised adoption would, of course confer on the child the right to be maintained by the adoptive parents. It would also impose on him a liability for their support.5
- The religious problem would almost inevitably involve the government in difficulties.

The CPRSI view
32.35 Adoption was recognised in canon law and informal ‘adoptions’ had been organised by, among others, the Catholic Protection and Rescue Society of Ireland

5 At the time, there was a legal obligation on children to maintain their parents. This remained the case until 1977 – see Chapter 1.
(CPRSI) for many years (see above). The CPRSI had been set up in 1913 in order to combat proselytism and to offer help to those who might go to Protestant agencies for help. In April 1939, it set out its reasons for objecting to the introduction of legal adoption. The main objection was that:

a great many Catholic girls go into the Protestant Home at Bethany, Orwell Road, Rathgar or give their babies to the Irish Church Missions and the various Homes attached to them. After a year or so many of these girls get remorse of conscience and come to us with their babies. If the Bill is passed these children will be lost to the Catholic religion forever as once they are legally adopted the person who adopts them can do what he likes with them.

32.36 The CPRSI pointed out that their ‘adoption’ form allowed for a review of the way the child was being brought up (see above). If it was not satisfied, the child could be removed; in effect, it was not a permanent arrangement. The organisation also pointed out that the archbishop would not approve and listed a number of organisations who also would not approve including the Sacred Heart Home,7 Drumcondra; the Girls’ Aid society attached to Holles Street hospital; and ‘Father Kenny, who runs the Society for unmarried mothers at the Rotunda, is not in favour of it either’. ‘It is the Joint Societies of Women Social Workers…who are keen on this Bill going through’. The CPRSI asserted that the members of this society were almost all non-Catholics.8

32.37 Of course, in the absence of any national adoption law, the type of adoption that the CPRSI was promoting was informal and conferred no legal status on a child ‘adopted’ in this way or on the adoptive parents. Towards the end of 1939, it became obvious to the Department of Justice that quite a number of informal ‘adoptions’ were taking place and further consideration was given to providing for legal adoption.

---

6 The other organisations involved in informal adoptions do not seem to have become involved in the debate on legal adoption.
7 This was an orphanage. It was not associated with the Sacred Heart mother and baby homes being investigated by the Commission.
8 This is unlikely to have been true. While the Joint Committee of Women’s Societies and Social Workers did include a number of Protestant organisations among its membership, it also included St Patrick’s Guild and the Irish Nurses Organisation.
CHAPTER 32 ADOPTION

Miss Litster's view

32.38 In December 1939, Miss Litster, who had been the inspector of boarded-out children in the DLGPH and who was now a general inspector in that department, advocated the introduction of adoption legislation:

the fact is that adoptions so called take place daily in the country. That there is no means of legalising such relationships is, I think, sufficient reason for pressing for legislation since such legislation would make for security for adopter and adopted.

The various guilds and societies which place children with foster parents arrange for adoptions in large numbers each year. The four principal Catholic Boarding out Societies, viz., The Catholic Protection and Rescue Society, Saint Patrick's Guild, The Rotunda Girls Aid Society and The Society for the Protection of Destitute Catholic Children arranged for some 120 adoptions during the year 1938. The Cork Catholic Women’s Aid Society boarded out about 130 children during the year 1938. All these children on expiry of a three year period will be adopted by their foster parents…we have therefore in Ireland an increasing number of children nominally adopted. Amongst the persons who have given such children the shelter of their homes are many who are desirous of giving them the further protection of the family name and who are amazed to find there is no legal machinery available. There is naturally no means of ascertaining the number of informal adoptions for which legal sanction would be sought, if an adoption act were in existence I think the number would not be small…in short adoptions do take place in this country and under present conditions they are unregulated and unsupervised and it would be in the interests of the children and their adoptive parents if legislation were set up governing the adoption of children.

32.39 Miss Litster's views were conveyed to the Department of Justice whose assistant secretary, Mr J E Duff, responded stating ‘there was very little likelihood of any legislation on this matter being introduced as there was considerable doubt as to whether the legislation would secure a real advantage to children legally adopted under it’. He also added that ‘a religious question is involved. It might happen under any scheme of legalised adoption, the essence of which is irrevocability, that an unmarried mother might consent to the adoption of her child by persons or

---

9 There were approximately 1800 ‘illegitimate’ births in 1938. The figures given here are not comprehensive so it seems likely that this was not an uncommon outcome for the children.
societies of different religion. If she subsequently wished to resume control of her child she would be unable to do so.’

32.40 Mr McArdle of the DLGPH stated:

I have heard of the protests made by certain societies they are based on the religious question. In my opinion any such danger as Mr Duff foreshadows can be safeguarded against by adequate provision in the Act. It can scarcely be argued that the religious persuasion of any mother who appears in Court as a party to the adoption of her child cannot be established beyond doubt. If any case arose in which a reasonable doubt were entertained on this point, it should be possible for the Court to refuse to legalise the adoption. Would it not be possible also to insert a clause in the Act rendering the adoption invalid if it should be subsequently proved that replies to queries regarding religious persuasion were false?

32.41 Nothing further happened and in late April 1940 a query from a member of the public met with confirmation that no plans were in place to provide for legal adoption. On 2 December 1943, the Minister for Justice, Gerald Boland, was asked if he would give the results of the consideration which his department had given to the question of a more satisfactory law relating to the adoption of children. He replied:

As a result of the consideration which was given to this question in 1939 it became clear to my department that any legislation relating to the adoption of children would be highly controversial, and, as there was no evidence that there was any general demand for such legislation, no action was taken in the matter.

The religion issue

32.42 In January 1944 a Department of Justice official, Mr S A Roche, wrote to Archbishop McQuaid of Dublin as follows:

As you are, no doubt, aware, there is no provision in the law of this country under which a person who adopts a child may acquire parental rights over the child. In England, Scotland and Northern Ireland, there are laws enabling the Courts to make ‘adoption orders’ transferring to adopters all the rights, duties, obligations and liabilities of parents in regard to adopted children, and representations have been made to this Department for the introduction of similar legislation in this country.
32.43 Mr Roche referred to the fact that the issue had been raised previously and no action had been taken largely because of the views expressed by the CPRSI. The question has now been raised again. It has been represented to me, for instance, by the present Attorney-General, Mr Kevin Dixon, that many more people would be willing to adopt destitute children if they could acquire parental rights over the children, and if they could be secured against the fear that the parents of the children might demand their return at any time. It is also urged that the procedure would give illegitimate children a better status: they would be registered as ‘adopted’ children under the new name.

I wonder whether the danger visualised by the Catholic Protection and Rescue Society would be met if a provision were included in the Bill prohibiting the making of an adoption order in any case where it is not proved to the Court that the religion of the adopter and the religion of the child are the same. I enclose a statement indicating the general form which legislation would probably take.

Personally, I am rather lukewarm about the whole proposal, but there is no doubt that many estimable people, with the highest motives, are in favour of it, and I don’t like to keep giving them the answer that there are grave objections from the Catholic point of view without making sure that this is in fact the position.

32.44 A summary of the Archbishop’s reply was as follows (parts of the archbishop’s reply are illegible)

I have today received your letter concerning adopting of children, in the full legal sense. This matter has caused much thought and I should be very willing to discuss the question with you. I cannot see how it can be maintained that legal Adoption is contrary to the Tenets of the Faith, from the point of view of Justice or Charity...The question seems to me, at the moment, and without refreshing my memory to be a matter of avoiding the danger of unworthy adopting parents and of what we know in this country as the unworthy traffic of proselytism.

32.45 In January 1945 an internal Department of Justice memorandum considered the ‘value’ of introducing legal adoption:

The foundation upon which adoption should be based is that of permanency. It benefits both adopting parents and especially the adopted child to have the relationship established and secure. The adopting parents then feel that they
can give to the child all that they would give to one naturally born to them without any fear that at some stage the child may be taken from them. For the child the sense of security although not understood or appreciated, has a deep formative effect. In other words, the true purpose of adoption is to set up a family in cases where nature has failed.

In many countries this purpose is recognised in law and Adoption Acts not only confer on the adopting parents the full legal custody of the child or children but exact from the adopting parents all the responsibilities towards the child which are implicit in ordinary parenthood. The child is therefore protected from instability in the adopting parents.

The effect of the legal position created by Adoption Acts is that adoption is made the serious step it should be and consequently makes it more probably that those entering upon adoption will make worthy parents.

At present in the Twenty-Six Counties anybody can adopt a child either permanently or for a period. There is no general mechanism to ensure that the right kind of child will go into the right kind of home (i.e., right psychologically). This mechanism is provided in other countries by legally recognised Adoption Societies which operating within a law specifically framed to protect the child are encouraged by the very existence of such a law to carry on their work. Where such societies do not exist, the work of getting children adopted is carried on by bodies formed to help and shelter mothers who have had illegitimate children. As the purpose of these bodies is principally to help the mother and for that reason to “place” the child, it is clear that the child is a very secondary consideration and that to get it placed at all is thought good enough.

This is not to reflect in any way whatever on the work done by those societies which aid unmarried mothers. But it is a matter of central importance to appreciate the difference between this method of disposing of unwanted children and that of adoption. Some of these rescue societies for instance offer a monetary reward to persons who will adopt one of the children it is sought to place. This is regarded as disastrous in the matter of true adoption, where the motive must be wholly unselfish, in a word an act of love. The British Act for instance makes it illegal without the consent of the court to take or offer any payment or other reward in consideration of any adoption. All reputable Adoption Societies are insistent upon this rule and not only require adopting parents to take a child without any reward, but insist upon preliminary expenditure on things necessary for the child in proof of sincerity
and seriousness on the part of the adopting parents. This is because it has been found that if adoption takes place as the result of payments, the adopting parents lose interest in the child when the payments cease and thereafter regard it as a burden.

Indeed it has been found that an Adoption Society was the more successful the more strict it was on the question of the parents’ responsibilities to the child and their ability to carry out those responsibilities. By making the gravity of the step about to be taken more apparent to prospective adopters, the Adopting Societies succeed in frightening away those who would enter on this course impulsively without any real consideration of what it would mean. The most important single element in convincing prospective adopters of the serious step they are taking is the existence of an Adoption Act and the sense of irrevocability (after a trial period of three months which is arranged in some cases) in what is being done. It is thus clear that if the question of the worthiness of the parents and their unselfishness is a vital one, the existence of an Adoption Act is of primary value.

The serious desire of many childless Irish couples to adopt is perhaps best illustrated by their reaction to there being no Adoption Act here. They feel that they cannot - as is their real desire - make the child their own and give it all the benefits of love and education without the fear that some time all may be undone by there being no legal protection for the adoption. I myself know at least four couples who are anxious to adopt but feel that they must wait until an Adoption Act is passed.

One important thing for the child in the passing of an Adoption Act has not been stressed. As is well known in Britain, America and other countries where adoption takes place so regularly, the majority of the children adopted are not born in wedlock. They carry with them through life unless they are adopted with a disability which it is impossible to exaggerate. Without disclosing their illegitimacy they cannot enter for examinations, for university life, for the Civil Service, for marriage, or for many other things for which they might be fitted.

In countries where there are Adoption Acts an Adoption Certificate is given a legal equality with a Birth Certificate for the purposes for which it is required. Thus not only do the Adopting parents in countries where there is such an Act make the child their own and give it what it could never otherwise attain but they also shield it from one of the most terrible social deprivations.
Mr Roche again wrote to Archbishop McQuaid in February 1945:

In January of last year I wrote to you regarding representations which were being made to me for the introduction of legislation which would enable the Courts to make ‘Adoption Orders’ transferring to adopters the rights, duties, obligations and liabilities of parents in regard to adopted children.

I mentioned that we were reluctant to introduce legislation on these lines because we feared that the making of adoption orders would give rise to religious problems, and that the Catholic Protection and Rescue Society of Ireland had indicated that they would be strongly opposed to such legislation.

I pointed out on the other hand that it had occurred to us that the religious difficulty might be met if a provision were included in the Bill prohibiting the making of an adoption order in any cause where it was not proved to the Court that the religion of the adopter and the religion of the child were the same - the religion of a child under seven years to be deemed to be the same as the mother’s religion.

From your reply to my letter I understood that you did not see any obvious objection to legislation on these lines, but that you would like to consider the matter.

I should be glad if you could now let me know whether, on consideration, you think that our proposal is satisfactory.

Archbishop McQuaid responded in March 1945:

I have not answered your letter at once, because I was anxious to give further consideration to your Adoption proposal. May I first clear up what may be a misunderstanding? You refer to my letter of 14th January, 1944 as not seeing any obvious objection to legislation on the lines suggested, viz, including a provision in reference to the religion of adopter and adopted. I was mainly pointing out that Legal Adoption as such is not contrary to the Tenets of the Catholic Faith. I have hereto seen no provision that, to my mind, would safeguard the faith of children. If your draftsman can put forward such a provision, it would be a matter of great interest to me.

The opposition of a body so experienced as the Catholic Rescue and Protection Society gives me grave reason to pause. I am aware of the activity in certain quarters which would press for legal adoption, but I regret to be obliged to say that I do not find frequently a comprehensive understanding of the complex difficulties involved in any proposal of legal adoption.
If my advice be sought, I would urge that no step be taken in respect of Catholic children and you know what proportion that category entails - without referring the matter to the Catholic Hierarchy.

32.48 Mr Roche’s memo to the Minister for Justice said:

Following your recent direction that the Department should reconsider the question of legislation for the adoption of children, I wrote again to Dr. McQuaid asking him whether, in his opinion, the religious difficulty would be met if a provision were included in the Bill prohibiting the making of an Adoption Order in any case where it is not proved to the Court that the religion of the adopter and the religion of the child are the same - the religion of a child under seven years to be deemed to be the same as the mother’s religion. Dr. McQuaid has made it clear in his reply (enclosed) that he is not in favour of legislation at all. He says that he does not think that our proposal would provide satisfactory safeguards for the faith of the children, and he ends up by saying that if his advice be sought, he would urge that no legislation on this subject should be introduced without referring the matter to the Catholic Hierarchy.

It is difficult to see why Dr McQuaid should object to an Adoption Bill which would contain a safeguard on the lines suggested by us. Perhaps he fears, however, that mothers of illegitimate children might be induced by Protestant societies to swear in Court that their religion was Protestant so as to enable the Courts to make Orders for the adoption of the children by Protestants. I do not think anything would be gained by referring this matter to the Catholic Hierarchy. If the Archbishop of Dublin is not in favour of the proposal, it is unlikely that the Catholic Hierarchy as a body would agree to it.

I suggest, therefore, that we should drop, for the present, at any rate, any idea of introducing legislation which would enable the Courts to make Orders transferring to adopters parental rights and duties in regard to adopted children.

The principal argument, put forward in favour of an Adoption Act, is that under the existing law, persons who adopt children, have no guarantee that the natural parents of the children will not demand the return of the children at some future date. This danger is not so serious as might appear at first sight, because the courts adopt the rule that any application by a natural parent to recover the custody of a child will be determined by reference to the child’s welfare and by that consideration alone.
Another matter on which advocates of an Adoption Act lay great stress is the fact that, while adopted children are usually known by the surname of their adopters, their births are registered in their original names, and great embarrassment is caused for those children when it becomes necessary for them to produce their birth certificates. In England, Scotland and Northern Ireland, provision is made in the Adoption Acts for the keeping of a special birth register for adopted children, in which the children are registered under the surnames of the adopters. Birth certificates issued in respect of children registered in this register disclose the fact that they are adopted, but do not disclose the names of their natural parents.

The birth certificate problem should be overcome without an Adoption Act, by the introduction of a Bill to authorise the keeping of a special births register for children who are in fact adopted. The Bill could provide that any person who has undertaken the guardianship and maintenance of a child other than his own child, and who has had such child under his care and maintenance for a specified period of, say, 3 years, may apply to the District Court for an order directing the Registrar-General to register the birth of such child in the name of the applicant in the Adopted Children’s register. The District Justice could be required, before making an order to satisfy himself, that it is in the interest of the child that he should continue under the guardianship of the applicant.

Legislation dealing only with the registration of adopted children would fall to be dealt with by the Department of Local Government and Public Health and, if you approve, I shall write to that Department informing them that it has been decided not to introduce an Adoption Bill, and suggesting that they should consider the introduction of legislation relating to the registration of the births of adopted children.

32.49 On 18 June 1945 the DLGPH expressed its concerns in a letter to the Taoiseach’s office. The Parliamentary Secretary, Dr Ward, broached the subject of legal adoption in a meeting with Archbishop McQuaid, who told him that while the Catholic church may have objections on religious grounds, it was possible for these to be overcome.

32.50 The issue of adoption legislation was again raised in the Dáil in October 1945. In reply to a parliamentary question, the Minister for Justice, Mr Boland said:

The suggestion that legislation should be introduced to confer full parental rights on persons who adopt children to the exclusion of the actual parents,
has been carefully examined. While I believe that in a number of individual cases this proposal would be advantageous, the result of my enquiries has been to convince me that there were serious difficulties in adapting the principle generally by way of legislation. In particular it has not been found possible to devise any scheme which would afford satisfactory safeguards against the danger that the question of the child’s religion might become involved in a controversial and undesirable manner. Unless this objection can be met I do not propose to introduce legislation.

32.51 In early 1946 the Taoiseach, Éamon de Valera, sought advice on the issue of adoption legislation from the Catholic hierarchy. Dr William Conway\textsuperscript{10} of St Patrick’s College, Maynooth was assigned to compile a memo for him on the relevant canon law. No practical progress was made and the Taoiseach wrote to Dr Conway in April 1946, stating that:

\begin{quote}
\hspace{1em} suggestions have been made to the government from time to time to the effect that legislation should be introduced to confer full parental rights on parents who adopt children to the exclusion of the actual parents. As a result of inquiries which we made however we concluded that there were serious difficulties in the way particularly in the regard to providing satisfactory safeguards against the danger that the question of a child’s religion might become involved in an undesirable manner. This is an aspect of the matter to which you have no doubt given thought and it would be very helpful to us if you would let us know of any opinions that you may have formed.
\end{quote}

Dr Conway assured Mr de Valera of his full cooperation.

32.52 In March the Taoiseach’s department wrote to the Secretary of the Department of Justice, Mr Roche, enquiring whether he had any observation to make in regard to the general question of adoption of children other than what had already been stated previously by Department of Justice officials.

32.53 Mr Roche replied the following month stating:

\begin{quote}
We went into this question again last year. The Catholic Protection and Rescue Society of Ireland had communicated with us a few years ago indicating that they were opposed to an adoption bill. In order to ascertain whether the religious difficulty might be overcome we wrote to Dr McQuaid
\end{quote}

\textsuperscript{10} Dr Conway was then a Professor of Canon Law in Maynooth and subsequently the archbishop of Armagh from 1963-1977.
and asked him whether he would see any objection to an adoption bill on the general lines of the British Act but containing a provision prohibiting the making of an adoption order in any case where it was not proved to the Court that the religion of the adopter and the religion of the child were the same. I enclose a copy of the reply which we received from Dr McQuaid and you will observe that he left no doubt in our minds that he would not favour such a bill. I also enclose a copy of a minute which I submitted to the Minister at the time and which sets out our views generally on the whole question. Following the receipt of the letter from Dr McQuaid the Minister decided to drop the idea of introducing an adoption bill, but he directed us to suggest to the Department of Local Government and Public Health that they should consider the question of introducing legislation to authorise the keeping of special birth registers for adopted children. We wrote to Local Government on that question on the 17th April, 1945, but so far Local Government have not taken any action on our suggestion.

32.54 In April 1945 an official from the Department of Justice interviewed two canon lawyers, Dr Cornelius Lucey\(^\text{11}\) and Dr John McCarthy of St Patrick’s College, Maynooth. They informed him that certain representatives of Catholic societies in Dublin had arranged some time previously for the drafting of a bill on adoption. The bill had now been drafted by a lawyer and they had been asked to examine it and to see whether there were any objections from a religious point of view. Their view was that the Minister for Justice was opposed in principle to the introduction of an Adoption Bill and before proceeding to examine the bill they were anxious to ascertain definitively what was the minister’s attitude.

32.55 They were informed that the minister was not opposed in principle to an Adoption Bill and that if the religious difficulties could be overcome he would be willing to introduce a bill himself. However the official told them that he had consulted Dr McQuaid on the religious point and that his reply was not encouraging.

32.56 The two religious leaders were satisfied that the minister was not opposed in principle to adoption but they were reluctant to go into any details on the question of legislation until they had given further consideration to the matter having regard to the views of Archbishop McQuaid.

\(^{11}\) Dr Lucey was subsequently Auxiliary Bishop of Cork from 1950 and Bishop of Cork from 1952-1980.
32.57 In May 1946, Dr Conway responded to the Taoiseach’s request for any opinions he might have had in relation to the question of legal adoption as affecting the religion of the adopted child. He stated:

I have considered the question carefully since then and I have come to the conclusion that the best way of preventing the question of the child’s religion arising in an unsatisfactory manner would be to introduce into the Bill the principle that for valid adoption the adopting parents must be of the same religion as the natural parents of the child (or as the natural mother in the case of illegitimate children). This principle could be effectively incorporated into the proposed legislation. It would have the effect of confining the adoption of children within the different religious groups, so that a child of Catholic parents could only be adopted by Catholics, a child of Protestant parents by Protestants and so on.

32.58 In July of that year an official from the Department of Justice contacted Dr Lucey again and suggested that he and Dr McCarthy might forward a copy of the Adoption Bill that had been drafted.

32.59 The interaction with Maynooth continued and in September 1946 Dr Conway wrote to Mr Roche regarding an interview that he had had with an English priest, Fr Agnells Andrew OFM, an expert in English adoption law. Fr Andrew did not see any difficulty in the way of introducing a bill along the lines of the English Act. He suggested that a commission should be set up which might encourage the Catholic hierarchy to come together and, having considered the problem, might overrule the objections which had been raised by certain Catholic societies.

32.60 Dr Conway was of the view that there was growing demand for legislation on adoption and that some legislation was desirable but the idea of a commission was not acceptable to the department. It is clear from the available documentation that, at this stage, all parties, the Department of the Taoiseach, the Department of Justice, the DLGPH and representatives of the hierarchy from Maynooth University were endeavouring to reach an agreement in relation to the introduction of some form of adoption legislation. However, despite examining such legislation in Canada and England and exchanging lengthy memos on the proposed legislation no agreement could be reached on the religious question. Even Dr Conway, who had invested a great deal of time in compiling memos on the issue, became disillusioned stating in a letter to the Department of Justice that the ‘difficulties are
such to render the framing of a satisfactory Adoption Act impractical at the moment’.

**The public campaign**

32.61 A public campaign to introduce legal adoption into Ireland did not commence in earnest until the second half of the 1940s. The campaign for a legally-based system of adoption was carried on mainly by the Adoption Society (Ireland), also known as the Legal Adoption Society, which was formed in 1948, although many other groups and individuals were also involved.

32.62 Hostility towards legislation appeared to come from politicians and deeply entrenched conservative elements within the rural population who were concerned about succession to land but there appeared to be widespread support among the urban middle classes. A more pronounced discussion demanding change began to emerge during the 1940s and, in November 1947, the *Dublin Evening Post* reported that a number of ‘adoptive’ parents began expressing concern about their lack of legal safeguards. In 1948, the Adoption Society (Ireland) began to campaign for legislation to give legal recognition to what it described as ‘de facto’ adoptions. According to Whyte, it was a body of amateurs, albeit well-informed and articulate: ‘Yet despite its scratch nature, it proved an uncommonly effective pressure group. Its officers seem to have worked together remarkably well’. Whyte described them as ‘ordinary, decent citizens who sincerely felt a grievance’.

32.63 During the 1948 general election campaign, the future Taoiseach, John A Costello, promised to legislate for adoption but pressure from the Catholic hierarchy soon saw him shelve these promises. This provoked a series of indignant letters that demanded that he fulfil his election promise with one letter writer asking ‘WHAT ARE THE FEARFUL DIFFICULTIES [emphasis in original]. Are we always in Southern Ireland to lag behind some other civilised countries?’

32.64 The Adoption Society was very active both politically and publicly. Its media campaign was complemented by parliamentary questions to relevant ministers from TDs from all parties.

32.65 The Joint Committee of Women’s Societies and Social Workers (JCWSSW) was also very active on the adoption issue. In February 1948 the JCWSSW sent a letter to the Minister for Justice stating that it was composed of representatives
from 17 women’s societies, representing over 50,000 women, and that it had been working for some years on the question of legal adoption and certain modifications of the birth certificates (see Chapter 1 in relation to the introduction of the short form birth certificate). Its letter stated:

The legislator does not appear to realise how great is the public demand for a legal adoption Act and the hardships endured by the lack of such an Act. If you favour us with the privilege of an interview, we can show you strong evidence of the necessity for such an Act. The amendment of the birth certificate would be a comparatively simple matter and would prevent needless pain and injustice to many innocent children. The reform which we press for has been in operation in practically every country for many years.

32.66 The arguments the JCWSSW put forward for legal adoption were:

- To give the unwanted or deprived child a settled home with the advantages of home conditions.
- Proper legal status for the child so that he cannot suffer for the sins or neglect of his parents.
- Protection for foster parents and the vesting in time of corresponding rights and duties.
- Incentive to many childless couples to come forward and adopt deprived children giving them the affection and advantages they would have given their own.

32.67 The JCWSSW met the Minister for Justice. They considered that the main objection to the promotion of adoption legislation was the parental rights of the birth mother. The JCWSSW felt that this objection could be put aside if the welfare of the child, the rights of foster parents and the fact that it was hard to legislate for isolated cases were taken into account. Interestingly, there was no discussion of any religious impediment that might face a possible adoption bill. The overall impression that the JCWSSW formed during this meeting was that the minister was sympathetic to the aims it shared with the Adoption Society.

32.68 The Adoption Society continued its own campaign and ran an advertisement outlining the need for legal adoption:
• To ensure that children may be adopted legally having a right to use their adopters name and to join the family circle of any home with complete security.

• To ensure the future happiness of children may not be marred by the production of a birth certificate when sitting for an examination, commencing employment or getting married.

• To ensure that childless married couples may take their part in the life of the country by bringing up families, fully assured that no interference from outside may occur.

• To ensure that children of unfortunate birth have equal citizenship rights with others as laid down in the Constitution.

• To ensure that our social conscience keeps abreast with all those democratic countries who have secured legal adoption by legislation.

32.69 According to Whyte, the Adoption Society succeeded in winning a considerable amount of sympathy. The annual conference of the Labour Party and the executive of the Irish Trade Union Conference passed resolutions of support. A circular to local authorities appealing for support was particularly successful. By May 1951 the Adoption Society was able to report that favourable resolutions had been passed by 46 out of 48 local authorities.

32.70 Other individuals and organisations also expressed support. The National Society for the Prevention of Cruelty to Children advocated legal adoption in its Reports for 1945-1946 and 1946-1947. The President of the High Court regretted the absence of legislation on adoption delivering a reserved judgement in an application concerning the custody of a child.\(^{12}\)

32.71 Meanwhile, questions continued to be asked in the Dáil during 1948. In December 1948, the new Minister for Justice, General Mac Eoin, stated: ‘I regret that the examination of this problem has taken longer than I expected. I can assure the deputy however that a decision will be taken as soon as possible’. This was followed by a further answer in April 1949 with General Mac Eoin stating: ‘this matter is still under consideration and I do not think that anything would be gained at the present stage by my making a statement on the difficulties or discussing them with the Adoption Society (Ireland)’.

\(^{12}\) *Evening Mail*, 22 June 1946.
32.72 In November 1949 he said that there were certain difficulties with the proposed legislation that were not easily overcome. In November 1950, he informed the Dáil that he had decided not to introduce proposals or any legislation that would provide for the irrevocable transfer of a parent’s rights and duties in respect of a child to any other person. In political circles there appeared to be uncertainty regarding the constitutionality of adoption based on Article 42 of the Constitution.13

A resolution

32.73 While the Irish State had been trying to harmonise its legislation with Catholic social teaching since its foundations, there was an incorrect view prevailing that the Church was opposed to legal adoption. In the *Irish Ecclesiastical Record* of October 1949, canon lawyer, Dr John McCarthy stated that there was nothing at variance with Catholic teaching in the principles of legal adoption. He remarked that the historic background and general indications was that the Church would favour legislation for legal adoption and adoption was referred to in sacred scripture. The safeguarding of the Catholic religion was a vital consideration; this meant that the Church could approve only if it could be safeguarded in any legislation. While this might be difficult, it would not necessarily be insurmountable. However, this view does not seem to have been publicly expressed by any Church leader.

32.74 The Adoption Society did interact with Church authorities. It should have been alerted to a serious problem when it communicated with Bishop Michael Browne of Galway about establishing a branch of the society there. Dr Browne responded that he had no problem with adoption in principle; his issue with the society’s campaign was that an adoption law would place ‘illegitimate’ children on the same level as ‘legitimate’ children.

I cannot give approval to your proposal to put illegitimate children on the same level as legitimate in regard to the birth certification that is a mischievous proposal. I also object strongly to the entirely exaggerated statements in your propaganda for adoption. It gives a misleading picture of orphanages and a distorted picture of the treatment of illegitimates.

His objections meant that a branch of the society was never opened in Galway.

---

13 The relevant section of Article 42 states: ‘The State acknowledges that the primary and natural educator of the child is the Family and guarantees to respect the inalienable right and duty of parents to provide, according to their means, for the religious and moral, intellectual, physical and social education of their children.’
Eventually an all-party meeting of TDs and the committee for the Adoption Society took place in November 1949. This led to a meeting with the Minister for Justice and TDs who were advocating legal adoption. At this point the minister indicated the difficulties he had in relation to the legislation particularly acknowledging the difficulty of providing suitable safeguards for the religious sensitivities concerning adoption. The minister defended his deferral to the Catholic church at this meeting saying that, while he could not for a moment admit the right of any Church authority to dictate or veto legislation, he was most anxious to avoid introducing legislation which might be regarded as objectionable by any Church.

The Attorney General, Charles Casey, in a speech to students in 1951, was even more explicit in his explanation for not favouring a legalisation of adoption when he asked: ‘how can any Catholic logically demand or permit any legislation which would endanger the soul of a single child?’ Although he did consider the position of the unmarried mother, he did so in terms of the ‘inalienable’ rights of the family. He stated:

if the word ‘inalienable’ is to be given any meaning at all, it may mean that no mother of an illegitimate child can alienate her right and duty to provide according to her means for the religious and moral, intellectual, physical and social education of her child. In other words if she cannot allow her child to be irrevocably adopted can the state pass legislation enabling her to do so.

According to Earner-Byrne, Attorney General Casey considered the issue purely from the perspective of principle and despite referring to the mental anguish of the unmarried mother, in truth that mattered less to him than the rights of ‘legitimate’ families. The Catholic understanding of the family was more important to many than social reality.

There was no consideration of other religious groups and their needs. Casey appeared to relish the idea of the counter-attack which his speech would engender telling Archbishop McQuaid that he was sure it would come hot and heavy, ‘I shall enjoy that in my bed.’ For the Attorney General, legal adoption was an opportunity to defend Catholic principles. According to Whyte, Archbishop McQuaid was consulted about the adoption issue by both ministers Mac Eoin and Boland, and when consulted advised against legislation. Archbishop McQuaid’s concern was that those who advocated legal adoption were overlooking the rights of the birth mother and her child in their zeal to safeguard the rights of the adoptive parents.
and he felt that the rights of all parties needed to be properly enshrined in legislation. He also expressed the fear of proselytism. Other senior clerics believed that ‘Protestants were running a slave trade in Catholic babies’. Bishop Staunton of Ferns was convinced there were children being born in undisclosed locations with records kept at a separate location to ensure that they could not be identified and that then these children would be raised in Protestant homes, known as ‘bird’s nests’, from the age of two. He wrote: ‘The children would be spirited off to England by Dr Barnardo’s, who would ensure that the boys, suitably indoctrinated, would join the British Army and the girls would be sent to work in restaurants etc’. Bishop Staunton alleged that government agencies were in collusion; he also expressed the view that Protestants were ‘always confident with the ascendancy complex, on which they were founded’; alleged that the homes were run by zealous Protestants, meaning that it was easy to keep it all a secret from Catholics. He also accused Miss Litster of being in collusion with this alleged system because she was a Protestant.14

32.79 Bishop Staunton recommended that Dr Alfred O’Rahilly, President of University College Cork be contacted as he ‘is well up in the matter’. This letter was passed on in the Department of Health and a written reply stressed that, while there were a large number of factual errors, there was some truth that helped fuel Bishop Staunton’s conspiracy theory. Protestant organisations had previously offered to help ‘illegitimate’ children of Catholic mothers but there was no evidence of a Protestant conspiracy involving Protestant civil servants. Despite the false nature of the claims, it was clear that the State was fearful enough of the power of the Catholic church to shelve efforts at legislating for adoption.

32.80 The Minister for Justice, General Mac Eoin, would not give any information as to why he refused to introduce legislation or encourage debate about the issue. In response to a Dáil question, the Minister for Defence - who was deputising for General Mac Eoin in this particular debate - stated that ‘there is an obligation on a minister to give his reasons for any legislation which he introduces. There is not an obligation on a Minister to give reasons for the multiplicity of pieces of legislation which he is not prepared to introduce’. The JCWSSW claimed a constituency of 50,000 women in Ireland and they wrote expressing outrage and 14 The Commission understands that Miss Litster had converted to Catholicism before this time.
frustration with what was going on, in particular with the refusal of ministers to outline the reasons for their inaction.

32.81 Despite General Mac Eoin’s hesitance to legislate, the Adoption Society moved to have a private member’s bill introduced. Mac Eoin’s successor as Minister for Justice, Gerald Boland, was more amendable to the bill, and encouraged its introduction, but he would not introduce a bill himself. By November 1951, the private member’s bill was placed on the Dáil’s order papers under the names of Pa McGrath of Fianna Fáil and Percy Dockrell of Fine Gael with others willing to back it in the Dáil as well. The Irish Independent was concerned with how the bill was brought forward, contending that the ‘case was made by a small section, which clamoured loudly and persistently for this so-called legal reform, and the government, putting aside infinitely more urgent business, set its draftsmen and its printers to work and yield to the pressure’.

32.82 Eventually Church leaders did set up a sub-committee on legal adoption. According to Whyte, the sub-committee’s membership was reported as consisting of Archbishop McQuaid as Chairman, Archbishop Kinnane of Cashel, Bishop Brown of Galway, Bishop Farren of Derry, and Dr Lucey who was then the coadjutor bishop of Cork, as members.

32.83 A report, authored by canon lawyers Bishop Lucey, and Drs William Conway and John McCarthy of St Patrick’s College, Maynooth, was sent to the government in October 1951. This report said that there was no conflict in principle between Church teaching and legal adoption:

The acceptance of the Roman law system of legal adoption has been an integral part of the Church’s tradition from the earliest time to the present century...to the objection that adoption abrogates inalienable parental rights, there is the answer that the child’s rights to family life is no less natural and fundamental than the rights of parents; that, in particular circumstances, legal adoption is the only practical way of securing the implementation of the child’s natural right to family life and that the Church has always recognised cases where parental rights are overborne.

32.84 Their report also identified benefits of legal adoption as, among others, providing a family life for children who might otherwise not have such; it could provide relief and remove abuses prevalent in the informal adoption system; and
it would tend to lessen the export of babies to Great Britain and America. The dimensions of this traffic cannot be precisely assessed, but it is very considerable for America (estimated at about 500 for last year) and probably much greater, as well as being largely hidden and uncontrolled, for Great Britain.

32.85 The Church had a legitimate interest in the terms of any proposed Adoption Act:

- In so far as its operation might constitute a danger to the faith of Catholics and particularly of Catholic children;
- In so far as its operation might constitute a danger to good morals and
- In so far as its operation might endanger the institution of the family as the natural social unit.

32.86 It proposed that the Church would not oppose the introduction of legal adoption if the following conditions were met:

**Religious**

i. In all cases the adopting parents must be the same religion as each other being the religion to which the natural parents (or, in the case of illegitimate children, the natural mother) belonged one year prior to the birth of the infant.

ii. If the natural parents of a legitimate infant were not of the same religion as each other one year prior to the birth of the infant, then the adoption parents must be of the religion in which the natural parents on the occasion of their marriage agreed in writing that their children should be brought up.

iii. Where the parents of an infant are unknown such infant shall in all cases for the purposes of this Act be deemed to be a member of the Holy Catholic Apostolic and Roman Church, and the adopting parents must be members of that Church.

iv. In all cases a natural parent or an adopting parent shall be deemed to be at all material times of that religion in which he or she was first baptized unless it shall be manifestly proved that he or she subsequently changed to and professed and practiced a religion other than that in which he or she was first baptized.
Moral and Social

i. An application for an adoption order may be made only by two spouses living together in lawful wedlock or by a widow who has no surviving natural children of her own.

ii. Only children who are (a) illegitimates or (b) full orphans (i.e., whose father and mother are dead or missing, or incurably insane) may be adopted. Provided that an infant only one of whose parents is dead may be adopted by two spouses one of whom is the uncle or aunt of the infant.

iii. In all cases the adopting parents must be at least twenty-five years older than the infant to be adopted.

iv. No infant may be adopted by a person, singly or with his or her spouse, who is related to the adopters or one of them in the first degree of the collateral line.

v. An adoption order shall in all cases be in the first instance for a probationary period of not less than two years in the case of children of five and under and of not less than one year in the case of children over five years of age.

vi. In all cases both the infant to be adopted and the adopting parents must be citizens of Ireland and resident in Ireland.

vii. If more than one infant is adopted by the same spouse or by the same widow there shall be a reasonable disparity of age between the children so adopted.

viii. No Adoption Order shall be made without the consent of every person or organisation, society or incorporated body who is a parent or guardian of the infant in respect of whom the application is made, or who has the actual custody of the infant, or who is in the loco parentis of such infant, or who is liable to contribute to such infant’s support.

ix. That parental consent to both the conditional and absolute orders must always be formal and explicit and, in the case of the mother, may be given only after a statutory period has elapsed after the birth of the infant.

x. That all adoptions must be made from or through institutions licensed and registered to hold children for adoption.

xi. That a Register be kept of all children who are admitted to institutions licensed and registered to hold children for adoption.

xii. That no infant may be admitted to an institution licensed and registered for adoption unless the religious instruction given in such institution is
exclusively that to which the parents (or in the case of an illegitimate child, the mother) belonged one year prior to the birth of the infant.

xiii. That no couple, or widow, may adopt more than three (or four) children.

The Adoption Board

i. That an Adoption Board be established to supervise the activities of licensed and registered institutions; to examine and report upon all applications for adoption orders; and generally to supervise the operation of the Adoption Act.

ii. This Board to be a semi-autonomous body representative of the State, the religious denominations, and the institutions licensed and registered to hold children for adoption.

iii. One religious advisor may be appointed by each of the religious denominations recognised officially in Bunreacht na hÉireann. Each religious advisor shall be entitled to sit on the Board and take part in its deliberations only when the infant to be adopted is of the same religious belief as said advisor.

iv. In the case of a doubt as to the religious belief of an infant the said matter shall be submitted to the religious advisors acting as a sub-committee of the Board, who shall submit their recommendations in writing to the Board acting as the Board without the religious advisor. These recommendations shall be entitled to serious consideration, but they shall not be final or binding on the Board. If the Board so acting without a religious advisor should in such circumstances decide by a majority vote that the religion of the infant is that of one of the religious denominations recognised by Bunreacht na hÉireann it shall not proceed further in its deliberations without the attendance of the religious advisor of that denomination.

32.87 In November 1951, Archbishop McQuaid wrote to the Minister for Health stating that the proposed adoption board needed to be judicially-led. He said there was no need to set up another judicial body when the Circuit Court was in existence and its decisions would be fully enforceable by law.

32.88 In January 1952, the archbishop again wrote to the minister:

It will be noted that I have omitted any mention of proselytism. I was uneasy lest such mention should stir up opposition in the Dáil and set moving a campaign in the press. Further, we achieve our purpose without mentioning
proselytism. To mention the evils of proselytism and to call for supervision of
institutions, emphasises supervision of Protestant houses, whereas we hold
that all institutions ought to be controlled.

32.89 In January 1952, the Catholic hierarchy issued a statement. The statement was
favourable in principle to legal adoption. It made clear that, provided certain
safeguards were included, the hierarchy would not oppose such a measure. The
statement made the following points:

- Parents have a natural right and obligation to provide for their children in
  regard to religious and moral training, physical wellbeing and preparation
  for civil life. Only for the gravest reasons may parents permanently
  relinquish this right or consider themselves excused from this obligation.
- The safeguards must be such that the Church considered sufficient to
  protect faith and morals. A child’s right in respect of faith and morals must
  be protected by such safeguards as will assure his adoption by persons
  who profess and practice the religion of the child and who are of good
  moral character.
- An Adoption Bill should contain such real minimum safeguards as will
  minimise the moral dangers that may arise as a result of the adoption.
- It was imperative that there should be supervision and control of all
  institutions holding children for adoption.
- The Church regarded the natural family as the ideal unit of family life and
  therefore must oppose any measure in an Adoption Bill that would tend to
  substitute an artificial for a natural family.  

Introduction of Government Bill

32.90 The Adoption Bill 1952 was introduced in the Dáil on 29 April 1952. Prior to its
introduction, a scheme for the bill had been circulated by the Department of Justice
to the other main religions and by March 1952 the Department of Justice had
reached an agreement with them. Stewart has noted that the other religious
denominations had been given less time than the Catholic church to examine and
consider the possible adoption legislation. The Adoption Society also gave its
approval to the bill publically in the Irish Times.  

32.91 There were a number of contributions in the Dáil during the adoption debate from
those in favour and those opposed to adoption. Among those who spoke was the

---

16 Irish Times, 2 May 1952.
Minister for Justice, Gerald Boland, who spoke of family values and the importance of the family as a fundamental unit in society. Among those opposed was the former Minister for Justice, General Mac Eoin, who had previously opposed the introduction of adoption legislation. He was one of the few TDs to focus on the issue of consent and pointed out that some women could, through stress of circumstances, be forced to sign consent forms and that once adoption was finalised there would be no legal way for those women to get their children back. He was however gracious and congratulated the minister on being able to do what he himself had been unable to do in introducing an Adoption Bill.

32.92 In the Dáil Committee stage debate on the Bill, Deputy Tom O'Higgins wanted to strengthen the provisions on consent. He proposed an amendment providing that the Adoption Board would have to satisfy itself that the consent was ‘voluntarily given with full knowledge of the consequences’. Deputy O'Higgins favoured legal adoption but wanted to ensure that safeguards were in place: ‘I do not think that merely providing that the consent must be voluntarily given is any safeguard. Consent can be given voluntarily, but in complete ignorance.’ The Minister for Justice thought that the Bill dealt adequately with the issue. Deputy O'Higgins argued that the onus should be put on the Adoption Board to inquire into the consent and to go behind the written document:

we can well imagine circumstances in which a mother is starving or in poor circumstances and who, by reason of her poor circumstances, wants to find a good home for her child. Under circumstances of that kind, she would be willing to alienate her rights to her child by providing for adoption. However, starvation, or circumstances leading to starvation, do not imply a full or free consent to the adoption of a child. If we provide that a mother who alienates her rights to her child does it for all time, as she should if there is to be a proper protection for a family, we should put the onus on the board to go behind any mere document of consent, to examine the circumstances in which the consent was given and satisfy itself that the consent is not merely a voluntary one but that it is also given in full knowledge of the consequences and of the circumstances. I do not think that Section 15 provides the answer.

32.93 The Bill was finally enacted on 13 December 1952 and came into effect on 1 January 1953.
C: Adoption law in Ireland

32.94 Legal adoption was introduced in Ireland by the Adoption Act 1952 which came into effect on 1 January 1953. It applied to adoptions within Ireland and did not regulate foreign adoptions - see below. It was amended by Adoption Acts in 1964, 1974, 1976, 1988, 1991 and 1998. These are the relevant Acts for the period covered by the Commission - 1922-98. (The current law on adoption is set out in the Adoption Act 2010 which repealed all of these Acts. Among other things, it established the Adoption Authority which took over the functions of the Adoption Board. This Act is not relevant to the Commission's investigation.) The Commission is not examining all aspects of adoption law; it is concerned with the law on consent, placement for adoption and the extent to which the welfare of the child had to be taken into account.

Adoption Board

32.95 The Adoption Act 1952 was in some respects pioneering. The establishment of a special adoption board to make adoption orders was a conscious departure from the court based systems adopted in most common law jurisdictions. The Adoption Board (An Bord Uchtála) was given responsibility for making adoption orders in Ireland. It also had responsibility for the making of declarations of eligibility and suitability to adopt and for the registration and supervision of adoption societies. The board did not have any function in deciding disputes about the custody of a child; this was reserved to the High Court.

Adoption societies

32.96 The 1952 Act regulated the operation of adoption societies, which made arrangements for the placement of children for adoption and restricted the making of those arrangements to registered societies and public assistance authorities. However private adoptions were not banned. They were restricted by the Adoption Act 1974 to adoptions where the parent of the child placed the child for adoption or where the adopter was a relative of the child or a spouse of a relative of the child.

Payments

32.97 The 1952 Act introduced bans on advertising adoptions and on the receipt of payments by adopters, parents or guardians in consideration for the adoption of a child.

---

17 A relative was defined by the Adoption Act 1952, Section 3, as a grandparent, brother, sister, uncle or aunt. In the case of an ‘illegitimate’ child the relationship was traced through the mother only.
child. Payments to those who made arrangements for adoptions were also prohibited.

**Eligibility of children for adoption**

32.98 In order to be eligible for adoption, a child had to be at least six months old, no older than seven years and be either an orphan or ‘illegitimate’. In *Re J, an Infant*, the parents who had married after the birth of their child sought the child’s return from prospective adopters who had refused to give up custody. In this case, the mother’s final consent to an adoption order had been given when the child was only four weeks old; this rendered the adoption order void as it was in breach of the requirement that the child be six months old at the date consent was given. However, the adoptive parents had refused to hand over custody of the child and the birth parents had challenged this refusal. The Supreme Court found that the birth parents had an absolute right to the custody of their child by virtue of the protection of the family afforded by Articles 41 and 42 of the Constitution and an order was made directing the adopters to return the child to the birth parents.

32.99 The *Adoption Act 1964* which came into effect on 5 February 1964 expanded the eligibility for adoption. It provided that children whose parents had married following the birth, but whose births had not been registered under the *Legitimacy Act 1931*, could be adopted. It also provided that children who were over the age of seven but under nine at the time the application for adoption was made could be adopted. The *Adoption Act 1974*, which came into effect on 29 July 1974, removed the age restriction which had previously been in place, subject to the approval of the Adoption Board. By 1988 the adoption of the children of married parents was permitted in certain circumstances.

**Eligibility of Adopters**

32.100 When adoption legislation was first introduced, those applying to adopt had to be either a married couple living together, the birth mother or birth father or certain relatives of the mother, or a widow. In the case of adoptions where neither of the

---

19 This provision was subject to the requirement that the father of the child gave his consent to the making of an adoption order or in the alternative that the consent of the father of the child had been dispensed with under Section 14 of the *Adoption Act 1952*.
20 *Adoption Act 1964*, Section 3. This section also required children over the age of seven to have been in the care of the prospective adopters since before the age of seven. The board could also make an adoption order under this section in respect of a child over the age of seven where the applicant was the mother, father or relative of the child.
prospective adopters was related to the child, the adopters were required to be at least 30 years old. This was reduced to 25 by the Adoption Act 1964 and to 21 by the Adoption Act 1991. In 1991, the eligibility requirements were expanded to permit adoption by a single person in certain circumstances; a widower; and by those who were separated, divorced or who had been deserted by their spouse.

32.101 The Adoption Board was also required to be satisfied that the applicant or applicants for adoption were of good moral character, had sufficient means to support the child and were suitable person(s) to be granted parental rights and to undertake parental duties.

Religious requirements

32.102 The Adoption Act 1952 stipulated that the applicants for an adoption order were to be of the same religion as that of the child and its parents or if the child was ‘illegitimate’, its mother. A child’s religion was classified as the religion in which the child was being brought up. In 1973, a challenge was brought to the constitutionality of this requirement of uniformity of religion by a married couple who were seeking to adopt a child that was the biological child of the mother only. The mother’s religion was Church of England and her husband’s was Roman Catholic. The child had been baptised in the Church of England but since the mother’s marriage had been brought up as a member of the Roman Catholic faith. The couple’s application for adoption had been refused. The High Court found that the requirement of uniformity of religion in the Act amounted to discrimination on grounds of religious belief in breach of Article 44.2.3 of the Constitution and was accordingly invalid. The Adoption Act 1974 eased the requirement that the birth parents (or in the case of an ‘illegitimate’ child, the mother alone), the child and the prospective adopters must have the same religion, by permitting adoption of children who were not of the same religion as the adopters, where the birth parents knew of the religion of the applicant when giving consent to the adoption.

---

22 In the case of a married couple one of whom is the birth parent or relative of the child, only one of them was required to have attained the age of 21.
24 An exception to this was provided by Section 12(3) however which permitted the Adoption Board to make an adoption order having regard to the ‘special circumstances of a particular case’ where the applicants were not of the same religion as the child and the parents, provided each of them was a member of one of the following: Church of Ireland, the Presbyterian Church in Ireland, the Methodist Church in Ireland, the Religious Society of Friends in Ireland, the Religious Society of Friends in Ireland, the Baptist Union of Ireland and the Brethren, commonly known as the Plymouth Brethren.
CHAPTER 32 ADOPTION

Consent

32.103 Under the 1952 Act, an adoption order could not be made without the consent of the child’s mother or guardian or any person having charge of, or control over, the child. Such a consent was invalid unless it was given after the child had reached the age of six months and no more than three months before the application for adoption was made. The Adoption Act 1974 reduced the minimum age of the child at which the mother’s consent to adoption would be valid from six months to six weeks.

32.104 Two distinct consents were involved. The first was a mother’s agreement to place her child for adoption. While the term ‘placing for adoption’ was not defined in legislation, it has been described as meaning ‘the originating arrangement for adoption made by a mother or guardian with an adoption society’. Before accepting a child for adoption, an adoption society was required to furnish a statement explaining the effect of an adoption order on the rights of the person placing the child for adoption, and explaining the provisions of the Act relating to consent. The adoption society was also required to ensure that the person understood the statement and signed a document to that effect.

32.105 The second consent was the mother’s consent to the adoption order. This could be withdrawn at any stage up to the making of the adoption order. The consent was required to be in writing and to be in a prescribed form. The Adoption Board was required to satisfy itself, prior to the making of the adoption order, that every person whose consent was necessary, and which had not been dispensed with, understood the nature and effect of the consent and of the adoption order.

32.106 In the case of M and M v An Bord Uchtála, the birth mother agreed to place her child for adoption in June 1970 when she was unmarried. The prospective adopters applied to adopt the child who had been in their care for several months in December of that year. The following summer, the mother signed her consent and an adoption order was made 12 days later. In 1972, the child’s birth parents married and, in 1974, they issued proceedings on the basis that a valid consent had not been provided. The mother gave evidence that, having signed the consent, she was under the impression that it was final and irrevocable and that, if she had known she could have reclaimed her child before the order was made,

---

she would have done so. The Supreme Court found that the mother had not been aware of her right to withdraw her consent and that the Adoption Board had not discharged its duty to ensure that the mother understood the nature and effect of the consent which she had given. The Court held that as a result, the board had not had any power to make the adoption order and it was void. The child was returned to the birth parents. As a result of this decision, the *Adoption Act 1976* was passed.\(^\text{28}\)

32.107 The *Adoption Act 1976*, which came into effect on 13 July 1976, provided for the retrospective validation of consents and adoption orders which had been made without compliance with certain of the requirements of the existing legislation in respect of consent. These consents and orders were validated even if:

- the person giving the consent was not aware of his or her right to withdraw the consent before the making of the final order;
- the person was not aware of the date on which the order was to be made;
- the person who gave his or her consent to the order was not aware of his or her right to be heard on the application for an adoption order; and
- the board had no information as to whether the person who gave consent was aware of those rights.

32.108 Under the Act, where there was a challenge to an adoption order, it would not be declared invalid if the court was satisfied that it would not be in the best interests of the child concerned to make such a declaration and where it was satisfied that it would be proper, having regard to those interests and the constitutional rights of all persons concerned, not to make such a declaration. These provisions applied only to adoption orders which had been made prior to the passing of the Act and could not operate to validate questionable adoption orders made after the Act came into effect.

32.109 The *Adoption Act 1976* also introduced further provisions in relation to consent. It provided that parents and guardians must be informed before giving consent or ‘as soon as may be’ after giving consent that they were entitled to withdraw their consent at any time prior to the making of the adoption order and of their right to be heard by the board on the application for the adoption order. The Act required that those giving consent would be asked, at the time of so giving, to indicate in writing

if they wished to be informed of the date on which the board would hear the parent or guardian or their legal representative on the application for an adoption order and also to indicate in writing if they wished to be consulted again in relation to the application.

32.110 Under the 1952 Act, considerable problems had arisen over the years where a mother had placed her child with prospective adopters (generally through an adoption society) and subsequently failed or refused to execute the consent to adoption. The Adoption Act 1974 represented an attempt to cure this problem. It made two major changes affecting the rights of a mother in relation to the adoption of her child. Firstly, the minimum age of the child at which a valid consent could be given by its mother was reduced from six months to six weeks. Secondly, her power to prevent an adoption order being made by the Adoption Board by either withholding or withdrawing her consent was qualified by a provision of the Act which enabled the High Court, in certain circumstances, to make an order permitting the Adoption Board to dispense with the mother’s consent.

**Dispensing with Consent**

32.111 Until the passage of the 1974 Act, a mother’s consent to the adoption of her child could not be dispensed with unless she was found to be incapable by reason of mental infirmity of giving consent, or where the mother could not be found. The 1974 Act meant that the High Court could dispense with the consent of a mother where she had already agreed to the initial placement of the child for adoption and where an application for an adoption order had been made but where the mother failed, refused or neglected to give her consent or withdrew her consent, it already having been given. The test which the court was to apply when considering whether to dispense with consent was whether it was satisfied that it was in the ‘best interests’ of the child to do so. This was a significant expansion of the circumstances in which the court could make an adoption order, notwithstanding the absence of a mother’s consent. The President of the High Court, Mr Justice Finlay, described the power as ‘A new jurisdiction…conferred upon the High Court entitling it to authorise the Board to dispense with the mother’s consent, notwithstanding her active opposition or her failure to make up her mind or to communicate or to deal with the problem’.  

---

32.112 Most of the cases which have come before the courts on the dispensation of consent have concerned applications to dispense with the consent of unmarried mothers to the adoption of their children and have focused on whether the obligations of the adoption society, to ensure that the mother’s consent was valid, were fulfilled.

32.113 In *G v An Bord Uchtála* a 21-year-old woman, who had signed her consent to the placement of her child for adoption less than two months after the child was born, applied to have her child, who was in the custody of the prospective adopters, returned to her. The mother had indicated her intention to regain the custody of her child approximately five weeks after she had placed him for adoption, having been assured of support from her parents, from whom she had originally kept the pregnancy and the birth a secret. The prospective adopters applied to have the mother’s consent dispensed with. In September 1978, Mr Justice Finlay in the High Court made an order that the child should be returned to its mother. In December, the Supreme Court rejected the adopters’ appeal. The prospective adopters had argued that the child’s constitutional rights were infringed by the refusal of the court to make an order dispensing with consent. The Supreme Court rejected this argument on the facts, finding that the mother had a constitutional right to the care and custody of her child. A majority of the court held that the mother had rights that derived from the fact of motherhood and from nature itself, that these rights were among her personal rights as a human being and were rights which the State was bound to protect and vindicate under Article 40.3.1 of the Constitution.

32.114 However, in *S v Eastern Health Board*, the High Court made an order dispensing with the consent of the mother to the adoption of her child on the grounds that to do so was in the best interests of the child. In this case the mother, who had given birth to her child in Pelletstown in June 1977, signed a consent to the placement of the child for adoption approximately six months after the birth. In December 1977, the child was returned to the mother at her request by the prospective adopters. However, the mother changed her mind shortly thereafter and the child was returned to the adopters. In May 1978, the mother signed a final consent to the adoption of her child but subsequently informed the Adoption Board that she was withdrawing that consent.

32.115 The President of the High Court, Mr Justice Finlay found that the consent signed by the mother in May 1978 constituted a clear agreement to place her child for adoption and that no pressure had been put on her to consent finally to the adoption of her child (as she had claimed). He found that evidence that, in any particular case, a mother either sooner or later after the making of such a decision changed her mind was not itself evidence of the invalidity of the agreement to place a child for adoption.

32.116 In *McC v An Bord Uchtála*, a mother, who consented to the placement of her child for adoption three days after his birth and had signed a final consent to his adoption when he was just under three months old, tried to regain custody when he was six months old. It was argued on behalf of the mother that her consent to place her child for adoption was not freely given, as she was so young and it was so soon after the birth of the child. Although the judge accepted that the mother’s consent was not given freely, he rejected the argument that, if the first consent (the consent to the placement for adoption) was not freely given, this fact invalidated the final consent. He found that, although the mother had changed her mind on several occasions, when she gave her final consent when the child was six months old, she had decided after full consideration to have the child adopted and that she was not pressurised into making this decision.

32.117 In *McF v G*, the plaintiff, who was an unmarried mother, had gone to Bessborough prior to the birth of her child. She left Bessborough three days after the baby was born and signed a form consenting to placement for adoption eight days later. When the child was a year old, she refused to provide a final consent to its adoption. In April 1981, almost two years after the child was born, she instituted proceedings seeking custody of her child. By this stage, the prospective adopters had also issued proceedings seeking to dispense with her consent. It was argued on the birth mother’s behalf that her consent was an invalid one having regard to the fact that it was signed so soon after the birth and having regard to the fact that she was afraid to disclose the circumstances of the birth to her mother and did not have any place to house or bring up the child.

32.118 The judge found that, when the mother signed the consent to placement, she fully understood the form and it was fully explained to her. Although in the case of *G v* [1982] ILRM 159.

33 [1982] ILRM 159.
34 [1983] ILRM 228.
An Bord Uchtála, Mr Justice Walsh had indicated that consent motivated by ‘fear, stress or anxiety, or consent or conduct dictated by poverty or other deprivations does not constitute a valid consent’, in McF the argument that fear, anxiety, poverty and other deprivations had nullified the mother’s consent was rejected by the judge who found that these should be approached from a ‘practical point of view’. He said that the mere fact of having an ‘illegitimate’ child caused stress and anxiety and that, if absolute rules as to fear, stress, anxiety or poverty were to be applied, there could hardly be a case found in which one or other of them would not be present so that it could be argued that a consent was not valid.

32.119 In VC v JM and GM, the judge found that the mother did not have any full realisation that, by signing her consent to having her child placed for adoption, she would be unable to get her child back. In that case, the mother had signed a form consenting to the placement of her child for adoption three days after the child was born. The social worker from the Rotunda Girls’ Aid Society had advised the mother that the court had a power to dispense with her consent to the adoption. However, the social worker also gave evidence that she had told the mother that she could change her mind. The judge found that it was essential, before there be a valid consent to placement for adoption, that the mother should be aware that solely by virtue of the fact that she had placed her child for adoption, she might not be entitled to have the child returned to her. He found that this was never the mother’s understanding of the position. On the basis that there was no valid consent to placement, the judge refused the application to dispense with the mother’s final consent. However, he granted a separate order for custody to the prospective adopters on the basis that the child had remained with them for a period of six years and the child’s welfare required that it should remain in the family surroundings where it had been for the previous six years.

32.120 On appeal, by a 3:2 majority, the Supreme Court found that the judge in the High Court had drawn the wrong conclusion as to the mother’s state of mind (which was held to be a matter of inference or opinion and not a matter of primary fact) from the undisputed facts and that in fact the mother at the time of the placement for adoption had given her full and free consent to the adoption. The judge found that the mother was:

a married woman with one legitimate child who after mature consideration and ample and careful counselling signed a formal agreement to place her illegitimate child for adoption. If there had been any want of true consent on her part, one would have expected her to repudiate the paper consent as soon as possible and certainly to do so when the adoption society acted on foot of it and placed the child with the adoptive parents. Instead of so doing, she on more than one occasion confirmed the consent and it was not until long afterwards that she sought to repudiate it. Such a later repudiation cannot be reconciled with her previous conduct. It was, in my opinion, no more than an afterthought. As such, it could not negate the full and free consent given earlier.

The Supreme Court made an order dispensing with the mother's consent and granting an adoption order.

32.121 In the 1991 case of *In re DG, an infant: OG v An Bord Uchtála*\(^{36}\) Chief Justice Finlay in the Supreme Court confirmed that a free and fully informed consent to placement for adoption was a pre-requisite to the power of the court to make an order dispensing with the mother’s final consent and that, in considering whether such a consent had been given:

it was of obvious importance to state that a mother agreeing to place her child for adoption could not be said to reach a fully informed decision so to agree, unless at the time she made the agreement she was aware that the right which she undoubtedly had to withdraw that consent or to refuse further to consent to adoption, is subject to the possibility that upon application by the prospective adopting parents, the court could conclude that it was in the best interests of the child to dispense with the mother’s consent and if following upon such a decision, the board decided that it was appropriate to order the adoption of the child, she, the mother, could lose, forever, the custody of the child.

32.122 In the case of *NB and TB v An Bord Uchtála*,\(^{37}\) Barron J. found that the mother knew, because the consent form had been read and explained to her, that if she refused her consent, or withdrew her consent once she had given it, the Adoption Board could dispense with her consent. However, he also found that the evidence showed that the only thing which the mother had clearly taken in was that she

\(^{36}\) [1991] 1 IR 491.

\(^{37}\) Unreported judgment of Barron J of 18 February 1983.
could change her mind. Notwithstanding this fact, the judge held that the mere fact that a mother may not have fully absorbed all the advice and information given to her by a social worker prior to agreeing to her child being placed for adoption did not, by itself, invalidate an agreement to place when it was clear that at the time of her agreement the mother wanted her child to be adopted, that the consequences of placing her child for adoption were fully explained to her and that, at the time of the explanation, the mother understood those consequences.

32.123 In the case of *DG and MG v An Bord Uchtála*, the judge found the mother had not understood that, if she changed her mind, having given her consent to the placement of her child for adoption, a court could dispense with her final consent and she could lose her child, although these facts had been explained to her by the social worker employed by the adoption society. The judge found that in determining whether there was a valid consent it was not sufficient merely to consider whether the relevant information was conveyed to the mother but also to consider the ability of the mother to receive that information and to intellectually process it in such a way as to lead to an understanding of the effect of an adoption order. The mother’s consent had not been free because it had been given in circumstances where her parents, with whom she resided at the time at which she placed the child for adoption, had made it clear that they wished the child to be adopted, forbade her from bringing the child home and made it clear that the existence of the child should be concealed. Ultimately the judge concluded that a valid agreement to place the child for adoption did not exist because the mother’s consent to place the child for adoption was neither fully informed nor free. The child was returned to the birth mother, 11 months after being placed with the prospective adopters.

32.124 It has been pointed out that there is an inconsistency between the decisions in *NB and TB v An Bord Uchtála* and *DG and MG v An Bord Uchtála* which make it difficult to predict how disputes concerning the validity of a mother’s consent which rest on a claim that the mother failed to understand the effect of the consent she has given, may be resolved in future cases.

---

Mothers who were themselves minors

32.125 The question of the validity of the consent to adoption given by mothers who were themselves minors was raised with the Commission. For most of the period being examined by the Commission, the age of majority was 21 or on marriage, if that was earlier. It was reduced to 18 by the Age of Majority Act 1985.

32.126 Many of the mothers who placed their children for adoption were under the age of majority and so were legally unable to make a number of significant life decisions. The law on adoption did not distinguish between mothers who were under and over the age of majority. The issue was addressed in the Dáil debate on the Adoption Bill 1952. An amendment was proposed by T F O’Higgins TD which would have required the consent of the father or guardian of a minor mother prior to the making of an adoption order. There was a very short debate on the issue and the amendment was withdrawn. The Minister for Justice was satisfied to leave the decision to the mother and he and another deputy expressed concern that a requirement to obtain the consent of a parent or guardian might prevent adoptions taking place.

32.127 The age of the mother when giving consent was recorded only if she was under the age of majority. The Adoption Act 1952, Rules 1953 set out the various forms to be used when adoptions were being arranged. These included forms for giving consent to adoption. There was one form for cases where the mother knew the prospective adopters (effectively the cases where the mother herself placed the child for adoption) and another, slightly different, form for cases where the mother did not know the prospective adopters (generally cases where the placement was through an adoption society). These forms contained a declaration that the mother was twenty-one years or older but also provided that if the mother was under twenty-one years that her age in years would be stated on the form. In effect, the forms recorded the age of the mother only if she was a minor. It is clear from this that the authorities were aware that minor mothers would be giving consent and that it was considered that her status as a minor did not prevent her from consenting to the adoption of her child.

---

40 See Chapter 1 for information about the legal age for marriage; very young married people were regarded as adults and had the right to make decisions about their children.
41 Dáil Debates, 26 June 1952.
The best interests of the child

32.128 The decisions of the High Court in applications by prospective adopters to dispense with the consent of the birth mother fell to be determined by reference to the ‘best interests’ of the child under the provisions of the Adoption Act 1974. The assessment of the ‘best interests’ of the child only proceeded where it had first been determined that the mother’s consent was a valid one.

32.129 The question of how the best interests of the child should be assessed was however, not specified in the legislation. In the case of *G v An Bord Uchtála*, it appears that no expert psychological evidence was given in relation to the bonding of the child with its carers, and was therefore not a factor which the court considered when determining what was in the best interests of the child. However, in *S v Eastern Health Board*, which was decided about the same time as *G v An Bord Uchtála*, such evidence was considered. In this case, the mother had given birth to her child in June 1977 in Pelletstown. She had left Pelletstown after ten days, leaving the child there, and had placed her child for adoption in December 1977. In April 1978, she sought the return of her child from the prospective adopters but, after three days with the child, she placed it in a children’s home. In May 1978, the mother signed a consent to the making of an adoption order and the child was returned to the original adopters at her request. However, she later withdrew her consent. In determining the prospective adopters’ application to dispense with the mother’s consent, the judge found (having heard evidence from a child psychiatrist) that the child’s emotional and psychological welfare had suffered significantly during the six months residence in Pelletstown. He also found that there was a danger to the intellectual and emotional development of the child, who, at this stage, was 19 months old, if it did not receive continuity of care by remaining with the adoptive family into which it was by that stage integrated. The judge made an order authorising the Adoption Board to dispense with the consent of the mother and to the making of the adoption order in favour of the adopters.

32.130 Since the judgment in *S v Eastern Health Board*, psychological evidence in respect of the bonding of the child has become a key determining factor in the assessment of a child’s best interests in applications to dispense with consent. In the cases in which applications to dispense with the consent of the mother to the adoption of her child were considered, the best interests were generally assessed by the court.

---

43 *S v Eastern Health Board*, unreported judgment of Finlay P. of 28 February 1979.
with particular reference to any psychological evidence which was put forward
concerning the bonding and attachment of the child to its carers, usually the
prospective adoptive parents.

32.131 In *McC v An Bord Uchtála*\(^{44}\) a mother who consented to the placement of her child
for adoption three days after his birth and had signed a final consent to his
adoption when he was just under three months old, tried to regain custody of her
child when he was six months old. The court found (having regard to the
psychological evidence) that by the time a child is six months old it has bonded
with its carers and that a change after a year is usually difficult and may even be
dangerous. It also found that the child was living in a stable and caring household
in which the mother was always available whereas the birth mother appeared to
have a lack of appreciation of what would be required for the proper care of her
child and also had an ‘on-off relationship’ with the child’s father which had the
potential to be very disturbing for the child. The court found that it was in the best
interests of the child that it would remain with the adoptive parents and so
dispensed with the consent of the child’s mother.

32.132 Similarly, in *McF v G*\(^{45}\) the judge dispensed with the consent of the child’s mother
on the basis that the child had been in the custody of the adoptive parents for 18
months and had developed attachments to them and that it was therefore in his
best interests that he remained with them.

32.133 In *JM & MM v An Bord Uchtála*,\(^{46}\) the President of the High Court, Mr Justice Finlay
dispensed with the consent of a birth mother to the adoption of her child who was
16 months old and who had been placed with prospective adopters when ten days
old. The judge indicated that he had ‘very carefully considered the importance or
potential importance of a blood link between the child and her parents’ but that on
the evidence before him, he could find ‘no strong or serious support for the
importance of that as a feature in the future welfare of the child’.

32.134 In *RC and PC v An Bord Uchtála and St Louise’s Adoption Society*,\(^{47}\) prospective
adopters, who had had a child in their custody for a period of nine months, sought
to dispense with the birth mother’s consent in circumstances where the mother had

\(^{44}\) [1982] ILRM 159.
\(^{45}\) [1983] ILRM 228.

\(^{47}\) Unreported decision of O’Hanlon J of 8th February 1985.
withdrawn her final consent. O’Hanlon J. considered that the onus of proof lay on the adoptive parents to prove that it was in the best interests of the child to dispense with the mother’s consent. The judge was presented with conflicting evidence from the psychiatrists retained by the mother on the one hand and the prospective adopters on the other hand. The psychiatrist who gave evidence on behalf of the prospective adopters indicated that, having observed the child, it had definitely bonded to the prospective adoptive parents and that, if this bond was broken, the child was likely to be psychologically marked for life. The evidence of the psychiatrist acting for the birth mother was that there was no reason to suspect the child would be psychologically damaged if it was moved from one caring loving environment to the other and that there was no reason to suspect that it could not form such a bond with its birth mother. Faced with this conflict of evidence the judge concluded that a baby and growing child would always be better off with its birth mother if she was a concerned and devoted parent and could provide in a reasonable manner for the physical and emotional needs of the child. The judge accepted that if too long a period elapsed during which the child was with the prospective adopters that the breaking of the bond between them could cause damage to a child but felt that on the facts of the case before him, ‘the point of no return’ had not been reached. He accepted the evidence of the psychiatrist acting for the mother that the child would do equally well if returned to the mother and refused the prospective adopters’ application to dispense with consent.

32.135 It is clear from an analysis of these decisions concerning applications to dispense with the consent of the mother to the adoption of her child, that the psychological evidence in respect of the bonding between a child and its carers which was adduced in these cases made it very difficult for an unmarried mother who had placed her child for adoption to regain custody of the child if she changed her mind. However, in the case of disputes arising between prospective adopters and the birth parents of a child, the marriage of the birth parents had the effect of creating a constitutional presumption in favour of the birth parents, that the child’s welfare was to be found within the family unless there were compelling reasons why this could not be achieved.48

Publication of adoptive parents’ names

32.136 While arrangements for adoption were generally conducted privately and secrecy was a major concern of all involved, it is nevertheless the case that the names and addresses of the adopting parents were published four times a year in *Iris Oifigiúil*. The *Adoption Act 1952* required that the Adoption Board shall cause to be published in *Iris Oifigiúil* a notice in the prescribed form of the making of every adoption order and of every registration and cancellation of registration in the Adoption Societies Register.

A notice in regard to an adoption order shall not refer to the child's natural parents, former surname, place of birth or otherwise to his origin.

**D: Adoption law in selected other countries**

32.137 In England and Wales adoption legislation was first introduced in 1926.49 Western Australia was the first of the Australian states to pass adoption legislation in 1896.50 In New Zealand the first instance of adoption legislation was the *Adoption of Children Act 1881*. The first Canadian adoption legislation was enacted in New Brunswick in 1873, although most Canadian jurisdictions passed adoption laws between 1913 and 1952.51

Consent - age of the child

32.138 As set out above, in Ireland, the *Adoption Act 1952* provided that a mother's consent was invalid unless it was given after the child had reached the age of six months (six weeks from 1974) and no more than three months before the application for adoption was made. In England, the minimum age of the child before which consent to adoption was invalid was six weeks.52 In New Zealand the minimum age was considerably less; a child was required to be ten days old to ensure a valid consent.53

32.139 Australian law did not provide for a minimum age at which a consent would be valid. The absence of such a provision was criticised by the Supreme Court of

52 *Adoption of Children Act 1926* section 4(3).
53 Section 7(7) Adoption Act 1955(NZ).
Victoria in the 1960 case of *R v B* where a mother, relying on a promise from a religious minister who arranged the adoption of her child that the adoptive parents would discharge her hospital bill, sought to revoke her consent which had been provided less than three weeks after the child was born. Referring to the legislation in England, providing for a minimum age before which a mother’s consent would not be valid, the judge observed:

> I venture to think that this is wise legislation which, if adopted here, would tend to prevent the occurrence of such cases as this is. There seems something out of harmony with usual notions of fairness in our present system, whereunder consents may be and are obtained from unmarried girls, still suffering from the physical effects of childbirth, and still affected by the mental and emotional strains of an illegitimate pregnancy and delivery, and often before they and their relatives have had time, after childbirth, fully to consider and consult upon the alternatives to adoption.  

32.140 Legislation was subsequently introduced in Australia which provided that a mother’s consent was invalid if it was given within a period of either three, five or seven days from the child’s birth, depending on the state in question. However a consent given earlier than the time periods specified could nevertheless be relied upon where it could be established that the mother was, at the time of signing, in a fit condition to give the consent.  

**Validity of Consent**

32.141 In Ireland, a mother’s written consent was required for an adoption to take place. The Adoption Board was also required to satisfy itself that a mother understood the nature and effect of the consent and of the adoption order. These requirements mirrored provisions in the English legislation. In the province of British Columbia in Canada, a sworn statement by the birth parents stating that the consent was

---

54 *R v B* [1960] V.R. 407 at p. 410. Sholl J. dismissed the proposed adoptive parents’ application on the basis that the promise of payment of the mother’s hospital expenses constituted a breach of the provision of the Act which made it unlawful for any person to make a payment to a parent in consideration of the adoption of the child and that such breach invalidated the consent. On appeal to the Full Court: it was found that Section 4 of the Act vests the court with a discretion whether or not to grant an application in all the circumstances of the case even if the application is in the prescribed form and the conditions laid down in the Act and rules thereunder have been complied with, and that such discretion had been properly exercised in dismissing the application, since the breaches of the rules had probably resulted in the mother’s failure to revoke her consent in time, as otherwise she was likely to have done.  
55 See for instance, (NSW) Adoption of Children Act 1965, section 31(3)  
56 Section 5(1) *Adoption Act 1950.*  
57 The U.N. Committee on the Rights of the Child has drawn attention to the fact that in Canada ‘domestic adoption legislation, policy and practice are set by each of the provinces and territories and vary considerably from jurisdiction to
free and voluntary and a sworn statement by the witness to the consent stating that the consent and the adoption itself was explained to and appeared to be understood by the parents and that the parents’ consent appeared to be free and voluntary was required.\(^{58}\)

32.142 Similarly in New Zealand the consent had to be witnessed\(^{59}\) and the witness was required to certify that he had explained the effect of an adoption order to the person giving the consent.\(^{60}\) Where a consent was found not to have been freely given, such as in one instance in the early 1970s where a young mother was found to have been pressured to consent to giving up her child by her parents, the judge found that he had no choice but to revoke an interim adoption order, even if it was not in the best interests of the child.\(^{61}\) In Australia (New South Wales) a court could refuse to make an adoption order in reliance on a consent given by a person if it appeared that the consent was given under fraud or duress or the person was not in a fit condition to give the consent or did not understand the nature of the consent.\(^{62}\) In a 1965 case in New South Wales a mother who was found to be suffering from schizophrenia was held to be in an unfit condition, due to mental illness, to give a valid consent. On this basis a previous order that the birth mother’s consent be dispensed with was set aside.\(^{63}\)

**Right to revoke consent to adoption**

32.143 In Ireland a mother was entitled to withdraw her consent at any time prior to the making of the adoption order. In Canada in the 1950s, three Supreme Court cases established the same right to revoke consent before an adoption was finalised.\(^{64}\) In the 1957 case of *Hepton v Maat*, the birth parents revoked their consent before an adoption order was granted but this was resisted by the prospective adopters. The court found that ‘the natural parents are entitled to custody unless by reason of some act, condition or circumstance affecting them it is evident that the welfare of the child requires that the fundamental natural relationship be severed’.\(^{65}\)

\(^{65}\) Hepton v Maat [1957] SCR 606 at 607.
32.144 In *Agar v McNeilly*, a case in which the court noted that the adoption agency had attempted to conceal the location of the child, the court emphasised again the birth mother’s right to her child: ‘the mother of an illegitimate child, who is of good character and is able and willing to support it in satisfactory surroundings, is entitled to the custody of that child’. In Australia, the birth mother’s right to revoke her consent was more limited; the law specifically provided that the consent of the child's birth parent was irrevocable after 30 days have elapsed.

**Dispensing with Consent**

32.145 In Ireland, the *Adoption Act 1974* empowered prospective parents to apply to the High Court to dispense with the final consent of the birth mother or of any person whose consent was required. This could be done where the court was satisfied that it was in the ‘best interests’ of the child to do so.

32.146 In Australia, adoption legislation introduced in the 1960s provided that the court could dispense with a parent’s consent where, among other reasons, due to mental or physical incapacity the parent was not capable of considering the issue of consent, where the child had been abandoned, deserted, persistently neglected or ill-treated, or where the parent had failed to discharge the obligations of a parent or guardian, without reasonable cause, for at least a year. The court also had the power to dispense with consent where ‘special circumstances’ were found to exist. In the 1955 case of *Mace v Murray* the Australian High Court held that:

> It must be conceded at once that in the ordinary case the mother’s moral right to insist that her child shall remain her child is too deeply grounded in human feeling to be set aside by reason only of an opinion formed by other people that a change of relationship is likely to turn out for the greater benefit of the child. It is apparent, too, that a court which is invited to make an order of adoption must appreciate that the child is another’s, and that only the most weighty and convincing reasons can justify the involuntary breaking of a tie at once so delicate and so strong as the tie between parent and child.

32.147 In England a court could dispense with a parent's consent if it had been refused unreasonably. However cases relating to this provision which were heard in the

---

67 Section 28(1)(b) Adoption of Children Act 1965 (NSW).
69 *Mace v Murray* at 385.
70 Adoption Act 1950 s. 3(1)
1950s emphasised that it was on the face of it reasonable for a parent to withhold consent and that in taking that decision the child’s welfare was not the paramount consideration. In New Zealand the courts could dispense with the consent of any parent or guardian where it was satisfied that the parent had abandoned, neglected, persistently failed to maintain, or persistently ill-treated the child, or failed to exercise the normal duty and care of parenthood in respect of the child or where the court was satisfied that the parent or guardian was unfit, by reason of any physical or mental incapacity, to have the care and control of the child and that the unfitness was likely to continue indefinitely. The New Zealand courts have stressed the significance of the biological bond between birth parent and child when determining applications to dispense with consent. In a 1989 case the Court of Appeal indicated that it was only where the conduct of the birth parent amounted to a rejection of that bond or had broken it that the court would be justified in dispensing with consent. In the case in question the child had been in care from birth and was seven years old at the time of the hearing; her mother had seen very little of her during this period and the order dispensing with consent was granted.

**Welfare of the child**

32.148 It was not until the introduction of the Adoption Act 1974 in Ireland that the welfare of the child became the first and paramount consideration for the Adoption Board and the courts in arrangements relating to adoption and the making of adoption orders.

32.149 In Australia, adoption legislation introduced in the 1960s also provided that the welfare of the child was the paramount consideration. The test in New Zealand was that the welfare and interests of the child would be promoted by the adoption. In England the courts were originally charged with simply ensuring that an adoption order, if made, would be for the welfare of the infant. However new legislation enacted in the 1970s gave greater prominence to the child’s welfare when decisions had to be made about adoption: the legislation required courts and

---

72 Section 8(1)(a) of the Adoption Act 1955(NZ).
74 See, for example, Adoption of Children Act 1964, s. 9 (Vic).
75 Adoption Act 1955, s. 11(b) (NZ).
76 Adoption Act 1958, section 7(b).
adoption agencies to give ‘first consideration’ to the need to safeguard and promote the welfare of the child throughout its childhood.\footnote{Adoption Act 1976 section 6. English adoption proceedings are not governed by the welfare principle of paramountcy. See Re T and E (Proceedings: Conflicting Interests) [1995] 3 FCR 260.} 

32.150 It has been suggested that in Canada, the fact of biological parenthood carried less weight in the 1980s than it had during the 1950s and that this shift is illustrated by two decisions of the Supreme Court of Canada\footnote{Racine v Woods [1983] 2 S.C.R. 173; King v Low [1985] 1 S.C.R. 87.} from the 1980s. In both cases, the birth parents sought to regain custody of their children who had been in the custody of the prospective adopters. They were refused, with the court in one case finding that the law no longer treated children as the property of those who had given birth to them but instead was focused on their best interests.\footnote{Rogerson Carol, *The Future of Child and Family Law* (Cambridge, 2012), p. 90.} In the other case the court indicated that the welfare of the child was the predominant factor to be considered in such disputes.\footnote{King v Low [1985] 1 S.C.R. 97.} 

**Involvement of third parties**

32.151 In Ireland, it was not until the *Adoption Act 1998* that private adoptions were expressly prohibited.\footnote{Adoption Act 1998, Section 7.} Prior to this enactment, there was no restriction on the placement of children for adoption directly by their parents. An Bord Uchtála noted in its *Annual Report 1989* that the prohibition on a third party causing a birth mother to place her child for adoption with a couple not related to the child could be circumvented and stated that it was aware of situations where an ‘introduction of a willing adoptive couple by a third party was followed by a subsequent decision by a natural mother to place the child with the couple’. In England the Report of the Interdepartmental Committee on the Adoption of Children (the *Hurst Report*) which was published in 1954 noted the risks inherent in ‘direct’ adoption placements (that is, where the mother gave her child to a friend, fellow-worker, or even a landlady) and in third party adoptions (that is, where the mother placed her child with prospective adopters through the agency of a private individual, perhaps a doctor\footnote{Referred to in Michael Cretney, *Family Law in the Twentieth Century* (Oxford, 2005), p. 617. Cretney cites paragraph 43 of the Hurst Report where the Committee noted ‘deplorable cases’ in which a doctor acted as a third party ‘for the benefit of a patient whose neurotic condition he seeks to remedy or whose marriage he hopes to stabilise by this means’ and quoted an ‘egregious letter’ from doctor to voluntary worker: ‘Mrs X tells me that her husband threatens to leave her unless another baby is forthcoming, and adoption is the only way. I feel myself that, although the home is not ideal, a baby...’} or other person concerned primarily to help either the mother or the prospective adopters).\footnote{Adoption Act 1998, Section 7.}
32.152 In 1972, a further Committee charged with considering the law, policy and procedure in respect of the adoption of children recommended that placements for adoption be made exclusively by adoption agencies (local authorities and registered voluntary societies) as it found that only in this way could the law give assurance of adequate safeguards for the welfare of the child. This report also highlighted the activities of doctors and maternity home matrons and hinted that the motivation of such people was often to provide a remunerative service to adults rather than serving the interests of the child. Legislation introduced in the mid-1970s prohibited persons other than adoption agencies from making arrangements for the adoption of a child or placing a child for adoption unless the proposed adopter was a relative of the child or the person was acting pursuant to an order of the High Court.

32.153 In Australia the introduction of uniform adoption legislation in the 1960s was aimed in part at curtailing adoptions which were arranged between individuals without the approval of a government department or a recognised adoption agency. As in other jurisdictions, criminal sanctions were introduced against unauthorised individuals who attempt to arrange private adoptions.

**Frequency of contested court applications in respect of adoption**

32.154 The rarity of contested court applications for adoption has been noted by a UK authority, who commented that this infrequency is not to say that unmarried mothers in particular were not pressurised in some form or other into giving up their children nor that they were unregretful afterwards. Nevertheless contested adoption hearings of any regularity were a much later phenomenon dating from the 1980s. The vast majority of babies adopted in England in the 1950s and 1960s were ‘illegitimate’. In 1951, of the 5101 orders made in respect of children under the age of 12 months, 4,701 were in respect of ‘illegitimate’ children (92%). By 1968 the number had increased to 12,237 of 12,641 (97%). However the
The number of babies being adopted began to decrease after 1968, falling to 4,548 in 1975, to 2,599 in 1980, to 969 in 1990 and to just 195 in 1998 (4%). That decline was attributed to the increasing number of legal abortions, more use of contraception and the changing attitude to illegitimacy.  

E: Adoptions in Practice

32.155 The main sources of information for this section were the studies quoted in it; interviews with social workers (including retired social workers) involved in adoption and with former members of the Adoption Board; interviews with mothers who gave evidence to the Commission; and adoption records seen by the Commission. From these sources, the Commission tried to establish:

- How adoption societies and the Adoption Board satisfied themselves that there was genuine consent on the part of the mother;
- What efforts were made to ensure that the welfare of the child was taken into account in the selection of adoptive parents.

32.156 There is now a vast literature on adoption practices and procedures both abroad and in Ireland. However, retired social workers have told the Commission that there is a worldwide dearth of research on the position of birth mothers in adoption particularly on the issue of consent. One commentator has said that mothers who gave birth were the silent partners to the adoption story and were rarely referred to or spoken about by anyone involved in the adoption process. The first Irish study dates from 1974 which means that there is little information about practices during the first 20 years of legal adoption. It is abundantly clear that practices and procedures have changed considerably over the years, and it is therefore paramount they be understood within their historical context and not judged by the standards of our own time.

What exactly constitutes free and informed consent

32.157 It is clear that consent was a major issue in adoption practice in the years under investigation. Nearly all of the court cases in relation to adoption centred on the validity of consent. Any assessment of the validity of a consent has to take

---

account of the mental state of the mother and her social circumstances at the time the consent was given. It is very difficult to retrospectively assess whether or not any particular consent was ‘full, free and informed’ at the time it was given.

32.158 In the unreported case of *AC v St Patrick’s Guild Adoption Society* (1995), the judge said that ‘the true test is whether in the circumstances that prevail at the time she makes her decision, that decision reflects her will or the will of somebody else’. In 1996, in the case of *DG and MG v An Bord Uchtála*, the judge reached the same conclusion but elaborated somewhat:

> fear, anxiety, stress and economic deprivation and other deprivations are frequently ingredients of the factual situations which give rise to an enquiry whether an agreement by a mother to place a child for adoption was freely made in order to determine the applicability of S3 of 1974 Act. In my view the presence of one or more of these features does not necessarily vitiate a mother’s consent. The true test is whether in the circumstances which prevail at the time she makes her decision, that decision reflects her will or the will of somebody else.\(^{95}\)

32.159 In this case, the court accepted that the mother’s social worker had fully explained to her the consequences of her placing the child for adoption. A month after signing the forms the mother changed her mind. The judge said that she subsequently agreed to place the child for adoption, almost one month later, under pressure from her parents. Her parents were described in the judgement as:

> a very conservative, inward looking people living in a rural community, adhering to a Protestant faith within that community and deeply conscious of preserving what they perceived as the family’s good name within the community. The mother’s parents were shocked when she told them she was pregnant. Her father’s reaction was to suggest she have an abortion…Her parents banished her and placed one option before her: to make the baby disappear. It was her parent’s will the infant should be placed for adoption and that his existence should be concealed.

32.160 The judge concluded that, in the second decision to place for adoption, the mother subordinated her own will to that of her parents because of fear which was a product of her upbringing, stress, anxiety, lack of maturity and deprivation of

---

\(^{95}\) *DG and MG vs An Bord Uchtála* IFLR 263 [HC], (1996).
emotional support: ‘It was not a free decision.’ This judgement was subsequently appealed to the Supreme Court which dismissed the appeal without delivering a written judgement.

32.161 Some witnesses told the Commission that they consented to adoption because they considered that it would provide the best outcome for their children; in general, these women regarded their consents as free and informed. Others said that they consented because they were not in a position, economically or socially, to care for the child in the absence of family support; their decision was informed but some considered that it was not free as they had no real choice. Some said that they did not give free and informed consent to the placement of their children for adoption or to the subsequent adoption orders. A number of women said that they had had no choice but to sign the adoption papers; that they had been ‘forced’ to do so by, for example, parents, adoption societies, mother and baby home staff, social workers or priests. A number had no memory of ever signing any adoption papers but accepted that they probably had; some who had no memory of signing recognised their signature on the adoption papers when they viewed them later. Some stated adamantly that they had not actually signed any adoption papers. A few said that they had subsequently seen the forms in the adoption society files and they asserted that the signatures were not theirs.

32.162 For much of the period under investigation, social attitudes were such that unmarried pregnant women were expected go away quietly, have the baby and place it for fostering or adoption and then resume life as if nothing had happened. Little consideration was given to how the mother felt about it. One commentator observed ‘the mother who has given birth was expected to do the decent thing and disappear’. A central theme in the literature globally is that many mothers did not believe that they freely chose to relinquish their children. Australian research published in 1984 showed that 44% of respondents said that relinquishment was against their wishes with parental pressure being cited as the main reason for going ahead with the separation. Similar findings were made in England (1987), USA (1988), and Canada (1995). Pressure from adoption agencies to relinquish

96 Kelly, Motherhood Silenced.
97 Robin Winkler and Margaret Van Keppel, Relinquishing Mothers in Adoption: their long term adjustment (Melbourne, 1984).
is also noted in the literature. Having two married parents who upheld the moral status quo regarding motherhood and parenting was promoted by agencies as being in the best interest of the child.\textsuperscript{99}

32.163 There seems little doubt that mothers who were not receiving family support had to make decisions which did not necessarily reflect what they wanted but reflected the fact that they had little or no choice. They were in a crisis situation and they made decisions which were necessary because they did not have any other viable options. This was especially the case before unmarried mothers became eligible for the Unmarried Mother’s Allowance and Rent Supplement (see Chapter 1).

32.164 There were very few qualified social workers in Ireland before the 1960s. While the first inspector of boarded out children was appointed in 1902,\textsuperscript{100} the first children’s officer - the precursor of professional social worker in child care - was not appointed until 1953.\textsuperscript{101} There was little understanding or insight into the birth mother’s state of mind. Many were so traumatised that, years later, they had no recollection of the sequence of events, including the provision of formal consent. While understood now, it was not known then that denial is a common feature in crisis pregnancy where memories can be blurred or obliterated by the associated trauma.\textsuperscript{102}

The formalities for consent

32.165 As outlined above, two distinct consents were required. The adoption society and the Adoption Board each had a role in ensuring that the consents were valid.

Consent to placement for adoption

32.166 The adoption society’s role was to:

- Give the mother a statement explaining how an adoption order affected her rights and explaining the rules about consent;
- Ensure that the mother understood the statement and signed a document to that effect.

\textsuperscript{101} Irish Almoners Report, 1953.
\textsuperscript{102} Hilda Loughran and Valerie Richardson, \textit{Mixed Method Adoption Research} (Dublin, 2005).
32.167 It seems to the Commission that the formal requirements of providing a statement about consent and the signing of the relevant document were generally met. However, it is impossible to know if the mother understood the statement. This is the relevant statement from 1953:103

Form 10.

ADOPTION ACT, 1952.

Memorandum to be furnished by a registered Adoption Society to a mother or guardian who proposes to place a child at the disposal of a registered Adoption Society.

If an adoption order is made in respect of the child, all your rights and duties in regard to the child will be transferred permanently to the adopters. The child will be regarded as the child of the adopters and you will have no right to get it back later on, even if you can then prove that you are able to give it a better home than the adopters can. If you have an insurance policy against funeral expenses for the child, the policy will be transferred to the adopters and it will be for them to pay the premiums from then onwards. If the child is illegitimate and the natural father is making any payments for the child’s benefit, either under an agreement or under an affiliation order, he will not be legally bound to continue these payments, unless the mother is the adopter.

The Board which deals with adoptions will not make an adoption order without the consent of the child’s mother or guardian, unless the mother or guardian cannot be found (or is unable to give consent because of mental infirmity). In order to ensure, therefore, that you will be informed of any proposal to have the child adopted, you should notify the Society of any change in your address. If you do not do this, it may not be possible to trace you, and the adoption order may be made without your consent.

(Perforate on this line).

32.168 This was changed slightly in 1965 but the essential information was not changed.\(^{104}\) In 1976, it was changed significantly to reflect the court decisions in relation to consent and the Adoption Acts of 1974 and 1976, particularly to ensure that the mother knew she could withdraw consent at any time before the adoption order was made and that she was aware if the provisions in relation to dispensing with her consent:

**FORM 10 ADOPTION ACTS, 1952 to 1976.**

Memorandum to be furnished by a registered adoption society to a mother, father or guardian who proposes to place a child with a registered adoption society for adoption.

Consent to the placing for adoption of ........................................... (here set out name of child) born on ..........day of ......19........

If an adoption order is made in respect of the child, all your rights and duties in regard to the child will be transferred permanently to the adopters and the child will be regarded as the child of the adopters. If the child is illegitimate and the natural father is under legal obligation to make any payments for the child’s benefit, he will not be legally bound to continue these payments, unless the mother is the adopter.

Subject to section 3 of the Adoption Act, 1974, an Bord Uchtála (Adoption Board) will not make an adoption order without the consent of

(a) the mother of the child,
(b) the father of the child (in the case of any child who has been legitimated by the marriage of its parents), and
(c) any person appointed by will or deed or by Court Order to be the child’s guardian,

unless the mother, father or guardian, as the case may be, cannot be found or is unable to give consent because of mental infirmity in which case An Bord Uchtála may dispense with consent.

Section 3 of the Adoption Act, 1974, provides that if a child is given for adoption, and a person whose consent to the making of the adoption order is required fails, neglects or refuses to give consent, or withdraws a consent already given, the applicant for the adoption order may apply to the High Court and, if that Court is satisfied that it is in the best interest of the child to do so, it may give custody of the child to the person who has applied for the adoption order and it may authorise An Bord Uchtála to dispense with such consent, whereupon An Bord Uchtála may make the adoption order.

A consent may be withdrawn at any time before the making of an adoption order. In order to ensure, therefore, that you will be informed of any proposal to have the child adopted, you should notify the society of any change in address.

Section 4 of the Adoption Act, 1974, provides that an adoption order shall not be made in the case where the applicants, the child and his parents or, if the child is illegitimate, his mother, are not all of the same religion, unless every person whose consent to the making of the adoption order is required, knows, when giving such consent, the religion (if any) of each of the applicants.

(Perforate on this line)

..............................................................................................................................................

CHAPTER 32 ADOPTION

RECEIPT FOR FORM 10.
(Detach here)

To the registered adoption society called
...........................................................................................................

I hereby consent to the placing for adoption of the child ...................................... (here set
out name of child) born on ...... day of ..........19...........

Here you may state your wishes as to the religion, if any, of the person(s) with whom the child
is to be placed for adoption .........................................................

I have received from you a statement in Form 10. That statement was attached to this receipt
and I have myself torn it off. I understand that statement.

Name (in block letters) .................................................................
Signature ..................................................................................
Address ..................................................................................

Signature of Witness.............................................................
Address..................................................................................
Occupation or Description....................................................

Date ...................................................

I certify that on behalf of
...........................................................................................................

I have handed the statement attached to this receipt to ....................... and explained its
contents to her/him.

I am satisfied that she/he understands it.
Signature ..................................................................................
Date .....................................................................................

32.169 This was changed again in 1990:

Memorandum to be furnished by a registered adoption society to a mother, father or guardian
who proposes to place a child with a registered adoption society for adoption.

Name of Registered Adoption Society
............................................................................................
Address ..................................................................................

Telephone No ..........................................................................

Consent to the placing for adoption of ................................. (here set out name
of child) born on the .......... day of .......... 19...........

Effect of an Adoption Order

1. If an adoption order is made for the child, you will lose all your parental rights and will be freed from all parental duties. These rights and duties will be transferred permanently to the adopters. The child will thereafter be regarded as their child as if the child were born to them in marriage.

_Payments by Natural Father_

2. If the child was born outside marriage and the natural father is under a legal obligation to make payments for the benefit of the child, he will not be legally bound to continue these payments after the adoption order is made.

_Consent to the Making of an Adoption Order_

3. An Bord Uchtala (The Adoption Board) will not make an adoption order without the consent of

   (a) the mother of the child,
   (b) any person appointed by court order or otherwise to be the child’s guardian,
   (c) in certain circumstances, the natural father

unless any such consent is dispensed with by the Board in accordance with the law.

4. The consent of the natural father to the making of an adoption order for a child born outside marriage is required in the following circumstances—

   (d) where he marries the mother after the birth of the child, or
   (e) where he has been appointed a guardian of the child or has been granted custody of the child pursuant to a court order (or otherwise has custody).

5. Where the prospective adopters, the child and the natural parents, or if the child was born outside marriage, his mother, are not all of the same religion, every person whose consent to the making of an adoption order is required must know, when giving such consent, the religion (if any) of each of the prospective adopters.

6. A consent may be withdrawn at any time before the making of an adoption order,

_Dispensing with Consent_

7. The law permits An Bord Uchtala (The Adoption Board) to dispense with the consent of any person to the making of an adoption order if it is satisfied that that person (a) is incapable by reason of mental infirmity of giving consent, or (b) cannot be found.

8. Where a person who has consented to the placing of a child for adoption fails, neglects or refuses to give consent to the making of an adoption order, or withdraws a consent already given, it is open to the prospective adopters, if they have applied for an adoption order for the child, to apply to the High Court for an order under section 3 of the Adoption Act, 1974. The High Court, if it is satisfied that it is in the best interests of the child so to do, may make an order under that section (a) giving custody of the child to the prospective adopters, and (b) authorising An Bord Uchtala (The Adoption Board) to dispense with such consent to the making of an adoption order in their favour.

_Reclaim of Child_

9. If, after the child has been placed with prospective adopters and before the making of the adoption order, you change your mind and want to reclaim your child, you should contact the adoption society without delay. If the prospective adopters decline to give up the child, it is open to you to institute proceedings to have custody of the child restored to you. Should this situation arise you would need to consult a solicitor as a court case may be involved.
CHAPTER 32 ADOPTION

RECEIPT FOR FORM 10.

(Detach here).

To the registered adoption society called .................................................................

I hereby consent to the placing for adoption of the child ..........................................................

(here set out the name of the child) born on the ..... day of ..........19....

I say that I am/i am not the sole guardian of the said child. The father has/has not been appointed a guardian of the said child pursuant to a court order or otherwise. (a)

To the best of my knowledge and belief, the father has not instituted proceedings in relation to guardianship or custody of the said child. (b)

Here you may state your wishes as to the religion, if any, of the persons(s) with whom the said child is to be placed for adoption.............................................

I have received from you a statement in Form 10. That statement was attached to this receipt and I have myself torn it off. I understand that statement. I also understand that my signature on this receipt is evidence that I have consented to the placing of the said child for adoption.

Name (in block letters)..............................................................................................

Signature .............................................................................................................

Address ..............................................................................................................

Signature of Witness ..............................................................................................

Address ..............................................................................................................

Occupation or Description .....................................................................................

Date .....................................................................................................................

I certify that on behalf of........................... I have handed the statement attached to this receipt to ........................................................ and explained its contents to her/him.

I am satisfied that she/he understands it.

Signature .............................................................................................................

Date.....................................................................................................................

(a) and (b) Delete words which do not apply.

32.170 In its first annual report the Adoption Board noted that it was aware of the difficulties faced by societies in tracing mothers for the purpose of obtaining consent in the case of long standing adoption arrangements, as mothers might have since married or have not been in touch. However, it stressed that ‘in no case has an adoption society failed to satisfy the requirements of the Board in the matter of consents’.

Consent to the making of the adoption order

32.171 The Adoption Board was required to satisfy itself, prior to the making of the adoption order, that the mother understood the nature and effect of the consent and of the adoption order. The Adoption Rules required that consent be given in a written prescribed form. The following is the consent form from 1953:

Form 4.

CONSENT TO ADOPTION.

(For use where the identity of the applicant is not known to the consenting party).\(^{107}\)

In the matter of an application for the adoption of..........................

I,............................ (name and description) of......................., aged twenty-one years and upwards (or, if under age, aged...............years) make oath and say as follows :

1. I am informed and believe that an application has been made under serial number.......................... (a) for an adoption order in respect of the child..............................

2. I am/the mother of the child/(b) the guardian of the child/(b) the person having charge of or control over the child/(b).

3. The child is not less than six months old, having been born on the...........day..............................., 19.......

4. I am of the..............................religion, and this has been my religion since...........................(to be completed by the mother only).

5. I understand that the effect of an adoption order is to deprive me of all rights which I have in respect of the upbringing of the child, and to give these rights and all parental rights and duties to the adopter.

6. I hereby give my consent to the making of an adoption order in pursuance of the application referred to above.

7. I understand that this affidavit may be used as evidence that I consent to the adoption order being made.

Signature............................................................................................

Sworn at............................ in the county of....................., on this.....................day of..........................., 19.........., before me .....................................(name) and I know the deponent (or and I know ................... who certifies to me that he knows the deponent).

Signature............................................................................................

Description (c)..............................................................................

Where the identity of the applicant is not known to the consenting party the applicant should request the Board to assign a serial number to the application and this number should be inserted here.

(b) Strike out words which do not apply.

(c) If the affidavit is being sworn in the State, it should be sworn before a Commissioner for Oaths; if it is being sworn elsewhere; it should be sworn before a Notary Public or other person duly authorised to administer oaths.\(^{108}\)

\(^{107}\) This example form was the form used when there was an adoption society involved; a slightly different form was used when the identity of the proposed adopters was known to the mother – in effect, where there was a private placement for adoption. The essential words were the same in each.
32.172 This was formal confirmation that the mother understood the effect of the adoption. This document was presented by the adoption society, then signed and sworn by the mother before a peace commissioner. There was no requirement that the mother get independent legal advice and no provision for free legal aid. In many cases, and especially in the early years of legal adoption, formal counselling services were not available to the mother.

32.173 This form was changed in 1976:

**FORM 4A**

**CONSENT TO ADOPTION.**

(For use by mother where the identity of the applicant is not known to her).

In the matter of an application for the adoption of

............................................................

I, ............................................................ of ............................................................ aged twenty-one years and upwards (or, if under twenty-one, aged ............................. years), make oath and say as follows:—

1. I am informed and believe that an application has been made under serial number ...................................... (a) for an adoption order in respect of the child ............................................................

2. I am the mother of the child.

3. I did/did not marry the father of the child. (b)

4. The child is not less than six weeks old, having been born on the ................. day of ................. 19....................

5. I know that the religion of the male applicant is ............................................................

and that the religion of the female applicant is ............................................................

6. I understand that the nature and effect of an adoption order is that I shall lose all parental rights and that I shall be freed from all parental duties with respect to the child and that these rights and duties shall be transferred to the adopter or adopters.

7. I have been informed and I understand that An Bord Uachtála (Adoption Board) may make an adoption order in respect of the child referred to in paragraph 1 at any time after the signing of the consent.

---

8. I hereby freely give my consent to the making of an adoption order in pursuance of the application referred to above.

9. I have been informed and I understand that this consent may be withdrawn at any time before the making of the adoption order, by informing An Bord Uchtála, 65 Merrion Square, Dublin 2, and that on the making of the adoption order my consent becomes irrevocable.

10. I have been informed and I understand that I am entitled to be heard in person or to be represented by counsel or solicitor on the application for the adoption order or to be consulted again in relation to the application and that I should indicate my wishes in this respect in writing.

11. My wishes in respect of the matters referred to in paragraph 10 above are as follows:

   (i) I do/I do not wish to be informed of the date on which the Board will, if I wish, hear me or my counsel or solicitor on the application for the adoption order. (b)

   (ii) I do/I do not wish to be heard in person or to be represented by counsel or solicitor on the application for the adoption order. (b)

   (iii) I do/I do not wish to be consulted again in relation to the application for the adoption order. (b)

12. I understand that this affidavit may be used as evidence that I consent to the adoption order being made.

Signature ........................................................... 

Sworn at ........................................................... in the county of ................................................ on this ............................................. day of ........................................................., 19...............,

before me, ........................................................... (name) and I know the deponent (or and I know ........................................................... who certifies to me that he knows the deponent)

Signature ...........................................................

Description (c) ...........................................................

(a) Where the identity of the applicant is not known to the consenting party the applicant should request the Board to assign a serial number to the application and this number should be inserted here.

(b) Delete words which do not apply.

(c) If the affidavit is being sworn in the State it should be sworn before a Commissioner for Oaths; if it is being sworn elsewhere it should sworn before a Notary Public or other person duly authorised to administer oaths.
32.174 This form was changed in 1984 and in 1990 but the essential elements of the mother’s consent remained the same.

32.175 Social workers have told the Commission that the changes made in 1976 meant that there were effectively three stages to consent:

- Initial consent was taken by a social worker or the adoption society. It had the effect of allowing the child to be placed with a view to adoption.
- Appended to the consent form (Form 10), was an information leaflet which the mother personally tore from the form and gave written consent on receipt. If the mother wished to proceed with the adoption after the prescribed period of time, she was accompanied by the social worker or adoption society worker to a commissioner for oaths where the final consent form (Form 4) was signed and sworn. The commissioner for oaths was obliged to go through the documentation to ensure her understanding before final consent was given.
- The Adoption Board introduced the concept of an authorised person into the system of consent for adoption. Under this arrangement the Adoption Board could appoint a person considered suitable to conduct enquiries on its behalf regarding the soundness of the consent being made. The authorised person would go through a questionnaire/affidavit with the mother. There was a series of questions, testing her knowledge and understanding. The authorised person met the mother alone with the condition that neither had met each other before. No case history was provided to the authorised person in advance. The authorised person then set out the mother’s rights including her right to withdraw consent at any stage up to the making of the order.

There can be little doubt that the 1976 changes did mean that consent was much more likely to be free and informed. At this stage, there was a greater likelihood that the mother could avail of counselling from adoption society social workers or health board social workers; however, as is outlined below, not all adoption societies had professional social workers and many of the Adoption Board’s welfare officers had no social work training. There was no right to counselling or to free legal aid.

32.176 The formal procedures for consent were clear but, from a practical perspective, there were no rules or guidance regarding the engagement of adoption services with the birth mother in relation to personal, emotional, psychological and social needs. For example, according to one social worker, there was no standard regarding the number of interviews a social worker should have with the birth mother who was considering adoption nor at what point in the pregnancy she might best engage with the adoption services.

Welfare of the child

32.177 The Adoption Board was required to make decisions on the eligibility and suitability to adopt of applicants for adoption. The formal application for adoption would have yielded very little information about their suitability. The 1953 application for adoption by a married couple required them to complete the following statement:

We, the undersigned being a married couple living together, desire to adopt the child named or described in this application form. We understand that if an adoption order is granted to us in respect of the child, we shall be fully responsible for the child's upbringing as if the child were born to us in lawful wedlock and we voluntarily undertake to discharge that responsibility as far as we are able. We have not received or made, or agreed to receive or make, any payment whatsoever in consideration of the adoption of this child.*

i) Husband’s signature.......................................................

ii) Wife’s signature...........................................................

iii) Date..............................................................................

*Payments made or received in respect of the child’s maintenance or solicitors’ remuneration for professional services are not referred to here.

32.178 The form then required them to give details of their names, address, occupation and relationship (if any) to the child. They were asked:

- Have you previously applied for an adoption order in respect of this or any other child and, if so, with what result?
- Have you any children of your own; if so, please give names, dates of birth and present addresses?
- Have you any other children in your care; if so, please give names and dates of birth.

---

111 Adoption Rules 1953.
32.179 If the child was already in their care, they were asked for the name and address of the ‘person or body from whom you got it’. If not, they were asked the name and address of the person who had charge of the child. They were then asked if they had the mother’s consent to the adoption and if they had the consent of the guardian or any other person or body who had control over the child.

32.180 They were then asked to give the names and addresses of two or more persons (either men or women) ‘to whom reference may be made by the Board. Where the name of a woman is given as a reference it is preferable that she should be a mother or a woman with experience in the care of children’. They were told that the board might require them to submit medical certificates on their state of health before making a decision.

32.181 This remained largely unchanged until 1990 when a requirement was introduced for a ‘Background Report on Child and Natural Parents’ to be completed by the adoption society. This asked for routine information (name, address, date of birth) about the child but it also looked for:

- Pre-placement history of the child;
- If the child was more than four months old at date of placement, the reasons for delay.

32.182 Routine information about the birth mother was required but so also was information about:

- Her level of education;
- Her occupation and whether or not she was currently in employment;
- Her community care area at the time of initial contact with the adoption society;
- By whom she was counselled;
- Her reason(s) for placing the child for adoption;
- Had she met the prospective adopters;
- Had she had other children; if so, the number and whether they were with her, adopted or elsewhere;
- Any known history of psychiatric or hereditary illness in her or any member of her family.
32.183 If she was under the age of 18, the following additional information had to be included:

- How she was referred to the adoption society;
- If her parents were aware of the pregnancy and, if so, their attitude to it;
- If her parents were interviewed by the society and, if so, was she interviewed separately.

32.184 Information was also required about the birth father:

- Was his name known;
- Was he registered as the father on the child's birth certificate;
- Was he married;
- Was he interviewed by the society;
- Was his relationship with the birth mother continuing or had it ended;
- What was his attitude to the proposed adoption;
- Had he been appointed a guardian of the child pursuant to a court order or otherwise;
- Had the society or the mother been given any indication that he intended applying to court for legal rights in relation to the child;
- Did he have other children; if so, how many and were they with him, adopted or elsewhere;
- Any known history of psychiatric or hereditary illness in him or any member of his family.

32.185 Any other information on 'the child's natural background which might have a bearing on the application' was also requested.112

**Overall role of the Adoption Board**

32.186 As well as making adoption orders, the Adoption Board (An Bord Uchtála) had three main functions:

- the making of declarations of eligibility and suitability to adopt;
- the registration and supervision of adoption societies;
- the requirement to satisfy itself, prior to the making of the adoption order, that the mother understood the nature and effect of the consent and of the adoption order.

---

32.187 It seems to the Commission that, at least for the first 20 years of its operation, the Adoption Board did not have the resources necessary to fulfil its role properly. Initially, it had one Probation Officer, on loan from the Dublin Metropolitan District Court, who carried out inspections/investigations of applicants for adoption orders. Its 1953 annual report lamented the fact that, despite repeated representations, no specifically qualified officer had been appointed to its staff to carry out inspections and to advise and guide local authority officers.\(^{113}\)

32.188 In December 1956, the Adoption Board wrote to the Department of Justice about creating a post of Special Investigator in its office. In the letter the board stated that it was dependent on local authority and social welfare officials for its investigations and they were not adequately equipped for this work. The board said that it had been obliged on many occasions to send its own investigator to a home already reported upon by a local officer when reports submitted were inadequate. The board wanted to have more of these investigations carried out by its own investigator. It pointed out that even where special Children’s Officers had been appointed and where, as a result, the standard of investigation was comparatively high, it still needed to have its own investigator.\(^{114}\)

32.189 The board argued that a very important aspect of the special investigator’s role would be inspecting the adoption societies:

Preliminary inspections of the Societies have already been undertaken and it is the Board’s intention that these should be followed up early next year by more intensive inspections and by directions as to what the Board is prepared to accept as minimum standards.

32.190 In June 1960, the Adoption Board told the Department of Justice that it needed to appoint one more inspector; it had two at this stage (one was a Probation Officer on loan to the board). This was to try to ensure that there were two inspections carried out on all applicants for adoption. The initial inspections were carried out by local authority officials except in Dublin where ‘existing arrangements with the Department of Health do not permit of Local Authority inspections’.

\(^{114}\) National Archives of Ireland, JUS/90/93/70.
32.191 Former members of the Adoption Board told the Commission that the board did not have sufficient staff to carry out its functions generally.

**Closed and open adoptions**

32.192 Just as attitudes to pregnancy outside marriage and other major social issues changed over the time period covered by the Commission, so did attitudes to adoption. Legally, adoption involved a complete break in the relationship between the birth mother and the child in that the birth mother no longer had any rights or responsibilities in relation to the child. The adoptive parents acquired these rights and responsibilities. Initially, the prevailing view was that, as well as the complete legal break, there should be no contact between the birth mother and the child. So, unless the birth mother organised the adoption herself, she did not know who the adoptive parents were or where they came from. Over time, this view changed gradually and, by the end of the period under investigation, ‘open’ adoptions became the norm. This could involve face-to-face contact between the birth mother, the adoptive parents and the child at the time of placement for adoption. It could also involve on-going contact. This change in attitude is reflected in the Adoption Board’s *Annual Report 2002*. It contained a recommendation that, where a birth parent wished to have continual contact with his or her child after the making of an adoption order, such contact could be made a condition of the adoption order and be legally enforceable. This, of course, came after the period being investigated by the Commission but underlines that it is important to take account of contemporary social norms prevailing at the time as well as the personal circumstances of the mother.

**F: Evidence given to the Commission**

**Witnesses to the Commission**

32.193 A witness who was involved with the Irish First Mothers group told the Commission ‘that there was a lot of emotional pressure put on mothers’. She said that, in her case, her father was standing over her when she was asked to sign the adoption consent at the office of a commissioner for oaths. ‘I don’t remember getting a chance to read the document because of the trauma I was feeling…we were never told what choices we had’. Others who gave evidence also complained of strong parental pressures.
32.194 A number of witnesses said that they were not aware of the existence of the Unmarried Mother’s Allowance (from 1973). They claimed that, had they been so aware, they might have made the decision to keep the baby.

**Adoption Rights Alliance**

32.195 Members of the Adoption Rights Alliance (ARA) gave evidence to the Commission. They said that their organisation grew out of the Adopted People’s Association which was founded in 2001. It campaigned heavily on the need for legislation to allow adopted people a statutory right to their birth certificates, their early files including medical files, adoption files, and mother and baby home files among others. This group continued until 2007 when the Adoption Rights Alliance was formed. It has connections with people working in adoption in the USA and in the UK. It maintains a virtual presence to keep costs down, using email and social media platforms.

32.196 The ARA told the Commission that it had been informed by the Adoption Authority that there were at least eight different types of consent forms in existence from the time that legal adoption was introduced in January 1953 to date.\(^{115}\) The ARA members said they were quite surprised to realise that there were so many different forms in use and that it would certainly back up their view that there was no consistent overview of how consent would be obtained and how consent would operate.

32.197 They claimed that the women who have been in touch with the ARA had reported that consent was obtained from them within hours or, at the very most, within days of giving birth. They said that they knew of significant numbers of women who were asked to sign these consent forms while medicated and what they were actually signing was not explained to them fully.

**Council of Irish Adoption Agencies**

32.198 Representatives of the Council of Irish Adoption Agencies (CIAA) gave evidence to the Commission. The original name of this body was the Central Council of Catholic Adoption Societies which was established in 1961. It was chaired by Fr Cecil Barrett who had been closely involved with the Irish Catholic hierarchy when discussions were going on about the introduction of legal adoption. The purpose of the new organisation was:

---

\(^{115}\) These are described above.
To provide a way for representatives of the registered Catholic Adoption Societies to meet, exchange their experiences and discuss common problems and assist the societies in achieving and maintaining a common high standard of work; to speak authoritatively on behalf of the societies in negotiations with the Adoption Board and departments of State and local authorities.

32.199 Subsequently, associate membership of the organisation was open to health boards doing adoption work and agencies of other denominations. However, these associate members did not have voting rights. This differentiation between Catholic and other adoption societies continued for several decades. By the 1990s, membership of the organisation had become pluralist in nature and a decision was taken by the members to change the name to Central Council of Irish Adoption Agencies to reflect that fact. Before any change could be made the matter had to be ratified by the Catholic bishops who were responsible for renewal of the organisation’s constitution. The change of name was approved at a general meeting of the Irish Episcopal Conference.

32.200 The CIAA representatives told the Commission about the background to their work and activities. On the issue of consent by mothers in mother and baby homes, CIAA representatives said it was their view that ‘considering that the mother was virtually incarcerated in the Home the question of her consent being “full, free and informed” was rendered moot’. Their view was that legal and ethical standards that currently inform adoption practice - supporting parents in their wish to rear their child, informing a parent about the impact of adoption, exploring all options available and the consequences of each, acknowledging that adoption severs the social and legal ties between parent and child but does not weaken the emotional ties - quite simply did not apply in the years before mother and baby homes employed social workers to counsel and support the mother in her decision.

Cúnamh
32.201 Staff from Cúnamh gave evidence to the Commission. Until 1992, it was called the Catholic Protection and Rescue Society of Ireland. It was one of the first adoption societies to employ professional social workers. One professional social worker who worked in the society from 1956 to 1996 and two others who worked there for periods between the 1970s and 1990s gave evidence of their experiences in adoption work.
32.202 The social worker who was there in the 1950s said that, when she started, her principal dealings were with a number of children who had been informally placed with a view to adoption prior to the passing of the *Adoption Act 1952*. Once the legislation was passed, it took a considerable length of time to get everything sorted and the society had to contact a lot of mothers in order to get their consent.

32.203 She said that, in Cúnamh, they always felt the best place for a child was with its birth parents. They felt strongly that, if the mother could at all keep her baby, that was the best thing for her child. However, this was not always possible. ‘We always tried to satisfy ourselves of the suitability…our aim was the interests of the child…what was in the best interest of the child’.

32.204 Cúnamh staff worked with the birth mother and assessed prospective adoptive parents. The staff visited the homes and every child who was in their temporary care was discussed. Over a period of weeks and months the social workers had a strong sense of whether or not the mother was ready for her adoption decision. The adoptive couple who were being assessed were also discussed: ‘you tried to place the child as close to the environment and personality as was possible’.

32.205 Another social worker with Cúnamh told the Commission that options were discussed with mothers during the 1970s but that there were very few. In the early days there were many more adopting parents than there were babies to be adopted. Cúnamh never got involved in American adoptions.

**Adoption Board social workers and members**

32.206 Two social workers who had been working with the Adoption Board gave evidence to the Commission. One had been there in the 1980s and 1990s and the other in the 1990s. The Adoption Board had six to seven social workers. The two witnesses pointed out that the Adoption Board had no function in the placement of children for adoption; that was the function of the adoption societies. These societies had responsibility for the pre-placement work with mothers who were considering adoption for their children. As far as the Adoption Board social workers were concerned, the adoption societies fully counselled the mother on the consent process. They told the Commission that it was the adoption society’s task to deal with the background history, the medical history, the relationship with the child’s birth father, how the society assessed the prospective adopters, ascertaining if the mother wished to be involved in the process and finding out if
chapter 32 adoption

she wished any follow-up information about her child post-adoption, discussions in relation to alternatives to adoption and supports that might be available to her if she decided to keep her child.

32.207 The principal function of the Adoption Board social workers was to carry out an independent social work assessment of the prospective adopters' eligibility and suitability to adopt the child already placed with them by the relevant adoption agency. Two former members of the Adoption Board told the Commission that in the early period they relied totally on what the Adoption Board social workers reported and that in retrospect they felt they should have been more probing but that was not encouraged.

32.208 Up until 1998 a mother could place her child with whomever she wished. Adoption Board social workers told the Commission that some of these direct placements were very problematic. In their view some of the prospective adopters were not suitable as they had a lot of problems themselves and as a result the adoption process, particularly in those cases, sometimes took a very long time. Because the Adoption Board social workers were principally involved in assessing adopting families, they were often unaware of whether children being adopted were born in mother and baby homes.

32.209 The Adoption Board social workers acknowledged that, in relation to the placements by the adoption agencies, some would provide very good reports; others would have little on their files and would not be comprehensive. As time went on more comprehensive reports were prepared by the placement agencies.

32.210 An Adoption Board social worker said:

I think adoption has played an important role in society and has given a lot of children great security and they vouch for that themselves, but I do think the secrecy that we had at the beginning where we didn't know very much about the mother and her consent and all of that, wasn't good practice. I think the idea of people being given as much information as possible, meaning the adoptive parents being given as much information as can be given about the birth parents, maybe even meeting them before the placement, I think all of that sort of thing is a good move. Now it doesn't work out in every case but I think generally openness and honesty is to be recommended. I think that has made a difference, we don't know yet how, what the difficulties of those
situations are, I am sure there are many as well, maybe it takes from the security that you want to give a child. It is an effort and I think it is a move forward. This break, as if the past didn’t exist, I remember a couple saying to me once that they were not given any information on the mother and I asked, I said well will you try to get information or would you like to get information and the answer was ‘oh no it is better not to know what you don’t know you cannot lie about’ so it was really coming from a very negative place. I saw a change in that, I thought that was doing a very good thing and that children were aware.

Health Board Social Workers

32.211 Health Board social workers who were based in Pelletstown in the 1970s and 1980s and who were principally dealing with mothers who were placing their children for adoption gave evidence to the Commission. They told the Commission there was a culture of adoption which was systemic in Pelletstown. While there was no explicit pressure put on the women, there was a belief system that adoption was the better option and there was an expectation that it would be the choice made; however, they were adamant they never saw women having their babies taken without their explicit consent. All options had been discussed with them including the right to withdraw consent up until the final order.

G: Research and analysis on adoption practices in Ireland

Adoption practice in 1974

32.212 In 1974, the first piece of research on adoption in Ireland was published. It was conducted by Vivienne Darling, then of the Department of Social Studies in TCD, sponsored by the Medico-Social Research Board and published by CARE which was an organisation campaigning for improved services for children. The author recognised the limited nature of the study as, among other things, it did not involve any contact with birth parents. It did involve a survey of adoptive parents and of the practices of adoption societies. It throws light on two aspects of adoption which the Commission is addressing: the extent to which the child’s welfare and protection were considered in practices relating to their placement and the practices and procedures of adoption societies. Overall, Darling was quite critical of adoption practices while recognising that there were not enough trained staff to carry out the work. She was also critical of the ‘negative attitude’ of the Adoption
Board to any suggestions for improvement while recognising that it did not have the power to require adoption societies to apply particular standards.

The main findings of the research were as follows:

**Adoptive parents**

32.213 Contact was made with the adopting parents whose names and addresses were in a particular edition of *Iris Oifigiúil*. A total of 143 responded to the invitation to take part in the research. The following were the motivating factors for adopting:

- Unable to have own children: 62.6%
- Wanted companion for a single child: 14.0%
- Wanted a baby to take the place of a child who had died: 2.1%
- Already had children but felt able to offer a home to another: 22.4%
- Child was related to adopters: 4.9%
- Other reasons: 5.6%

32.214 Just over half of the adopters from Dublin gave inability to have their own children as a motivating factor whereas 68.4% of those living outside Dublin did so. Darling points out that Dublin residents accounted for a disproportionate number of adopters: In 1970, there were 631 adoptions in the Dublin area which had one third of the population of Ireland at the time. There were 783 adoptions in the rest of the country. She pointed out that motivation for adoption should be a major factor in the assessment of the suitability of prospective adopters but she formed the impression that ‘consideration of motivation sometimes received little or scant attention from the societies involved in the arrangements’.

32.215 The adopters came from a wide variety of occupations ranging from high professionals to unskilled labourers. The survey did confirm the findings of researchers in other countries that professionals and senior salaried employees were more likely to adopt than farmers and unskilled workers. The following table gives a comparison of the socio-economic groups of the adopting fathers compared with the percentages in the various groups of gainfully employed males in the country.

**The adoption societies**

32.216 At the time, there were 21 registered adoption societies but three had ceased to operate. Darling sent questionnaires to the remaining 18 and 16 replied. The two that did not were responsible for only 2% of the adoptions arranged by adoption societies in 1970.

32.217 She classified the adoption societies as follows:

- Those which, in addition to adoption arrangements, provided a complete casework service for unmarried mothers;
- Those which only dealt with the mother in connection with adoption arrangements after the decision to place for adoption had been taken; in some cases, they provided nursery care for the babies pending placement;
- Those which were never involved with the care of the mother; they receive the applications on behalf of the mother from other agencies but had no direct contact;
- Those which provided partial but not total care for the mother, for instance, mother and baby homes which looked after the mothers while resident, placed the babies with adopters but were not necessarily responsible for aftercare once the mothers had left the home;
- Local authorities which were registered as adoption societies and arranged adoptions as part of a total child care service.

She also noted that there were some local authorities which had not registered as adoption societies but did place children for adoption.
**Staffing**

32.218 It was not possible from the information available to clearly establish if there were adequate numbers of staff in the societies to deal with their workload. Concern was also expressed about having the same social worker providing a full casework service for unmarried mothers and also dealing with the adopters. It was possible to establish the qualifications of the staff. Eight societies between them employed four full-time and seven part-time professionally trained social workers, that is, those who had taken post-graduate courses in social work. Nine societies, including five of those who employed professionally qualified social workers, employed one or more full-time (ten in total) or part-time (13 in total) basic grade social workers. Four societies had no trained social workers and they were responsible for 13% of the adoptions registered in 1970. Of the 12 societies who employed social workers, 11 also employed unqualified personnel to carry out adoption work. In total in the 16 societies, there were 12 full-time and 21 part-time untrained adoption workers. This meant that 50% of the personnel employed in adoption work had no training in social work although some of these had some other training which could possibly be relevant.

**Financing of adoption societies**

32.219 Of the 16 societies surveyed, 11 claimed to be financed entirely by voluntary contributions and five by local authority grants but one of these also received voluntary subscriptions. The *Adoption Act 1952* prohibited adoption societies from receiving any payment in consideration of the making of arrangements. This differed from the situation in Britain where agencies were allowed to charge expenses reasonably incurred in connection with the adoption of an infant although fees could not be charged. Darling considered it unrealistic to expect the societies to exist solely on voluntary contributions but noted that the Minister for Justice had just announced the government’s intention to make money available to adoption societies for the employment of trained social workers. These grants began to be paid in 1974 - see below.

**The adoption process**

32.220 Less than half of the adoptive parents had received advice on adoption from any source. Some had received advice from their doctor, some from their priest and a small number from the adoption society. Prospective adopters did not see adoption societies as a counselling source nor did societies set out to offer such a service. Darling concluded that adoption workers saw their first, and in some
cases only, duty as being the welfare of the child without considering that the
needs of the child and the adoptive parents cannot be divorced from one another.

*The birth parents*

32.221 While the research did not involve contact with birth parents, it did elicit some
information about the interaction between the adoption societies and the birth
parents. Some offered services to the birth mother and some provided nursery
care for the babies awaiting placement. There was very little interaction with the
putative fathers. Some gave no information to the birth mother apart from a
reassurance that the baby had gone to a good home or with suitable and loving
parents. The level of information provided by other societies varied and could
include information about the background and personalities of the adoptive
parents.

*Selection procedure*

32.222 Darling found that the assessment of the prospective adoptive parents was done
‘on a rather superficial level’. In some cases, there were no home visits prior to
placement and the prospective adopters were interviewed only once. This was
possibly due to an inadequate number of trained staff in the adoption societies and
the fact that the Adoption Board did not or possibly could not insist on certain
standards of practice by the societies.

32.223 In matching adopters and children, all the societies took account of social
background. Most also took account of educational background, material
circumstances and mother’s wishes. A range of other factors were also taken into
account. For instance, one society asked couples if they would accept a red-
headed child or a child of mixed race. It seems that many adopters were reluctant
to accept a red-head or ‘foxy’ child.116

*Information about the child*

32.224 The adoptive parents received very little information about the child. Only 21%
were given information about the child’s background and ‘in some cases this
included nothing more than necessary medical details’. The majority of adoptive
parents did not want any information. Of those who did want information, some
were concerned as to whether the mother had parted willingly with the child and

---

116 English research had shown that this was also the case there.
others felt that the children should be facilitated if they subsequently sought information about their birth parents.

**Supervision of placement**

32.225 The research showed that supervision of the placement by the adoption societies was patchy and some felt that this was the role of the Adoption Board. Darling notes that many of the social workers employed by the board had no social work training but the board was not prepared to tell her how many did.

**Third party adoptions**

32.226 Darling was unable to establish the exact numbers of third party placements for adoption because the statistics published by the Adoption Board did not record this. She expressed the view that adoption workers generally regard such adoptions as undesirable. There were also no statistics available for private placements by the mother.

**Need for inquiry**

32.227 Darling concluded that there was a need for a full scale Government inquiry into the adoption of children such as those carried out by the Hurst and Houghton Committees in Britain in 1954 and 1972 respectively. In 1983 the Minister for Health established a review committee on adoption services which is considered below.

**Adoption in the 1980s**

32.228 Eileen Farrelly-Conway’s PhD thesis, ‘Adoption Policy and Practice in Ireland in the 1980s’, provided the Commission with very useful information about how adoption societies worked in practice. In addition to providing findings from research conducted in 1983/84 (a time when there were many infants available for adoption), she produced a very comprehensive literature review. The following are the main findings of her study which are relevant to the Commission’s remit:

**Administration and staffing of adoption societies**

32.229 The executive committees of the 19 adoption societies studied dealt with day-to-day policy and practice and consisted mainly of social workers, priests and

---

Almost all adoption societies had at least one worker with a professional qualification in social work. However, there were four societies still without any professionally trained social worker. The social work ratio in some societies was very high; in eight of the societies, the ratio was 90 to 1. When social workers were asked about their caseloads at that time, four of the 18 social workers who were interviewed had a caseload of 90 or more and one of these had 245 cases.

**Assessing suitability of prospective adoptive parents**

32.230 The adoption societies first established that the prospective adoptive parents were eligible to adopt. Clearly, all had to meet the legal criteria. Each adoption society had its own policies in relation to matters such as age limits, the existence of birth children within the family, whether or not the couple had had infertility treatment, whether or not it was appropriate for the prospective adoptive mother to work outside the home and whether or not the applicants had been rejected by another society. The study concluded that there was such variation in the adoption societies' policies that the fate of adopting applicants depended as much upon their choice of society as upon their own social and familial characteristics.

32.231 The study set out how the suitability assessment was carried out. References were required by all the societies; these generally came from the couple’s parish priest or clergyman, personal friends, employers or people of standing in the community to whom the applicants were known. Garda clearance was generally required. Medical reports were required by all societies. Most societies conducted at least four interviews with the couple and children already in the family were also interviewed. The interviews covered areas such as the relationship between the couple, their motivation to adopt, their parenting capacity and their expectations of the child. Conway formed the view that much of the assessment was subjective.

32.232 The decision on suitability was generally made by a case committee having heard a report from the social worker. In one society the decision was made by the director and the social worker and the case committee was not involved. The members of the case committees were usually social workers (although two had no social workers on their committees), priests, doctors, nuns, nurses and legal advisors.
Placement practices

32.233 The study showed that throughout the placement process there was an emphasis on meeting the child’s needs. All societies tried to match the social class and educational backgrounds of the prospective adopters and the birth mother. Six social workers said it was their practice to introduce the birth mother and the adopting parents while 12 said this was not their practice.

32.234 Nearly all the societies gave written information about the birth mother to the adopting parents but half of them did not do this until the adoption process was complete. The following information was given: her age, her educational and occupational background, her family background, her medical history, her interests and hobbies, her reasons for choosing adoption and the nature of the relationship with the birth father. Information was sometimes included on the appearance of the birth mother; her personality; rural/urban background; how the birth mother coped with her decision to place the baby for adoption; and what she went on to do following the placement of her child. Sometimes information was given about the birth mother’s wishes about a possible meeting with her child in the future.

Motherhood Silenced

32.235 Ruth Kelly’s *Motherhood Silenced: Reflections of Natural Mothers on Adoption Reunion* (2005) was one of the first studies done in Ireland that addressed the issue of consent and birth mothers. It was a very small study in which the experiences of 18 birth mothers in Ireland between the 1950s and the 1970s were surveyed. The survey showed that the majority experienced shock and denial and their immediate concern was to preserve the secret. Twelve of those surveyed told their parents, two told siblings, two told boyfriends and two confided in friends. None of the mothers regardless of age or social class considered they had any real choice when it came to signing adoption consents.

32.236 Parental pressure was a big factor with seven women stating they felt categorically that this pressure was so intense that they ‘did not feel responsible for making the adoption decision’. Adoption societies were also considered to be a source of pressure. Sixteen of the women described them as unhelpful saying they colluded ‘in compelling them towards adoption’.

---

119 Ruth Kelly, *Motherhood Silenced: The Experiences of Natural Mothers on Adoption Reunion* (Dublin, 2005)
Review Committee on Adoption Services 1984

32.237 The Minister for Health, Mr Barry Desmond TD established the review committee on adoption services in April 1983 to ‘examine the present standards, practices and laws in regard to adoption and to make recommendations for their improvement or amendment as considered necessary’. Its report was published in 1984.\footnote{https://www.lenus.ie/handle/10147/45641} The committee was chaired by Dr Joseph Robins, then Assistant Secretary in the Department of Health. Its membership included Dr William Duncan who is a member of this Commission. Responsibility for adoption had moved from the Department of Justice to the Department of Health in 1983. The committee considered that ‘a child had the right to grow up in his/her family of origin. The State should lend its support to this principle and ensure, in particular, that no mother be obliged to give up a child for adoption because of the economic problems that would otherwise be created for her’. The following are its main recommendations in the areas relevant to the Commission’s remit:

Consent

32.238 The committee considered that the procedure for obtaining consent was too long and complex. It recommended the implementation of a simplified system, involving two stages - agreement to placement for adoption, and consent to adoption. The existing method of obtaining the agreement of the birth parent to the placement of a child for adoption should continue to operate. The birth parent should be statutorily entitled to the return of her child within the first three months of placement for adoption, or up to the time she consents to adoption in the event of her consenting before this three month period expired. After the expiration of this period she should be required to apply to an Adoption Court for the return of her child. A new comprehensive consent arrangement should be introduced under which the consent of a birth parent to the adoption of her child could, in exceptional circumstances, be conclusively obtained at the beginning of the adoption process.

Adoption board/court

32.239 The committee recommended that the Adoption Board should be replaced by a specialist Adoption Court. The Adoption Court should be a single authority with a nationwide jurisdiction and having sufficient autonomy within the legal system to develop its own special style and procedures. It should have High Court status.
and function as a distinct branch of the High Court. This recommendation was not accepted by the government.

**The right to information**

32.240 The committee said that it should be normal practice to give non-identifying information to an adopted person about their origins except where their age and understanding would make this inappropriate. A majority of members recommended that in all future adoptions an adopted person should have the right of access to their original birth certificate on reaching 18 years of age and should receive counselling before exercising this right. This recommendation was not accepted by the government which the Commission finds regrettable because it would have given people adopted after 1984 right of access to their birth certificates. A majority of the review committee did not recommend that this right should be retrospective.

**Adoption societies**

32.241 The committee considered that there were too many adoption societies and recommended new criteria for the registration of societies; registration should be subject to renewal every three years.

**Other recommendations**

32.242 Other recommendations which led to changes included:

- Publication of a notice of the making of adoption order should no longer be required.
- At the time of placement for adoption, a birth parent should be required to sign a document authorising any medical treatment which a child might require up to the making of an adoption order.
- Persons in paid employment should have a right to special leave from work on having a child placed with them for adoption.
- Further (and greater) efforts should be made to secure the adoption of children with disabilities.
- It should no longer be lawful for a person other than a relative to receive a child for the purpose of adoption unless the child was placed by an adoption society.
Changing face of Adoption

32.243 Vivienne Darling, who was a member of the Adoption Board between 1983 and 1998, gave a paper in 1999 called ‘Changing face of adoption’ in which she outlined some of the changes that had taken place during her 15 years on the board. Acknowledging that adoption had always been a highly emotional subject because it touches on blood types, folklore, heredity, non-marital births, parenting, race, religion and sex, she found that a combination of all of these can produce an explosive situation and a confused reaction. She noted that dramatic changes occurred in the adoption area in the 1980s and 1990s and noted that adoption as it was understood in the 1950s had more or less ceased to exist.\(^\text{121}\)

32.244 There was a significant drop in the number of babies being placed for adoption in the 1990s from over 1,200 annually in the early 1980s to just 108 in 1997. She also noted an increase in family adoptions whereby the mother and her spouse adopted her child. In 1998, adoptions by birth mothers and their husbands represented 63% of all adoptions.\(^\text{122}\)

Private Placements

32.245 Another feature of the change in the adoption legislation was the decrease in the number of private placements. As Darling noted as far back as 1984, the Adoption Review Committee recommended that in order to protect children from unsatisfactory placements it should be unlawful for a person who is not a relative or a spouse of a relative to receive a child for the purpose of adoption other than through an adoption society. The Adoption Act 1998 banned such private placements other than with a relative. The view in adoption circles was that that was a very progressive move.

Birth Fathers

32.246 As a result of the judgement in the European Court of Human Rights in the case of Keegan v Ireland,\(^\text{123}\) the Adoption Board felt compelled to locate all birth fathers and offer them a right of consultation. Darling noted that many mothers found the necessity of involving the father very threatening and were reluctant to proceed and accordingly many placements were held up. Contact with the father was totally dependent on the mother’s willingness to co-operate. Many mothers voiced

---

\(^{122}\) Adoption Authority, *Annual Report 1998*.

\(^{123}\) 26 May 1994, Series A 290, 18 EHRR 342.
their objection to having the fathers contacted. Darling noted at this time there was a dramatic increase in the number of births claimed to have been as a result of rape, one night stands and alcohol excess where the mothers stated that they did not know the father’s name or whereabouts. Where the mother refused to reveal the identity of the father, the board was advised that it had no option but to proceed to make the order.

32.247 The Adoption Board decided that adoption societies must be informed that in all existing and future placements birth fathers who were readily identifiable and traceable would have to be notified. This would have to be effected even where this was contrary to the wishes of the mother. Kerry O’Halloran, in the third edition of *Politics of Adoption*, noted that in England the traditional ‘and rather dismissive approach of the law towards unmarried fathers without parental responsibility had gradually given way to a more accommodating attitude’. He noted that the Keegan judgement established the principle that, where an unmarried father had previously enjoyed a settled cohabitating relationship with a woman who had decided to place their child for adoption, the father should be informed and consulted.  

32.248 At its meeting in October 1994, the Adoption Board: requested that in premarital cases where visits are yet to be completed the female applicant is to be asked if there is any objections to the natural father being notified of the adoption application. Where she states she objects to notification she is to be requested to give her reasons for this. Cases where final visits have not yet been completed but a decision has been conveyed to the applicants that the natural father will not have to be notified should be referred either to [the Registrar] or the Chairman for further consideration.

32.249 The board decided that the same procedure should be followed in welfare officer interviews with birth mothers in family adoptions or private placements. In her commentary on the changes in adoption, Darling noted that whereas ‘counselling is available to birth mothers from Placement Agencies and from the Boards’ Welfare Officers, no such facility is available to those birth fathers not in contact with an Adoption Agency but who may be trying to make decisions as to the future welfare of their children’.

---

Inter-country Adoption

32.250 As the number of Irish children available for adoption declined, there was a growing interest in the possibility of adoption from overseas, particularly from countries suffering economic and social difficulties or civil unrest. As Darling noted ‘inter-country adoption seems to arouse great passion in people and its introduction was controversial. It produced two extremes in viewpoint, the same action being regarded by some as laudable and by others as deplorable; on the one hand a humanitarian act and, on the other, an example of class, race and national exploitation’. The question of the regulation of foreign adoptions is outside the Commission’s Terms of Reference.

Open Adoption

32.251 Darling noted in her article that up until the 1980s secrecy had been the key-note to adoption and a clean break being the governing principle. At the time of her appointment to the board, in 1983, she noted that one registered adoption society had initiated pre-placement meetings between birth mother and adopters and that during the latter part of her period on the board, that society began to set up arrangements for on-going contact between adopters and birth mothers. Such arrangements, however, had to be dependent on the good will of adopters as the effect of the adoption order severed all rights of the birth mother.

Access to Birth Records

32.252 Another major development during Darling’s time on the Adoption Board was the start of a movement for access to birth records and the establishment of a contact register. While the board was sympathetic to an application for access to birth records, it did not feel able to release anything other than non-identifying information and this was the position until an unreported judgment in 1993, Rogers C v An Bord Uchtála, determined that, where an adoptive person was seeking information under section 22(5) of the Adoption Act 1952, the board was obliged to inform itself about the circumstances of the individual case and to decide whether to release or withhold the information sought.

32.253 The issue became more complex after a Supreme Court judgement was given in the case of IO’T v B and the Rotunda Girls Aid Society and MH versus Rev GD

126 High Court, Number 125, 1993.
The Supreme Court recognised a person’s unenumerated constitutional right to know the identity of his/her birth mother, but said that this had to be balanced against the birth mother’s right to privacy. It stated that neither set of rights was absolute. While the court implied that access to adoption records might be appropriate in certain cases, this, it held, would depend on many factors including:

- The circumstances surrounding the birth mother’s loss of custody of the child;
- The current status and circumstances of the birth mother and the potential effect upon her of disclosure of her identity;
- The birth mother’s own wishes and attitude regarding the disclosure, and the reasons behind these wishes and the aforementioned attitude;
- The current age of the birth mother and child respectively;
- The attitude of the adopted child, including the reasons why he or she wishes to seek disclosure of his or her birth mother’s identity; the present circumstances of the adopted child; and
- The opinion of the adoptive parents or other interested persons.

Considerable judicial emphasis was placed on the birth parent(s) privacy rights. In this case, the people seeking to establish the identity of their birth mothers had not been legally adopted but had been incorrectly registered - see section on illegal birth registration.

The role of the Adoption Board

While, in general, Darling thought the concept of a central Adoption Board with general oversight of adoption arrangements had much to commend it, she was critical of a number of aspects of the board members’ role. She stated that board members were not involved in any real decision making unless there was a perceived problem such as the validity of a marriage in the early years. She did accept that, with the impact of new legislation and new insights into adoption, different and more complex problems began to emerge, for example, the rights of birth fathers, and foreign adoptions, so the role of board members in decision making increased enormously. As an agent of change she felt that the board’s role was limited. Any attempt to have an input was rebuffed, board members were told

---

by civil servants that legislation was a matter for the legislators and their job was to confine themselves to the administration of the law as passed.

32.256 She did make a number of recommendations, some of which have been subsequently implemented. Among them was that there should be a consolidated Adoption Act and this has been achieved with the Adoption Act 2010. She promoted the idea of a National Contact Register and this was launched in 2005. By the end of 2008 nearly 8,000 people had registered with new applicants continuing to present each year.

H: Adoption societies and State support

32.257 The Adoption Act 1952 required that adoption societies be registered with the Adoption Board (An Bord Uchtála). The majority of adoption societies were voluntary organisations but some were operated either directly or indirectly by the public assistance/health authorities. The health authorities’ societies were financed by and accountable to the health authorities. The voluntary societies were responsible for their own fundraising. The Department of Health started to pay grants to the voluntary societies from 1974. This was mainly for the employment of qualified social workers.

32.258 The following are the main adoption societies over the period 1953-1998; many ceased to operate in the 1990s. There were other societies but they arranged very few adoptions, for example, the National Maternity Hospital (Holles Street) which had its own adoption society in the 1950s and the Jewish Association for Adoption and Fostering in Ireland which was first registered in 1986. The list is compiled from various annual reports of the Adoption Board.128

Cork

Sacred Heart Adoption Society, Blackrock, Cork (operated from Bessborough).

St Anne’s Adoption Society, Assumption Convent, Blackpool, Cork (this was set up mainly to repatriate children who were born to Irish women in the UK (see Chapter 7).

Dublin

---

128 The annual reports list the adoption societies which were involved in the adoption orders made in the year in question. There could be other registered societies which are not on the list because they were not involved in making adoption orders in the particular year.
Chapter 32: Adoption

Catholic Protection and Rescue Society (later Cúnamh), 30 South Anne Street, Dublin 2.

Cairdeas Adoption Society, 20 Harcourt Terrace, Dublin 2. This ceased to be registered in 1985 but appears to have been inactive for some time prior to that; it received no State funding in the period from 1974.

St Brigid’s Adoption Society, Holy Faith Convent, 16 The Coombe, Dublin 8.

St Louise Adoption Society, Park House, North Circular Road, Dublin 7 (formerly James’s Street). This was financed by the Dublin Board of Assistance/Dublin Health Authority/Eastern Health Board. It was very closely associated with Pelletstown and held its meetings there for many years.

St Patrick’s Guild, 82 Haddington Road, Dublin 4 (later Merrion Road).

St Thérèse Adoption Society, Whitefriar Street, Dublin.

Protestant Adoption Society (the name was changed to PACT in 1985).

Rotunda Girls’ Aid Society, Marlborough Street, Dublin.

Other Areas

Dungarvan: St Kevin’s Adoption Society, Dungarvan; this was financed by the public assistance/health authorities.

Ennis: St Catherine’s Adoption Society, Ennis.

Galway: St Nicholas’ Adoption Society, Galway; renamed Clann in the 1990s; this was financed by the public assistance/health authorities.

Kilkenny: Ossory Adoption Society, Kilkenny; this changed its name to Challenge in 1984. Killarney: St Anne’s Adoption Society, Killarney.

Letterkenny: St Mura’s Adoption Society, Letterkenny/Lifford.

Limerick: Limerick Catholic Adoption Society, Catherine Street, Limerick; this was financed by the public assistance/health authorities.

Meath: St Clare’s Adoption Society, Stamullen, Co Meath.

Sligo: St Attracta’s Adoption Society, Sligo.

Tralee: St Mary’s Adoption Society, Tralee; this was financed by the public assistance/health authorities.

Waterford: St John’s Adoption Society, Waterford.

Grants 1974-80

32.259 The following State grants were paid to the voluntary societies in 1974-1980.129

---

129 PQ No 271 of 27 November 1980.
CPRSI £109,060
St Patrick's Guild £55,650
St John's Adoption Society, Waterford £14,150
Sacred Heart, Bessborough £39,050
St Anne's Adoption Society £36,860
Rotunda Girls' Aid Society, £34,510
St Brigid's Adoption Society £26,150
Ossory Adoption Society £23,430
St Clare's Adoption Society £20,625
St Mura's Adoption Society £18,100
PACT £15,575
St Catherine's Adoption Society £15,640
St Attracta's Adoption Society £1,600

Grants and staffing levels in 1983

32.260 On 10 October 1984, in reply to a Dáil question the Minister for Health gave details of the public money received by adoption societies, the number of adoption orders made and the staffing levels of registered adoption societies in 1983.\(^{130}\)

32.261 The CPRSI had received £59,220 in 1983. It had been involved in 120 adoption orders. It had five social workers and five secretarial staff. The services other than adoption placement which it provided were described as:

- Counselling service for single pregnant women, adoptive parents and adopted adults. ‘Society anxious that putative father and girls' families avail of this counselling service’.
- Arrangement of ante-natal and post-natal accommodation.
- Assistance for women who are keeping their babies and foster and nursery care for those awaiting adoption.

32.262 The Limerick Catholic Adoption Society was financed by the Mid-Western Health Board. It was responsible for 28 adoption orders and had one social worker with secretarial assistance provided by the health board. The services other than adoption placement which it provided were described as:

- Counselling service for single pregnant women and adoptive parents.

\(^{130}\) PQ No 476 of 10 October 1984.
• Foster and nursery care for babies awaiting adoption.

32.263 Ossory Adoption Society had received £9,000 and was responsible for 46 adoption orders. It had two social workers and one secretary. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and their families, adoptive parents and adopted children.
  • Self-help support group for single mothers keeping their children.
  • Foster care for babies awaiting adoption.

32.264 The Protestant Adoption Society received £18,500 and was responsible for 18 adoption orders. It had two social workers and three secretarial staff with 13 social workers throughout the country working on a part time basis. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents and adoptive parents and adopted children.

32.265 The Rotunda Girls' Aid Society received £12,500 and was responsible for 70 adoption orders. It had two social workers and two secretarial staff. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents;
  • Accommodation provided for pregnant women;
  • Foster care for babies awaiting adoption;
  • Nursery care available for babies if required.

32.266 The Sacred Heart Adoption Society received £12,300 and was responsible for 104 adoption orders. It had three social workers and one secretary. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents;
  • Nursery care and family placements.

32.267 St Anne's Adoption Society received £15,000 and was responsible for 58 adoption orders. It had five social workers and three secretarial staff. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women, adoptive parents, and adult adoptees;
  • Foster care for babies awaiting adoption;
• A day nursery.

32.268 St Attracta’s Adoption Society received £5,000 and was responsible for 38 adoption orders. It had one social worker. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents;
  • Accommodation and ante-natal care for women;
  • Foster and nursery care for babies awaiting adoption.

32.269 St Brigid’s Adoption Society received £6,000 and was responsible for 40 adoption orders. It had one social worker and one secretary. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents;
  • Foster care for babies awaiting adoption;
  • Financial aid for mothers, if necessary;
  • Post-placement support for mothers as required.

32.270 St Catherine’s Adoption Society received £11,000 and had 34 adoption orders. It had two social workers and one secretary. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents;
  • Foster care provided for babies awaiting adoption.

32.271 St Clare’s Adoption Society received £5,000 and had 57 adoption orders. It had one social worker and one secretary. The services other than adoption placement which it provided were described as:
  • Nursery and foster care for babies awaiting adoption.

32.272 St John’s Adoption Society received £1,500 and had eight adoption orders. The services other than adoption placement which it provided were described as:
  • Counselling service for single pregnant women and adoptive parents.

32.273 St Kevin’s Adoption Society was funded by the South Eastern Health Board. Its estimated expenditure for 1983 was £8,324. It had nine adoption orders. It had one social worker and two public health nurses. The services other than adoption placement which it provided were described as:
- Counselling service for single pregnant women and adoptive parents;
- Ante-natal clinic;
- Family placements for women;
- Foster care for babies awaiting adoption.

32.274 St Louise Adoption Society was funded by the Eastern Health Board. Its estimated expenditure for 1983 was £136,500. It had 74 adoption orders. Its adoption work was carried out by the social workers in each of the ten community care areas of the EHB working through the Senior Social Worker. The services other than adoption placement which it provided were described as:
- Counselling service for single pregnant women and adoptive parents;
- Social work contact maintained with women who decided to keep their children;
- Foster care for babies awaiting adoption.

32.275 St Mary's Adoption Society was financed by the Southern Health Board. Its estimated expenditure for 1983 was £13,000. It had nine adoption orders and employed one social worker. The services other than adoption placement which it provided were described as:
- Counselling service for single pregnant women and adoptive parents;
- Foster care for babies awaiting adoption.

32.276 St Mura's Adoption Society received £8,000. It had 24 adoption orders. There were two social workers, one child care worker and one secretary. The services other than adoption placement which it provided were described as:
- Counselling service and accommodation for single pregnant women;
- Nursery for babies awaiting adoption.

32.277 St Nicholas' Adoption Society was financed by the Western Health Board. Its estimated expenditure for 1983 was £25,000. It was responsible for 29 adoption orders. It had six social workers. The services other than adoption placement which it provided were described as:
- Counselling service for single pregnant women and adoptive parents;
- Access for women to Western Health Board medical and para-medical services;
- Foster care for babies awaiting adoption.
32.278 St Patrick’s Guild received £19,200. It was responsible for 139 adoption orders. It had three social workers and three secretarial staff. The services other than adoption placement which it provided were described as:

- Counselling service for single pregnant women and adoptive parents;
- Accommodation arranged for the women, if necessary;
- Nursery care for babies awaiting adoption.

32.279 St Thérèse Adoption Society received no state funding. It was responsible for 16 adoption orders. It had two social workers. The services other than adoption placement which it provided were described as:

- Counselling service for single pregnant women and adoptive parents.
- Foster and nursery care for children awaiting adoption.

I: Foreign Adoptions

Sources

32.280 The main sources for this section are:

National Archives of Ireland, Department of Foreign Affairs files:
DFA/5/345/96

These contain over 2,000 separate passport applications that were made on behalf of couples looking to adopt an Irish child. Not all of these related to those born in a mother and baby home or a county home being investigated by the Commission. The Department of External Affairs (DEA) kept a record of passports issued for adoption abroad only from November 1950 onwards so it is not known how many such applications were made prior to that date. Other relevant DFA files are listed in Part 5. A number of the DEA documents which are quoted in this section are published in Documents on Irish Foreign Policy, Vols IX and X.

Dublin Diocesan Archives

The institutional records of the various institutions
Washington DC, The Catholic University of America, The American Catholic Research Center and University Archives

131 An application for a passport and the issuing of a passport do not necessarily mean that the child went to the USA or that the adoption went ahead. It would appear that the vast majority were, in fact, adopted in the USA but the Commission is aware of cases where a passport was issued and the child did not go.
Introduction

32.281 Foreign adoption of Irish children, and, in particular, American adoption, became a phenomenon in the mid and late 1940s. Miss Litster had expressed concerns about foreign adoptions in 1940 when she drew the attention of the DLGPH to cases of children being removed from the country ‘in a haphazard manner without due regard for their safety and moral and physical welfare’. She said that the Secretary of Bethany Home constantly advertised in English Protestant religious papers for people to adopt children from Bethany. The prospective adopters required only a clergyman’s reference; there was no home inspection. An eight month old child was sent to an English home which was subsequently reported by the police to the NSPCC to be unsuitable. The child’s correct name was not given to the prospective adopter and neither a birth nor a baptismal certificate was provided.

32.282 She further reported that three children, one from Pelletstown and two from the Sacred Heart Home, Drumcondra were removed by a woman on the pretext of adoption. The whereabouts of the Pelletstown child had not been established; one child was adopted in England and the third was taken to America. This woman admitted that she had ‘traded in illegitimate children for 15 years and preferred to take them from Ireland where fewer inconvenient questions were asked’. Ms Litster’s report names two other women who engaged in similar practices. There is no evidence that anything was done as a result of this report.132

32.283 By the mid-1940s, there was significant ‘demand’ for adoption, particularly by Americans. Milotte estimated that 20 American couples were chasing every available white American child.

In the mid-1940s, hopeful American adopters were presented with a new source of children among the hundreds of thousands of displaced orphans in post war Europe. Many such children were acquired by American military and government personnel stationed in US-occupied territories such as Italy and West Germany. Others were shipped to the States in groups to be offered for adoption there. Thousands of Americans servicemen were also stationed in Britain and remained there long after the war ended, but in 1948 the UK

---

132 Department of Health, INACT/INA/0/474129.
forbade foreign nationals from taking British children out of the country. As a result many of the US Military personnel stationed in Britain turned to Ireland just a short flight away. As a war time neutral, Ireland had no war orphans but it had a significant number of ‘illegitimate’ children.\footnote{Mike Milotte, Banished babies: the secret history of Ireland’s baby export business (Dublin, updated edition, 2012), p. 15.}

The numbers involved

Institutional and official external records examined by the Commission show that between 1922 and 1998, 1,638 children, who were resident in mother and baby homes and the four county homes under investigation, were placed for foreign adoption. The vast majority, 1,427, were placed for adoption to the USA. A Passport Office record was found for 1,266 of the children placed for foreign adoption. A passport would not have been needed in respect of the 188 children who went to the UK. A Passport Office record was found for an additional 265 children who were in the institutions but were not recorded as placed for adoption.

Adoption country

As already stated, 1,427 children were adopted to the USA; 149 to Great Britain; 39 to Northern Ireland; five to Canada; four to Saudi Arabia; two each to Australia, Egypt, Italy and Venezuela; one each to Guernsey, Germany, Serbia, Singapore, Norway and the Philippines.
32.286 The vast majority of foreign adoptions were children who left the institutions in the period 1945-1969. The figures given here all relate to the year the child left the institution which may not be the same as the year of the actual adoption. The institutional records show that there were 15 children in total placed for foreign adoption in the period 1926-1944. In subsequent years the numbers were as follows:

32.287 There were a total of ten in the 1970s and three in the 1980s. There were 88 for whom no date of discharge was recorded.

32.288 It is clear from DEA records that children from other orphanages and institutions, including county homes and industrial schools, were sent abroad for adoption as
were a number of children who were boarded out by public assistance authorities. It is also possible that children were placed for adoption abroad directly by their mothers or by third parties. A memorandum compiled in January 1958 by the DEA stated that passports were issued to 122 children in 1957 to enable them to leave the country for legal adoption abroad. The figures for the preceding five years were as follows:

32.289 An undated (but likely to have been 1952) statement on American adoptions by Archbishop McQuaid said that there were only two agencies in the Dublin Archdiocese which arranged American adoptions - Pelletstown and St Patrick’s Guild (which is not being investigated by the Commission). The statement said that St Patrick’s Guild arranged one American adoption in 1947, one in 1948, 13 in 1949, 42 in 1950 and nine in 1951. It stated that 143 Catholic children were adopted by American citizens of whom 74 were adopted in 1950 and 49 in 1951.\(^{135}\) Figures compiled in the 1990s when the issue of foreign adoptions became controversial suggest that St Patrick’s Guild sent 643 children for adoption between 1947 and 1967.

**Regulation of foreign adoptions**

32.290 There was no regulation of foreign adoptions during the period under investigation. The *Adoption Act 1952*, which came into effect on 1 January 1953, regulated only domestic adoptions. It did not regulate adoptions taking place abroad of children born and normally resident in Ireland. Its main impact on the regulation of foreign adoptions was that it restricted the removal from the State of ‘illegitimate’ children under the age of one. The State’s involvement with these adoptions was largely limited to the issuing of passports by the Passport Office which was part of the DEA. The DEA was clearly not enthusiastic about its involvement but it did try to ensure that children going abroad for adoption were going with the consent of the parent(s) and were going to suitable homes.

\(^{134}\) National Archives of Ireland, DFA/5/345/96 Part 3A.

\(^{135}\) DDA/AB8/b/LII/A; presumably the other 20 were adopted in earlier years; these figures are not directly comparable with the Commission’s figures as some refer to the year of adoption whereas the Commission’s figures relate to the years when the children left the institutions.
32.291 The Catholic Church hierarchy played a central role in organising and facilitating foreign adoptions of Irish children, mainly to the USA. It had no formal legal or regulatory role in either foreign or domestic adoptions. However, in practice, it effectively took on a significant regulatory role. Its main interest was in securing what was seen as the child’s religious welfare but its insistence on standards for prospective parents, their homes and their material well-being did promote the welfare of the children concerned. Archbishop McQuaid of Dublin and Fr Cecil Barrett, who was the director of the Catholic Social Welfare Bureau in the Dublin Archdiocese, were the main people involved but Archbishop Walsh of Tuam was involved in all proposed adoptions from the Tuam Children’s home. Others such as Bishop Lucey of Cork were interested in adoption legislation (see above) but he does not seem to have had any direct involvement in foreign adoptions.

32.292 Prior to 1953, there were no specific rules about removing children from Ireland. Section 40 of the Adoption Act 1952 introduced a general prohibition on the removal from the State of a child under seven who was an Irish citizen. This did not apply to ‘legitimate’ children who were removed by or with the approval of a parent, guardian or relative. In the case of a child who was ‘illegitimate’ and under the age of one, removal abroad was permitted with the approval of a parent/guardian or relative of the child provided the child was going to reside with the parent/guardian or relative outside the State. Otherwise an ‘illegitimate’ child had to be at least one year old before it could be removed from the State. Once removal had taken place, there was nothing in the Act to prevent or regulate an adoption occurring abroad.

32.293 The adoption of children by foreigners in Ireland (that is, once legal adoption was introduced in Ireland) was rendered unlikely by section 11(5) of the 1952 Act which required that the applicant or, in the case of a married couple, the husband, be an Irish citizen or ordinarily resident in the State for five years. Under the Adoption Act 1964, this rule was changed and replaced by a requirement that the applicant should be ordinarily resident in the State and should have been so resident during the year ending on the date of the adoption order.

32.294 The Adoption Board (An Bord Uchtála), which was established under the 1952 Act, had no role in relation to foreign adoptions of Irish-born children. In the 1950s, consideration was given to giving it a role in vetting the prospective adopters but this did not happen, probably because it did not have the resources to do so. The
board did assist in compiling details of such adoptions in conjunction with the Department of Foreign Affairs (the successor of the DEA) in the 1990s when controversy arose about these adoptions.

Consent

32.295 Foreign adoptions were arranged directly by, among others, a number of mother and baby homes, a number of adoption societies, a number of public assistance authorities and some private individuals. Until 1998, a mother could give or entrust her child to whomever she wished. Therefore it is possible that a number of foreign adoptions were arranged directly by mothers. There is unlikely to be any record in Ireland of such arrangements. Nobody has come forward to the Commission to give evidence of their involvement in such private arrangements, although the Commission is aware of a number of doctors, priests and nuns who facilitated such adoptions including USA and UK adoptions.

32.296 More often than not the mother ‘surrendered’ the child to an authority that could organise a foreign adoption. This was usually the person in charge of the mother and baby home where the baby was born - the Mother Superior in the case of the homes run by Catholic orders or the matron in Bethany. Alternatively the surrender could have been to the public assistance authority or to an adoption society. The institution to which the child was surrendered was the agency which arranged the adoption. The Commission has seen a number of examples of ‘Certificates of Surrender’. They varied somewhat between the different agencies but a typical one read as follows:

I [name] Mother and parent having the sole custody of [name] an infant born on [date of birth] do hereby give to [name of agency] for the period of life, complete custody and control of my said infant child, with authority to place him/her in a family for legal adoption, whether out of Éire or otherwise; and I do agree and promise not to attempt to retake my said infant child from, or induce him/her to leave any place where she/he may be found.

This was signed by the mother and witnessed by a representative of the agency involved.

32.297 In some cases the certificate of surrender was in the form of an affidavit and was signed in the presence of a solicitor or peace commissioner. Some specifically mentioned consent to ‘the issue of a passport to enable my child to travel to the United States for adoption’. The agency to which the surrender was made then
signed another affidavit ‘as legal guardian’ of the child surrendering her/him to the adoptive parents in the USA.

32.298 In some cases, a more elaborate statement was signed by the mother. For example, one mother who surrendered her child directly to an American adoption agency swore an affidavit stating:

…after due consideration I have come to the conclusion that the best interests of my said child will be promoted by his being placed for adoption. I have been advised and fully realize that by so doing, I waive all claims to said child finally and irrevocably. I further state that no representations or promises of any kind or nature have been made to me to induce me to execute this instrument and that the same is done freely and with a full realization of the effects thereof.

This document was clearly an American document but the affidavit was signed in Ireland.

32.299 The legal validity of the surrender was questionable in some instances. It is clear that the DEA was concerned about whether or not it was legally permissible for a mother to surrender her child to someone else. It is doubtful if the agency which received the surrender could accurately claim to be the child’s guardian especially if the mother was contactable; if the mother had effectively abandoned the child, the claim to be the guardian would have been stronger. It is very likely that a mother who had made such a surrender would have had it overturned by the courts if an application had been made. This does not appear to have happened. A number of mothers thought that, by agreeing to the child going to the USA in particular, they were giving that child opportunities not available in Ireland. Some mothers, having traced their child, told the Commission that they were disappointed their child had not been adopted to the USA.

32.300 The general attitude taken by government and many of those involved in the process seems to have been that children, who could not or would not be taken care of by their mothers or extended families in Ireland, would be better off going to adoptive homes, particularly in the USA, rather than being placed in orphanages and industrial schools in Ireland. In so far as controls were exercised by the DEA through the Passport Office, they were largely exercised because of concern for the welfare of the children. Some of the actions taken were driven by concern about bad publicity but they nevertheless did promote the welfare of the children.
Department of External Affairs concerns

32.301 Before the late 1940s there were only a small number of adoptions to the USA. The increase in numbers from about 1948 gave rise to some concerns in the DEA about a policy (or the absence of a policy) on issuing passports to children for the purpose of adoption abroad. In March 1949, an official suggested that ‘as we shall probably be asked to grant two Irish passports to two infants for a 4,000 mile journey into the virtually unknown, it might be as well to consider the policy aspect involved before doing anything further’. By December 1949, it is clear that the Department of Health was aware that a number of children were being sent abroad for adoption. The Minister for Health expressed uneasiness to the DEA about the practice because ‘it seems possible that applicants for children may be persons turned down as adopters in their own country and, further, there is no means of knowing or ensuring that children placed in the care of applicants will be adopted legally in their new country or even if they will remain in the care of the original applicants’. The minister acknowledged that ‘illegitimate’ children faced an uncertain future in Ireland and that he ‘would be diffident in suggesting any obstacles should be placed in the way of their acquiring a new permanent home’. He enquired as to whether some measures could be taken to safeguard the children’s interests and he sought the views of the Minister for External Affairs on whether it would be possible to arrange that ‘aliens136 wishing to take children out of this country for adoption should be obliged to produce evidence of character, suitability and religion which should be supported by a recommendation from the Diplomatic Representative in this country’. Later in December 1949, a DEA policy seems to have been agreed as another DEA official stated that the DEA was prepared to ‘issue passports to children who are to be adopted by people in the United States provided the parents or guardians’ consent is obtained and that satisfactory evidence of the foster-parents’ suitability is produced’. The Commission has not seen any evidence that this policy was ever publicly stated.

32.302 In 1950, discussions were continuing within the DEA about the issue. In May 1950, the Irish embassy in Washington reported that it had received a number of queries in recent months from people living in the USA who wished to adopt Irish children and ‘similar enquiries have been received by the various welfare agencies both in the United States and in Ireland’. The embassy had made informal enquiries with the US Department of Justice and the District of Columbia courts.

136 Alien was the legal term for a non-Irish citizen.
This had led to the suggestion that the appropriate authorities with whom to discuss the implementation of the measures to which the Minister for Health referred in December 1949 were the qualified welfare agencies in the USA. In the District of Columbia, these qualified welfare agencies were described as extra-governmental organisations which were grouped under the Board of Public Welfare. The embassy had also made informal enquiries with this board and established that the agencies concerned carried out investigations as to the character and general suitability of Americans adopting American children. The embassy had also made informal enquiries in respect of Americans adopting children from countries occupied by American troops such as Germany and Austria.

32.303 The embassy reported that the National Conference of Catholic Charities (NCCC) was concerned with Catholic children in the USA. The question of adopting Irish children was on the agenda for its May 1950 meeting. The assistant secretary of the conference told the embassy that Ireland and Italy were the two countries chiefly concerned as France did not allow foreign adoptions, Belgium was ‘very strict’ and the Netherlands was somewhat less strict. The assistant secretary of the NCCC pointed out that adoption laws differed from state to state in the US and, while the welfare agencies generally had the power to inquire into the religion of the prospective adopters, ‘in practice they often tend to disregard this aspect’.

32.304 The practice of the embassy in dealing with applications for the adoption of Irish children at this stage was to state that there was no Irish legislation with which it was necessary to comply and that the permission of the United States immigration authorities was all that was required. Catholic applicants were referred either to the NCCC in the USA or to the appropriate Catholic orphanages and organisations in Ireland. The embassy had been told that such adoptions had been ‘closed down by the Archbishop’ (McQuaid), pending a full investigation. Applicants who did not specify their religion were also given the addresses of the Protestant Orphan Society, 28 Molesworth Street, Dublin, and the Presbyterian Association, 16 St Stephen’s Green.

32.305 The embassy noted that an article in the *Norfolk Virginian-Pilot* of 21 April 1950 stated that ‘many Americans passing through Ireland during the Holy Year’ \(^{137}\) will

---

137 1950 had been designated a Holy Year by Pope Pius XII.
take Irish children home with them’. This statement was attributed to a Dublin report. The Commission has not seen a copy of this report and does not know if it was genuine.

32.306 A follow-up report from the Irish embassy in Washington in June 1950 reported on a meeting with a representative of the Children’s Bureau which was described as the federal authority responsible for co-ordinating child welfare services in the different states. The representative expressed willingness to provide assistance in vetting applicants for adoption. The assistant secretary of the NCCC had also been in touch with the embassy. He said that an international conference on adoption would be held in the Vatican in September 1950. Representatives of the NCCC would be attending and would stop over in Dublin en route. He suggested that the DEA organise a meeting in Dublin between representatives of the NCCC and Irish bishops and representatives of the organisations involved in foreign adoptions. The DEA noted that this was a ‘very delicate thing’ to be asked to do because there could be public criticism that it might be giving official backing to this ‘traffic’ and they need to be careful not to do ‘anything which would embarrass the Archbishop’.

32.307 The DEA took the view that adoption was a personal matter between the birth parent and the adopting couple. A memorandum from August 1950 stated that the Irish Department of Justice was ‘very “cagey” on this subject as they state the whole matter is very delicate at the present time’ - a reference to the various discussions ongoing about introducing legal adoption in Ireland at this time - see above. This memorandum also stated that the American embassy in Dublin had been offering assistance to couples applying for passports for Irish children.

32.308 In November 1950, a DEA official noted that the department was getting a large number of applications for passports to enable children (mostly ‘illegitimate’) to be brought to the USA for adoption. The US consulate in Dublin had issued 140 visas to such children in the period 1 July 1949 to 30 September 1950. The official said that he had recently interviewed an adopting parent who was the wife of an American airman in Britain and gathered from her, in her words, that Ireland enjoyed ‘quite a reputation’ among US air force personnel there ‘as a place where one can get children for adoption without much difficulty’. 
32.309 In November 1950, the DEA wrote to the secretary of the Department of Health. In summary, the DEA did not want to be seen to encourage or promote foreign adoptions. The Dublin board of assistance had written to the DEA in August 1950 asking about the use by Irish public assistance authorities of Irish diplomatic offices abroad to make enquiries about prospective adopters. The DEA said that it would not favour these offices abroad, and particularly those in the USA, making such enquiries.

32.310 A DEA memorandum, dated 29 December 1950, described how it approached the issuing of passports:

Under the United States Displaced Persons Act of 1948, as amended, orphans are being admitted, for adoption, to the United States under a special non-quota immigration visa system. Under the said Act as amended the United States Consular Office may grant visas to orphans of various European countries, including Ireland, who are being brought into the United States for adoption either by individuals or by institutions. The conditions under which visas may be given are prescribed in Section 2(F) of the Displaced Persons Act 1948, as amended…This Section is quoted in the aide mémoire handed to me by [an official in the USA embassy in Dublin] towards the end of October last.

At the time [the official] informed me that from the 1st July, 1949, to date the Embassy here had issued about 140 visas to orphans who were going to the United States for adoption, i.e. about 10 per month. Since [the official’s] visit I have arranged to have referred to me all applications for the issue of passports to children leaving the State for adoption and from what I have seen so far I would say we had in fact received on an average 10 applications per month.

In the course of dealing with these applications I have had occasion to interview and discuss the question generally with the Rev. Mother Superior of St. Patrick’s Home on the Navan Road [Pelletstown], where there are about 30 illegitimate children; the Rev. Mother Superior of the County Home, Tuam Co. Galway [the Tuam Children’s Home]; the Matron of the Bethany Home, 98 Orwell Road, Rathgar, Dublin; Mr. Giff of the Children’s Home in Townsend Street; and Miss Crowe of the Catholic Girls Protection Society, Cork.

... From the Mother Superior of St. Patrick’s Home, I learned that His Grace the Archbishop of Dublin, though in principle opposed to the taking of children of
the country in this fashion, has given his agreement in individual cases on the understanding that the adopting parents are vetted by the Conference of Catholic Charities of which there is usually a branch in each parish of the United States.

From our point of view here this is very satisfactory - satisfactory also from the point of view of the persons in charge of institutions like the Navan Road. The Conference of Catholic Charities furnish, I understand, a comprehensive report on the adopting parents and also follow up the career of the child when it has arrived in the States and see that it is in fact adopted according to the law. Even then they still continue to follow it up. This practice is also enforced in the Diocese of Meath and I myself in my correspondence on individual applications with various Catholic institutions throughout the country have brought to the notice of a number of religious superiors of institutions the fact that the Conference of Catholic Charities is at their disposal in matters of this kind.

I also discussed the matter at length with Mrs. Glover, the Matron of Bethany Home in Orwell Road, Rathgar. From her I gathered that the Committee of the Bethany Home are extremely careful before handing over a child to anybody. Before a child is handed over

1. The Committee insist that the adopting parents or at least one of them, see the child.
2. That satisfactory references are produced, including references from clergymen.
3. That the adopting parents are regular church goers.
4. That neither of the adopting parents are a divorced person.
5. That the adopting parents, or parent, are interviewed by the Committee and approved.

I gathered from Mr. Giff that the practice is similar in the institution in Townsend Street, of which he is a Director.

From all of these interviews and conversations, I gathered that in the cases of all institutions, both Catholic and non-Catholic, the Superiors do in fact follow up the child after it leaves them and that in fact they do receive regular reports on its welfare. It would also seem that in all cases the children that left the State were in fact in due course legally adopted in the United States.

In dealing with these applications myself I do not authorise the issue of a passport until I am satisfied on the following points:
1. That the person handing over the child for adoption is in fact the guardian of the child and has also been authorised by the mother to arrange for its adoption.

2. That satisfactory references, including references from clergy men have been produced in respect of the adopting parents.

3. In cases where a satisfactory report has been furnished on the adopting persons by the Conference of Catholic Charities, I take that as satisfactory evidence of the parents' character, etc.

In all these cases we have to be satisfied on the following points:

1. Is the person who is handing over the child legally entitled to do so.

2. We must be reasonably satisfied that the person taking the child for adoption is a person of good character, able and willing to rear a child, prepared to bring it up as the mother would have wished to bring it up had she been able to do so, and that the person genuinely proposes to adopt the child according to law and rear it as its own.

With regard to this latter point, it is well known that in the United States of America there are many private institutions of a shady character that, so to speak, do a business in children for adoption.

32.311 In May 1951, the DEA became aware that Pelletstown had been instructed (apparently by Archbishop McQuaid) to cease all adoptions to the USA. The question of foreign adoptions was 'very much a live issue' when proposals for legalising adoption had been discussed and there had been 'considerable newspaper comment' on the number of such adoptions. A DEA official in Dublin told the Irish Consulate in New York that the DEA had no official information about any instructions given by the ecclesiastical authorities to orphanages. The DEA suspected that the Archbishop of Dublin and the Bishop of Meath had instructed organisations in their dioceses to cease foreign adoptions pending an investigation. He repeated the DEA view that its only role was in relation to issuing passports. Before doing so, the DEA 'now' satisfies itself that the appropriate consent has been given by the parent or guardian and that satisfactory evidence of the foster parents' suitability is produced; 'it is not part of our function to assist foreigners to remove children from this country'.

32.312 In May 1951, a note by an official of the DEA set out the problems which could arise in the USA. Californian law required the written consent of the birth parent(s) but this was not necessary if the parent had relinquished the child to a 'licensed or
authorised Child Placing Agency in another jurisdiction’. The DEA note said that it was clear that ‘the Convent at Castlepollard’ was not such an agency. The same official explained to an official in the American embassy in Dublin that the public assistance authorities were responsible for placing children. Castlepollard was approved by the public assistance authorities for receiving such placements. Castlepollard was neither authorised or unauthorised to accept the surrender of a child but, if the mother wanted the child back, there was little doubt that an Irish court would accept her right to do so.

32.313 In June 1951, the DEA official sent a follow up letter to the New York consulate stating that the DEA had just found out ‘unofficially and indirectly’ the conditions under which the Archbishop of Dublin would ‘allow’ foreign adoptions. The New York official was asked to treat this information as ‘confidential, private and secret and should not be used officially under any circumstances’. The letter included a copy of the requirements (which are set out below) and noted that the DEA had independently come to the conclusion that vetting by the NCCC or a kindred organisation was satisfactory. This may now ‘also be regarded as a necessary condition for the issue of a passport in these cases’.

In November 1951, Archbishop McQuaid’s secretary asked the DEA how many children had left Ireland for adoption in the USA during 1950-51. When he did not get an immediate reply, he called to the Passport Office. A DEA official asked the minister if he should provide the information or should he plead ‘Official Secrets’. The minister agreed that the information be provided. The DEA figures were not complete for 1950. From November 1950 to November 1951 there were an average of ten a month.

**Church involvement**

32.314 Archbishop McQuaid and his advisor on adoption matters, Fr Cecil Barrett, who was the director of the Catholic Social Welfare Bureau, were also actively involved in trying to control foreign adoptions. Fr Barrett was sceptical about claims of proselytism on the part of Protestant homes and adoption societies but he wanted clarity around the issue of religion in the proposed legislation on adoption. This could then inform the passport application process and he looked for robust guarantees that would protect the spiritual well-being of Catholic babies being placed abroad for adoption. He doubted that the numbers of children being sent to
America was ‘very considerable’ and that it was likely to be 100-150, both Catholic and non-Catholic.  

32.315 Archbishop McQuaid was reticent about placing Irish children for adoption abroad but accepted that it was happening and he sought to have robust checks in place to ensure the religious and material welfare of the children. The archbishop and Fr Barrett consulted a wide variety of organisations and institutions in the USA in order to put a coherent system into place. Fr Barrett met representatives of the NCCC on a number of occasions. Archbishop McQuaid and a representative of the NCCC agreed that the Catholic Charities would co-operate by vetting American applicants for Irish children. The Passport Office found this arrangement to be acceptable.

32.316 Following some adverse publicity about Irish children being sent to the USA for adoption Archbishop McQuaid drew up protocols in the early 1950s for those seeking to adopt an Irish child abroad. (These, of course, had no legal standing). They had to satisfy certain criteria that were published and distributed in a one-page leaflet. The leaflet read:

- The prospective adopting parents must have a written recommendation from the director of Catholic Charities of the Diocese in which they live.
- The prospective adopting parents must supply for inspection their Baptismal certificates and their Marriage certificates.
- The prospective adoptive parents must have a written recommendation from the Parish Priest of their Parish.
- The prospective adopting parents must submit a statement of their material circumstances, with a guarantee as to their income, so as to ensure a good home and good prospects in life for the adopted child.
- The prospective adopting parents must submit medical certificates stating their ages, that they are in good health, physical and mental, and that they are not deliberately shirking natural parenthood.
- The prospective adopting parents must swear an affidavit to the effect that they are Catholics, that they guarantee to rear the adopted child as a Catholic, that they undertake to educate the adopted child, during the whole course of its schooling, in Catholic schools, that, if in the future the child is sent to a University, it will be sent to a Catholic University, that they

---

undertake to keep the adopted child permanently and not to hand it over to any other party or parties.\textsuperscript{139}

**Department of External Affairs protocols**

32.317 In January 1952, an official in the Irish embassy in London contacted the DEA in Dublin about issuing a passport for a child who had been placed by St Bridget’s Orphanage (not an institution being investigated by this Commission) with a US army couple, taken to the UK without any travel documents and whom it was now proposed to take to the USA. The London official said that ‘the papers appear to be in order’ and ‘the necessary conditions appear to have been complied with’. In reply, the Dublin official was cautious and set out at some length the issues of concern to the DEA:

That is quite true, as far as it goes, but, as the result of our experience here over the past couple of years, it does not go far enough. You will remember that in the Jane Russell case\textsuperscript{140} the papers were also in order, even more so in order perhaps, and yet that did not keep us out of trouble.

In dealing with these cases, I think we have to remember what I believe is one of the fundamental principles of law, namely that people cannot surrender their natural rights and obligations. There is no law in this country whereby a person may surrender this child to anyone else; to put it another way we have no adoption act. It is, at the same time, however, that there is no law which says that a person may not surrender his child to the care and custody of another party. The consents which you forwarded in this case for our inspection, of which we see plenty of specimens in dealing with such cases, are alright as far as they go but one can never tell but that, supposing one of them were produced before the Supreme Court, it might not be held repugnant to the Constitution. You may remember that, prior to the […] case, at all events, the undertaking given by a non-Catholic spouse that he would have his children brought up in the Catholic faith had no value in law on the theory that the father could not surrender his natural right and obligation to bring up his children as he saw fit. That is what I mean by saying that people cannot surrender their natural rights.

The vast majority of the persons to whom children are surrendered for the eventual purpose of adoption are American citizens and the child eventually

\textsuperscript{139} DDA/AB8/b/LII/A/19/(1). This is the earliest version of this document. Later versions appear in various files, but amendments are slight.

\textsuperscript{140} Jane Russell was a well-known American actress who adopted an Irish child in the UK; see *Documents on Irish Foreign Policy*, Vol. X, 1951-1957, pp 73-74 for an account of how the passport application was dealt with.
travels with its adopting parents to the USA where adoption proceedings are in due course initiated; but the child may not enter the USA without a passport on which a visa is endorsed. We come into the picture because it is we who give the passport without which the child cannot travel to the USA.

Now, while the consents to which you refer are quite alright, supposing it happened that the child was surrendered to persons who, on arrival in the USA, proceeded to sell it off to the highest bidder, with consequent press publicity etc. It is we who would be held responsible as it is we who would have to answer parliament questions, face a press campaign here and so on. I have taken an extreme case for my example but the fact is that, if any child who left this country for adoption in America figured in an unsavoury press campaign, racket or other exposure, it is this Department that would face the music. Hence the consents to which I refer are not sufficient for our purpose and we here would not issue a passport on the production of these documents alone.

Briefly, we have to bear in mind the following additional considerations in dealing with applications for the issue of passports in such cases:

1. Are the adopting parents fit and proper persons (same religion as child, financially solvent, good morals, etc)?
2. Do they genuinely intend to keep the child, rear it as their own and adopt it according to law?

To satisfy ourselves on this point we try to get as many references as possible on the adopting parents and it is our experience that the best kind of reference is a reference from an organisation and not a reference from individuals though we do also accept the latter. There is for instance in each diocese in the United States a branch of the organisation called the Catholic Charities which gives the most complete ‘vetting’ of a couple intending to adopt a child. If they recommend the couple, we can be quite satisfied that the recommendation is sound since they go into such matters as family background, housing conditions, finances and so on, as well as character, etc.

You are, presumably, aware of the existence of the orphanages run by St. Patrick’s Guild in Abbey Street and Navan Road, Dublin.141 I think it was Sr. Elizabeth142 of this Institute that first drew our attention to the existence of the Catholic Charities. No child leaves her care unless the adopting couple is recommended by Catholic Charities. In her case also she has the specific

---

141 This is a reference to Pelletstown, which was not run by St Patrick’s Guild.
142 Sister Elizabeth was with St Patrick’s Guild, not Pelletstown.
approval of His Grace the Archbishop of Dublin for each specific case of the surrender of a child to such an adopting couple. All this, you will agree, is extremely satisfactory from our point of view. In dealing with other orphanages run by religious orders throughout the county, we have, I think, successfully endeavoured to get them to do what St. Patrick’s Guild does, viz. get each adopting couple ‘vetted’ by the Catholic Charities or some similar Catholic organisation and not merely content themselves with references given by individual persons.

I shan’t bother you with details of how the Protestant orphanages in this country conduct their business but from what I have seen I am satisfied that they are extremely careful in surrendering children for adoption. Another point to bear in mind in this case is this. The adopting parents when bringing a child to America must, before they can get a visa for the child, file an affidavit of support undertaking that the child will never become a public charge. Such undertaking is alright as far as it goes but from our point of view it is worthless. Since the demand for children for adoption in the USA exceeds the supply, to put it crudely, there is no danger that such a child would ever become a public charge; it would simply be sold or surrendered to another couple.

32.318 In February 1952, an article from Empire News stated that ‘Canadian police believe they have stumbled on a ring of crooks who were selling babies for as much as £1,785 each’ with doctors and lawyers implicated in it. There was a fear of trafficking and that children might eventually be sold to the highest bidder if more robust action was not taken. At this point, the DEA stated that it would be more appropriate to receive references from organisations rather than individuals as it allowed them to more effectively control the issuing of passports. The Passport Office was further assured by St Patrick’s Guild that no child was going to leave its care unless the prospective adoptive family was recommended by a Catholic charity in the United States. Publicity that surrounded the Jane Russell case angered the Irish authorities because it portrayed Ireland as ‘exporting babies’ for the benefit of wealthy Americans who wanted children.

32.319 This all resulted in the Passport Office drawing up relatively robust protocols in conjunction with Archbishop McQuaid and with the assistance of the Catholic Charities in the USA. References and reports were to be provided for each prospective parent in order to assure the authorities that children were being sent
to Catholic couples that were capable and competent. They were generally to be people with an inability to have children or who had fewer than three children. These home study reports were carried out to ensure their sincerity and assess the resources of the couple in order to establish that a child would not become a ward of the state or that the couple were not adopting for the purpose of filling a void left by the death of a child.

**Department of External Affairs US Adoption Procedures**

32.320 The DEA wrote to the Secretary/Consul of the US embassy in Dublin:

As you probably know, the only function of the Department of External Affairs in the matter of adoption is to consider applications for passports when submitted on behalf of children to enable them to travel abroad for the purpose of legal adoption but, as requested, I am attaching hereto a list of the Department requirements when considering such applications.

1. Every such application must be accompanied by documentary evidence that the adopting parents are suitable from the point of view of character and that they are able and willing to provide adequately for the spiritual and material welfare of the child. Where the proposed adopting parents of a Catholic child reside in an area in the United States in which there is a branch of the Catholic Charities Organization or the Catholic Home Bureau the required evidence consists of a report and recommendation based on a home study prepared by a representative from either of these Organizations. Such reports give a very detailed account of the family life of the adopting parents, and a report from a similar type of organization is required in the case of a child who is a non-Catholic.

2. In addition the following documentary evidence is required and must accompany the application:

   (a) A statement signed by the child’s mother in the presence of a Notary Public whereby she relinquishes all claims to the child and consents to the removal of the child from the State for the purpose of legal adoption. This surrender must be made in favour of the proposed adopting parents or alternatively in favour of a Guardian (e.g., Reverend Mother, Sister or matron in charge of Orphanage) who in turn executes a similar surrender in favour of the adopting parents.
(b) A sworn declaration signed jointly by the adopting parents whereby they undertake

   i. To adopt the child legally;
   ii. Not to part with the child to any person or persons;
   iii. To accept full responsibility for the maintenance, and care and education of the child and
   iv. To have it educated according to the religion in which it was baptized.

(c) Copies of the Baptismal Certificate and Marriage Certificate of the adopting parents.

(d) A reference from the adopting parents' local Pastor.

3. When all the foregoing documentation has been obtained the usual form of application for a passport may be sent to this Department accompanied by two passport size photographs of the child, the child's birth certificate, and a postal order for £1 in respect of the fee.

4. Attention is drawn to the fact that under the provisions of the Adoption Act 1952 the removal of a child under one year of age from the State for the purpose of adoption is forbidden.

32.321 In October 1952, a DEA note recorded that the department started keeping a record of adoption passports in November 1950. Since then 330 such passports had been issued. In November 1952, the DEA noted the effect that the Adoption Bill 1952 would have when it was enacted. The DEA saw nothing in the Bill 'to justify us using the passport machinery to exercise an administrative restraint on the travel abroad, for adoption or other purposes, of children in the exempted categories'.

32.322 In April 1954, the DEA said that it was not aware of the source for a suggestion that 'the Government does not greatly favour sending children to America for adoption'. The Department of Justice was not aware of the source either. A Department of Justice official had told the DEA official that his minister favoured sending children to America if the alternative was life in an institution in Ireland; however, his minister had not stated this view publicly. The DEA official noted that he was not aware that the government had ever 'indicated a line of policy on the question'. He repeated the DEA view that its role was solely in relation to the issuing of passports.
32.323 In May 1955, the Minister for External Affairs decided that passports would not be issued to children where the proposed adoptive parents were not themselves both of the same religious persuasion. Passports would also not be issued ‘in the case of US citizens resident in Europe applying for passports for Catholic children where no Catholic Charities report is available’.

32.324 During 1956, the DEA was concerned about the operation of some of the agencies in the USA who were being asked to vet prospective adopters. It was decided to use only agencies that were licensed and approved as child-placing agencies by local state authorities.

32.325 Archbishop McQuaid also had concerns about some of the agencies involved. In August 1957, he wrote to Bishop Rodgers of Killaloe regarding the conditions for American adoptions in advance of the October meeting of bishops:

the danger to our Catholic children have been found to be so real that, after several years of experience and after prolonged consultation with American Diocesan Authorities, as well as with our Department of External Affairs, I have thought it necessary to change the existing regulations which we had hitherto believed to be sufficient.

32.326 Archbishop McQuaid was of the view that adoptions should be limited to those American dioceses in which a proper Diocesan Charity Office was organised. He was of the opinion that home study reports prepared by the state welfare authorities were prepared by non-Catholics and gave no adequate information concerning the availability of Catholic schools nor did they give a satisfactory picture of the religious atmosphere of the home nor the stability of the relationship between husband and wife. Later the question of giving the Adoption Board in Ireland responsibility for vetting foreign adopters was considered but nothing came of the suggestion.

32.327 In January 1958, the DEA prepared a memorandum for the information of the government on the subject of foreign adoptions. This memorandum said that the children for adoption came almost exclusively from institutions and orphanages and that their Superiors negotiated directly with interested parties in the USA. It went on to say that, while the DEA was not directly involved in the process, it did become aware of the arrangements in each case. As the power to grant passports was vested in the Minister for External Affairs it followed that the department...
‘inescapably assumes responsibility for investigating the bona fides of the application and the suitability of the proposed home before sanctioning the issue of the passport’. The department further recognised that there were no other official controls on such adoptions.

32.328 It then set out the documents required to be furnished before a passport would be issued. These were as set out above. The DEA felt satisfied that the procedures which were enforced by these requirements were sound and that, provided they were adhered to scrupulously, there was a minimum likelihood of undesirable adoption arrangements being approved. It did refer to undesirable aspects of the arrangements which the department could not control. These included the distance separating the two countries which prevented any the interested authorities in Ireland from making an independent inspection or assessment of the American adopters and their homes. The distance factor also rendered impossible any follow-up procedure to ensure the child was happy and well cared for and that the formal adoption was in fact carried out. It further noted that the Irish institutions involved with the adoptions and the DEA were entirely dependent on the Catholic Charities organisation. At this time, the policy of the department was to discourage applications from American citizens temporarily resident in the UK or other parts of Europe because legal adoption could normally only take place when the adopting parents returned to their home in the USA.

32.329 An official of the Department of Justice told a DEA official in January 1958 that if there were suitable homes elsewhere then children should not be kept in institutions. Officials believed that the State had an obligation to ensure that Irish children were going to suitable homes before issuing passports even as it was ‘an obvious argument but not an acceptable one that almost any home is an improvement on an Irish institution’. At this stage, the DEA had age limits for prospective adoptive parents: ‘Rightly or wrongly we have chosen 42 for the mother and 45 for the father’.

**Implementation of Department of External Affairs protocols**

32.330 It is clear from an examination of the DEA files that the rules about the issue of passports were kept and exceptions were very rarely made. In a number of cases, representations were made to the Minister for External Affairs and the Taoiseach
and these were unsuccessful. Representations were sometimes made by priests in the USA but, again, these were unsuccessful.

32.331 The most common reason for a couple being deemed unsuitable for the placement of a child was their age. In many such cases, the couple were deemed suitable in all other respects. A passport was also refused in cases where the prospective adopters already had a child of the same age as the child to be placed. Some applications were declined because there was doubt about the religious practices of the couple. The following are examples of cases where passports were refused or the applications were withdrawn because it became clear that a passport would not be granted.

32.332 On occasion, there was hostility to the Passport Office’s demands for further information prior to issuing passports. One couple wrote to the mother superior in Sean Ross, in 1952, stating that the Passport Office had no right to demand information on their other children and adoption charities in the USA and Canada had respected this. The DEA had previously informed the mother superior that the reason it sought this information was because the couple had been received into the Catholic church in 1949 and had adopted a child from a Protestant orphanage in 1950. The prospective adoptive mother had called to her about it and insisted that only the mother superior be the person to communicate in this matter. The mother superior had apparently told her that the DEA was reticent about issuing a passport because of her mother-in-law’s divorce. She wanted to assure the DEA that both were very much against divorce, hoping that her mother-in-law’s ‘sins’ would not work against her or her children.

32.333 In this letter, she commented that she had also noticed two or three boys of a similar age to the girl she wanted to adopt and asked the mother superior to ‘tag one for us that would go well with the others and when you get my cable at the end of the week you can get his papers going’. She hoped that this would not be refused while the other papers were being processed. This application was eventually withdrawn, partially because they were hostile to extra information being demanded of them.

32.334 An American couple were recommended for the adoption of one but not two children in 1954 because it was ‘not deemed a wise policy to place two unrelated children at one time in any home here in the United States’. This was done to see
how the child and the adoptive parents would get on. A priest in the USA wrote to the DEA regarding the delayed issuing of a passport. He said that this would cost the adopting couple an additional £200. He was a doctor earning $7,000, his future earning was assured and any child adopted into the family would be guaranteed a loving future. The priest hoped that Galway county council would expedite the case once they became aware of what was happening but he came to discover that the issue was with the DEA.

32.335 In 1955, the DEA wrote to Galway county council, regarding the lack of detailed evidence around the health and suitability of a prospective adoptive father. This meant that the minister would not be issuing a passport for the child involved (who was in Tuam), despite the approval of Archbishop Walsh of Tuam. Subsequently the DEA told Galway county council that the home of the prospective adoptive parents had not been approved by the New York Foundling Society and the couple had previously been informed of this. ‘In the face of such rejection it would not be possible for this Department to authorise the grant of a passport in the case unless convincing evidence were forthcoming that the circumstances which caused the refusal of the earlier application to the New York Foundling Society no longer obtained’. There was further correspondence between the DEA and Galway county council but a passport was not issued.

32.336 In 1956, an application for a passport to send a child from Tuam to the Netherlands was rejected by the DEA as there was no arrangement for legal adoption in the Netherlands at the time. Also in 1956, the DEA discovered that an adoptive family in the USA did not want to keep a child who had been adopted from Sean Ross. The DEA told the mother superior that doctors in the USA did not consider that the child was of average intelligence. In addition, her adoptive parents argued that it was not their fault that she could not fit in. It had been decided that it was not a good idea to keep her with them. The DEA demanded to know whether she had been placed in an institution or removed to another adoptive home. The DEA official involved was clearly very angry and concerned about what had happened to the child: ‘If she has been given into the care of another family I presume you have received, or will receive, the usual home study report and other references in respect of this family’. This official believed that the American vetting agency involved and the Sean Ross mother superior had succeeded in ‘making a farce of our regulations’. The Passport Office informed Sean Ross that it would be
inappropriate to continue pursuing the couple’s application to adopt another child. As they were
considered here to have acted with inexcusable haste and precipitancy in relieving themselves of their legal responsibilities in the adoption of [the first child]. Even if it is conceded that there was a mistake to have sent that child to them, the urgency with which they turned their backs upon all the legal obligations into which they had entered, made a distinctly bad impression here. It is unlikely in these circumstances that any future application from them will be considered favourably.

32.337 In 1956, a man wrote to the Minister for External Affairs about a couple’s desire to adopt a child. He stressed that they were quite wealthy, capable and willing to provide for the future education of the child. However, he also stated that the local priest was seen to be anti-Irish and objected to Irish children being placed in his parish. In response, the minister told him that there was no home study report, which meant that the adoption could not take place but the fact that the couple were 55 and 56 respectively meant that there was little point in continuing to pursue it. The man then asked the minister: ‘leaving aside the adoption would it be possible for this child to be sent to these foster parents as an ordinary emigrant?’ The child had been resident in the ‘Convent orphanage Cork’ and her mother had already signed the various surrender forms. This note also states that the couple had already been approved as foster parents by their local Catholic charities but age was a sticking point. The DEA refused to make an exception in this instance.

32.338 An application by one couple who already had a number of children was refused even though there were no doubts about their suitability:

The decision to refuse must not be taken as a reflection on the family concerned, whose motives for offering a home to this orphan were never in doubt but it is the considered opinion of this Department and of both lay and clerical authorities in this country who are experienced in adoptions that it is not in the best interest of the adopters or of the child to approve the placement of a child in a large family where there are already children in the infant stage.
Home study reports

32.339 The home study reports were assessments of the suitability of a couple for adoption and of their home environment. The Commission has examined a number of these reports in the passport application files and in the institutional records. The level of detail in the reports varied but they generally included evaluations of the house and neighbourhood and of the couple themselves. They examined the motivation for adoption, the religious background and practices of the couple, their financial situation, their personalities and their health and education. There was a strong insistence on separate bedrooms for children and there are instances of couples being deemed unsuitable because they could not fulfil this particular requirement, though exceptions were made if a child being placed with the couple was the same gender as one of their other children.

32.340 The sincerity of the couple’s Catholicism was often queried. This was initially proven by the production of baptismal certificates, evidence that they had been married in a Catholic church and were involved in sodalities and parish life in the area that they lived in. Fr Barrett also wanted to test the sincerity of a person’s conversion to Catholicism - he did not want to place a child with a couple where one party converted solely for the purpose of adopting a child from Ireland. Therefore, part of the protocols for the Passport Office in the issuing of passports insisted that a parent who converted to Catholicism needed to prove they had received instruction, who was instructing them as well as evidence of when they were finally received into the Catholic faith. It was policy that they be Catholics for at least two years before being considered for a Catholic child in order to satisfy officials that their conversion was sincere. In several instances, the Passport Office consulted Fr Barrett before making a final decision on the suitability of a couple.

How wealthy were the adopting couples

32.341 It has been frequently alleged that adoptive parents in the USA were very wealthy and so were in a position to effectively ‘buy’ an Irish child. A number of witnesses who gave evidence to this Commission also made this allegation but no witness produced any evidence to support it.

32.342 The Commission examined the home study reports which give detailed accounts of the incomes of the prospective adopters. This was to establish that they could financially support a child. The Commission looked at 937 such reports; 48 of
these include the salary of the mother but these salaries are not included in the final calculation of average salary because the adoptive mother pledged to resign from work when the child was placed with her.

32.343 The average annual wage for a manufacturing job in 1945 in the USA was $2,300. In 1951, the average industrial wage was $3,700; in 1952, it was $3,900 and by 1957, it had increased to $4,713. There was no consistent method of reporting salaries in the home study reports. They are reported as hourly, weekly, monthly or annual, depending on where the report was carried out. In this analysis, where annual salaries are not given, they are calculated at a 40-hour week for 52 weeks a year. The average annual salary for the couples whose files were examined was $9,190. However, as can be seen below, 57% of the couples (or 539) had an income below $8,000. While there were wealthy couples who were deemed suitable adopters, the majority of applicants earned around the average industrial wage and worked in ‘blue-collar’ jobs, such as manufacturing and mining. Some were small business owners and tradesmen.

32.344 In 1955, a couple who were described as a ‘good couple’ were turned down for adoption because they did not have the material resources necessary. He worked as a labourer, earning $97 a week. Fr Barrett wrote to the DEA to say: ‘The sending of children abroad for the purpose of adoption is tolerated only in individual cases when it is abundantly clear that the future prospects offered to the child surpasses those available to the child in this country’.

Public assistance authorities and foreign adoptions

32.345 Two of the institutions being investigated by the Commission came under the remit of the public assistance/health authorities - Tuam and Pelletstown. Each was involved in organising foreign adoptions until it was drawn to their attention that they had no legal authority to do so. Galway county council as the public assistance authority was actively involved in the Tuam adoptions whereas the Dublin board of assistance, while ultimately responsible, seems to have left the details to the Daughters of Charity in Pelletstown.

32.346 The question of whether or not public assistance authorities had the power to send children abroad for adoption seems to have been raised in 1956. In a letter to Galway county council in December 1956 in relation to an application for a passport for a foreign adoption, the DEA stated:

the regulations of this department governing such applications have recently been under review and it has been decided that all passport applications submitted on behalf of children in institutions under the control of public authorities must be accompanied by a letter from the Department of Health to confirm that the child in question may be removed from this country for the purpose of legal adoption abroad…It would not therefore be advisable for you to pursue the present application until you have obtained this letter.

32.347 In January 1957 the Department of Health wrote to local health authorities pointing out that they had an obligation to care for children in their care. However, this did not include provision for sending children outside of the State and ‘any action in that respect by an officer of a health authority must be taken on his own responsibility’. The Department of Health pointed out that they had no authority under the Adoption Act 1952 to send children abroad.

32.348 In February 1957, the Department of Health wrote to the Minister for External Affairs about the proposed adoption of five children from Pelletstown:

the minister assumes that in the view of the circumstances explained in previous minutes from this department there will be no objection to his informing the interested parties that your department will not now require his consent as a condition of the issue of passports to these children…the minister, as has already been explained, has been subject to considerable pressure from parties interested in the arrangement of adoptions abroad, and he feels obliged to reply to the present representations as quickly as possible.
32.349 A subsequent letter, also in February 1957 from the Department of Health to the DEA, indicated that there had been discussions about the responsibilities of health authorities regarding adoptions and the Department of Health stressed that sending children out of the country for adoptions was not part of their function. It did not have parental rights vested in it and the power of the minister extended only to ensuring that the authorities fulfilled their statutory powers.

32.350 In April 1957 the Minister for Health wrote to Pelletstown to point out that it had no authority to arrange adoptions. The minister said that he did not doubt ‘the moral and material advantages of the current system of foreign adoptions but it is not legal for a local authority to engage in making these arrangements’. The Daughters of Charity were not happy with this decision and pointed out to the minister that American Catholic adoption agencies (who prepared the home study reports) would engage only with local authorities and legal adoption agencies. The minister told the Daughters of Charity:

I have not, however, closed the door. I have told the Dublin Board of Assistance that I would have no objection to their co-operating with a responsible person (not being a member of their staff) or an appropriate charitable organisation to the extent of passing on to such person or organisation any request it might receive from a person abroad for a child for adoption and later handing over to such person or organisation a particular child, subject to certain conditions which, I am sure, my official will be telling you about shortly and which should make no difficulties for you.

It is not for me to tell you how you could work such an arrangement. There is nothing to prevent your showing any suitable visitor the Home or the children and if, for instance, the ‘responsible person’ I have referred to above is a member of the sister community across the road from you, there is nothing to prevent your preparing letters, etc., and working in co-operation with her as long as you do not appear in the picture or use the address of the home.

32.351 In August 1957, the Department of Health told all county managers that local authorities had no power to send any child abroad or to act as an agency for such purpose:

144 Documents supplied by the Daughters of Charity.
Though local authorities have been sending children abroad for the past ten years it is only now that the Department of Health has discovered that they have been acting without authority.

32.352 It seems reasonable to assume that that was why Galway county council transferred its foreign adoption files to Sean Ross and in 1957 St Louise’s Adoption Society was established to deal with adoptions from Pelletstown.

32.353 From 1957, Galway county council was replying to prospective American adopters saying that it could not arrange foreign adoptions. It gave Sean Ross as a potential source and also pointed out that a mother who left the Tuam home could make such arrangements directly.

Tuam/Galway County Council

32.354 The Tuam institutional records include some information on the approach of Galway county council to foreign adoptions. Galway county council seems to have first considered American adoptions in 1950. The institutional records show that one child left Tuam in 1950 for adoption to the USA. In 1954, the American embassy in Dublin contacted Galway county council and arranged to meet a member of its staff in order to exchange information about the process. This meeting took place in 1955.

32.355 At some stage (it is not clear exactly when but seems to have been about 1951) the secretary of the county council drew up a list of requirements which were issued to applicants for adoption:

The following documents are necessary and must be forwarded here by prospective adopting parents:-

Affidavit of support in triplicate (two for Embassy and one for Passport Office). Copy of Embassy Form No. 9 is attached giving details. Affidavit should state arrangements for meeting child on arrival in U.S.A.

1. Corroboratory evidence of support (in triplicate) as detailed in Form No. 9 attached.

2. Report of Catholic Charities Organisation re suitability of applicants. If there is no Catholic Charities Organisation, a letter from Catholic Charities headquarters stating so must be submitted with report from the Parish Priest or Chancellor of Diocese.
3. Medical certificates from both applicants stating their ages, that they are in good health and that they are not deliberately shirking natural parenthood.
4. Baptismal and marriage Certificates (Church, not State) of applicants.
5. Affidavit that child will be raised as Catholic
6. Recommendation from applicants’ Parish Priest re their suitability as adopting parents (for transmission by me to Archbishop of Tuam).
7. Affidavit sworn jointly by applicants undertaking:
   a) To adopt child legally
   b) Not to part with the child to any person or persons
   c) To accept full responsibility for the maintenance, care, and education of the child and, in the case of a Catholic child, to have it educated in Catholic schools and later, if necessary, in a Catholic University.
9. Evidence that the Agency in U.S.A. carrying out the placement of the child is licensed by the Government Authorities as an Approved Child Placing Agency in the particular State concerned under the relevant State laws.

A deposit of £50 should be forwarded forthwith. Any balance over or under this amount will be adjusted when child is ready for departure for U.S.A.

On receipt of the necessary documents as listed above, I will apply to the Archbishop of Tuam for his approval to the adoption. Please note that you are not to communicate direct with the Archbishop regarding this matter as he will be written to by me.

I wish to emphasize that the requirements will probably take the greater part of nine months and transport arrangements should not be made by you until you are advised that a visa has been issued for the child. This is very important and should be borne in mind as the matter of adoption cannot be rushed unduly.

32.356 It is clear from the files of Galway county council that these requirements were enforced. The files contain many complaints about the delay in formalising the transfer of the infants to the prospective adopting couples. Not all applicants were successful.
Church involvement

32.357 It is notable that the approval of the Archbishop of Tuam was required in all cases. It appears that Archbishop Walsh had reservations about foreign adoptions and his role in the system. There is a note in the Tuam institutional records, undated and unsigned, which points out that the archbishop would approve a foreign adoption only if the county manager approved but the county manager would only approve if the archbishop did. Another similar note states ‘didn’t the Archbishop say that he would not meddle with these adoption cases anymore? So, where does that leave us?’

32.358 In 1951, the Mother Superior of the Children’s Home, Tuam, and Archbishop Walsh of Tuam, having made enquiries about the proposed adopters, rejected an application from an American couple. This was as a result of the home study; the applicants were considered suitable but the report showed ‘that their home would not be suitable for an Irish boy’. It is not clear what exactly was considered unsuitable.

32.359 In December 1953, the Galway county manager wrote to the Archbishop of Tuam about an application for an American adoption:

> Nothing has yet been done in relation to this application as it is understood that your Grace is of the opinion that children should not now be sent to America in view of the recent Adoption Act here which may encourage Irish people to adopt homeless children. I submit, however, for consideration by Your Grace, that it will be some time before the Adoption Act is in any way effective and Your Grace will appreciate that before any children can be adopted in America or elsewhere, the approval of the Adoption Board must be obtained. I am generally in sympathy with the idea that children should be kept at home if suitable adopting parents can be got for them in Ireland but, in view of the delay that is likely to occur in finding adopting parents for many of the children in the Tuam Home, there is much to be said for permitting children to go to parents abroad where they are given very good opportunities in life.

---

145 This was not correct; the Adoption Board had no role in foreign adoptions.
Consent

32.360 In 1954, Galway county council was advised by a solicitor that, in order to arrange an adoption from Tuam, the mother would have had to surrender her parental rights to the county manager; the child’s mere presence in the Tuam home did not confer rights on the board of assistance (see Chapter 1). In one case, it was discovered that a child for whom a passport application had been made was registered as a ‘legitimate’ child. He was, in fact, an extra-marital child. Galway county council applied to have the birth re-registered. The Registrar General refused because the application would have had to be made by the mother and she would have had to make a statutory declaration amending the birth record.

32.361 In 1959, Sister Hildegarde in Sean Ross wrote to Galway county council emphasising the need to ensure that the birth mother understood the consent forms. She said that very often when women were sent to solicitors to sign papers, the solicitor did not give them time to read what they were signing. The women then later complained that they did not understand what they were doing.

Fees charged

32.362 As already stated, Galway county council charged applicants for adoption a £50 fee to meet the costs involved in processing the application. Any amount unused was returned. This payment would not cover the travel costs of taking the child to the USA and the legal and other fees that were necessitated to process the USA adoption and naturalisation of the infant in the USA. The fees were refunded if the application was rejected at county council level. There are a number of examples of the refund of fees in the Tuam institutional records. Fees paid to Galway were transferred to Sean Ross when the arrangements for foreign adoptions were transferred there. Examples of the costs incurred by Galway county council were 6s for passport photographs, £1 2s for a birth certificate, £1 13s 6d for affidavits.

Pelletstown

32.363 Foreign adoption became the exit pathway for a significant number of children in Pelletstown from 1950. There had been small numbers before that: the first foreign adoption recorded from Pelletstown was in 1940 and the first adoption to the USA was in 1943. There were three placements for foreign adoptions in 1945 and seven in each of 1948 and 1949. In 1950, there were 31 placements for foreign adoption.
The Daughters of Charity provided the Commission with documentation about foreign adoptions from Pelletstown. The American adoptions were arranged in accordance with guidance issued by Archbishop McQuaid. The Director of the Catholic Social Welfare Bureau in the Archdiocese of Dublin, Fr Barrett, and the archbishop’s secretary, Fr Christopher Mangan, were frequently in contact with Pelletstown about the arrangements for these adoptions, with Fr Barrett being heavily involved. On one occasion, he wrote to Pelletstown warning against allowing certain named people to adopt: ‘These people are English and quite undesirable as adoptive parents’. He also asked that he be contacted if there were any applications that aroused suspicions.

In 1950, Archbishop McQuaid’s secretary told Pelletstown that all future adoption cases were to be dealt with through the Director of Catholic Charities of the diocese where the prospective adopters lived and he also directed that they send a list of all the past adopters to the director in each diocese. In 1954, Fr Barrett wrote to Pelletstown to say that, as a general rule, it would be better to give only one child at a time to any prospective adopters. He pointed out that the passport authorities (the Department of External Affairs) were unwilling to issue a passport for a second adopted child until there was evidence of the success of the first placement and of that child’s legal adoption. In 1955, he told Pelletstown that he was consulting the DEA about adoption applications from Americans temporarily resident in Europe. He said that, in the case of European countries other than the UK, the ‘difficulties on their part of fulfilling our regulations are so great that it would be inadvisable to give such applicants any encouragement or indeed any hope that they might be able to adopt an Irish child’. For Americans temporarily resident in the UK, the main difficulty was in getting a home study report by Catholic Charities. Instead of this report, a similar report from an adoption worker or administrator of the English Catholic Rescue Society of the diocese in which they were temporarily resident may be accepted; they must also submit a report from the pastors in the American diocese where they had parental domicile.

The affidavit which prospective adopters signed when getting a child from Pelletstown included a promise to rear and educate the child as a Catholic, send the child to Catholic schools and a Catholic university ‘if perchance the child in future years is sent to a University’. Prospective adopters were also required to undertake to legally adopt the child and not hand it over to any other party. Certificates of vaccinations were provided by Pelletstown.
In 1957, the Director of the Daughters of Charity, Fr Sheedy, issued directions about children leaving Pelletstown. He stated that the Sisters’ work did not include boarding out, transfer or adoption of children. The Dublin board of assistance was responsible for these activities and they should not be undertaken by the Daughters of Charity, even with the approval of the board without special permission from community superiors:

None of the sisters should do anything to encourage the exportation or adoption of children by foreigners. There are issues involved in the natural Divine Law governing the relations between Parents and children, which neither the will of the parent not the material interests of the child can change. It is not right for any Sister of Charity to promise children from St. Patrick’s Home to any individual and if further adoptions are to take place I forbid Sisters to have anything to do with them or to express opinions in public about the question of adoption, concerning which they do not understand the Theological Principles involved.

He went on to say that money or gifts coming from America or elsewhere in relation to adoptions from Pelletstown could not be accepted by the Sisters, either as personal gifts or as donations towards community works. If such funds were given, they should be handed over to the Dublin board of assistance.

In 1959, Pelletstown was told by the board of assistance solicitors that some American states were requiring that the orphanages accept responsibility for taking a child back if the adoption broke down (before it was finalised). The solicitors had been talking to the Ohio State Department of Public Welfare and explained that Pelletstown had a difficulty with this requirement. Ohio had suggested that the difficulty might be overcome if the parents agreed to pay the costs of repatriation. The solicitors explained that this would not be satisfactory as it would not be in the best interests of the children and there would need to be some form of enforceable security. Toledo (Ohio) Catholic Charities said it would not accept direct surrender of the children if this involved responsibility for them if the adoption broke down; Chicago (Illinois) said it would accept direct surrender of the children from the birth mothers; the writer did not anticipate any difficulty in finding alternative homes for the children if adoption broke down. The following American diocesan Directors of Catholic Charities agreed to accept a specific number of Irish children for placement for adoption: Denver, Chicago, Indianapolis, St Louis, Newark, Buffalo, New York, Cincinnati, Cleveland, Milwaukee.
Costs of foreign adoption

32.370 Many allegations have been made that large sums of money were given to the institutions and agencies in Ireland who arranged foreign adoptions. These allegations are impossible to prove and impossible to disprove. It is unlikely that there would be documentary evidence of any such transactions. Some of the language used by some of the prospective adopters was crass - for example, the reference above to ‘tagging’ a child for a woman. Some had an undue sense of entitlement - they were good people and should be given a child - and others were very specific in their requirements. One woman specified to Galway county council that she wanted a blond blue eyed girl. While such language and sense of entitlement might indicate that they saw the process as a commercial one, it does not necessarily mean that they were ‘buying’ children.

32.371 There is evidence available about the actual costs involved and, in the case of adoptions to the USA, they were considerable. In an affidavit for the Commission, dated 2017, one person adopted to the USA provided documentary evidence of some of the costs of his adoption in the 1950s. It included an air fare of $273 and a payment of $142 to Sean Ross. The $142 included a contribution to the cost of the airfare for the accompanying adult who looked after the children on the flight. There were further costs incurred including payment for the home study report and legal costs in finalising the adoption.

32.372 There is an undated note from Sean Ross in Dublin Diocesan Archives files which states:

> From time to time we have heard that people in the States buy children from Ireland. We have never been able to account for this as no fee has ever been charged by any Society for an adoption. It has been brought to our notice that in some parts of America Catholic Charities demand a high fee before they will do the necessary home study, if this is the case - and we have good reason to believe it is - it is probably one of the reasons that people think they are buying the children.¹⁴⁶

32.373 The Commission has not seen evidence of the charges made for the home study - these were incurred in the USA and paid directly by the prospective adopting parents. The Commission is aware that the charging of fees for arranging

¹⁴⁶ DDA/AB8/b/LII/B/204.
adoptions by members of the Catholic Charities was often debated at the meetings of the National Council of Catholic Charities. In the case of adoptions from Ireland, the Catholic Charities were not arranging adoptions - they were providing a private service to prospective adopters. Files of the Catholic Charities Bureau, based in Washington DC, have been examined by the Commission and show a lively debate on the question of fees and on the question of asking for donations after the adoption had been processed.\(^\text{147}\) The practice varied widely and depended to some extent on local laws. There is evidence of the legal fees involved in finalising adoptions; parents who had adopted children from Ireland would have had to pay these. For example, the legal fees in Kansas in 1952 were $73 for the lawyer and $52 to the courts. Further costs would have been incurred in relation to the child’s naturalisation in the USA.

32.374 A report in the *Evening Star* Washington on 28 April 1955 made reference to a Marine who said he had found a son after a 9,000 mile search. He said seven months of patience, about $1,000 and several trustworthy airlines allowed him to be able to adopt this boy. The boy was placed from Cork and was now joining his new brother who had been adopted from the Washington DC area with the direct permission of his mother. The Marine remarked: ‘when we tried to get a brother for him here, we ran into the most ridiculous and unnecessary kind of red tape’. He was over 40 and was a member of armed forces so it was impossible to adopt in Maryland or Washington DC. This child was located in a foster home and his adoptive father claimed to have negotiated his emigration.\(^\text{148}\)

32.375 If this report is accurate, it seems to the Commission that it shows that some American adopters were adopting Irish children in order to get around the rules within the USA but the amount of money mentioned is likely to be the actual costs rather than any ‘buying’ of a child. It is clear that members of the armed forces in the USA found it difficult to meet the requirements of most states that the prospective adopters be resident in the state for a number of years.

32.376 Intercountry adoptions are expensive. American Adoptions, one of the largest domestic adoption agencies of its kind in the USA estimated that between 2010

\(^\text{147}\) Washington DC, The American Catholic Research Center and University Archives, Catholic Charities USA records.

\(^\text{148}\) Washington DC, The American Catholic Research Center and University Archives, Catholic Charities USA, Series 4, Subseries 5, box 170.
and 2013, the total cost of an intercountry adoption varied between $31,000 and $46,000 depending on the country involved.

**Donations**

32.377 A number of witnesses spoke about donations they believed were sent by their adoptive parents following on from their USA adoption. Again, no concrete evidence was provided. Such donations would not have been illegal and could not be described as unethical unless the adoptive parents were trying to adopt another child. The fact that the Daughters of Charity were advised by their director that money or gifts coming from America or elsewhere in relation to adoptions from Pelletstown could not be accepted, either as personal gifts or as donations towards community works would indicate that some donations were being made. The Commission has not seen evidence that money or gifts were received by the Daughters of Charity for adoptions nor of any funds being given to the board of assistance.

32.378 There is a reference in the Bethany records to a substantial donation by an American who had adopted two children from Bethany. He transferred $3,000 worth of shares which Bethany could sell and then use the proceeds for the benefit of the home. The sale of those shares raised £1,267 16s 6d and contributed to its bank debt being cleared.

**After arrival in the USA**

32.379 The children who left Ireland for adoption abroad were adopted in accordance with the laws of the receiving country. Once the child had left Ireland, there was no means of ensuring that the adoption did actually proceed. The evidence seen by the Commission suggests that the vast majority did proceed. The DEA files include information on one case where the adoption did not proceed. This seems to have come to light when the couple involved sought to adopt another child; the outcome for first child is not known. It is possible that the adoptions did not proceed in other cases.

32.380 As already stated, each state of the USA had its own adoption procedures but most required a court hearing before the adoption order was made. Some arranged a Guardian ad Litem to represent the child’s interests in the proceedings. The following is an example of a decree issued by a State County Court:
On this day come the said petitioners, [...] and [...], his wife, and this cause coming on to be heard upon the answer and consent of [...] Guardian Ad Litem of the said minor defendant, and upon the consent of the SUPERIORESS OF SEAN ROSS ABBEY, a licenced child welfare agency, and it appearing to the court that the said minor defendant has had due notice of the pendency of this cause by personal service of summons by the Sheriff of [...], according to the statute in such case made and provided, and is now personally present in open court.

And the Court having heard the testimony taken in open court in support of said petition, and now being fully advised in the premises, finds that it has jurisdiction of the parties to this cause and the subject matter thereof; that the petitioners are husband and wife and that they are reputable persons residing in [...].

The Court further finds that the said minor is a female minor child of about [age], born [date of birth] in Roscrea, Ireland and that said child is now in [name of county and State] and has been in the [name of State] for more than one year last past.

The Court further finds that the said minor is now in the home of the petitioners, and has resided in said home for a period of over six months residence immediately preceding the filing of the petition herein.

The Court further finds that [...] the mother and sole surviving parent of said child surrendered her said child to the SUPERIORESS OF SEAN ROSS ABBEY, and by an instrument in writing authorised and empowered the said Superioress to place the said child in a family home for legal adoption and to consent to the adoption of said child without further notice to or of the consent of the mother, all in accordance with the laws of the Republic of Ireland.

The Court further finds that the said child is now in the legal custody of the SUPERIORESS OF SEAN ROSS ABBEY.

The Court further finds that the said SUPERIORESS OF SEAN ROSS ABBEY, a state licensed child welfare agency, thru the cooperation of the CATHOLIC HOME BUREAU, a cooperating agency for the [...] area, placed
the said child in the home of petitioners and that the said mother and sole surviving parent and the said SUPERIORESS OF SEAN ROSS ABBEY consent to the adoption in writing of said minor child by the petitioners herein.

The Court further finds that [...] was duly appointed by the Court as Guardian ad Litem to represent said child herein and with authority to consent to the legal adoption of said child by said petitioners and has filed his written consent to said adoption.

The Court further finds that upon the filing of the petition herein, CATHOLIC HOME BUREAU was duly appointed by this Court to make an investigation as to the parties and facts and conditions of said adoption and that a report of such investigation has been duly presented to this Court as required by law.

The Court further finds that all of the allegations in the petition herein are true and have been proved as therein alleged.

IT IS THEREFORE ORDERED, ADJUDGED AND DECREED in accordance with the statute in such cases made and provided that from this date the said child [...] a minor, shall to all legal intents and purposes be the same as if born to the petitioners in lawful wedlock.

IT IS FURTHER ORDERED, ADJUDGED AND DECREED that the name of the said child be and is hereby changed to [same forename, adopters’ surname]

IT IS FURTHER ORDERED, ADJUDGED AND DECREED that the Clerk of this Court issue a certified copy of the decree of adoption herein on the application of the adopting parents or their attorney and the payment of the Clerk’s fees for such services.

Conceived in Ireland, born in USA, adopted in USA

A witness told the Commission that she went to Bessborough in 1973 when she was pregnant and aged 19. She said she stayed there for only a short time. The Bessborough institutional records do not record her presence there at all. She said that she was placed in a home to look after children and also to do some household chores while she awaited the birth of her child. During the course of her
pregnancy she was taken to Dublin by her brother to obtain a visa in the American embassy to enable her to travel to the USA. This was done with the compliance of her father (she was legally a minor at the time). She said that her father had to show that there were sufficient funds to sustain her while she was in the USA because her story was that she was going to the USA to pursue her studies.

32.382 She went to the USA and was initially placed with the wife of a doctor and then placed with another family for the duration of her pregnancy. She said that the doctor’s wife and the family were very kind to her and the doctor’s wife stayed with her during the birth. She was aware that the baby was to be adopted but very little was said about it. There was a lawyer involved but she never saw him nor did she see any papers until after the birth. It was never explained to her that an adoption was not finalised until six months after the birth, in fact she said that nothing at all was explained to her. A notice giving the birth father entitlement to object to the adoption within 30 days was posted in a newspaper in Chicago. This she claimed was meaningless as he was resident in Ireland. It was her view that this was all intentional and deliberate to progress the adoption without challenge.

32.383 It would appear that the witness returned to Ireland before the adoption was complete. She said that she was aware of four other women from Bessborough being sent to the USA in similar circumstances. The Bessborough institutional records do not reveal any evidence of such cases.

32.384 The witness’s daughter traced the witness in later life even though she was under the impression that her record in the USA was supposed to be completely sealed and confidential but the daughter was able to access her file. While the witness was never opposed to tracing she was critical of the way a lot of things had been handled in relation to the whole matter. It seems to the Commission that the arrangements were made by the woman’s family and there is no evidence of Bessborough being involved.

**Born in the USA**

32.385 In March 1986 ‘Born in the USA’ was an article published by Sunday Independent journalists which stated that childless American couples were turning to Ireland for children to adopt. According to the article, Irish adoption societies were receiving many letters from the USA enquiring about the availability of Irish babies for adoption. Most adoption societies had been unwilling or unable to deal with these
requests given that they were not in a position to provide all the children that were sought for adoption in Ireland. However, according to the article, a Dublin priest, Fr Flanagan, who was the head of the St Thérèse Adoption Society, had been assisting Irish women who wished to go to America to have their babies adopted there.

32.386 The journalists attempted to get facts in relation to such arrangements but they came up against a brick wall. The Adoption Board confirmed that it had two unofficial reports of such activity by the same adoption society. St Thérèse was thought to have been in existence for over 100 years but it had been registered as an adoption society only since 1973. The newspaper decided to present the priest in charge with the reporter purporting to be a pregnant woman called Catherine. It should be said that the priest in question denied that the interview with Catherine ever took place. Catherine presented herself as a 24-year-old woman, pregnant by a married man. She told the priest that she had heard about his service from somebody in Bray.

32.387 The priest was initially suspicious but then relaxed and gave her a full account about how the process worked. The reporter was of the view that he was clearly a man who genuinely believed that he was providing a good and charitable service. He explained that he had satisfactorily organised a dozen such Irish pregnant girls as herself to have their babies born and adopted in the USA. He said that it cost £9,500 to send a woman to the USA paid for by his society. He broke it down as £3,000 for gynaecological and legal fees, £600 airfare and £100 a week for her keep for an unspecified period between three and six months. According to the reporter the priest repeatedly spelt out the speculative nature of the whole enterprise. It was necessary to be certain that the woman did not want to have the baby in Ireland and to keep it. She would have to decide that, if she went to the USA, she would actually give up the baby for adoption. According to him the legal situation was that any person, including a pregnant woman, had the right to travel freely out of the country to another country. He gave her a letter of introduction to a nursing religious sister in an Irish hospital which asked the nurse to ‘take good care of her in the usual way’. He advised her she should tell no one that she was going to the USA.

32.388 When the story was published, the adoption society threatened libel proceedings and denied all knowledge of the activities of the priest involved. The Adoption
Board, which already had concerns about the adoption activities of this particular society, asked to interview key personnel. The adoption society voluntarily deregistered as a society and the Adoption Board seems to have closed the file. No investigation took place in relation to any breaches that may have occurred in regard to Irish adoption legislation.

32.389 It should be said that it was open to any pregnant woman to make arrangements to go to the USA, give birth there and have the baby adopted under American law. It did however involve a lot of planning and probably could not be easily arranged without assistance from other people who knew how the American system worked. It is not clear that there was any illegality involved in helping women to go to the USA in order to birth there and have the baby adopted there.

J: Illegal birth registration

32.390 In its 2nd Interim Report, the Commission pointed out that, while false registration of birth was a criminal offence at all times in the period covered by the Commission’s remit, it is possible that, in some cases, such registrations were carried out for what were perceived to be good reasons (this does not change the fact that it was an offence). Among the reasons that have been suggested were a wish to ensure that the child did not have the stigma of ‘illegitimacy’, the absence of legal adoption before 1953, the difficulty of having a non-marital child adopted, and the fact that the ‘adoptive’ parents did not meet the requirements for legal adoption.

32.391 As was pointed out in the Commission’s 5th Interim Report, it was not illegal for a child to use the name of his/her foster parents. Until the Registration of Births Act 1996 came into effect, children were not given a registered surname. The child’s forename was recorded as were the forename and surname of the parent(s) but there was no requirement that the child use a parent’s surname.

32.392 It is a criminal offence under the Births and Deaths Registration Act 1874 to register a birth incorrectly. The maximum penalty on summary conviction is a fine of £10. The maximum penalty on indictment is a fine or ‘imprisonment, with or without hard labour, for a term not exceeding two years, or to penal servitude for a term not exceeding seven years’. The Commission has not seen evidence of any prosecution on indictment.
32.393 The fact that such registrations occurred seems to have been known to the Department of Health for many years and did not seem to cause any significant concern there. There are a number of references in departmental files known as the Clandillon papers, although none of the references seen by the Commission involve the institutions being investigated. For example, in 1950, Miss Clandillon noted that a woman had collected a child from a private nursing home and had him registered as her child. In 1951, Miss Clandillon noted that a child whom she was visiting had a false birth certificate which recorded his foster parents as his birth parents. Miss Clandillon knew the name of the child’s birth mother and the circumstances of his birth but does not suggest that anything should be done about the false registration.\textsuperscript{149} St Patrick’s Guild (SPG) wrote to Miss Clandillon in the Department of Health in 1952 seeking her advice about the discrepancy between the names on a child’s baptismal certificate and her birth registration. The child involved was an extra-marital child who was born in Holles Street and her mother had arranged the placement of the child with the ‘adopters’. The Sister in charge in SPG was anxious to ensure that the child would not have to ‘carry the stigma of illegitimacy if it could be avoided’.\textsuperscript{150} The Commission has not seen a reply to this letter. In late 1954, Miss Clandillon did advise a woman who had registered a child as hers to ‘apply for L. A. at once’ (presumably legal adoption).\textsuperscript{151} In another example from 1964, Miss Clandillon noted the fact that a child had a ‘legitimate birth certificate which is false’.

32.394 The Commission has not seen any evidence that any of these irregularities were reported to the Gardaí or to the General Register Office (GRO) which was responsible for the registration of births and which came under the remit of the Department of Health at the time.

32.395 In 1965, the Adoption Board became aware of a case of illegal registration when a woman who had been illegally registered in 1948 discovered the fact and tried to investigate what happened. In a letter to the Minister for Health in 1992, she said that she was visited by a person from the Adoption Board who had papers which she could sign in order to legalise her ‘adoption’.\textsuperscript{152} This woman took legal advice about pursuing the gynaecologist involved and SPG but was advised that any such
case would be statute barred. Again, the Commission has not seen any evidence that this was reported to the appropriate authorities.

32.396 In the early 1990s, the Adoption Board became aware of the existence of the ‘adoption from birth’ cases in SPG and was told by SPG that there were 74 such cases on their books. The Adoption Board decided that it had no further role when the birth mother who had originally brought the issue to its attention decided not to pursue it further. These are the cases which gave rise to considerable controversy in 2018 - see below.

32.397 The case of I O’T v B, which was decided by the Supreme Court in 1998, was concerned with the right of a person to know the identity of his/her birth mother in circumstances where the birth mother had stipulated that she did not wish to be contacted (see above). The births of the two people concerned in this case had been illegally registered but this fact was mentioned only in passing in the court judgments and it would appear that it did not attract much attention at the time and it appears that no action was taken as a result.153

32.398 The Commission has not seen evidence of illegal registration of births which occurred in the mother and baby homes and county homes under investigation. Of course it is not possible to say that this did not occur but neither the institutional records nor the Department of Health records reveal any such evidence.

St Patrick’s Guild

32.399 The records of St Patrick’s Guild (SPG) were transferred to the Child and Family Agency (Tusla) in May 2016. SPG was founded in the early 1910s as an organisation for the care of destitute Catholic expectant women and nursing mothers and their children. It became a registered adoption society after adoption legislation came into effect in 1953. SPG was an adoption society and it is not being investigated by this Commission. (There is some information about it in Chapter 27 and it is mentioned a number of times in relation to the boarding out of children). In 2018, Tusla announced that it had established from these records that a number of births between 1946 and 1969 were incorrectly registered and a

number of others were being further investigated. Tusla considered that an incorrect registration had taken place if:

- the name of a person who is not a birth parent of the child was entered in the register of births as a parent of the child and/or
- the name of the birth mother of the child was not entered in the register of births as the mother of the child.

32.400 Tusla provided these records to the Commission. They clearly show that the registration of the births of a number of children was incorrect and illegal. The children involved had been born to unmarried mothers and their births were then registered to the ‘adoptive’ parents. The records in question generally have the words ‘adopted from birth’ written on them. It would appear that whoever was compiling the records was conscious of the need to have a record of the correct information. In some cases, the children knew that they had been ‘adopted’ while others did not. Tusla has since been in contact with the majority of the people involved.

32.401 The SPG files provided to the Commission do not show any evidence of the involvement of mother and baby homes or county homes in the illegal registration of births. The births almost all occurred in private nursing homes and the births were registered mainly by the person in charge of the nursing homes and occasionally by the ‘adoptive’ parents. While it is clear that SPG facilitated the ‘adoption’ of the children and were fully aware of the practices involved, its staff do not appear to have been directly involved in the incorrect/illegal registrations. In some cases, the birth was registered twice; correctly the first time and in the names of the ‘adoptive’ parents the second time.

32.402 In one of the cases, the child was born in an institution being investigated by the Commission. The child and the mother left the institution two days after the birth and the child was handed over to ‘adoptive’ parents. The birth was then registered as a birth to the ‘adoptive’ couple.

32.403 In May 2018, the Minister for Children and Youth Affairs commissioned an independent review into incorrect birth registrations. The report of this review has not been published but has been provided to the Commission. This was a scoping

---

154 [www.tusla.ie](http://www.tusla.ie); by October 2019, Tusla had identified 151 such records.
exercise to identify potential indicators of incorrect registration practices; it did not seek to provide proof of such practices in individual cases. The review involved an analysis of adoption records held by the Adoption Authority of Ireland (formerly the Adoption Board) and by Tusla. A number of potential indicators or markers were identified. These included markers which, in themselves, would not be conclusive, such as personal placement for adoption, mother under the age of majority and very early placement. Records from adoption agencies associated with four of the mother and baby homes under investigation were sampled by Tusla. A small number of those did have markers or other suspicious circumstances but there were no clear indicators such as existed in the SPG files.

Illegal registration of births by Americans

32.404 There were a number of American couples who engaged in illegal activity in order to acquire an Irish child. In June 1954, the US embassy in Dublin asked the DEA for assistance in carrying out a discreet investigation into the bona fides of certain reports it had received relating to eight children born in Dublin. The embassy officials suspected that the people who reported the birth of these children and had the births registered were not the birth parents.

32.405 The matter was referred to the Gardaí. A detective inspector investigated and prepared a report dated July 1954 in which he outlined what he had discovered and said that the investigation was not yet fully completed. He said that:

As instructed enquiries were conducted and continue to be so conducted personally and on a confidential basis. Despite this many of the persons interviewed showed a great reluctance to speak on the affair and much hesitancy was encountered, some of which was undoubtedly due to motives of charity or again through fear of exposure.

32.406 His report stated that the eight children in question were children of unmarried mothers who came to St Rita’s private nursing home, Ranelagh, to give birth (one was actually born in the Rotunda). Shortly after the birth of the children, the nursing home owner, Mrs Keating, handed them over to the wives of American servicemen. These servicemen were attached to United States Air Force bases in Britain.

32.407 The mother of one child was an unmarried Irish woman who came from England to give birth. The arrangements had been made by an American woman, the wife of
a member of the US Air Force in England. She had been given information about St Rita’s by the administrator of the Pro-Cathedral (a priest) in Dublin. This was confirmed by the administrator but he did not know the name of the birth mother. The detective inspector said that the correct name of the birth mother was ‘unknown here’ but he hoped that he would be able to find it with the cooperation of Mrs Keating. He said that the baby was handed over to the American woman ‘with the consent of the natural mother’. The birth mother had returned to work in England. The information about the mother’s consent presumably came from Mrs Keating.

32.408 Four other children were born to Irish women who had been working in England. The names of three of the women were unknown. The detective had not got a certificate of surrender from the woman whose name was known. Each child was registered to the American couple involved. Two of the children were twins born to a woman living in Ireland whose name was known. They were handed over ‘with the mother’s consent’ to the wife of an American Air Force member. The births were registered to the American couple. The report said that the detective had seen the birth mother and had obtained a ‘certificate of surrender’ from her in respect of each child. The remaining child was born to a woman whose name was known and the detective obtained a certificate of surrender from her. The report stated that the certificates of surrender were attached but they were not in the file seen by the Commission. It is seriously doubtful if such certificates of surrender had any legal validity.

32.409 There were no prosecutions. The Commission has not seen any evidence that the issue was taken up by the Department of Health or the local authority responsible for registering maternity homes, in this case, the Dublin board of assistance. The Registrar General was not informed of the illegal registrations; the GRO became aware of the matter only when the subsequent illegal registrations came to light in 1963/4.

32.410 The children involved did go to the USA. While what had taken place was illegal, the US Air Force was satisfied about the character and sincerity of the prospective adoptive parents, in particular their desire to have children. The American embassy agreed that they were all appropriate for the placing of children; therefore they should be allowed to take them to the USA for eventual adoption. The DEA did not agree for a number of reasons including that both prospective parents were
not Catholics. Officials in the DEA wanted to be ‘morally certain that these children will receive a proper up-bringing in the religion in which they were baptised’ and the sworn affidavit and other evidence presented to them failed to assuage their concerns. ‘The whole atmosphere of this case, and the manner itself in which the custody of the children was obtained in the first instance, raises serious doubts in my mind as to [their] suitability for the adoption of Irish Catholic children’. However, it was recognised that ‘a strong bond of affection had been formed between the children and the couple’ and ‘it would appear to be an unbearable hardship to refuse a passport in the circumstances and thus prevent them continuing to have custody of the children. It seems to be a determining reason for allowing the passports to issue in this case’. It seems that the American embassy issued visas without insisting that the children have passports.

Further illegalities at St Rita’s

32.411 In November 1962, the public welfare authorities in Wisconsin requested the DEA to verify the birth certificates of two children who were supposed to have been born in Ireland to a Wisconsin resident.

32.412 The registration of the births of these two children was investigated by the Gardaí and led to the prosecution of Mrs Keating in the District Court. The Commission sought the prosecution file in this case but the Gardaí were unable to locate it. A file received from the Department of Health in December 2018 contained further information on the case.155 It included letters from an official in the DEA and from the Registrar General, both of which had information from the Garda report on the case. It also included the Irish Times report of the court proceedings.

32.413 In the course of the Garda investigation, the Records and Particulars book of St Rita’s were inspected. It was discovered that, during the period January 1960 to January 1963, there were 51 births, particulars of which were given in the Record Book, which were not registered. During the same period 43 births were registered as having occurred in St Rita’s although the relevant particulars of these births could not be traced in the Record Books. Of these 43 births, 33 were registered by Nurse Keating. The Registrar General noted that ‘It seems evident that in these 43 cases the names of the parents were changed when the birth was being registered’.

155 Department of Health, INACT/INA/0/461625.
32.414 Mrs Keating was charged with forging a register of birth with the intent to deceive in July and August 1962 and that, on 16 July 1962, she uttered a forged birth certificate purporting to be that of one baby X, knowing it to be forged and with intent to deceive and that in August 1962 she issued a forged birth certificate purporting to be that of one baby Y, knowing it to be forged and with intent to deceive. The Assistant Chief State Solicitor stated that there were two registrations involved but only one child. The offences were ‘very grave’.

32.415 The Garda who had investigated the case explained its background to the court. In 1959 a Catholic American childless couple visited Dublin and met Mrs Keating. They remained in touch with her when they returned to the US and expressed a wish to adopt a female baby. In June 1962 a baby girl was born to an unmarried mother in the nursing home and Mrs Keating notified the American couple who agreed to take it. They told her to register the baby in their name and she did so. Sometime later Mrs Keating received a letter from the American woman stating that she could not come to Dublin for the baby but that she was sending her sister-in-law. The sister-in-law arrived and they found that they would have to have a certificate in the name of the person taking the baby out of the country. Mrs Keating then registered the baby in the name of the sister-in-law who took it to America and handed it over to the first American woman.

32.416 The Garda said that Mrs Keating had given every assistance and it would have been difficult to sustain charges against her if she had not given him the necessary particulars. Mrs Keating pleaded guilty and was given the benefit of the Probation Act. The judge said that if the transaction had been as a result of bribery and corruption Mrs Keating would have had to go to prison; however he was satisfied that the only money she got was the ordinary fees payable to a nursing home.

32.417 No other matters in relation to the running of the nursing home were put before the court nor was her involvement with the Wisconsin family prior to these offences revealed. Mrs Keating had earlier provided a child to this couple and that child’s birth was also falsely registered. The Commission has not seen any evidence that further enquiries were made into the 43 registrations that the GRO clearly considered to be incorrect/illegal.

32.418 Following her conviction the Department of Health enquired as to whether or not the nursing home was still registered as a maternity home under the Registration
of Maternity Homes Act 1934 and whether any action had been taken or was contemplated by the Dublin Health Authority. The DHA replied that its chief medical officer had had the matter examined and that no further action was contemplated. The nursing home continued to operate for many years afterwards.

32.419 The Commission considers that the actions of State authorities in this case fell far short of what should have been expected from those charged with implementing the maternity home regulations.
Chapter 33A: Deaths Statistical Analysis

by

Liam Delaney, University College Dublin and Mark McGovern, Rutgers University

1. Introduction

This statistical appendix uses detailed data compiled by the commission team to calculate and display mortality rates for the largest institutions. Such data do not in and of themselves allow for definitive assessments of why mortality rates varied across institutions or populations, but do provide a quantitative summary of the scale of mortality in these institutions that can be compared to the overall national rate. It also allows us to document the timing of major declines in the mortality rates, the primary cause of death, and the age at which the deaths occurred. Section 2 briefly describes the data used in the subsequent analysis. Section 3 provides mortality rates by institution, examines structural breaks in the timing of mortality, provides mortality rates by cause, and provides annual comparisons to broader national and urban trends. Section 4 provides a summary of the findings.

2. Statistical Data

The data is derived from the reports of six key institutions, Bessbororough, Castlepollard, Sean Ross Abbey, Bethany, Tuam, and Pelletstown. The data available includes the date of birth, date of admission, date of death, cause of death, child’s first name, in each of the institutions. This allows us to compute annual infant mortality rates for each of the institutions for the relevant years and to examine the basic statistical pattern in mortality rates across the years for each of the institutions. The information on the children recorded in the data is generally complete, although there are a small number (approximately 3 per cent) without a date of birth or date of death listed. They are excluded from the analysis below. In what follows we focus on the outcomes of live births, but it is important to bear in mind that approximately 2 per cent of the records are listed as stillbirths or miscarriages (these are also excluded from the analysis). In this report, we assign all infants present in the records of an institution to that institution, regardless of place of birth, length of stay, place of death, or other characteristics.

3. Mortality Rates

3.1 Mortality Data by Year and Institution

Figure 1 below documents the infant mortality rate (defined as the number of deaths before the age of one per 1,000 live births) across institutions. The raw numbers used in these graphs are available in Annex 3 and provide exact numbers of births and deaths of infants by year across institutions.
3.2 Structural Breaks in Mortality

Given there were relatively few births per institution in some years, particularly during the early and later parts of the century, caution should be exercised when considering the death rate in any single year. With a low number of births, the mortality rate is more sensitive to random variation. As a result, there is potentially a substantial amount of statistical noise in how the mortality rates vary from year to year within institutions. More reliable comparisons can be made across multiple years, or across institutions, where the sample size (number of births) is larger. For this reason, we construct mortality rates that are five year moving averages (that is they include data on all births and infant deaths within a moving five year window, centred around a given year along with the two years before and after). These rates are shown in Figure 2. To give a sense of the variation in the data we also show interval bands for the mortality rate which are the rate in the institution plus and minus two standard deviations (estimated for all the institutions by decade).

Estimating these mortality rates over time allows us to examine whether there was likely to be a structural break during the time period we consider. As a preliminary step, we tested for a single unknown break in the series. The output of this test is test graphically for each of the individual institutions in Annex 1. In each case, the data exhibit a marked structural break in the late 1940s or early 1950s, indicating that mortality conditions in the homes had improved significantly during this period in particular. However, it is important to bear in mind that this test identifies the most statistically relevant break, which does not preclude there from being other important turning points in the series.
3.3 Comparisons to National and City Mortality

Comparisons with national and city mortality are complex due to the nature of the institutions themselves and the lack of data availability on localised birth and death records during this time period. Identifying a comparable population is also a complex task. The most localised information that are available in the form of a consistent series are at the county or city borough level, so it is possible to compare the rate in an institution with that of the surrounding city. Figure 3 plots the rates of mortality in Pelletstown with that in the surrounding city (Dublin) by year, and shows far higher rates of mortality prior to the 1950s but a similar pattern of decline. The national rate is also shown in the graph, and is lower than that in Dublin, which was itself an outlier, having the highest rate amongst the counties or city boroughs. Having said that, this comparison between Dublin and Pelletstown is not ideal as we know there was a substantial amount of variation in infant mortality even within the city, and the population served by the institution was not representative of the population as a whole.
Figure 3 Infant Mortality Rates in Ireland, Dublin City, and Pelletstown

Note to Figure 3: Source - institutional records (Pelletstown) and Registrar General Reports (Ireland and Dublin City).

3.4 Mortality by age of death

In order to establish the age at which mortality was most likely to occur, Annex 2 displays rates of mortality during the perinatal, neonatal, infancy, and childhood periods for each of the institutions by decade. These figures show the mortality rate in each of these periods, excluding deaths which occurred outside the timeframe, and are therefore different from the infant mortality rates shown in Figures 1-3 above. For example, in what follows the mortality rate during the perinatal period refers exclusively to deaths that occurred within the first 7 days of life, and the mortality rates during the childhood period refers exclusively to deaths that occurred between 366 and 1825 days. These data show that, in absolute terms, it was declines in deaths during the infancy period (29-365 days) that were most responsible for reductions in mortality over the course of the 20th century in the institutions covered by this report.

3.5 Mortality by Cause

Figure 4 shows data on the primary cause of death. For this report we assume that reporting was accurate but future validation would be valuable. Specific cause data were grouped into the categories shown. Some labels were shortened on the figure to aid with presentation. “Congenital Heart Disease” also includes myocarditis. “Convulsions” refers to fits, epilepsy, and status epilepticus. “Generalized infections” refers to generalized infections, toxaemia, septicaemia, and sepsis. “Haemorrhage” refers to haemorrhage, intracranial, melena, anaemia, and thrombosis. “Tuberculosis” refers to TB in its various forms (including TB meningitis), and phthisis. “Gastroenteritis” refers to various forms of gastroenteritis, gastritis, vomiting, and diarrhea. “Respiratory Infections” refers to various forms of respiratory infections, pneumonia, bronchitis, laryngitis, and consolidation. “Malabsorption” refers to malabsorption, marasmus, and cachexia. “Spina Bifida” refers to spina bifida, hydrocephalus, and encephalocele. “Syphilis” refers to syphilis,
lues, and tabes. Causes with less than 100 occurrences were grouped together as “other”. A relatively high percentage of deaths (18%) were classified as “Non-specific” as they did not have adequately specific information to ascertain a primary cause (because they were originally listed as, for example, congenital debility).

Note to Figure 4: See the text for an explanation of the categories. Source - institutional records and authors’ calculations.
4. Summary

Mortality rates in each of the institutions were very high in the period compared to the overall national rate of infant mortality. Even compared to other locations where infant mortality was relatively high among the general population, such as Dublin City, rates of infant deaths were substantially higher in these institutions.

The mortality decline in the late 1940s and early 1950s was particularly significant, and the data are consistent with the presence of a structural break in death rates in each of the homes during this time period. This decline in mortality in the institutions occurs at the same time as the overall decline in national infant death rates during these decades, albeit from a substantially higher base.

The data available do not facilitate testing alternative explanations for why mortality rates differed by location or time, not least because of difficulties in constructing a comparison group for infants in the institutional records. Another significant data limitation is that ascertaining precise causes of death given the recording practices and changes in diagnosis procedures over such a long time period is challenging.
Annex 1: Structural Break Tests by Institution

Annex Figure 1 Five Year Moving Average Infant Mortality Rate for Bessboro with Test for Structural Break

Annex Figure 2 Five Year Moving Average Infant Mortality Rate for Bethany with Test for Structural Break
Annex Figure 3 Five Year Moving Average Infant Mortality Rate for Castlepollard with Test for Structural Break

Annex Figure 4 Five Year Moving Average Infant Mortality Rate for Pelletstown with Test for Structural Break
Annex 2: Mortality during the Perinatal, Neonatal, Infancy and Childhood Periods

Annex Figure 7 Perinatal Mortality Rate by Institution and Decade

Note to Annex Figure 7: Children without a date of birth or death are excluded. The perinatal mortality rate is defined as the number of deaths between 0 and 7 days old per 1,000 live births. Deaths at other ages are not included. Source - institutional records and authors’ calculations.
Annex Figure 8 Neonatal Mortality Rate by Institution and Decade

Note to Annex Figure 8: Children without a date of birth or death are excluded. The neonatal mortality rate is defined as the number of deaths between 8 and 28 days old per 1,000 live births. Deaths at other ages are not included. Source - institutional records and authors' calculations.

Annex Figure 9 Mortality Rate During the Infancy Period by Institution and Decade

Note to Annex Figure 9: Children without a date of birth or death are excluded. The mortality rate during the infancy period is defined as the number of deaths between 29 and 365 days old per 1,000 live births. Deaths at other ages are not included. Source - institutional records and authors’ calculations.
Annex Figure 10 Mortality Rate During the Childhood Period by Institution and Decade

Note to Annex Figure 10: Children without a date of birth or death are excluded. The mortality rate during the childhood period is defined as the number of deaths between 366 and 1825 days old per 1,000 live births. Deaths at other ages are not included. Source - institutional records and authors’ calculations.

Chapter 33: Deaths

A: Child deaths

Introduction

33.1 High rates of infant and child mortality are a marked feature of the mother and baby homes under investigation. This is especially so in the earlier years of their existence. The numbers of deaths and the level of official knowledge about those deaths are described in the individual institutional chapters. The Commission has had a detailed examination of the deaths in Pelletstown, Bessborough, Castlepollard, Sean Ross, Tuam, and Bethany conducted by statisticians - see associated Statistical Analysis. These are the institutions in which there were a large number of deaths. There were deaths associated with Regina Coeli but the Commission did not conduct a detailed analysis because the available data did not facilitate doing so - see Chapter 21. There were some deaths associated with the other mother and baby homes but the numbers were very small. For example, a small number of children born to mothers who were in Dunboyne died but the children were not admitted to Dunboyne and they died in hospitals. The situation was similar in The Castle and Miss Carr’s. The Commission does not have detailed information about deaths in Kilrush or St Gerard’s.

Establishing the number and causes of deaths

33.2 The Commission’s information on deaths comes from the institutional records and the General Register Office (GRO). The database compiled by the Commission records all deaths which are recorded in the institutional records. The GRO provided the Commission with lists of deaths for Tuam, Bessborough, Castlepollard and Sean Ross. When compiling these lists, the GRO used the place of death and the last address of the deceased as the means of identifying the relevant deaths. The Commission analysed the names from these lists and compared them with the information compiled from the institutional records. There were some differences between them. In some cases, the institution was not mentioned as either the place of death or the last known residence and, as a result, these deaths were not on the GRO lists. Where the Commission was aware of a death which was not on the list provided by the GRO, the online register was checked. The online register covers deaths up to 1969. In the vast majority of cases, the Commission found that the deaths recorded in the institutional records were on the GRO register. The GRO checked the post 1969 deaths on behalf of
the Commission. Again, the vast majority of the deaths recorded in the institutional records were found on the GRO register.

33.3 The Commission examined the cases of children who went to hospital from the institutions and did not return. In some cases, the institutional records record that the child died in the hospital. Where there was no such record, the Commission checked the GRO register to try to establish if any of those children died within a year of their going into hospital. These deaths are included in the total deaths for each institution. (In the vast majority of these cases, the deaths occurred within two months of their going into hospital). In a small number of cases, children who left the institution to go to a place other than a hospital are recorded in the institutional records as having died within a year. These deaths are also included in the total deaths for each institution.

**Causes of death**

33.4 The institutional records record the cause/causes of death in almost all cases. The GRO register also gives the causes of death. In many cases, there is more than one cause of death recorded and there are minor differences between the causes recorded in the institutional records and those recorded in the GRO register. In analysing the causes of death, the Commission has used the causes as recorded by the GRO. Where multiple causes of death are recorded, the Commission, with the assistance of a paediatrician, has identified the likely most immediate cause of death and classified the death accordingly.

**Marasmus**

33.5 The term marasmus as a cause of death was common until the 1940s and was used in instances where a child could not absorb enough nutrients from food to thrive. Marasmus was always associated with an underlying health condition or disease which resulted in a failure to thrive. From the 1950s, marasmus was not generally accepted as a cause of death and doctors citing marasmus as a cause of death were asked to investigate and identify the underlying medical condition or disease. Some commentators have concluded that infant deaths which occurred in mother and baby homes due to marasmus indicates that infants were neglected, not appropriately cared for, and/or wilfully starved to death in these institutions. However, marasmus was a frequently cited cause of infant deaths in institutional, hospital and community settings in early twentieth-century Ireland. The Commission considers it unlikely that deaths in hospitals and family homes were
due to wilful neglect and so cannot conclude that the term marasmus denotes 
wilful neglect in mother and baby homes. The more likely explanation is that 
marasmus as a cause of death was cited when an infant failed to thrive due to 
malabsorption of essential nutrients due to an underlying, undiagnosed medical 
condition.

Explanations of causes of death

33.6 The Commission engaged a paediatrician to assist in its analysis of the various 
causes of deaths. The words used varied over time and some of the causes given 
were quite non-specific. The following explanations were provided by the 
paediatrician.

Cardiac Failure: This is the final outcome of many causes of death, for 
example, sepsis. Primary failure of the heart would be very unusual and 
probably confined to children with congenital heart lesions, diphtheria, viral 
myocarditis or specific severe vitamin deficiency.

Congenital Debility: This is lack of viability ‘life force’. The use of ‘congenital 
debility’ decreased rapidly from 1921 until it was removed in 1948 in the UK.

Premature Birth: Too vague a cause of death; evolved into more specific 
entities that actually caused the death.

Gastroenteritis: Infectious (Bacterial or Viral) disease causing diarrhoea, 
vomiting and dehydration. Fluid and Electrolyte solutions were only used 
since the 1940s/1950s.

Bronchopneumonia: Infection involving the airways (Bronchi) and the lung 
proper; can be very severe without antibiotics and/or oxygen. The infection 	en often spread to the bloodstream. Antibiotics started to be used in the 1940s.

Convulsions: Acute onset of chaotic electrical activity in the brain; sudden 
loss of consciousness; inadequate oxygenation of brain. Death from 
prolonged convulsions (status), Aspiration of stomach contents into lungs or 
injury. Medical treatment started with phenobarbitone in the 1920s and 
phenytoin in the 1940s.
Measles: Serious (400 to 500 deaths in the US each year) common infectious disease until vaccine (1963) reduced the incidence by 98%.

Meningitis: Infection of the lining of the brain and spinal cord (the meninges); bacterial, tubercular and viral. The former two had 100% mortality before the introduction of antibiotics in the late 1940s.

Influenza: Highly contagious airborne virus; local epidemics and pandemics since ancient times (for example, 1918-19 Spanish flu). No vaccine until the 1940s; seasonal vaccines in the late 1960s; subunit vaccines in the late 1970s. Monitoring for Antigenic drift of influenza virus. Crowding of vulnerable children allowed mini epidemics to occur of many infectious diseases.

Gastritis: part of acute gastroenteritis.

Congenital Heart Disease: The most common serious congenital anomaly. 17/10,000 incidence of life threatening disease. Tetralogy of Fallot, Transposition of Great Arteries, Hypoplastic left heart Syndrome. No surgery till the late 1950s.

Hydrocephalus: Part of Spina Bifida; Very common in Ireland before periconception folic acid supplementation was introduced in 1993; poor drainage of cerebrospinal spinal fluid led to its accumulation in the ventricles (fluid filled sacs) of the brain. The ventricles expanded causing the baby’s head to grow excessively either before (leading to difficult labour) or after birth causing a huge head and brain damage from stretching of the brain.

Pertussis: (Whooping Cough) Major infectious disease; major cause of death in those less than 20 years; 3.7% of deaths in the Netherlands in this age group before vaccination which dropped to 0.024% with vaccination. Particularly dangerous in infants. 50% need hospital care. Vaccination began in 1952 in Ireland.

TB/Tuberculosis/Phthisis: serious infectious disease involving an initial infection that may become manifest immediately or lay dormant and become manifest years later. Initial portal of entry is through the lungs from contact
with someone with pulmonary TB. TB can then spread to involve almost any part of the body including meninges, bone, kidney, bowel etc. The BCG vaccine was introduced in Ireland in the 1930s and 1940s. Streptomycin as a treatment was introduced in the early 1950s. These resulted in a dramatic decrease in mortality.

**Diphtheria**: ‘The children’s plague’; an infectious disease with mortality of 20% in under 5s before treatment introduced. Diphtheria caused obstruction of the airway and the toxin produced by the infection caused nerve paralysis, myocarditis. Antitoxin introduced in the 1930s and penicillin and vaccination in the 1940s.

**Syphilis** (Tabes): Congenital; 40% of babies born to mothers with untreated syphilis died. Infection spread to bone, bone marrow, liver and spleen, eyes, ears, meninges, skin. Penicillin introduced in the late 1940s.

**Sepsis** (Septicaemia): Bacterial blood infection that often arose from the spread of infection from primary sites such as pneumonia. Needed antibiotics to improve the desperate mortality.

**Atelectasis**: Collapse of the small air sacs in the lung. Could be caused by obstruction of the airways with plugs of mucous, enlarged lymph nodes. Asthma/ TB/ pneumonia/ preterm lungs.

**Cerebral Haemorrhage**: Traumatic and Non Traumatic. The latter divided into the area of brain involved. Sub Arachnoid, Sub Dural or Intra Cerebral. Could be vascular malformation or a severe bleeding tendency from low platelets, vitamin K deficiency.

**Asphyxia**: Lack of oxygen usually refers to asphyxia during difficult delivery of the baby.

**Laryngitis**: leading to obstruction of airway from Epiglottis, Diphtheria, Tetany.

**Otitis Media**: without antibiotics could spread to cause mastoiditis, meningitis and Dural sinus thrombosis.
Icterus Neonatorum: Neonatal jaundice if severe caused kernicterus or acute brain damage. Exchange transfusions as treatment only in the late 1950s. Phototherapy in the 1980s.

Registration of Deaths

33.7 The registration of deaths in the period 1922 - 1998 was governed by the Registration of Births and Deaths (Ireland) Act 1863 (which was amended by the Births and Deaths Registration Act (Ireland) 1880) and by the detailed rules set out in the Regulations for Registrars of Births, Deaths, and Marriages 1880. Initially, the poor law unions formed the superintendent registrars’ districts for the purpose of registration of births and deaths. The dispensary districts within the poor law unions were the registrars’ districts; each was headed by a registrar who reported to the relevant superintendent registrar. The superintendent registrars reported to the Registrar General of Births and Deaths in Ireland. After independence, the poor law unions were replaced by County Boards of Health and in 1942 by the public assistance districts created under the Public Assistance Act 1939. The title of the Registrar General was changed to an t-Ard-Chláraithreoir in 1952 under the Vital Statistics and Birth, Deaths and Marriages Registration Act 1952. The health boards became the superintendent registrars when they were established in 1970/71.

33.8 The registrar of the district in which a person died was responsible for registering the death. The relatives or people present at the death were required to inform the registrar of the death. In the case of deaths which occurred in institutions, the law provided:

   Where a person dies in a place which is not a house, or a dead body is found elsewhere than in a house, it shall be the duty of every relative of such deceased person having knowledge of any of the particulars required to be registered concerning the death, and in default of such relative, of every person present at the death, and of any person finding and of any person taking charge of the body, and of the person causing the body to be buried, to give to the registrar, within the five days next after the death or the finding, such information of the particulars required to be registered concerning the death as the informant possesses, and in the presence of the registrar to sign the register.
CHAPTER 33 DEATHS

33.9 So, the obligation to inform the registrar was placed, in order, as follows:

(i) every relative having knowledge of any of the required particulars,
(ii) in default of such relative -
   a. every person present at the death,
   b. any person finding the body,
   c. any person taking charge of the body,
   d. the person causing the body to be buried.

33.10 In general, the particulars had to be given to the registrar within five days of the death but this could be extended to 14 days in certain circumstances.

33.11 The person who registered the death was known as the informant. The informant was required to sign the register, giving his or her qualification under the Act (for example, mother, son, present at death, responsible for burial) and residence. The registrar would sign and date the entry in the register. If the death took place in a public institution, the former residence of the deceased would also usually be entered.

**Medical certification**

33.12 Medical certification of the cause of death was not an absolute requirement. If the deceased was attended before death by a registered medical practitioner, the practitioner was required to sign and provide a certificate in relation to the cause of death. The informant was required to deliver that certificate to the registrar who would then insert the cause of death in the register. (This requirement did not apply where an inquest was held, as the certificate of the jury furnished by the coroner was sufficient). The GRO told the Commission that there was no legal requirement to retain these certificates as the registration would have incorporated the cause of death as it appeared on the certificate. The GRO does hold a small number of Medical Cause of Death Certificates from 1989 to 2005.

33.13 If there was no medical certificate from an attending medical practitioner, unless the death was, in the opinion of the Registrar, sudden, violent or suspicious, the Registrar could fill in the cause of death on the basis of the ‘best information’ obtained from the informant, rather than a certificate.
Actual registration of deaths

33.14 The evidence compiled by the Commission suggests that the institutions being investigated did generally comply with the requirements for the registration of deaths. Most deaths in the institutions are recorded as ‘certified’.

33.15 In the case of Tuam, the death certificates very often name the informant as Bina Rabbitte who lived and worked in the institution. It has been suggested that she effectively ‘certified’ the deaths. There is no evidence that this was the case.

33.16 The Medico-Social Research Board was concerned about the failure to certify and register deaths. Its 1971 Annual Report noted that the number of deaths which were registered but not medically certified had dropped from 11.2% in 1948 to 1.9% in 1968. However, there was still a high rate of non-registration and this was a particular problem in the west of Ireland. In 1970, a study on the registration and certification of deaths during the years 1966-69 was undertaken on a random sample of 21 parishes in the west of Ireland.\(^1\) This showed that 86.3% of deaths had been medically certified and registered; 6.2% had been registered but not certified and 7.5% had been neither certified nor registered. A follow up study was carried out on burials in the period 1974-77.\(^2\) This showed that 6.1% were neither certified not registered. The Medico-Social Research Board, while recognising that there had been an improvement, concluded that the certification and registration of deaths in the west of Ireland remained unsatisfactory.

Timeliness of registration

33.17 The deaths in the institutions were generally registered in a reasonably, but not strictly, timely manner. It seems to have been the practice, particularly when the death rates were very high, to register a number of deaths at the same time. For example, in Bessborough, six deaths were registered on 12 May 1941; these occurred between 3 March 1941 and 27 April 1941; nine deaths were registered in 26 August 1943; they occurred between 22 July 1943 and 23 August 1943. There are some examples of quite late registration. There is no obvious explanation in most cases.

---

\(^2\) Medico-Social Research Board, *Annual Report 1979*
B: Maternal Deaths

Introduction

33.18 The Commission examined the institutional records of Pelletstown, Bessborough, Sean Ross, Castlepollard, Tuam, Dunboyne, Bethany, Denny House, Cork county home, Stranorlar county home and Thomastown county home in order to establish the number and causes of maternal deaths. It identified 200 women who died when resident in one of these homes (no maternal deaths were recorded in Dunboyne). A number of these deaths occurred several years after the woman had given birth. Four women who were admitted to Bessborough in the 1920s, and continued to reside there, died in the 1950s, 1970s, and 1980s (2 deaths). The Commission located GRO death records for 193 women (96.5% of deaths).

33.19 Maternal deaths are defined as a death of a woman while pregnant or within 42 days of the termination of the pregnancy. Maternal deaths are classified into three categories: this classification has been made by an obstetrician.

- **Direct obstetric deaths**: direct obstetric deaths are those resulting from obstetric complications of the pregnancy state (pregnancy, labour and the puerperium), from interventions, omissions, incorrect treatment, or from a chain of events resulting from any of the above.
- **Indirect obstetric deaths**: indirect obstetric deaths are those resulting from previous existing disease or disease that developed during pregnancy and which was not due to direct obstetric causes, but which was aggravated by physiologic effects of pregnancy.
- **Coincidental maternal deaths**: Deaths from unrelated causes which happen to occur in pregnancy or the puerperium.

33.20 Of the 193 deaths where GRO death records have been located, 71 can be classified as direct maternal deaths, and 53 as indirect maternal deaths; 69 were probably coincidental. However, 14 of the 124 deaths that would be classified as direct or indirect maternal deaths, on the basis of the death certificate, occurred more than a year after the birth of a child, and should therefore be omitted from those categories, so the figure is 110. The Commission has taken a decision to exclude only deaths that occurred more than a year following birth; this means that

---

3 The maternal deaths in county homes relate only to the unmarried mothers whose records were analysed by the Commission. Married women also gave birth in county homes; their maternal mortality rates have not been examined.
the number of deaths classified as indirectly or directly related to pregnancy is probably overstated.

33.21 Among the direct maternal deaths, the largest cause was puerperal sepsis which accounted for 32 deaths. During the 1920s an average of 105 women died in Ireland each year from puerperal sepsis; in the 1930s an average of 74 women died each year from puerperal sepsis. In the late 1930s it was established that the anti-bacterial drug, sulphonamide, was a highly-effective treatment for this condition, and the death rate from puerperal sepsis fell sharply during the 1940s. In 1950, 20 women in Ireland died from puerperal sepsis and the number continued to decline in the following years.

33.22 The second most common direct cause of maternal deaths in the institutions was eclampsia and its variants such as acute fatty liver of pregnancy. This figure is arrived at by including cases where eclampsia or ‘nephritis’ or ‘albuminuria’ or ‘toxaemia’ is mentioned on the death certificate. They account for 25 deaths; however, two of the deaths where nephritis or kidney disease is recorded occurred more than a year after the birth. There were eight deaths from haemorrhage/shock/obstructed labour and four from pulmonary embolism. The relatively low rate of death from haemorrhage is probably due to fact that the majority of women were first-time mothers.

33.23 The majority of indirect maternal deaths were due to cardiac disease in pregnancy. This is consistent with the period between the 1920s and 1970s where many women went into pregnancy with underlying cardiac disease due to damage to heart valves caused by rheumatic fever. Deaths due to appendicitis in pregnancy are classified as indirect deaths as pregnancy obscures or delays the diagnosis of appendicitis. Other deaths classified as indirect deaths are deaths from influenza and brain haemorrhage where pregnancy is a precipitating or aggravating factor.

33.24 The commonest cause of coincidental death was infectious disease. Tuberculosis was overwhelmingly the biggest contributor. Many of the 16 deaths due to typhoid, dysentery, diphtheria, measles, scarlet fever and meningitis may have occurred due to institutional outbreaks. Seven deaths due to pneumonia, where no other factors were listed, have been classified as coincidental, although there may have been pregnancy-related factors, which if known would indicate classification as indirect deaths.
33.25 Maternal mortality in the homes was higher than the national rate until the 1970s. However, as noted earlier, the Commission’s figures probably overstate the number of deaths and the excess mortality is much less than in the case of infant mortality in these institutions. The downward trend mirrored the national decline. The significant improvement in maternal mortality during the 1940s both nationally and in these homes contrasts with the spike in infant mortality during that decade.

33.26 The mortality from causes that were not associated with pregnancy, either directly or indirectly is a greater cause of concern. The 16 deaths of women from infectious diseases reflects major shortcomings in these institutions that were also responsible for many infant deaths.

Chapter 34: Vaccine trials

Introduction

34.1 The Commission’s Terms of Reference require it to establish the extent of compliance with relevant regulatory and ethical standards of the time of systemic vaccine trials found to have been conducted on children in one or more of the institutions being investigated by the Commission during the relevant period.

Sources

34.2 GlaxoSmithKline provided the Commission with extensive documentation about vaccine trials and clinical trials conducted in children’s residential institutions in Ireland in the period 1930 to 1973. These trials all involved either the Wellcome Foundation or Glaxo Laboratories. These companies are today part of the same pharmaceutical corporation - GlaxoSmithKline - but were separate commercial entities when the trials described here were being conducted. The archives of both companies, although now merged, evolved separately. The Wellcome Foundation retained extensive documentation while Glaxo Laboratories’s available documentation was quite sparse. Most of the documentation quoted below, particularly the protocols for the tests and the correspondence between the companies and the researchers, came from the GlaxoSmithKline archives.

34.3 The institutional records of the mother and baby homes involved, which were provided to the Commission by the Child and Family Agency (TUSLA), were then used to establish the identity of the children involved where possible and to establish what, if any, involvement or knowledge the authorities in these institutions had about the trials. These institutional records are described in the individual chapters on the institutions.

34.4 Relevant documentation was also provided by the HSE and the Department of Health (see Part 5: Archives).
Regulatory Standards

34.5 The legislation governing clinical research and the importation of vaccines into Ireland during the period under review was the *Therapeutic Substance Act* 1932,\(^1\) and the *Control of Clinical Trials Act* 1987.\(^2\) None of the trials described here took place after the enactment of the latter Act.

34.6 The *Therapeutic Substance Act* 1932 aimed to regulate the manufacture, import and sale of therapeutic prophylactic and diagnostic substances. Its primary purpose was to ensure that imported vaccines, sera, toxins, antitoxins and antigens complied with standards of strength, quality and purity as prescribed by an advisory committee. The act also made provision for the Minister for Local Government and Public Health/Minister for Health to grant Manufacturer’s Licences, Import Licences, Import Permits and Research Licences to suitably qualified applicants.

34.7 Researchers undertaking clinical trials were obliged to get a Research Licence from the Minister for Local Government and Public Health (the Department of Health from 1947). A Research Licence granted the holder ministerial approval to import therapeutic substances covered by the *Therapeutic Substance Act* for the purpose of scientific research. The terms and constraints of a Research Licence were clearly defined. Firstly, the licence applied to the licensee only. Secondly, scientific research could be undertaken only at the address stated on the licence; if the licence holder wanted to conduct clinical research in a location other than that stated on the licence, the holder was obliged to get the authorisation of the minister to do so.

34.8 The Act did not specifically provide for a regulatory body or mechanism to oversee its implementation. The Act required that a Therapeutic Substances Advisory Committee be established to advise and assist the minister in the making of orders and regulations under the Act. This was not done until 1939 when the events surrounding the Ring College immunisation problems in 1936, and the associated High Court case in 1939, forced the government of the day to establish such a

---

It has been stated that there was widespread non-compliance with the Act and that the code was not enforced by the department.  

34.9 The National Drugs Advisory Board (NDAB) was established in 1966. It was set up to organise and administer a service for obtaining, assessing and disseminating information about the safety of new and reformulated drugs and of drugs already in use, and to advise the Minister for Health on matters relating to the safety and quality of drugs. As its name makes clear, it was an advisory and not an implementation board. A voluntary agreement was entered into by the NDAB with the pharmaceutical industry and the medical profession whereby the prior approval of the NDAB would be sought before the undertaking of clinical trials. This did not change the law in any way.

**Ethical Standards**

34.10 Ethical standards relating to clinical trials in human research subjects, and especially the critical issue of consent, applicable during the period 1922-1998 were set out in the *Nuremberg Code* (1947), *Report of the Medical Research Council (UK)* (1962) and the *Declaration of Helsinki* (1964). The main points of each are as follows:

**Nuremberg Code (1947)**

34.11 The *Nuremberg Code* was drawn up by American judges sitting in judgment of Nazi doctors accused of conducting murderous and torturous human experiments in the Nazi concentration camps. It states:

> The voluntary consent of the human subject is absolutely essential. This means that the person involved should have legal capacity to give consent; should be so situated as to be able to exercise free power of choice, without the intervention of any element of force, fraud, deceit, duress, over-reaching, or other ulterior form of constraint or coercion; and should have sufficient

---

3 In 1936, an immunisation accident at Ring College, County Waterford, caused twenty children to develop tuberculosis and the death of a 12 year old girl. See Michael Dwyer, *Strangling Angel: Diphtheria and childhood immunisation in Ireland*, (Liverpool, 2018), 101-43.

4 This view was expressed by Mr Thomas McGuinn, chief pharmacist at the Department of Health to the Lindsay Tribunal and accepted at p. 210 of the *Report of the Tribunal of Inquiry into the Infection of Persons with Haemophilia and Related Matters* Dublin: Government Publications, 2002.

knowledge and comprehension of the elements of the subject matter involved, as to enable him to make an understanding and enlightened decision. This latter element requires that, before the acceptance of an affirmative decision by the experimental subject, there should be made known to him the nature, duration, and purpose of the experiment; the method and means by which it is to be conducted; all inconveniences and hazards reasonably to be expected; and the effects upon his health or person, which may possibly come from his participation in the experiment.

The duty and responsibility for ascertaining the quality of the consent rests upon each individual who initiates, directs or engages in the experiment. It is a personal duty and responsibility which may not be delegated to another with impunity.

34.12 In its report for 1962/63, the British Medical Research Council (MRC) published a series of recommendations aimed at clinicians engaged in clinical research. The MRC subsequently published a statement on ‘Responsibility in investigations on human subjects’ in the *British Medical Journal*. 9 The principal recommendation echoed that of the *Nuremburg Code* in relation to the obtaining of consent - that it is ‘both considerate and prudent to obtain a patient’s agreement before using a novel procedure’. The second MRC recommendation was that clinical researchers must ensure that it is clearly within the competence of a parent or guardian of a child to give permission for procedures intended to benefit the child when he is not old or intelligent enough to be able himself to give valid consent.

It should be understood that the possibility or probability that a particular investigation will be of benefit to humanity or posterity would afford no defence in legal proceedings. The individual has rights that the law protects, and nobody can infringe those rights for the public good. In investigations of this type it is therefore always necessary to ensure that the true consent of the subject is explicitly obtained.

The need for obtaining of consent in this type of investigation has been generally recognised, but there are some misunderstandings as to what constitutes evidence. In general, the investigator should obtain the consent

---

himself in the presence of another person. Written consent unaccompanied by other evidence that an explanation has been given, understood, and accepted, is of little value.

In the opinion of the Council, the head of a department where investigations on human subjects take place has an inescapable responsibility for ensuring that practice by those under his direction is irreproachable.

Declaration of Helsinki (1964)\textsuperscript{10}

34.13 This states:

The nature, the purpose and the risk of clinical research must be explained to the subject by the doctor. Clinical research on a human being cannot be undertaken without his free consent after he has been informed; if he is legally incompetent, the consent of the legal guardian should be procured. The subject of clinical research should be in such a mental, physical and legal state as to be able to exercise fully his power of choice. Consent should, as a rule, be obtained in writing. However, the responsibility for clinical research always remains with the research worker; it never falls on the subject even after consent is obtained.

Consent for children

34.14 Common law recognised that medical procedures could not generally be carried out without the consent of the person affected. Legally, children do not, and did not at the time of these trials, have the capacity to consent to participation in the trials. In general, the parent(s) or guardians had the authority to consent to medical procedures involving the child. The situation in respect of illegitimate children was unclear before the enactment of the Guardianship of Children Act 1964. This Act provided, for the first time, that an unmarried mother was automatically the guardian of her child. The notion that either parent (if married) or the mother (if unmarried) could give consent on behalf of the child to medical treatment was assumed to be part of the parent’s custody rights and responsibilities with respect to the child.\textsuperscript{11} In more recent years, case-law has qualified the legal capacity of parents to give consent to experimental or

\textsuperscript{10} World Medical Assembly, Declaration of Helsinki: Recommendations guiding doctors in clinical research. Adopted by the WMA, June 1964.

\textsuperscript{11} Skegg, “Consent to Medical Procedures on Minors” (1973) 36 M.L.R. 370 at 375.
investigative treatment in the absence of a direct medical benefit to the child. For the purposes of the trials that occurred before 1964, the mother’s consent, in the case of ‘illegitimate’ children who remained in their mother’s custody, was required prior to medical treatment or vaccination unless some other legal guardian was appointed or an order had been made placing the child formally in the care of the State under the Children Acts 1908-1941 or in the context of wardship proceedings.

34.15 The common law view of the mother as custodian of the illegitimate child was strengthened over the years by the application of provisions of the Irish Constitution. In State (Nicolau) v. An Bord Uchtala (1966), the Supreme Court reasoned that the mother had a personal constitutional right to the custody of her child born out of wedlock, by virtue of Article 40. This view deepened in G. v. An Bord Uchtala (1979), where it was found that the right to custody ‘is clearly based on the natural relationship which exists between a mother and child’. The Supreme Court in G. considered that s. 6(4) of the Guardianship of Infants Act 1964, deeming the unmarried mother automatically the guardian of her child, was construed merely to ‘constitute a compliance by the State with its obligation, in relation to the mother of an illegitimate child, to defend and vindicate in its laws this right to custody’ - in other words, that this was a right which predated the Guardianship of Infants Act 1964.

34.16 It seems clear that, in cases where the children who were subjected to vaccine trials were accompanied in the institutions by their mothers, the mother was the person whose consent should have been sought. The issue is a bit more complex in the cases of children whose mothers were not with them in the institutions. If the mother’s whereabouts were known, it is strongly arguable that she should have been contacted and her consent requested. In cases where mothers could not be contacted, the guardian of the children could be either the authorities in the institution or the health authority which was paying to maintain them in the institution. Precisely who was the guardian is, however, largely irrelevant as no attempt seems to have been made to seek the consent of parents or guardians.

14 The father of the ‘illegitimate’ child did not have a similar constitutional right to custody or guardianship of the child, though, since the passing of the Guardianship of Infants Act in 1964, he has a statutory right to apply for either.
Confirmed Vaccine Trials

34.17 The Commission has identified a total of 13 vaccine trials which took place in the period covered by the Commission’s remit 1922-1998; seven of these were conducted in the institutions under investigation and were conducted in the period 1934-1973. There is a further suspected trial in 1965 but it has not been confirmed.

1930: J C Saunders, Wellcome’s APT anti-diphtheria vaccine Cork.\(^\text{16}\)

34.18 In 1930, Dr J C Saunders, Chief Medical Officer, Cork City, administered Wellcome’s experimental Alum Precipitated Toxoid (APT) anti-diphtheria vaccine to 142 children in two unidentified orphanages and to 436 children aged between eight months and 14 years among the general child population in Cork city. This was backed by the Department of Local Government and Public Health, the South Cork Board of Public Assistance and the Irish National Teachers’ Organisation. It was regarded as an important public health response to one of the worst diphtheria epidemics ever recorded in Europe.\(^\text{17}\) The Commission has been unable to definitively identify the children’s institutions referred to in Dr Saunders’s published report of the trial. Records relating to Cork County Home give no indication that the trial was conducted there. The institutional records of the only other Cork institution which comes under the Commission’s remit, Bessborough, do not indicate any involvement in this trial. Accordingly, there is no evidence to suggest that this vaccine trial was conducted in an institution under the Commission’s remit.

1934-36: JC Saunders, Wellcome’s APT anti-diphtheria vaccine Cork.\(^\text{18}\)

34.19 In the mid-1930s, Dr J C Saunders partnered with Wellcome Research Laboratories to develop a ‘one-shot’ anti-diphtheria vaccine to protect infants and children from diphtheria, the most dreaded childhood disease at that time. Between 1934 and 1936, Dr Saunders administered Wellcome’s still experimental APT anti-diphtheria antigen to 250 children in an unidentified residential institution for boys and to 2,541 children among the general population. Again, this was backed by the Department of Local Government and Public Health as well as the South Cork Board of Public Assistance. It was regarded as an important public

---

\(^{17}\) Michael Dwyer, *Strangling Angel: Diphtheria and childhood immunization in Ireland*, (Liverpool University Press, 2018), 82-90.

health intervention against endemic diphtheria. It was not possible to identify the children’s institution referred to in Dr Saunders’s published report of the trial. Records from Cork County Home and from Bessborough give no indication that the trial was conducted in either institution. Accordingly, there is no evidence to suggest that this vaccine trial was conducted in an institution under the Commission’s remit.

1935: Denis F Hanley, Wellcome’s APT anti-diphtheria vaccine Dublin.

34.20 In 1934, Dr Denis Hanley, Assistant Medical Officer for the City of Dublin, administered Wellcome’s APT anti-diphtheria vaccine to 24 children, varying in age from seven months to 14 years, resident in the Dublin Union. In 1935, Dr Hanley administered Wellcome’s APT vaccine to a further 46 children, aged four to 15 years, resident in St Vincent’s Industrial School, Goldenbridge, St Joseph’s School for Deaf Boys, Cabra, and St Saviour’s Orphanage, Lower Dominick Street, Dublin. Dr Hanley also administered Wellcome’s APT vaccine to 39,267 Dublin school children before it had been made commercially available. The Dublin Union comes under the Commission’s remit and the trial is described under Trial A below.

1935: Naughten, White, Foley, Wellcome’s APT anti-diphtheria vaccine Tipperary.

34.21 In 1935, medical officers trialled Wellcome’s APT antigen in children’s residential institutions in Tipperary. In an article in the British Medical Journal, Dr Martin Naughten, County Medical Officer for Tipperary South Riding, Dr J.H. White and Dr A. Foley reported that they had trialled Wellcome’s APT anti-diphtheria vaccine among 370 children in three residential institutions. The trial was limited to children aged ten years and older. Although the institutions involved are not named in the article the number of children involved, and their age range, suggests that the trial was undertaken in the three industrial schools in Tipperary South: St Bernard’s Industrial School, Fethard; St Francis’s Industrial School, Cashel; and St Joseph’s Industrial School, Ferryhouse, Clonmel. These institutions are outside the Commission’s remit.

---

19 Dwyer, Diphtheria, (Liverpool, 2018), 94-110.
1960/61: Professor Patrick Meenan and Dr Irene Hillery, Wellcome’s ‘Quadrivax’ vaccine.

34.22 In 1960 and 1961, Professor Patrick Meenan and Dr Irene Hillery, both of the Department of Medical Microbiology, University College, Dublin, trialled Wellcome Laboratories Quadruple (4 in 1) vaccine ‘Quadrivax’ on 58 infants and children resident in a number of institutions, four of which come under the Commission’s remit: Bessborough, St Patrick’s Home, Navan Road (Pelletstown); Dunboyne; and Castlepollard. The other institutions involved were St Clare’s Home, Stamullen and Mount Carmel Industrial School, Moate. This trial is described under Trial B below.

1963: Professor Patrick Meenan, Oral Polio Vaccine Carrig-on-Barrow, County Wexford.

34.23 In 1963, Professor Meenan conducted a field-trial of Wellcome Laboratories Oral Polio Vaccine (OPV) in Carrig-on-Barrow, County Wexford. Professor Meenan received permission from the Department of Health to undertake the trial in conjunction with the Wexford health authorities. The extant documentation suggests that the trial was undertaken among the general community in Carrig-on-Barrow. There is no evidence to suggest that this trial was conducted in an institution under the Commission’s remit.

1964: Professor Meenan and Dr Hillery, Wellcome ‘Wellcovax’ Measles Vaccine Sean Ross, Roscrea.

34.24 In 1964, Dr Hillery conducted a trial of Wellcome Laboratories ‘Wellcovax’ measles vaccine on 12 children living in Sean Ross. This institution comes under the Commission’s remit and the trial is described under Trial C below.

1964/65 Professor Meenan and Dr Hillery, Glaxo Laboratories ‘Mevilin-L’ measles vaccine Dublin.

34.25 In 1964/65 Professor Meenan and Dr Hillery conducted a vaccine trial of Glaxo Laboratories ‘Mevilin-L’ measles vaccine in Dublin. There is evidence that this trial was undertaken on children living in two of the institutions under the Commission’s remit - Bessborough and St Patrick’s, Navan Road (Pelletstown). This trial is described under Trial D below.
CHAPTER 34 VACCINE TRIALS

1965: Professor Meenan and Dr Hillery, Glaxo Laboratories ‘Quintuple’ 5 in 1 vaccine.

34.26 In 1965, Dr Hillery conducted a trial of Glaxo Laboratories ‘Quintuple’ (5 in 1) vaccine on children resident in two institutions under the Commission’s remit - Bessborough and St Patrick’s, Navan Road (Pelletstown). This trial is described under Trial E below.

1968: Dr Victoria Coffey, Glaxo Laboratories measles vaccine St Patrick’s.

34.27 In December 1968/January 1969, Dr Victoria Coffey, Trinity College, Dublin, conducted a trial of Glaxo Laboratories ‘Mevilin-L’ measles vaccine on at least 30 children resident in St Patrick’s, Navan Road (Pelletstown). This trial is described under Trial F below.

1969: Professor Meenan and Dr Hillery, Wellcome Rubella vaccine trial, Westmeath. 23

34.28 In 1969, Dr Hillery and Professor Meenan undertook a field-trial of Wellcome’s Rubella vaccine involving 81 children living in the general community in Westmeath. The County Medical Officer for Westmeath facilitated the trial. The published trial results and associated documentation examined by the Commission suggest that this trial was not undertaken in a children’s residential institution and is not covered under the Commission’s remit.

1970: Dr Hillery, Wellcome Rubella vaccine, Dublin. 24

34.29 In 1970, Dr Hillery conducted a field trial of Wellcome’s Rubella vaccine on 72 children living in the general community and 69 children aged between two and 18 years old ‘resident in an orphanage in a suburb of Dublin’. The Commission has not been able to identify the orphanage but the age range of the institutional children involved suggests that this institution is not covered under the Commission’s remit.

1973: Professor Meenan, Dr Hillery and Dr Margaret Dunleavy, Wellcome Diphtheria, Tetanus and Pertussis (DTP) Trial, Dublin.

34.30 In 1973, Dr Hillery and Dr Margaret Dunleavy undertook a trial of Wellcome’s modified DTP vaccine on 65 children in the general community and 53 children resident in St Patrick’s, Navan Road (Pelletstown) and in three residential

children’s homes - Madonna House, The Cottage Home and Bird’s Nest Home. It was also conducted in another location which the Commission has been unable to identify. This trial is described under Trial G below.

**Unconfirmed vaccine trial**

34.31 There may have been an oral polio vaccine trial in St Patrick’s, Navan Road (Pelletstown) in 1965.

**Milk trials**

34.32 The Commission has identified two clinical milk trials both of which were conducted in institutions being investigated by the Commission - Pelletstown and Bessborough - in 1968/69. These were not vaccine trials and so do not come under the Commission’s specific vaccine trials remit. However, the Commission considers that they are relevant to other Terms of Reference, in particular in relation to conditions within the institutions and to the involvement of mothers in relation to decisions about their children. These trials are described below under Milk Trials.

**Trial A: 1935: Denis F Hanley, Wellcome’s APT anti-diphtheria vaccine Dublin.**

34.33 In 1934, the Dublin municipal health authorities introduced an anti-diphtheria immunisation scheme in city schools. Dr Denis Hanley, Assistant Medical Officer for the City of Dublin, conducted the childhood immunisation scheme under the supervision of Dr Matt Russell, Chief Medical Officer to the City of Dublin. Dr Hanley reported that, while children were presented willingly for the first injection, each successive visit met with increasing reluctance resulting in a reduced uptake of the subsequent vaccination injections. In the 1930s, diphtheria was one of the deadliest diseases of childhood. In Cork, Dr Jack Saunders, Chief Medical Officer for the City of Cork, definitively demonstrated the benefits of utilising Wellcome Laboratories experimental one-shot Alum Precipitated Toxoid (APT) anti-diphtheria vaccine in reducing the incidence of diphtheria and associated child mortality there. Before Dr Saunders’s intervention, Wellcome’s APT vaccine had not previously been tested on children. In 1935, the APT vaccine was not commercially available and was still considered by Wellcome to be in the experimental stage. However,

---

Dr Saunders’s application of the APT vaccine in Cork convinced the Department of Local Government and Public Health of its efficacy and safety and urged Dublin health authorities to adopt an anti-diphtheria scheme along the lines of the Cork model. Considering the endemic nature of diphtheria in the city, the Dublin public health authorities decided to explore the possibility of substituting the generally used three-shot vaccine with Wellcome’s APT vaccine in Dublin.

34.34 In January 1935, with the ‘consent and co-operation of the medical superintendent and staff’ of the Dublin Union, Dr Denis Hanley administered Wellcome’s APT vaccine to 24 children, varying in age from seven months to 14 years, resident in the institution. Satisfied that the trial had not produced ‘an unduly high percentage’ of reactions, Dr Hanley took further steps to ascertain the immunising power of the vaccine.

34.35 Early in 1935, Dr Hanley ‘sought and was readily granted’ permission to test Wellcome’s APT vaccine from the authorities at three children’s residential institutions: St Vincent’s Industrial School, Goldenbridge; St Joseph’s School for Deaf Boys, Cabra; and St Saviour’s Orphanage, Lower Dominick Street, Dublin. A combined 360 children, varying in age from four to 15 years were selected for inclusion in the trial. However, Dr Hanley found that 314 of the children selected had a natural immunity to diphtheria and were subsequently excluded from further tests. Forty six children drawn from the three institutions were subsequently included in the trial. Working on the results of his own investigations, and with the full support of the Dublin municipal health authorities, Dr Hanley administered Wellcome’s still experimental, and not commercially available, one-shot APT vaccine to 39,267 schoolchildren in Dublin.

**Compliance with regulatory and ethical standards**

34.36 In the 1930s, diphtheria took a heavy toll on child health and life expectancy. The Department of Local Government and Public Health (DLGPH) promoted childhood immunisation as the most effective means to tackle ‘this most deadly disease of childhood’. Dublin health authorities had long struggled to arrest the spread of diphtheria among school children and the disease had persisted in endemic form for over 25 years. Traditional methods of disease control had failed to stem the spread of the disease and Dublin health authorities were eager to embrace any option, however radical, to protect the lives of children. The DLGPH report for 1935/6 reported that, in the years 1933-35, 2,991 diphtheria cases were recorded.
in Dublin and 277 associated child deaths ensued. In this context, the decision to introduce Wellcome’s APT one-shot vaccine may be considered to have been an appropriate response to a pressing public health crisis. The fact that the DLGPH had authorised the Dublin public health authorities to import and use Wellcome’s APT vaccine suggests that Dr Hanley’s intervention in Dublin complied with the regulatory framework in existence at that time.

34.37 An examination of the institutional records of the Dublin Union and Pelletstown failed to identify the 24 children involved in Dr Hanley’s initial APT trial. However, it is more than likely that the children selected for inclusion were ‘illegitimate’ and unaccompanied children as most children resident there at the time were categorised as such. Children living in institutions were routinely used as research subjects in vaccine trials in the United Kingdom, the United States and several other jurisdictions at this time. In the United States, William Park and the New York Department of Public Health undertook vaccine trials in the Israel Orphan Asylum, the New York Foundling Asylum and the Howard Coloured Orphan Asylum. In the United Kingdom Wellcome Laboratories, in conjunction with the London County Council health authorities undertook vaccine trials in the Holborn and Lambeth Poor Law Schools and in Dr Barnardo’s Girls’ Homes, Ilford. Although the utilisation of institutional children as research subjects would not now be regarded as acceptable, these vaccine trials, along with the Dublin APT trials, pre-dated any formal codification of ethical practices in relation to clinical trials involving human subjects and may not have been in breach of any ethical guidelines in place at that time.

34.38 However, in the local authority anti-diphtheria immunisation scheme, overseen by Dr Hanley in Dublin schools during 1935, health authorities insisted on obtaining written parental consent before inoculating children. This applied to children treated in the city schools and to children treated in municipal public health clinics. In his published report on the matter, Dr Hanley emphasised the importance of obtaining written consent prior to treatment and provided a breakdown of the number of consent forms returned in each school. No child was immunised unless a written parental consent form was produced. However, Dr Hanley made no mention of consent, written or otherwise, in respect of institutional children. If the

children resident in the Dublin Union/Pelletstown were unaccompanied, and/or under the guardianship of the Dublin Board of Public Assistance, then Dr Hanley may have taken the ‘consent and co-operation’ of the medical superintendent as the consent of the children’s guardians.

34.39 The Dublin APT trial was part of a wider DLGPH initiative to reduce the negative impact of diphtheria on the health and life expectancy of Dublin school children. It was undertaken by the municipal health authority with ministerial approval and the vaccine was of direct benefit to those children resident in institutions as well as those among the public. The trial was not an academic or commercial exercise to assess the efficacy, or otherwise, of a new vaccine. Dublin health authorities had already decided to adopt Wellcome’s APT vaccine as the primary anti-diphtheria vaccine in the municipal childhood immunisation scheme and they had a duty of care to ensure that institutional children, as well as children among the general population, were afforded protection from diphtheria. The decision to undertake initial tests of the vaccine among vulnerable institutional children before rolling it out to the general population would not be regarded as acceptable practice today. However, even a cursory perusal of the most respected medical journals demonstrates that such practices were accepted in all jurisdictions in the early twentieth century and predated any codification of ethical standards pertaining to clinical research in human subjects.

Trial B: 1960/61 Professor Patrick Meenan and Dr Irene Hillery, Wellcome’s ‘Quadrivax’ vaccine.28

34.40 In 1959, Wellcome Laboratories considered developing a Quadruple (4 in 1) vaccine combining the Salk-type Polio vaccine with their commercially available Triple (Diphtheria, Tetanus, Pertussis) vaccine. The rationale was that Quadruple vaccine would reduce the number of injections necessary to confer immunity in infants. Wellcome considered that such a vaccine would be potentially beneficial to infants presented for immunisation as well as being ‘highly desirable administratively’. In early 1960, Wellcome produced ‘Quadrivax’; a quadruple vaccine. Dr Neville Butler, Health Department, Swindon, field-trialled ‘Quadrivax’

28 Irene B Hillery, P. N. Meenan: Department of Medical Microbiology, University College Dublin; A.P. Goffe, G.J. Knight, A.D. Kanarek: The Wellcome Research Laboratories; T.M. Pollock, Medical Research Department: The Wellcome Foundation Antibody Response in Infants to the Poliomyelitis Component of a Quadruple Vaccine', British Medical Journal, 21 April 1962, 1098-1102.
and found that the vaccine had poor antigenic effect.\textsuperscript{29} By October 1960, Wellcome had produced two further batches of the Quadrivax vaccine. Dr Tom Pollock, Wellcome Research Laboratories, contacted Professor Patrick Meenan, Head of the Department of Medical Microbiology, University College, Dublin, asking if he would be willing to conduct a clinical trial to compare the antigenic effect of Quadrivax with the standard Triple vaccine plus Polio immunisation schedule.

34.41 Professor Meenan had previously written to Dr David Long, Chief Medical Adviser to The Wellcome Foundation, regarding the prospect of conducting clinical trials of Wellcome products in Ireland. Professor Meenan stated that he had made discreet inquiries regarding children’s homes and asked Dr Long his views on conducting part of the proposed Quadrivax trial in children’s residential institutions in Ireland. Professor Meenan cautioned that, if the proposed trial was undertaken in conjunction with Irish public health authorities, it would be confined to infants who had already received some form of vaccination. Professor Meenan informed Dr Long that he would gather ‘some information on other field possibilities first’. In November 1960, Dr Pollock acknowledged that Professor Meenan had found ‘suitable participants for the Quadrivax studies’ and suggested to him that the clinical trial should be started immediately ‘if the infants are available now and you feel it is most convenient to begin’.

34.42 In December 1960, Dr Pollock drew up a Trial Protocol, ‘Comparison of Quadruple Antigen and Triple Antigen plus Polio Vaccine in Infants in Eire’, and forwarded it to Professor Meenan. The trial sought to study:

- The antibody response in infants to Salk polio vaccine when given in combination with Diphtheria toxoid, Tetanus toxoid and Pertussis vaccine (Quadrivax), and Salk polio vaccine given concurrently but not in combination with Diphtheria toxoid, Tetanus toxoid and Pertussis vaccine (DTPP)
- The individual influence upon these antigenic responses of (i) age and (ii) maternal antibody
- The co-relation of the antigenic responses obtained in (a) with those obtained in the [laboratory] chick.

\textsuperscript{29} Neville Butler, et al, ‘Immunization with Quadruple antigen’, Publication unknown.
34.43 The Trial Protocol stated that participants in the investigation would be infants aged between three and twelve months, ‘resident in children’s homes in Eire’. Children were to be immunised with either DTPP in one arm and Polio vaccine (Type I, II, III) in the other, or with Quadrivax.

34.44 The allocation of infants to each group due to receive the DTPP plus Polio vaccine regime, or to the group to receive Quadrivax, was done through random selection at the Wellcome Research Laboratories based on the age of the selected infants. Allocation of infants to the DTPP plus Polio vaccine group or to the Quadrivax group was arranged as follows:

Professor Meenan sent a list of the children’s homes concerned and the names and dates of birth of the infants who are to be vaccinated with their pre-vaccination blood samples. The Statistical Section at the Wellcome Research Laboratories, Beckenham, allocated the infants as due to receive one of the two regimes (Regime A or Regime B) in a way as to ensure that within each home each group contained equal numbers of children of the same age. At Beckenham, the name and date of birth of the child was entered on a Clinical Record Card labelled appropriately A or B. The Clinical Record Cards were sent to Professor Meenan. At the vaccination sessions the infants were immunised from ampoules marked A or B or B1 according to the Clinical Record Card held.

34.45 The Wellcome Immunological and Virological Departments, Beckenham, drew up a brief description of the vaccine trial suitable for inclusion in a published report. The Quadrivax, DTPP and Polio vaccines were each packed in 1 ml. containers and transported by air to Professor Meenan in an insulated box and kept refrigerated until use. The Polio vaccine component in the Quadrivax group and the Polio vaccine given concurrently with the DTPP were drawn from the same batch of vaccine. As an external check on this batch of Polio vaccine it was to be administered to a third group of infants aged seven months or older: an age when the antibody response was unlikely to be affected either by immaturity or by the presence of maternal antibody. A sample of six A, B and B1 ampoules used in the trial were returned by air to London where a potency test for Polio was estimated using chicks at Wellcome Research Laboratories. These levels were compared with the levels obtained from trial infants and children in Ireland.
34.46 In all cases, children received intramuscular injections into the deltoid area. Either 1 ml. of Quadrivax or 1 ml. of DTPP plus 1 ml. of Polio vaccine was administered according to the Clinical Record Card associated with the infant. Quadrivax or Polio vaccine was always administered in the left deltoid and DTPP in the right deltoid of the appropriate infants. Each infant received three injections at intervals of 28 days. Blood samples were taken (1) within 14 days of the first immunising session and (2) approximately 14 days after the third immunisation. The blood samples were forwarded by air in refrigerated containers to Dr Alan Goffe, Department of Virology at the Wellcome Research Laboratories, London. Professor Meenan held the clinical record cards of each child until the final blood sample was withdrawn. They were then returned to Dr Pollock, Wellcome Research Laboratories, for statistical analysis.

34.47 In April 1962, the *British Medical Journal* published the results of this quadruple vaccine trial. Dr Hillery and Professor Meenan were named as lead investigators. The stated rationale for the trial was that a satisfactory quadruple vaccine (Diphtheria, Tetanus, Pertussis, and Polio) would reduce the number of injections necessary to immunise a child in early childhood. The authors stated that quadruple vaccine had been used in the USA and Canada but that it was not in routine use in Ireland or the UK.

34.48 The trial of Wellcome’s quadruple vaccine was undertaken between December 1960 and November 1961. It involved 58 infants living in five children’s homes and 10 children living in an industrial school in Ireland. Documentation made available by GSK shows that 25 children were living in Bessborough; 14 were in Pelletstown; nine in Dunboyne; six in Castlereagh; these are all institutions being investigated by the Commission. Four children were living in St Clare’s, Stamullen. The third group of children in the control group ‘Regime B1’ were 10 children, aged between two and 12 years, living in Mount Carmel Industrial School, Moate. The Commission has identified all 68 children involved in this trial.

**The trial in Bessborough**

34.49 The Bessborough institutional records show that 25 children living there were selected for involvement in the polio vaccine trial in 1960. They received their first inoculation on 9 December 1960; the second on 6 January 1961 and the third on 10 February 1961. In February 1961, Dr Hillery returned to Bessborough and extracted blood samples from the trial children.
34.50 Bessborough’s institutional records show that 12 children were assigned to Regime A and were administered Wellcome’s Quadrivax 4 in 1 combined vaccine (Diphtheria, Pertussis, Tetanus and Polio combined). Thirteen children were assigned to Regime B and were administered Wellcome’s Polio, Diphtheria, Pertussis and Tetanus vaccines following standard procedure used in the national childhood immunisation programme. The 13 infants assigned to Regime B were inoculated with commercially available vaccines and the method of inoculation employed did not deviate from that employed in the general childhood immunisation programme.

34.51 In Bessborough, 23 of the 25 children involved in the quadruple vaccine trial were living with their mothers in Bessborough at the time of this trial. One child involved in the trial was an abandoned child resident in the institution. The child had been placed in Bessborough by the Cork Board of Public Assistance who paid the Congregation of the Sacred Hearts of Jesus and Mary for the child’s maintenance. The institutional records show that 24 of the 25 children involved were public patients maintained there by Boards of Public Assistance.

34.52 The Bessborough institutional records show that at least five mothers of children resident in Bessborough who participated in the trial had mental health issues. Another mother was 17 years old.

**The trial in Pelletstown**

34.53 Fourteen children living in Pelletstown were involved in the 1960/61 Quadrivax quadruple vaccine trial. Dr Hillery administered the vaccines on 1 December 1960, 30 December 1960 and 27 January 1961. She administered the Quadrivax 4 in 1 combined vaccine to six children and the remaining eight were inoculated using routine vaccine and procedure. She returned in August and September 1961 and drew blood samples from the trial children.

34.54 The Pelletstown institutional records show that 13 of the 14 children involved were described as ‘illegitimate’. Nine were accompanied by their mothers at the time of the trial and five were unaccompanied.\(^30\) Three had been born in Grangegeorman Mental Hospital and admitted to Pelletstown unaccompanied. Another was

\(^30\) It should be noted that unaccompanied children were among the ‘Schedule A’ and ‘Schedule B’ groups.
described as an ‘abandoned’ child admitted unaccompanied. Two children were described as ‘mixed-race’.

The trial in Dunboyne

34.55 Nine children resident in Dunboyne were involved in the 1960/61 Quadrivax vaccine trial. All were ‘illegitimate’. Eight of the children were accompanied by their mothers. The mother of one child was under treatment in Mullingar Mental Hospital when Dr Hillery administered the first and second vaccinations and was present in Dunboyne on the date of the third vaccination. Dr Hillery conducted the inoculations on 1 December 1960, 29 December 1960 and 26 January 1961. She administered the Quadrivax 4 in 1 combined vaccine to five children and the other four were inoculated using routine vaccine and procedure. Dr Hillery returned to Dunboyne in February 1961 to extract blood samples from the trial children.

The trial in Castlepollard

34.56 Six children resident in Castlepollard were involved in the quadruple vaccine trials. The institutional records do not record the dates involved but it seems likely that Dr Hillery administered the vaccine there on dates between 1 December 1960 and 10 February 1961. All children were ‘illegitimate’, and all were accompanied by their mothers. Dr Hillery administered the Quadrivax vaccine to three children at Castlepollard and the remaining three were inoculated with a routine vaccine and procedure. She returned to Castlepollard in September 1961 to extract blood samples from the trial children.

Compliance with regulatory and ethical standards

34.57 The Commission understands the stated rationale for the trial of Quadrivax and recognises that there is no evidence that any child who participated in the trial was harmed in any way. However, it is abundantly clear that Trial B did not comply with the regulatory and ethical standards in place at the time:

- There was no import licence in place for the vaccine.
- The researchers did not have a research licence which covered research carried out in the children’s institutions.
- There is no evidence that consent was properly sought or received.
Import licence

34.58 Although the Quadrivax vaccine was composed of the same four commercially available Polio, Diphtheria, Pertussis and Tetanus vaccines used in the general childhood immunisation programme the product itself ‘Quadrivax’ was prepared by Wellcome Research Laboratories specifically for the purpose of a vaccine trial and, according to Dr James Kiely, former Chief Medical Officer, Department of Health, was not a commercially available vaccine. In his Report on 3 Clinical Trials, Dr Kiely concluded that, although the individual components of the quadruple Quadrivax vaccine were each covered by Wellcome Research Laboratories import licence, the Quadrivax vaccine itself was not.31 In January 1999, the Acting Head of Glaxo Wellcome’s Medical Department confirmed that Wellcome’s Quadrivax vaccine ‘was not used or licensed for use in the UK.’ In his 1997 report on the quadruple vaccine trial, Thomas McGuinn, Chief Pharmacist, Department of Health, confirmed that Wellcome’s quadruple Quadrivax vaccine administered to Group A ‘was clearly not licensed’ for use in Ireland under the Therapeutic Substances Act 1932.32

34.59 The Commission has not seen any evidence that Professor Meenan sought or received an import licence to import Wellcome’s Quadrivax vaccine used in this clinical trial.

Research licence

34.60 In July 1958, the Minister for Health granted a research licence to Professor Meenan. The research licence issued under the provisions of the Therapeutic Substances Act 1932, licensed Professor Meenan to import therapeutic substances for the purpose of scientific research. The terms of the licence specified that it applied only to Professor Meenan and to scientific research conducted only at the Department of Medical Microbiology, University College, Dublin, or ‘in such other place or places as the said Minister may from time to time authorise’.33

34.61 No documentary evidence has been produced to suggest that Professor Meenan sought ministerial approval to conduct the quadruple vaccine trial outside of University College, Dublin, or to conduct the quadruple vaccine trial in children’s

residential institutions. Dr Hillery did not hold a research licence and appears to have not been aware of the requirement to have one. In her formal statement to the Department of Health in 2000, she stated that, to her understanding, there were no statutory controls relating to vaccine trials in place at the time and that ‘the issue of non-compliance does not arise’. Dr Hillery told the Department of Health that she conducted all vaccine trials under the direction of Professor Meenan, and with his full knowledge. When, in 1990, Professor Meenan was asked about his involvement in vaccine trials in children’s residential institutions he stated that he presided over ‘several drug tests’ between about 1960 and 1975 and that the clinical work associated with them was supervised by Dr Hillery. However, the fact that her work was supervised by Professor Meenan does not explain why she was not aware of the statutory requirements which were in place.

**Consent**

34.62 The requirement to get consent for vaccine trials was very well known and respected in the conduct of such trials in the UK. Authors of published reports relating to two contemporaneous Wellcome-sponsored vaccine trials, (which reference the same scientists from the Wellcome Research Laboratories who were involved in Professor Meenan and Dr Hillery’s quadruple vaccine trial), suggest that the practice of getting parental consent for a child’s participation in a vaccine trial was common practice. In a published report of a measles vaccine trial involving 85 institutional British children, the authors, who included Dr Goffe and Dr Pollock of the Wellcome Foundation, explicitly stated that ‘parental consent for the vaccination of these children was obtained’. Similarly, the published report of clinical trials of a Wellcome measles vaccine involving 90 children in Ibadan and Ilesha, Nigeria, in 1960, (which also involved Drs Goffe and Pollock) also explicitly stated that ‘parental consent for vaccination was received for each child’.

34.63 It was accepted best practice in general immunisation schemes at the time in Ireland that the consent of the relevant person should be in writing. Written parental consent was a prerequisite for children receiving immunisation under a local authority immunisation scheme since at least 1935. School children who did not produce a written consent form were not eligible for immunisation.

34 **Sunday Tribune**, 28 October 1990.
34.64 In the case of Trial B, it appears that the researchers proceeded with a vaccine trial based on a loose arrangement with the institutional medical officers who themselves may not have been fully informed about the nature of the work. There is no evidence that the consent of mothers was sought or received; similarly, there is no evidence that the consent of possible guardians was sought or received. Professor Meenan has always asserted that consent was obtained from institutional medical officers. He has said that he did not secure parental permission from women in residential institutions. Dr Hillery has stated that she obtained consent from medical officers in charge of the children’s institutions but her public statements about getting consent from mothers are conflicting. On one occasion she said that she had received consent from ‘those mothers who requested information’. She has also stated that she did not consult the mothers so that they could ‘maintain their anonymity’. On another occasion she has stated that she consulted all parents where available. She was quoted in a Sunday Tribune article as saying, ‘I never got them to sign anything as there was no requirement for consent forms’.

34.65 The first draft of the British Medical Journal (BMJ) article in which this trial was reported named all five children’s homes in which Professor Meenan and Dr Hillery trialled the quadruple vaccine. This section was subsequently withdrawn prior to publication. In the published article, the authors, Dr Hillery and Professor Meenan, named and thanked five medical officers who they stated ‘had granted them permission to carry out this investigation on infants under their care’ but did not name the institutions involved.

34.66 There is nothing in the institutional records or any other documentation seen by the Commission that suggests that the institutional medical officers named in the published report discussed the question of vaccine trials or any attendant issues with either the mothers who were present in the institution or the owners or administrators of the institutions or with any local or national health authorities.

42 Irene Hillery, Response to the draft Report of the Chief Medical Officer into vaccine trials in the 60s and 70s, 4 May 2000.
43 Sunday Tribune, 28 October 1990.
34.67 One of the medical officers named in the publication is Dr R Sutton. At the time of the quadruple vaccine trial, he was the medical officer to Bessborough. The Bessborough institutional records do not include any documentary evidence to suggest that Dr Sutton discussed the matter with or informed either the mothers who were resident there at the time or the Congregation of the Sacred Hearts of Jesus and Mary or the Boards of Health/Public Assistance who were paying for the children involved. In an affidavit drawn up for the Commission to Inquire into Child Abuse in 2002, Sister Sarto said that, to the best of her knowledge, information and belief,\(^{44}\) the trial was conducted by Professor Hillery, acting with the authority of the Department of Health and in co-operation with Dr Sutton. She said that the local health authority attended annually to administer vaccines to the children. She said that the vaccines administered in 1961 were part of the annual programme. Former residents of Bessborough have insisted to the Commission that they were unaware that their children had been part of a vaccine trial and have remained equally insistent that their consent was never sought for their children’s involvement. It appears that Dr Sutton, in his capacity as medical officer, independently granted access to Bessborough and to the children under his medical care there.

34.68 Dr Hillery stated that the children in Pelletstown were presented to her by the medical officer ‘who was responsible for the assessment of the children’s health and their suitability for vaccination’. Dr Victoria Coffey was the medical officer when Dr Hillery undertook the quadruple vaccine trials there. In a letter to Dr W L Burland, Glaxo Laboratories, in October 1968, Dr Coffey confirmed that she was aware that Dr Hillery was conducting vaccine trials on children in her care in Pelletstown and that she had assisted Dr Hillery in doing so.

34.69 The Pelletstown institutional records show that it was the matron who gave written consent for all medical procedures which unaccompanied children underwent. When infants from the institution were presented for standard routine vaccination at municipal public health clinics written consent was obtained from either a parent or guardian. This was usually the matron. Pelletstown was a local authority institution and the matron was a local authority employee. The local authority may have been the guardian of unaccompanied children in Pelletstown.

\(^{44}\) Sister Sarto was not in Bessborough when this trial was conducted.
34.70 The Commission has seen no documentary evidence to suggest that the researchers informed the matron or the Dublin Health Authority that children resident in Pelletstown were to be used as research subjects in a vaccine trial. It would appear that Dr Coffey may have been solely responsible for providing Professor Meenan and Dr Hillery with access to Pelletstown.

34.71 The Dunboyne institutional records contain completed written consent forms relating to instances where infants resident there were presented for immunisation at the public health clinic. These consent forms were signed by either the mother or the matron. The Commission has not found any evidence of written consent forms relating to the quadruple vaccine trial. The Good Shepherd Sisters who ran Dunboyne adamantly refute claims that they knowingly allowed ‘vaccine studies or trials’ to be carried out on children resident there. It appears that Dr Hillery was given access to Dunboyne by the medical officer as he was one of those named in the published report.

34.72 As with the other institutions involved no written consent forms have been produced to indicate that Dr Hillery obtained parent or guardian consent in Castlepollard.

**Adverse consequences**

34.73 In January 1961, several children involved in the quadruple vaccine trial in Bessborough fell ill. All afflicted children experienced vomiting and mild diarrhoea after receiving the second inoculation. In her report on the matter to Dr Pollock, Dr Hillery stated that 15 of the 22 infants who received the second inoculation at Bessborough subsequently fell ill. Two children resident in Bessborough who were not involved in the trial also fell ill with the same symptoms. The remaining three children from the original group of 25 had been discharged from the home for adoption. Two of these children were administered the second inoculation in their foster homes and, as far as Dr Hillery was aware, had not become ill. Another child, who had been discharged for adoption the day before the second inoculation was due, had also fallen ill with vomiting and diarrhoea although he had not received the second inoculation.

34.74 Thirty-three children resident in the four other institutions involved in the Quadrivax trials, and ten older children in Moate Industrial School, had all received the second inoculation from the same batch of vaccines and none had fallen ill.
Analysis of the Bessborough medical records show that infants inoculated under both Regime A and Regime B had fallen ill. As both groups had been administered different vaccines it is not possible to say with any certainty that the illness experienced by the infants at Bessborough was caused by one of the vaccines. All affected infants fully recovered from their illness and all were presented for the third inoculation without any further complications.

34.75 At Wellcome, Dr Pollock was anxious to know if the vaccine could have been in any way responsible for causing the illness at Bessborough. Professor Meenan undertook bacteriological examination of faecal specimens taken from the afflicted children and reported that ‘nothing had shown up’ to suggest that Wellcome’s vaccines were responsible. In a letter to Dr Goffe, Professor Meenan conceded that he ‘had not yet got to the bottom of the Cork episode after the second injection’ but he suspected that the second inoculation had coincided with an outbreak of influenza in the institution.

34.76 There is no documentary evidence of any adverse consequences among the Pelletstown, Dunboyne or Castlepollard children.

Claims that the Bessborough vaccine trial documentation was ‘altered’

34.77 On 15 November 2016, the Irish Examiner reported that files relating to children involved in the quadruple vaccine trial in Bessborough had been altered. The claim was based on a one page document listing 16 changes to information collated by staff at Bessborough on foot of a discovery order issued by the Commission to Inquire into Child Abuse (CICA) in 2002. The Irish Examiner article caused great distress among former Bessborough residents who called for ‘a full criminal investigation’ into the matter. One former resident who was directly involved in the quadruple trial in Bessborough told the Commission that she filed a criminal complaint with An Garda Síochána and also complained to the Data Protection Commissioner.

34.78 The Commission has examined the document on which the Irish Examiner based its claim. This was not an original document from the institutional records but rather a document compiled by Bessborough staff for the Commission to Inquire into Child Abuse. The Commission has concluded that there were no alterations made to any original institutional document. The alterations that were made
involved corrections to the information previously supplied to CICA which had been found to be incorrect.

34.79 Most of the changes made were minor. In the case of the complaint filed with An Garda Síochána, the ‘altered’ information related to the county of origin of the complainant’s mother: the word ‘Dublin’ was correctly inserted instead of ‘All Counties’.

34.80 The changes which caused most controversy related to instances where the discharge dates of three women were extended by periods of four months, twelve months and two years, respectively. The Commission has cross-referenced these dates with the original documents and can state that the amended dates of discharge were, in fact, correct. The original dates recorded by staff at Bessborough related to the discharge of the three women from the Bessborough Maternity Hospital. The amended dates related to the final discharge of the women from the Bessborough Home. (see Chapter 18).

**Trial C: 1964: Professor Meenan and Dr Hillery, Wellcome ‘Wellcovax’ Measles Vaccine Sean Ross**

34.81 In August 1964, Dr Hillery trialled a Wellcome Laboratories Measles Vaccine at Sean Ross Abbey. The stated objective of the trial was to compare the anti-body response and reaction after vaccination with 1 ml. of Measles Vaccine 27 and 0.1 ml. MV27.

34.82 In Wellcome’s Trial Protocol, Dr Pollock, Wellcome Research Laboratories, stated:

> The trial will be made in appropriate infant homes in Eire under the direction of Professor Meenan and Dr Hillery will carry out the field work. The infants concerned will be those without a previous history of measles, aged eight months or more. About thirty infants will be concerned. As soon as the infants’ ages and names are known, a list will be sent by Dr Hillery to Mr Knight [Wellcome Laboratories] who will allocate children to receive either the small or large dose. The trial will begin about the middle of August.

34.83 Dr Hillery selected 32 children resident in Sean Ross for inclusion in a field-trial of Wellcome’s MV27 measles vaccine. The MV27 vaccine was not a licensed or

---

45 *Wellcome Measles Vaccine (MV27) Trial, Sacred Heart Home, Sean Ross, August 1964. (Unpublished)*
commercially available measles vaccine. When it transpired that 20 of the selected children had previously had measles, Dr Hillery removed them from the trial. She took pre-vaccination serum samples from the remaining 12 children aged between eight and 18 months. Later she administered the Wellcome measles vaccine to all 12 children. She then took post-vaccination serum samples from ten of the 12 children and sent them to the Wellcome Research Laboratories, Beckenham. Dr Hillery stated that she had made arrangements with ‘the sister in charge’ at Sean Ross to take a rectal temperature from each child before vaccination and every day for the following fourteen days.

34.84 In a letter to Professor Meenan in March 1965, Dr Goffe, Wellcome Research Laboratories, concluded that although the measles vaccine trial at Sean Ross had been disappointing it had produced ‘very useful results’. The measles vaccine failed to confer immunity in more than half of the trial children and Dr Goffe conceded:

> Retrospectively we have established that this particular batch of vaccine MV 27 was an unstable lot after freeze-drying and this explains the low conversion rate. We have now got a lot more stable vaccine and we should be glad to let you have some if you would like to repeat the exercise.

34.85 It subsequently transpired that Dr Hillery had inadvertently administered 0.1 ml. of Wellcome’s Measles vaccine to children at Sean Ross instead of the recommended 0.3 ml. dose. She gave Dr Goffe an undertaking to re-trial the MV 27 measles vaccine at a later date. However, Dr Hillery qualified her offer by informing Dr Goffe that she had recently completed a trial of a measles vaccine for Dr A J Beale of Glaxo Laboratories and that ‘this has used up my available sources of small babies for some months’.

**The children involved**

34.86 The Commission has identified all 12 children involved in this trial. Ten of the 12 children involved were accompanied by their mothers on the date of vaccination. Three of these women were aged under 18 years; two were 17 and one was 16 years old. Another woman was described as ‘mentally retarded’ by a family member. Another child had been admitted to Sean Ross unaccompanied. In another case it is unclear if the child was accompanied or not on the date of vaccination.
Compliance with regulatory and ethical standards

34.87 It is clear that Trial C did not comply with the regulatory and ethical standards in place at the time:

- There was no import licence in place for the vaccine.
- The researchers did not have a research licence which covered research carried out in the children’s institutions.
- There is no evidence that consent was properly sought or received.
- The results of the trial were not published.

Import licence

34.88 While it is clear that new vaccines were developed and produced at Wellcome Laboratories under conditions which complied with contemporary safety standards as they applied to pharmaceutical companies in the UK, Wellcome’s MV 27 measles vaccine was not licensed for general use, it was not commercially available and was not covered by Wellcome’s Import Licence. There is no evidence that Professor Meenan applied for or received an import licence for the vaccine.

Research license

34.89 As described above, while Professor Meenan did hold a research licence to conduct trials in UCD, this did not permit him to carry out trials elsewhere. At this stage it is clear that Professor Meenan was aware that he needed ministerial permission to conduct clinical research outside of University College, Dublin and that the Department of Health was not willing to approve the conduct of such trials in children’s institutions.

34.90 In 1963 Professor Meenan had written to the Department of Health asking permission to import a live polio vaccine for use in a vaccine trial to be conducted among the general population of Carrig-on-Barrow, County Wexford, in conjunction with Dr Aughney, Wexford County Medical Officer. In his letter Professor Meenan stated:

I am not clear whether my own licence under the Therapeutic Substance Act is sufficient to enable me to import vaccine without any further special licence, but I am writing so that the Department would be aware of what is proposed.
The Department of Health, in response, confirmed that his research licence did not cover him to import a live polio vaccine for use outside the confines of University College Dublin. His application to extend the terms of the licence to include Carrig-on-Barrow was approved by the Minister for Health. The minister specified that full details of the application and approval of the vaccine trial were to be sent to the Wexford county medical officer and to the Wexford health authority.

A Department of Health document dated 30 September 1963 dealing with this application noted that, in April 1962, Professor Meenan had asked to field-trial an Oral Polio Vaccine in Pelletstown. In that instance, it was noted that the Department of Health had no objection to the trial itself but raised concerns regarding the selection of Pelletstown: ‘While the procedure proposed appeared to be a safe one, the selection of the group to participate was open to objection and approval was not given on that occasion.’

There is no documentary evidence to suggest that he subsequently sought or received ministerial permission to conduct clinical trials in children’s residential institutions and specifically no such evidence that would have covered this trial. Dr Hillery did not hold a research licence.

The Commission has not seen any evidence that consent was sought or received from either the mothers who were present in the institution, or the Congregation of the Sacred Hearts of Jesus and Mary who ran the institution, or from any health authority which may have been a guardian of the children. As already stated, Dr Hillery did arrange with the Sister in charge in Sean Ross to take the children’s temperatures before and after the vaccine was administered. There is nothing in the Sean Ross institutional files to indicate that this trial took place. Clearly the Sister in charge must have co-operated with the trial but there is nothing to indicate whether or not she understood its nature. No records which the Commission has seen indicate that the nursing staff at Sean Ross knew that they were monitoring children who were research subjects in a vaccine trial or that the medical officer in Sean Ross was involved in any way.

The results of the measles vaccine trial in Sean Ross were never published. This was in breach of the researchers’ ethical duties as set out in the Declaration of
Published in the year in which the vaccine trial in Sean Ross was undertaken, the Declaration of Helsinki stated that the results of all clinical trials involving human subjects should be published whether such trials had been successful or not. The declaration stated:

Researchers have a duty to make publicly available the results of their research on human subjects and are accountable for the completeness and accuracy of their reports. All parties should adhere to accepted guidelines for ethical reporting. Negative and inconclusive as well as positive results must be published or otherwise made publicly available.

Adverse consequences

The Commission has not found any evidence that any child involved in the trial suffered any adverse effects as a result of participation in the trial nor that any such trial child was left with no, or a compromised, vaccination status. One infant was recorded as having a 'slight temperature and rash' 14 days after vaccination.

Measles vaccine trials in the UK

Measles vaccine trials conducted in Ireland were undertaken on different terms to those which governed vaccine trials in the UK. Firstly, vaccine trials in the UK were conducted under the auspices of a professional medical body, the Medical Research Council. Secondly, they were undertaken with the full cooperation of general practitioners and public health authorities. Thirdly, they were undertaken on children from among the general population; they were not undertaken in children's residential institutions. Fourthly and critically, the participating children were included in the UK trial only when the relevant parental consent had been obtained.

In 1964 the British Measles Vaccine Committee undertook a vaccine trial to compare measles vaccines prepared by Wellcome Laboratories; Glaxo Laboratories and Pfizer Ltd. The vaccines were prepared under the auspices of the British Medical Research Council's Measles Vaccine Committee and involved 242 children attending 38 general practitioners and 108 children attending day nurseries in London. The trial was undertaken with the cooperation of the Chief Medical Officer of London County Council, 38 general practitioners and the administrators of 20 day nurseries. The published findings of this study, which
appeared in the *British Medical Journal* in March 1965, stated that ‘the parents were approached and, in each case, agreed to the participation of their children’. In late 1964/early 1965, the British Medical Research Council undertook clinical trials to assess the efficacy of the measles vaccine produced by Glaxo Laboratories. The vaccine trial, which included over 47,000 children, was conducted under the auspices of the British Measles Vaccines Committee with the cooperation of Municipal Medical Officers. The children involved were drawn from the general population and parental consent was secured in every case.

**Trial D: 1964/65 Professor Meenan and Dr Hillery, Glaxo Laboratories ‘Mevilin-L’ measles vaccine Dublin**

In 1990, in response to media queries, Professor Meenan and Dr Hillery acknowledged that they had undertaken vaccine trials in children’s residential institutions in Ireland. In a statement to the *Sunday Tribune*, Dr Hillery stated that ‘Wellcome was the sole sponsor’ of vaccine trials undertaken by her and Professor Meenan. However, the Commission has confirmed previously undisclosed vaccine trials in children’s residential institutions which were undertaken by Professor Meenan and Dr Hillery and sponsored by Glaxo Laboratories.

In 1965, Professor Meenan and Dr Hillery trialled a Glaxo Laboratories measles vaccine in Dublin. In May 1964, a Glaxo Clinical Trials Meeting was told that Professor Meenan was anxious to ‘do something on measles’. In December 1964, Dr A J Beale, Glaxo Laboratories, forwarded 50 doses of Mevilin-L adjuvant measles vaccine and 50 doses of an adjuvant placebo to Professor Meenan and Dr Hillery. A confidential memorandum relating to biological research activities involving Glaxo products in the period January to March 1965 referred to the clinical trials involving Glaxo measles vaccines which ‘were carried out in Dublin by Professor Meenan’.

49 Department of Health file: INACT-INA-O-451644.
34.102 The published results of this trial in the *Lancet* do not state when or where the trial was undertaken.\(^{51}\) It is not clear from the *Lancet* article whether institutional children were used as research subjects for the Dublin measles vaccine trial nor does it give any indication as to where the trial was undertaken. However, the evidence suggest that it was probably undertaken in a children’s institution.

34.103 Thirty-four children aged over eight months were the research subjects. Blood samples were taken from children selected for participation in the trial one month before the first measles vaccine, Glaxo’s inactivated measles vaccine, was administered to 34 children. A second measles vaccine, Glaxo’s attenuated measles vaccine, was administered to one half of this group of children one month later.

34.104 The *Lancet* article outlined the protocol followed by Dr Hillery while undertaking the Dublin measles vaccine trial. Serum samples were taken before and one month after vaccination and children had rectal temperatures taken for 14 days after vaccination. This mirrors the approach adopted by Dr Hillery while undertaking the previously discussed measles vaccine trial in Sean Ross some months earlier (Trial C). Children involved in the Dublin measles vaccine trial had a rectal temperature taken at 6pm each evening; this would probably have been difficult to arrange outside of an institutional setting. In addition, the trial results refer to ‘the adults looking after the children’ rather than referring to parents.

34.105 There were few institutions in Dublin where 34 children aged between eight and twelve months could be monitored for a period of two weeks. As already discussed, Professor Meenan and Dr Hillery had previously undertaken clinical trials in Pelletstown in 1960/61 and they had done so with the co-operation of the institutional medical officer Dr Victoria Coffey. The Commission considers it likely that children living in Pelletstown were involved in the Glaxo measles vaccine trial but has found no conclusive evidence in this regard. Despite thorough analysis of Pelletstown’s institutional records, the Commission did not identify children who may have been involved in the Glaxo measles trial.

34.106 However, there is evidence that Bessborough children may have been involved. Analysis of Bessborough’s institutional records identified seven children whose

---

medical records suggest that they were involved in a measles vaccine trial conducted in the manner described. Medical records relating to all seven children contained handwritten lines which read ‘Blood spec. taken for measles vaccine’ and ‘1st injection for measles’. All seven children were over eight months old and match the age profile of children involved in this measles vaccine trial. All blood specimens were taken on 18 November 1964 and all ‘1st measles vaccines’ were administered to children on 7 December 1964. Glaxo had dispatched a consignment of their inactivated and attenuated measles vaccines to Professor Meenan and Dr Hillery in December 1964. The Commission takes the view that, on the balance of probabilities, the measles vaccine trial may have been undertaken, at least partially, in Bessborough.

Compliance with regulatory and ethical standards

34.107 As so little is known about this trial, it is difficult to know whether or not it complied with the regulatory and ethical standards of the time. It seems unlikely that it was covered by the terms of the research licence which Professor Meenan held. Nothing is known about what consents, if any, were sought or obtained.

Trial E 1965: Professor Meenan and Dr Hillery, Glaxo Laboratories ‘Quintuple’ 5 in 1 vaccine

34.108 In 1965, Dr Hillery field-trialled Glaxo Laboratories’ Quintuple (5 in 1) Measles Vaccine. The stated purpose of the trial was to assess the effectiveness of Glaxo’s Quintuple measles vaccine on its own, as compared with the Quintuple vaccine supplemented by a follow-on attenuated measles vaccine. The trial protocol named Dr Hillery, University College, Dublin, as lead investigator and Dr Beale, Glaxo Laboratories, as ‘the person responsible for follow-up of the trial’. The vaccine used was Glaxo Quintuple V CT21:

34.109 The immunisation schedule was as follows:

1. Quintuple as primary course (not earlier than 3 months of age)
2. Inactivated Measles (not earlier than 3 months of age).
3. Both groups to receive 5 doses at monthly intervals and to be bled before and one month after the third dose. Six months after primary immunisation half the children to receive a booster dose of inactivated measles and the

---

other half an attenuated measles vaccine—the child being bled before and one month later.

34.110 An examination of a contemporaneous published article leads the Commission to the view that the vaccine schedule outlined in this trial of Glaxo’s Quintuple vaccine is identical to that outlined in the published results of another trial of Glaxo’s Quintuple vaccine carried out by A.J. Beale in association with researchers at the Middlesex Hospital Medical School, London, and the Department of Microbiology, Queens University, Belfast, in 1966.53

34.111 On 25 August 1965, Dr Hillery initiated a trial of the Quintuple vaccine in two of the institutions being investigated by the Commission - Pelletstown and Bessborough. Dr Hillery administered the Quintuple vaccine to three infants resident in Pelletstown on 25 August, 22 September and 27 October 1965. She administered the Quintuple vaccine to 16 infants resident in Bessborough on 26 August, 25 September and 23 October 1965. All 19 infants received the first injection; 15 received the second injection and seven infants received all three injections while resident in one of the institutions. Most children involved in the trial were adopted and discharged from their respective institutions during the timeframe of the vaccine trial. Dr Hillery administered the third injection to at least two children in their adoptive homes. The Commission heard evidence that Dr Hillery may have visited all discharged children in their adoptive homes to administer the later injections and, on separate occasions, to take blood samples from children. A former resident of the Bessborough Home produced a letter to the Commission, dated 13 April 1966, from an adoption agency to one foster mother to let her know that ‘a lady doctor, Dr Hillery’ would be calling to her home to give her foster child an injection. The letter stated: ‘She gave [the child] course of inoculations when he was in Bessborough and he is due one further injection and it is necessary that she gives this herself’.

34.112 Further evidence heard by the Commission suggests that there may have been up to 25 infants involved in the Glaxo Quintuple vaccine trial. The Commission has identified 19.

The children involved
34.113 Eighteen of the identified 19 infants involved in the Quintuple vaccine trial were in the institution with their mothers at the time of vaccination. The institutional records from Pelletstown and Bessborough show that two of the mothers were under 18 years of age. One woman was described as being of ‘very low mentality’ and another had suffered a ‘nervous breakdown’. One child, described as ‘an unaccompanied foundling’, was awaiting adoption in Bessborough. Another child was suspected of having Cerebral Palsy and another was referred to as a ‘mixed race child’.

Compliance with regulatory and ethical standards
34.114 It is clear that this trial did not conform to the regulatory and ethical standards in place at the time.

Import Licence
34.115 Dr Hillery is named as the sole clinical investigator in this trial. Dr Hillery did not hold a research licence to import vaccines. Furthermore, the vaccine was not covered by Glaxo Laboratories Import Licence. The vaccine was prepared by Glaxo Laboratories specifically for field-trial in Ireland and was not licensed for commercial use in Ireland or the UK.54

Research licence
34.116 There is no evidence that Dr Hillery held a research licence to conduct such trials.

Consent
34.117 A former resident of Bessborough has publicly stated that she did not know that her child was part of a vaccine trial and that she was not asked for consent for her child’s participation.55 There is no evidence that consent was sought or received from the mothers who were in the institutions, the authorities in the institutions or the health authorities who may have been the guardians of children in the institutions.

54 This quintuple vaccine appears to be the same or similar to the quintuple vaccine prepared by Glaxo and trialled by G.W.A Dick et al. See Dick, G.W.A., et al, ‘Quintuple vaccine’, *Lancet*, 20 August 1966, 424-5.

**Chapter 34 Vaccine Trials**

### Adverse consequences

34.118 One child died of cardiac and respiratory failure two weeks after receiving the first injection. The available medical records do not suggest that this child’s death was in any way linked to the vaccine.

### Trial F 1968/69 1968: Dr Victoria Coffey, Glaxo Laboratories measles vaccine, Pelletstown

34.119 GlaxoSmithKline supplied the Commission with a list of vaccine trials conducted worldwide in the period November 1963 to December 1968. One of the listings was a trial of a Glaxo measles vaccine involving Dr Victoria Coffey, Trinity College, Dublin. Dr Coffey was also institutional medical officer to Pelletstown. At a meeting of Glaxo’s 25th Biological Clinical Trials Committee in January 1968, Dr W L Burland, Head of clinical research at Glaxo Laboratories, stated that he had recently visited Ireland and that ‘both the Public Health Department in Cork and Dr Coffey, Trinity College, Dublin, had indicated that they would be prepared to undertake trials’.

34.120 In June 1968, Dr Coffey informed Dr Burland that she had spoken to ‘the Chief Medical Advisor to the Government’ who had informed her that he was very interested in the proposed measles survey and that he wished to be kept informed of the results. Dr Coffey suggested that the measles vaccine trial should involve 50 trial children and an equal number of control children. In return for conducting the measles trial, Glaxo promised Dr Coffey a grant to assist towards the purchase of laboratory equipment. Dr Coffey asked that the grant would be sent to the Medical Research Council of Ireland. In July 1968 Glaxo issued a cheque to the value of £230 to Dr Coffey made payable in her own name. Dr Burland wrote to Dr Coffey suggesting that 100 trial children and 100 control subjects would be a more suitable number for the proposed measles trial and requested more details of Dr Coffey’s plans. Dr Coffey informed Dr Burland that she did not wish to discuss the proposed measles trial by post and suggested that they discuss the details in person on his visit to Dublin in August 1968.

34.121 Following their meeting in Dublin, Glaxo forwarded Dr Coffey a Trial Protocol relating to a field trial of Glaxo’s Measles vaccine in Dublin. The Trial Protocol named Dr Victoria Coffey as lead clinical researcher and Dr W L Burland was

---

56 *Dr Victoria Coffey/Glaxo Measles (BT 58) Vaccine Trial Dublin December 1968. (Unpublished)*
assigned to follow up on the trial on behalf of Glaxo Laboratories. The Trial Protocol also stated that Dr Hillery, Dublin, would carry out Measles HA titres. The Trial Protocol read as follows:

- **Measles Vaccine Trial**
- **Final Protocol**
- **Clinician:** Dr V. Coffey
- **Glaxo Laboratories:** Dr W.L. Burland
- **Purpose of Trial:** 1. Establish the form and rate of reactions in children to a single dose of live further attenuated measles vaccine prepared from the Schwarz strain of virus. 2. To estimate the effectiveness of vaccination as measured (a) by post-vaccination antibody levels and (b) by protection from the natural infection after sibling contact.
- **Materials/Vaccine:** Live further attenuated measles vaccine (Schwarz strain). Each dose contained in 0.5ml for subcutaneous injection.
- **Population:** 250 healthy, susceptible children aged 12 months or more with an older susceptible sibling living at home. Some children in St Patrick’s Home, Dublin, will be vaccinated and each paired with a susceptible child of like age as control. (Exclude children with a personal history of convulsions, or allergy, asthma and eczema, or strong family history of same).
- **Method:** Each of the children should be vaccinated and then these and their sibling controls observed for any symptoms such as fever, rash, Coryza, pharyngitis, cough, conjunctivitis, vomiting, diarrhoea, anorexia and others during the following three week period.
- **Every 5th child will be bled immediately prior to vaccination and again 4 weeks later.** Paired sera should be separated and assayed for measles HI antibody titres.
- **The children will be followed up and the incidence of measles in the susceptible sibling contacts and the vaccinated children recorded after twelve months or after the next measles epidemic.**
- **Assays:** Measles HA titres will be carried out by Dr Hillery, Dublin.

34.122 On 5 September 1968, Dr Coffey told Dr Burland that she had come up against ‘the usual complications’ while trying to arrange to field-trial Glaxo’s measles vaccine in Dublin. Dr Coffey had planned to conduct the trial in association with the Dublin Child Welfare Service. However, she said that the Dublin health
authorities refused to facilitate her on the basis that the risk of convulsions and other adverse reactions were too high and they were not prepared to accept responsibility for this. In response, Dr Burland advised Dr Coffey to liaise with Dr Hillery as 'she may be able to suggest a way in which you could overcome the problems you have encountered'. On 3 October 1968, Dr Coffey replied:

Thank you for your letter of 23 September concerning the measles vaccine trial. I agree that Dr Hillery was able to follow-up her cases easily because most of her trials were carried out in St Patrick’s Home and only necessitated the children being detained there for six weeks. In this I was able to assist her whereas in the measles trial it would necessitate detaining them for twelve months. However, with your offer for financial assistance in the follow-up trial this would be much simpler. I could carry out the trial in St Patrick’s and arrange the follow-up by a junior doctor. By this means I could easily trial at least 250 children and we could start as soon as you would be agreeable to let me have the material.

On 30 October 1968, Dr Burland sent a cheque for £250 to Dr Coffey 'to meet the expenses involved in your proposed measles trial' and notified her that the supply of vaccine for use in the trial had been dispatched to Dublin. The minutes of Glaxo’s 31st Biological Clinical Trials Meeting, held on 27 November 1968, confirmed that 250 doses of Glaxo’s ‘Mevilin L’ vaccine had been supplied to Dr Coffey and that the ‘B.T. 58 Measles Vaccine Trial’ was underway. A Glaxo Laboratories memorandum written in February 1969 noted that Dr Coffey had vaccinated 30 children with Glaxo’s trial vaccine and that she was ‘actively searching for suitable families’ to take part in the trial. The Commission has not been able to identify the children involved in this trial.

**Compliance with regulatory and ethical standards**

It is clear that this trial did not conform to the ethical and regulatory standards in place at the time. There is no evidence that Dr Coffey applied for or received a research licence under the *Therapeutic Substances Act*. There is no evidence that the relevant consents were sought or given. Glaxo’s Mevilin-L (live attenuated) Measles Vaccine appears to have been commercially available in Ireland since 1966 and is presumed to have been covered for importation under Glaxo’s Import Licence.
Adverse consequences

34.125 As the Commission has not been able to identify the children involved, there is no information available on any possible adverse consequences for them.

Trial G: 1973 Professor Meenan, Dr Hillery and Dr Margaret Dunleavy, Wellcome Diphtheria, Tetanus and Pertussis (DTP) Trial, Dublin.\(^{57}\)

34.126 The stated purpose of this study was to compare the reactogenicity\(^{58}\) of commercially available combined Diphtheria/Tetanus/Pertussis (DTP) vaccines, Trivax and Trivax AD, developed and marketed by Wellcome, with a new modified combined DTP vaccine containing a ‘two-phase’ pertussis component developed by the Wellcome Research Laboratories, Beckenham, Kent. In their Protocol for Clinical Trial of the modified DTP vaccine, Wellcome stated that commercially available DTP vaccines contained 20,000 million killed pertussis organisms and were known to cause ‘minor disturbances’ in up to 50% of children after inoculation. The new modified DTP vaccine contained 15,000 million killed pertussis organisms and in theory this would attenuate post-vaccination reactions in children without lowering the potency of the vaccine.

34.127 Wellcome was a commercial company and, not surprisingly, there was a significant commercial impetus behind this trial. In the late 1960s and early 1970s Wellcome’s Trivax and Trivax AD vaccines competed with similar commercially available vaccines developed, licenced and marketed by Glaxo Laboratories and the Lister Institute. Trials designed to assess and compare different brands of commercially available DTP vaccines were previously undertaken by the municipal health authority in Cardiff and by clinicians at Guy’s Hospital, London. It is evident from Wellcome documentation that pharmaceutical companies eagerly anticipated results which would give their product a marketable edge over their competitors. Trial results, however, revealed no discernible difference between the commercially available DTP vaccines. It was within this milieu that the idea of a modified Wellcome DTP vaccine emerged. Wellcome’s stated aim was to produce a modified DTP vaccine with ‘a real possibility of reduced reactions and increased potency’. According to contemporaneous documentation surrounding the project,

\(^{57}\) The Wellcome Foundation Ltd: Clinical trial to compare the reactogenicity of commercially available batches of the combined Diphtheria/Tetanus/Pertussis (DTP) vaccines Trivax and Trivax AD with a modified combined DTP vaccine containing a ‘two-phase’ Pertussis component. (Unpublished) 1973.

\(^{58}\) Reactogenicity of a vaccine relates to its capacity to produce adverse reactions.
however, internal exchanges of memoranda as well as records of minutes of meetings regarding the modified DTP vaccine appear to show that Wellcome’s primary motivation for producing an improved DTP vaccine was a desire to cut production costs, to increase sales and to turn their DTP vaccine from a ‘loss-making product’ into a ‘moderately profitable’ one.

34.128 In August 1971, Wellcome Research Laboratories began production of their modified DTP vaccine. A Wellcome Laboratories memorandum revealed that, at this juncture, Wellcome had already made arrangements to conduct clinical trials of the modified DTP vaccine in Ireland. In August 1972, five separate batches of the modified ‘two-phase’ vaccine were bulked and laboratory tested and Wellcome submitted laboratory reports to the British Committee on Safety of Drugs for approval. Documentation produced by the Wellcome Foundation shows that the modified DTP vaccine complied with standards prescribed by *British Pharmacopoeia* (1968), the *Therapeutic Substances Act 1956* [UK], the World Health Organisation Technical Report Series and the *European Pharmacopoeia* (1971) Vol. II. As a further precaution, Wellcome recruited adult volunteers working at their research laboratory at Beckenham to participate in a trial which closely modelled the proposed trial due to be undertaken in Ireland. Acknowledging that their commercially available and modified DTP vaccines were normally given exclusively to infants, researchers at Wellcome were anxious to compare the effects of the new formulation vaccine with those produced by Trivax and Trivax AD ‘before proceeding to infant trials’.

34.129 In a Wellcome Laboratories memorandum dated October 1972, Dr A H Griffith, Head of the Department of Clinical Microbiology, Wellcome Research Laboratories, outlined the necessity to carry out clinical trials of Wellcome’s modified DTP vaccine. Dr Griffith stated that it was ‘difficult to arrange meaningful trials of any medicinal products in young children’ and that Professor Meenan, Department of Medical Microbiology, University College, Dublin, was willing to carry out the trials. Dr Griffith said that Professor Meenan, and his senior lecturer Dr Hillery, had a long association with Wellcome and had been ‘good collaborators on other lines’. He said that Professor Meenan had ‘appealed’ for a grant to employ a laboratory technician and recommended that Wellcome sanction a ‘non-renewable grant’ of £1,650. He also recommended that a ‘personal grant’ of £650 be put in place for Dr Hillery to draw down while undertaking the Dublin trials. Professor Meenan requested that the cheque for £1,650 be made payable in his
own name stating that he would endorse and forward it to the Secretary, Bursar, University College, Dublin. Wellcome’s grant to Professor Meenan was renewed in 1973 and again a cheque for £1,650 was made payable to him personally.

34.130 In October 1972, Dr Griffith forwarded draft protocols for clinical trials of Wellcome’s modified DTP vaccines to Dr Hillery and to Dr Margaret Dunleavy, Deputy Chief Medical Officer, Eastern Health Board, Dublin. Dr Hillery and Dr Dunleavy were asked to consider and comment on the draft protocols with a view to informing an application to the National Drug Advisory Board of Ireland, which had been established in 1966, for a clinical trial certificate. In February 1973, Dr Griffith forwarded a final draft of the application to Dr Hillery’s home address in Dublin with a handwritten note which read ‘Cheque for £300 enclosed’. Dr Hillery received the balance (£350) of Wellcome’s £650 ‘personal grant’ in November 1973.

34.131 In October 1972, Wellcome Research Laboratories authorised clinical trials of Wellcome’s modified DTP vaccine in Dublin with the proviso that an initial group of five subjects would be studied at least one week before the main study and that the main trial should proceed on the basis that there were no adverse side effects.

34.132 In February 1973, The Wellcome Foundation Ltd made an application for a Clinical Trial Certificate to the National Drugs Advisory Board. The four vaccines to be compared were:

- Trivax: Normal commercial preparation.
- Trivax AD: Normal commercial preparation.
- New DTP Plain: Batch No. PX 296 (in manufacturing Batch A) at 15,000 million organisms per dose.
- New DTP Adsorbed: Batch No. PX 297 (in manufacturing Batch A) at 15,000 million organisms per dose.

34.133 Wellcome’s finalised Trial Protocol proposed that clinical trials to compare all four vaccines for reactogenicity and antigenicity would be carried out ‘under existing practices’ in an institution and a day nursery among children who were due to receive routine immunisation with a standard DTP vaccine. Participants were required to be under 12 months old and either in care at an institution in Dublin or

59 Antigenicity: The property of being able to produce a specific immune response.
attending a day nursery in the city. Children were allocated to receive one of the
four vaccines (a 0.5.ml. dose on two occasions, separated by an interval of six
weeks).

34.134 Only children without previous history of immunisation or whooping cough were
deemed suitable for inclusion in the vaccine trial. Blood samples were to be taken
one week after the second dose was administered and sent to Wellcome
Laboratories to assess diphtheria and tetanus antitoxin levels and for slide
pertussis agglutinin tests. Temperatures were to be taken at the time of
vaccination and four to six hours later. The number of children in the trial was not
to exceed 120 with up to 30 in each group. Reactions were to be assessed by a
nurse or a doctor who would ‘call on the mother’ on the morning after vaccination
and complete a reaction form. The site of the vaccine was to be examined on this
occasion and seven days later when a second reaction form was to be completed.
The reactogenicity of the vaccine was to be assessed according to the data on
these completed forms. Dr Hillery and Dr Dunleavy were named as lead
investigators.

34.135 In April 1973, Dr Aileen Scott, Medical Director, National Drugs Authority Board,
approved the Wellcome Foundation Ltd application to conduct a comparative trial
of the reactogenicity of commercial Trivax and Trivax AD, and the corresponding
new DTP vaccines (Batch No. PX 296 and PX 297) made with an improved ‘two-
phase cultured’ pertussis component in Ireland. This approval came with a caveat
- the proviso was to the effect that the results of the investigation were to be
forwarded to the National Drugs Advisory Board on completion. On receipt of a
clinical trial certificate for the Dublin DTP trials Wellcome forwarded 100 doses of
Batch No. PX 296 and PX 297 to Dr Irene Hillery, University College, Dublin.

34.136 A Wellcome Research Laboratories memorandum of a phone call from Dr Hillery in
July 1973 suggests that the Dublin DTP trials had been initiated in June 1973.
Documents made available by the Wellcome Foundation confirmed that the Dublin
DTP trials among the control group, who were administered Wellcome’s
commercially available Trivax and Trivax AD by Dr Margaret Dunleavy, had
commenced in January 1973. The first doses of the new modified DTP vaccine
were administered some months later in June 1973. Minutes of the Sixth Meeting
of the Department of Clinical Immunology, Wellcome Research Laboratories, held
in June 1973, also confirmed that the Dublin trials of Trivax and the modified DTP vaccines were underway at that time.

34.137 In June 1973, Wellcome became aware that there had been a setback in the Dublin DTP trials. A significant number of adverse reactions were reported among children involved in the trial and two children had been hospitalised due to severe adverse reactions. A letter from Dr Dunleavy in August 1973 confirmed that post-inoculation reactions ‘were occurring with greater frequency’ and that all reactions were associated exclusively with Wellcome’s commercial ‘off the shelf’ Trivax and Trivax AD vaccines. Dr Dunleavy reported that most cases had ‘resolved themselves after a few days’ but noted that two children remained in hospital suffering ‘infantile spasms’.

34.138 One hundred and sixteen children were involved in the Dublin DTP trials. Fifty three institutional children were administered Wellcome’s modified APT vaccines. The remaining children, drawn from the general population, were administered Wellcome’s commercially available Trivax and Trivax AD DTP vaccines as part of routine immunisation procedure in public health clinics in Dublin.

34.139 Of the 53 institutional children 20 were resident in Pelletstown; 19 were in Madonna House, Blackrock, Dublin; seven were in Cottage Home, Dun Laoghaire; six were in Mrs Smyly’s Bird’s Nest Home, Dun Laoghaire and one lived in an institution which the Commission has been unable to identify. Pelletstown is the only one of these institutions which comes under the Commission’s remit. The Commission has identified all 20 infant residents of Pelletstown involved in this trial.

34.140 Dr Hillery administered Wellcome’s modified APT vaccine to the 20 children resident in Pelletstown on dates between 16 August 1973 and 30 April 1974; 14 were given the New DTP Plain (Batch No. PX 296) vaccine and six were given the New DTP Adsorbed (Batch PX 297) vaccine.

34.141 Thirteen children were administered vaccines on the same three dates: 16 August 1973; 27 September 1973 and 14 January 1974. Of these, five received three doses of antigen. The remaining seven received two inoculations; five had been discharged for adoption after the second inoculation.
34.142 Four children were administered vaccines on the same three dates: 22 January; 7 March and 30 April 1974. Of these, three received all three doses and the remaining child received two doses. The remaining three children received all three shots on 23 November 1973; 4 January 1974 and 11 March 1974.

**The children involved**

34.143 The Pelletstown institutional records show that all 20 children were unaccompanied ‘illegitimate’ children aged between three and nine months old. Seven had been admitted unaccompanied by their mothers; in the remaining 13 cases, mothers had discharged themselves. Two of the children were recorded as having Downs’ Syndrome; another had Crouzon Syndrome (Facial Deformity); another had Congenital Talipes Equino-Varus (Club Foot) and another had Congenital Heart Disease. Another was described as a ‘mixed race child’. Institutional records note that at least seven of the mothers had psychiatric disorders or were recorded as being ‘mentally handicapped’. Another mother was 15 years old.

**Compliance with regulatory and ethical standards**

34.144 In July 1997, the Minister for Health gave an undertaking to make enquiries into media allegations that vaccine trials had been undertaken in children’s residential institutions in Ireland. In his subsequent report on the matter Dr James Kiely, Chief Medical Officer, Department of Health made the following observations:

> The prevention and control of infectious disease was still considered to be of major public health importance at the time of the trial. The use of effective and safe vaccines was a major element in disease control and, given that the minimisation of adverse reactions was a major factor in the acceptance of vaccines by the general population, research which would result in the production of vaccines which had a lower incidence of reaction and were, therefore, considered to be safer, was an appropriate and reasonable subject for clinical trials.  

60

34.145 Wellcome’s application to the National Drugs Advisory Board stated that the purpose of the trial was to develop a less reactogenic and, in theory, safer DTP vaccine and as Dr Kiely concluded, this would have been ‘an appropriate and

---

reasonable subject for clinical trials’. As already noted, there were also significant commercial considerations involved in this trial.

34.146 A public statement issued by the Wellcome Foundation in July 1997 stated that the context in which the Dublin DTP trials were undertaken was a response to a request issued in August 1973 by the Eastern Health Board, through its Deputy Chief Medical Officer, Dr Dunleavy, to investigate the increased occurrence of adverse reactions to Wellcome’s commercial DTP vaccines, Trivax and Trivax AD - vaccines then in use in the Eastern Health Board’s Immunisation Programme. A public statement issued by Dr Hillery in July 1997 also stated that this was the reason for her involvement in the Dublin DTP trials:

When in 1973 it appeared there were more than the expected number of adverse reactions (such as soreness at the site of the injection, raised temperature and irritability) possibly associated with the triple (DTP) vaccine in use at vaccination clinics in Dublin, I agreed to undertake an investigation involving the vaccine on behalf of Wellcome.

34.147 In September 1973, Dr Dunleavy contacted Wellcome Laboratories ‘regarding the possibility of reducing or altering the pertussis element in their [DTP]vaccine’. As noted earlier, documents made available by the Wellcome Foundation clearly show that arrangements for the Dublin DTP trials had been made two years earlier, in August 1971. Furthermore, draft copies of the proposed Dublin DTP Trial Protocol were sent to both Dr Hillery and Dr Dunleavy in October 1972. One draft Trial Protocol explicitly stated that the vaccines would be trialled on ‘in-care children’ and on ‘infants under the care of Dr Dunleavy’.

34.148 In April 1973 the National Drugs Advisory Board issued a clinical trial certificate for the Dublin DTP trials naming Drs Hillery and Dunleavy as lead clinical investigators. In addition, DTP Reaction Forms made available by the Wellcome Foundation unequivocally show that children administered the commercial Wellcome DTP vaccines, Trivax and Trivax AD, received their first inoculations in January 1973. Similarly, the same records show that children administered Wellcome’s modified APT vaccine received their first inoculations in June 1973. Thus, it appears to the Commission that the extant documentary material does not support the claim by the Wellcome Foundation and Dr Hillery that the Dublin DTP trials were initiated on foot of an Eastern Health Board request to investigate the cause of increased reactions to Wellcome’s DTP vaccines in August 1973. The
documents provided to the Commission show that the Dublin DTP trials were planned, sanctioned and initiated well before this date.

34.149 Dr Aileen Scott of the National Drugs Advisory Board, who approved Wellcome’s application for a Clinical Trial Certificate, has stated that she was not aware that any vaccine trial involving institutional children had been undertaken on foot of a general trial approval issued by the NDAB. However, Wellcome’s application for a Clinical Trial Certificate clearly stated: ‘All the participants will be under twelve months of age and be either in care at an institution in Dublin or attending a day nursery in the City.’ Despite Dr Scott’s assertions, the unambiguous wording of Wellcome’s application clearly stated that the subjects of the Dublin DTP trial could potentially have involved institutional infants. This, in fact, turned out to be the case. The Commission assumes, therefore, that the NDAB was fully aware of this when it granted Wellcome a Clinical Trial Certificate to undertake the Dublin DTP trials. There is no documentary evidence to suggest that Dr Scott, or any other person from the NDAB, consulted the Department of Health before approving Wellcome’s application for the trial certificate.

Import licence

34.150 The arrangement whereby applications were made to the National Drugs Advisory Board was a voluntary one and did not change the law in relation to import licences. It is clear that the issue of a Clinical Trial Certificate to Wellcome from the NDAB related exclusively to the supply of materials for the purpose of clinical trials and certified that the vaccines used conformed to specifications prescribed by British Pharmacopoeia 1968, the Therapeutic Substance Act [UK]1956, the World Health Organisation Technical Report Series and by European Pharmacopoeia (1971) Vol. II. The NDAB Clinical Trial Certificate did not sanction the importation of the trial vaccines nor did it sanction their use in an institutional setting.

34.151 The Wellcome Foundation and Dr Scott of the National Drugs Advisory Board have stated that Wellcome’s modified DTP vaccine, administered to the 53 institutional

children, was not a ‘new vaccine’. Glaxo Wellcome Ltd, however, has acknowledged that the modified DTP vaccine used in the Dublin DTP trials was an unlicensed product. It was not licensed for commercial use in the UK or Ireland and was not covered under Wellcome’s Import Licence, issued under the *Therapeutic Substances Act*, 1932. Thomas McGuinn, Chief Pharmacist, Department of Health, has also confirmed that ‘none of the modified vaccines used in this [DTP] trial were licenced under the *Therapeutic Substances Act*, 1932’. 65

**Research licence**

34.152 As already set out, Professor Meenan did have a research licence but its use was limited to research carried out in UCD. Professor Meenan does not seem to have taken an active part in this particular trial. Drs Hillery and Dunleavy were the only named clinical investigators in the trial protocol.

34.153 The Department of Health had been made aware in 1969 that Professor Meenan had conducted trials in breach of his research licence. The Department of Health Chief Medical Officer, Dr Daly, raised concerns within the department about the published results of a clinical trial ‘Rubella Vaccine in Children’ undertaken by Professor Meenan and Dr Hillery in Westmeath. 66 This trial appears to have been undertaken on behalf of Wellcome Laboratories and the rubella vaccine was trialled among ‘mothers of large isolated families’ at their family homes in Westmeath. Dr Daly pointed out that Professor Meenan had not asked the department for permission to conduct a trial in Westmeath and that Professor Meenan’s research licence did not cover the importation of the rubella vaccine used in that trial. Dr Daly also highlighted the fact that Professor Meenan had sought and received ministerial approval for the Carrig-on-Barrow trial in 1963 and was well aware of his obligation to secure approval from the Department of Health to undertake the Westmeath trials, but had failed to do so. 67 The department resolved to pursue the matter and insisted that, in the future, Professor Meenan was to give it advance notice of any scientific research with therapeutic substances undertaken outside University College, Dublin.

---

65 Department of Health file: MED-IMP-0-135205.
67 Dept of Health file: B136/216.
34.154 There is no evidence that Dr Hillery or Dr Dunleavy ever had a research licence. There is no documentation to suggest that ministerial approval was sought or obtained.

Consent

34.155 In her statement issued on 11 July 1997, Dr Hillery stated that the children were presented to her by the medical officer to the home who she claimed, ‘was responsible for the assessment of the children's health and their suitability for vaccination’. Dr Coffey was the medical officer at this time. There is no evidence that the mothers or the authorities in Pelletstown were asked for or gave consent. The Commission has not seen any evidence that anyone in the Eastern Health Board, other than Dr Dunleavy, knew about or was involved in this trial.

34.156 All 116 children involved in the Dublin DTP trials were due to be vaccinated as part of the general National Childhood Immunisation Programme. For the 63 children among the general population, acting as the control group, the immunisation treatment and vaccine administered to them did not deviate from the standard procedures associated with routine immunisation treatment. These children were presented by parents for vaccination at Dublin public health clinics and on that basis, it may be reasonable to assume, by virtue of such presentation, that parental consent was obtained. These children were inoculated with licenced, commercially available prophylactics - Trivax and Trivax AD. These were the DTP vaccines used by the Eastern Health Board in their childhood immunisation programme at that time.

Adverse consequences

34.157 DTP vaccine reaction files, produced by the Wellcome Foundation, record one instance where a Pelletstown child had a ‘moderate reaction’ after the second inoculation and was given Aspirin.68 No adverse reactions were recorded among the remaining 19 children. Wellcome concluded that the results of the DTP trials in Ireland had been ‘quite satisfactory’ and considered obtaining a product license to make the modified vaccine commercially available. It is not clear if the new vaccine ever came to market.

---

68 'Moderate Reaction': defined as a baby so upset as to require extra attention or nursing.
There is medical and scientific consensus that Wellcome’s modified DTP vaccine was less reactogenic, and therefore safer, than Wellcome’s commercially available DTP vaccines. The available evidence suggests that, in practice, this was proven to be the case. Adverse reactions recorded by Dr Dunleavy, and reported to the Wellcome Research Laboratories in August 1973, all occurred in children who were administered commercially available Trivax and Trivax AD vaccines in Dublin Public Health Clinics.

Veterinary Vaccine Controversy

In 2001, the *Irish Independent* reported that one child presented for DTP vaccination at a Dublin public health clinic during the Dublin DTP trial was unwittingly administered Wellcome’s Tribovax T, a veterinary vaccine, rather than Wellcome’s Trivax DTP vaccine. This controversial story quickly escalated and media reports ‘confirming the widespread use of a cattle and sheep vaccine to inject babies at Dublin health clinics during 1973’ became a cause for concern.69 There is no documentary or clinical evidence to support the claim that the veterinary vaccine Tribovax T was ever administered to a child, inadvertently or otherwise in a Dublin clinic or in any children’s residential institution.

This controversy arose from an entry in a list of children who experienced adverse reactions to the Trivax vaccine which was forwarded by the Wellcome Foundation to the Commission to Inquire into Child Abuse in 2001. In one instance, a child who attended a Dublin clinic is recorded as having been inoculated with a vaccine from ‘Batch No.84796’. Batch No. 84796 relates to Wellcome’s Tribovax T veterinary vaccine. The claim that children in Dublin clinics were administered a veterinary vaccine rests on this evidence alone. However, one of the Wellcome DTP vaccines in general use in the childhood immunisation programme in Dublin during this period was a vaccine from ‘Batch No. 84769’. It seems reasonable to suggest that the recording of Batch No. 84796 was no more than a clerical error. In fact, 21 other children inoculated with vaccine from Batch No. 84769, a commercial Trivax DTP vaccine, also suffered adverse reactions comparable with those suffered by the child who was purportedly administered a veterinary vaccine.

---

Suspected Oral Polio Vaccine Trial: Pelletstown 1965

34.161 When examining the Pelletstown institutional records in the context of Trial D, the Commission established that nine children were administered immune globulin measles prophylaxis on 30 July 1963 and a further 25 children were administered the measles prophylaxis on 21 June 1964. The Commission understands that immune globulin measles prophylaxis was utilised to confer a level of protection against measles in children who were exposed to the measles virus. The medical records associated with children who were administered immune globulin measles prophylaxis also noted that they were administered an Oral Polio Vaccine on dates between 9 June and 24 August 1965. A trawl of medical records associated with over 800 children admitted to Pelletstown in the years 1962-64 showed that a total of 56 children were administered an oral polio vaccine. All 56 children were administered the first dose of an oral polio vaccine on 9 June 1965. Fifty of the children were administered a second dose on 5 August 1965 and 42 were subsequently administered a third dose over three days in September 1965: 20 September (22 children); 22 September (four children) and 24 September (16 children).

34.162 The 56 children selected to receive a course of oral polio vaccine were all children who were living in Pelletstown unaccompanied. At least 44 of these children had already received a full three-shot vaccination against polio. The institutional records show that 53 of the 56 children selected were ‘illegitimate’ children and that the three ‘legitimate’ children involved were either ‘abandoned’ or had a physical disability. Eight of these children were described as ‘mentally retarded’, ‘backward’ or ‘of low intelligence’. Others had physical disabilities and associated notes which read ‘child won’t walk’, ‘not lifting head’, ‘underdeveloped child’, ‘enlarged heart and partially deaf’ and ‘no teeth, large head’. In 13 further instances, children were described as ‘half-caste’ or ‘coloured child’.

34.163 As is noted above under Trial C, Professor Meenan sought permission from the Department of Health to import an oral polio vaccine and to field trial it among children living in Pelletstown. Permission was refused. It is clear from the minutes of Glaxo’s Clinical Trials Meeting that the company was field trialling its oral polio vaccine in 1964 and a *Lancet* article, authored by Dr Beale of Glaxo Laboratories, showed that Glaxo had evaluated the use of their oral polio vaccine in children.
already immunised with the Salk polio vaccine in 1965. The Commission has found no corroborating evidence to confirm that the administration of oral polio vaccine to children living in Pelletstown in 1965 was a vaccine trial. However, considering the methodology employed and the selection criteria as it pertained to the children involved, the Commission takes the view that there is a high probability that it was.

**Milk Trials: Glaxo Infant Milk Trials, Bessborough and Pelletstown 1968/69**

34.164 Thirty two of the children’s files in Bessborough's institutional records include a printed form with the heading ‘Clinical Acceptability Trial: Overseas Milk Powders’ or ‘Clinical Acceptability & Safety Trial: Golden Ostermilk+Lactose’. The forms, produced by Glaxo Laboratories, refer specifically to the ‘Bessborough Convent’ and name Dr E Conlon as the ‘clinician responsible’.

34.165 These forms contained blank sections for completion by an attending clinician or nursing staff. The 32 forms examined by the Commission were blank; none of the forms had been completed nor was there any patient information contained therein. Feeding charts relating to the 32 infants in question demonstrate that 18 of them were fed neither commercially available Ostermilk nor any other Glaxo product. The 14 infants who were fed Glaxo’s commercially available Ostermilk lived in Bessborough on various dates between 1969 and 1976. At least four of these infants were not born in Bessborough and were admitted at intervals after birth already weaned on commercially available Ostermilk.

34.166 The name of the ‘clinician responsible’, Dr E Conlon, which was printed on each Glaxo Milk Trial Form, is taken to be Dr Eithne Conlon who was an assistant to Bessborough’s medical officer, Dr Reginald Sutton. The Commission was given access to Dr Conlon’s private records by her family. These records contain no documentary evidence that Dr Conlon had either conducted or been involved in any trials conducted in Bessborough. Bessborough’s institutional records do not contain any documentary evidence that a Milk Powder Trial was undertaken at Bessborough.

---

34.167 On foot of a specific request from the Commission, however, GlaxoSmithKline archivists located files which confirmed that Glaxo Laboratories had undertaken clinical trials of non-commercial infant milk products in Bessborough and Pelletstown on at least two occasions in 1968 and 1969.

34.168 In November 1967, Dr Burland, Glaxo Laboratories, wrote to a Glaxo representative in Dublin about the possibility of conducting clinical trials with experimental milk food preparations in young infants in Ireland. In his letter, marked ‘Highly Confidential’, Dr Burland stated:

I am looking for establishments, such as Homes for illegitimate babies, etc., where these investigations could be set up and where there are sufficient numbers to enable us to have two groups of babies, one fed with experimental milk, and one to act as controls. Do you think it would be possible to set up a trial of this nature in Eire?

34.169 In reply Dr Burland was told that similar trials, which led to the introduction of 'new formula Ostermilk', were previously undertaken by Dr Coffey in Pelletstown as well as by Dr B V (Biddy) Foley, Bacteriologist, and Dr Eithne Conlon, Obstetrician, in Bessborough and it was likely that they would be willing to undertake further Infant Milk Trials.

34.170 Dr Burland visited Ireland in January 1968. Prior to his visit, he drew up a Trial Protocol and forwarded a copy to Drs Coffey, Conlon and Foley. The Trial Protocol, ‘Clinical Evaluation of L.14 and L.20 Infant Milk Foods’ read as follows:

L.14 and L.20 are both infant spray-dried infant milk foods. Both milks are already marketed in a non-instantized form and the only change in the milks to be used in the trial is in the method of manufacture. These milks vary from standard milk preparations, such as Ostermilk 1 and 2, in their fat, lactose and vitamin content. L.14 contains 14% fat and L.20 contains 20% fat (Ostermilk 1 contains 20%, Ostermilk 2 contains 26.5%). The fat content of these products has been reduced by ‘dilution’ with added lactose. L.14 and L.20 have small amounts of thiamine, riboflavin, pyridine, vitamin B12 and nicotinamide added.

Trials:
The trials I have in mind will take the following form: The first study will involve the first 10 to 14 days of feeding. The second, the remaining period of 3 or 4
months. The plan is to feed alternate babies on L.14—every other baby will receive the normal half-cream employed in the particular institution. Obviously, trials with L.14 and half-cream milks will be limited in time because of the desirability to go to fuller cream milk. Likewise, alternate babies will be fed on L.20—every other one receiving the normal full-cream milk used in the particular institution. It will be necessary to follow the babies’ weight and food intake and to note any untoward events, both in the trial and the control groups, e.g. vomiting, diarrhoea, constipation, excess wind, etc.

Centres:
Both Maternity Hospitals and Baby Homes would make ideal trial centres. It is not a trial that will involve a laboratory in any way but will require experienced clinical observation, such as that that can be obtained from experienced nurses.

34.171 In January 1968, Glaxo Laboratories directed Glaxo’s Irish representatives to investigate the feasibility of obtaining a license to import 240 kilos of L.20 and L.14 for clinical trials in Ireland. Glaxo acknowledged that the process of obtaining an import licence could take up to three weeks and stated:

We would therefore be grateful if you could let us know as soon as possible what the chances are of success as it may be necessary to arrange clinical trials in a different area.

34.172 On 15 January 1968, Dr Burland, accompanied by Mrs B M Walker met Dr Coffey in Dublin. Dr Burland stated that Mrs Walker had ‘a particular responsibility for nutrition trials’ at Glaxo Laboratories. Dr Coffey told Dr Burland that Glaxo’s experimental infant milk had arrived at Pelletstown and that the ‘Sister in charge of the babies’ had prepared some of the milk according to instructions. Dr Coffey planned to start her trial in Pelletstown in March 1968. As reimbursement for her participation, she asked Glaxo for a Chromatography Column (value £170) for her work with ‘mentally deficient’ children. Dr Coffey stated that she was willing to send copies of the chromatography reports to Glaxo Laboratories along with the Hb levels of babies at 1 month and 3 months.

---

71 Dr Coffey had a particular interest in Down’s Syndrome children – see Chapter 13.
34.173 On the following day, Dr Burland and Mrs Walker travelled to Cork to meet Dr Conlon at Bessborough. As reimbursement for her work, Glaxo offered to pay Dr Conlon’s air fare for a vacation in England. As the proposed milk trials were to compare Glaxo’s experimental infant milk with the established feeding regime at Bessborough, Dr Burland stated that he discussed details of the trial with members of the Congregation of the Sacred Hearts of Jesus and Mary involved in preparing infant feeds: Sister Martha, Sister Benedict and Sister Peter.

1968 Trial

34.174 In March 1968, Dr Conlon field-trialled Glaxo’s experimental infant milk in Bessborough. Fourteen infants were involved in the trial and were divided into three groups as follows:

- Babies fed L14: 4
- Babies fed L20: 3
- Control group: 7

34.175 The infants in Group A were fed Glaxo’s L14 infant milk for 14 days. Dr Conlon reported that infants in this group experienced moderate to severe vomiting, moderate to severe wind, loose stools and green stools. She noted that all infants in this group suffered continuous slight vomiting and regurgitation, that stools were undigested and that vomits contained large curds. She noted that Glaxo’s L20 infant feed was tolerated far better and was an acceptable infant feed. She concluded that Glaxo’s L14 infant milk, prepared and fed as directed by Glaxo Laboratories, was not well-tolerated by infants.

34.176 Also in March 1968, Dr Coffey conducted trials of Glaxo’s experimental infant milk at Pelletstown. Nine infants were involved in the trial and were divided into three groups as follows:

- Babies fed L14 (as recommended): 3
- Babies fed L14 (diluted): 2
- Control babies fed cow’s milk: 4

34.177 The three infants in Group A were fed Glaxo’s L14 infant milk for five days and several side effects were recorded. Two infants experienced ‘severe vomiting’ and the third experienced ‘moderate vomiting’. Two infants experienced ‘severe regurgitation’ and all three infants were noted as being ‘irritable’ and ‘loose with
green stools’. The use of Glaxo’s L14 infant milk was discontinued due to ‘the severity of the side effects’.

34.178 Both infants in Group B were fed a diluted form of Glaxo’s L14 infant milk for three days. These infants experienced moderate to severe regurgitation, slight vomiting, green stools and irritability. While Dr Coffey considered that these infants were making ‘reasonable progress’ she conceded that they were not as satisfactory as infants in the control group.

34.179 The four infants in the control group were fed diluted cow’s milk for nine days. One child experienced green stools and another experienced slight regurgitation: no other side effects were recorded in this group. Dr Coffey concluded that, due to ‘the frequency of undigested stools, frequent vomiting and vomiting of large curds’ among trial infants, Glaxo’s L14 milk was ‘most unsatisfactory’.

34.180 Following the abandonment of the milk trials at Pelletstown and Bessborough, congregational nursing staff involved in infant feeding in both institutions remonstrated that the preparation and feeding instructions which accompanied the experimental feeds, and in some cases the weight of the infants involved in the trials, did not make for a ‘fair trial’.

34.181 In April 1968, Mr P M Paterson, Analytical Department, Glaxo Laboratories, travelled to Pelletstown and Bessborough to liaise with the Sisters responsible for infant feeding in both institutions. He reported that the nursing staff (who were Sisters) in both institutions altered the method of preparing Glaxo’s experimental infant feeds resulting in a more diluted mixture. Infants selected for inclusion in what Glaxo called the ‘Nun’s Trial’ were over seven pounds in weight and deemed better equipped to process the new feeds. He observed nursing staff in both institutions as they incorporated Glaxo’s infant feeds into their already established feeding regimes and reported good results. He reported that the nursing staffs in both institutions were happy to be involved in the development of an improved infant milk product but remonstrated that they had not been told more about the infant milk trials in the beginning and complained that the clinicians involved, Drs Coffey and Conlon, had largely left them in the dark.
1969 Trial

34.182 In consultation with the nursing staff involved in infant feeding at Pelletstown and Bessborough, Glaxo Laboratories produced re-formulated infant milk products with a view to undertaking further clinical trials. Dr Burland once again secured the cooperation of Drs Conlan and Foley in Cork and Dr Coffey in Dublin. On this occasion, he consulted the administrators of both institutions in order to secure their cooperation. In April 1969, Glaxo trialled their new infant milk in Bessborough and Pelletstown whilst undertaking concurrent trials of the same experimental infant milk products in Malaya and Argentina.

34.183 Glaxo’s Trial Protocol for the April 1969 infant milk trials ‘Overseas Milk Powders: Clinical Acceptability and Safety Trials’ named Bessborough and Pelletstown as the Irish trial centres. Drs Conlon, Foley and Coffey were named as the clinicians involved. The stated aim of the clinical trial was to compare Glaxo’s new infant milks, BY 0111 and BY 3010, with a control group of infants fed on the commercially available Ostermilk 1. The Trial Protocol called for the inclusion of 40 infants in both institutions and stipulated that the mothers ‘House Name’ would be recorded as the only identifying factor on documentation relating to the trial.

34.184 GlaxoSmithKline archivists produced written notes and charts relating to Glaxo’s infant milk trials to the Commission. Because of the passage of time, these records are difficult to read, and they did not assist the Commission’s efforts to identify the children involved in the milk trials. It was possible, however, to discern that Drs Conlon and Foley selected 21 Bessborough infants for inclusion in the trial. These infants were fed Glaxo’s new infant milk BY 0111. The extant records show that at least half of these infants experienced vomiting, excess wind and constipation.

34.185 It was also possible to extract from the records that Dr Coffey selected 89 infants resident in Pelletstown for inclusion in the trial. Dr Coffey noted that trial infants in Pelletstown experienced vomiting, regurgitation, irritability and green stools. In two instances, infants experienced ‘violent vomiting’ in reaction to the feed and these children were subsequently withdrawn from the trial.

34.186 Although the Commission has identified uncompleted Glaxo Infant Milk trial forms in the files of 32 former Bessborough residents, it is unlikely that these particular infants were involved in a clinical trial. All of these 32 infants were born after the
last known infant milk trial was undertaken in Bessborough in April 1969. There is no documentary evidence to show that infant milk trials occurred after that date. Fourteen of these 32 infants were born in a cluster of dates in December 1969 and January 1970. It may have been intended that they would be part of a further milk trial. The comprehensive feeding charts associated with this group of infants give no indication that they were part of a clinical trial but indicate that all infants concerned received commercially available infant milk. Most were fed on non-Glaxo products, generally SMA. The maternity records associated with these 32 infants include detailed daily feeding charts which appear to confirm that infants born in or admitted to Bessborough were subject to the same institutional feeding regime as all other infants resident in the institution at that time. In all cases, newborn infants were fed water and glucose for several days before being put on commercially available Ostermilk and SMA infant feeds.

34.187 The Commission is satisfied that the trial forms relating to infants who were involved in one of the infant milk trials were completed contemporaneously with the clinical trial and forwarded to Glaxo Laboratories.

Compliance with regulatory and ethical standards

34.188 It is not clear that the milk trials constituted clinical trials within the meaning of the Therapeutic Substances Act 1932 so it is not clear if an import licence or a research licence was required. There is documentary evidence that Glaxo Laboratories considered the question of applying for an import licence to cover the importation of their experimental infant milk products into Ireland. The Commission has seen no evidence that it actually applied for or received such a licence. Likewise, the Commission has no evidence that any of the doctors involved held a research licence.

Consent

34.189 There is no documentation to suggest that Glaxo either applied for or received an import licence to import the L.20 and L.14 infant foods. The Commission has not seen any documentation to suggest that Glaxo or the clinicians involved in the Infant Food Trials either applied for or held Department of Health issued research licences to conduct these trials.
34.190 As it has not been possible to identify the children involved in the trials, it is not known if all or any were accompanied by their mothers. There is no evidence that any attempt was made to seek the consent of their mothers.

34.191 It would appear that the three doctors involved conducted the initial trials without consulting the authorities of either institution. While congregational nursing staff in both institutions took directions from the doctors it is unlikely that they were made aware of the experimental nature of the infant feed. It seems to the Commission that it was only when the congregational nursing staffs were tasked to take remedial action to counter the adverse reactions suffered by the children that the authorities at both institutions realised the true nature of the study.

34.192 The Mother Superior at Bessborough wrote to Glaxo Laboratories to voice her annoyance that she had not been consulted about the infant milk trials in the first instance. The documentary evidence, however, demonstrates that the administrators at both institutions did communicate with Glaxo about the April 1969 infant milk trial and assisted the company in its bid to produce a superior infant feed in what became known as the ‘Nun’s Trial’.
Chapter 35 Finance

Introduction

35.1 The information available to the Commission about the finances of the different institutions is set out in the relevant chapters. The most detailed financial information available is from Dunboyne as the Good Shepherd Sisters provided the Commission with audited accounts for nearly every year of its operation (see Chapter 24). The Congregation of the Sacred Hearts of Jesus and Mary was unable to provide detailed financial information about its three homes (Bessborough, Sean Ross and Castlepollard - see Chapters 17-20). At some stage (it seems likely to have been from 1947), the congregation was required to provide the Department of Health with audited accounts each year so that the capitation rate for the women and children could be set. It seems that they did this for at least some years as the records provided to the Commission by the Department of Health contain copies of some audited accounts. Similarly the Sisters of Bon Secours were unable to provide financial information for Tuam (see Chapter 15). There is no evidence that there were ever audited accounts for Tuam but information about its capitation rate was collected from Department of Health files.

35.2 Very little is known about Pelletstown’s (Chapter 13) finances as they cannot be distinguished from the general finances of the Dublin Union and its successors; it was not financed on a capitation basis. There is some limited information about the amount it charged other local authorities who were responsible for residents in Pelletstown and there is information available about what its staff were paid. The county homes were directly financed by the health authorities and it is not possible to distinguish the amounts involved in housing unmarried mothers and their children. The members of religious orders who staffed Pelletstown and the county homes were paid as public servants; this was not the case with the homes financed by capitation. The smaller homes and hostels all had different methods of financing and these are described in the relevant chapters.

35.3 In 1943, the Joint Committee of Women’s Societies and Social Workers sent a memorandum to Government (and others) on the issue of children in institutions. In this they argued that the money being paid to institutions should instead be paid to the mother. This chapter tries to put the amounts paid in respect of women and
children in the institutions under investigation in context by comparing the

capitation rates with the payments which the State made to families living in the

community, including payments made in respect of boarded out children, the

payments made to some other institutions, and, to a limited extent, the

contemporary rates of pay of workers. It is clear that the payments made in

respect of women and children in the institutions financed by capitation payments

were considerably more generous that the State payments available to a parent

and child in the community before the Unmarried Mother’s Allowance was

introduced.

General financial situation

35.4 The Commission has seen no evidence that the religious orders which ran the

institutions which were financed on a capitation basis made a profit from so doing.

All the evidence suggests that they struggled to make ends meet particularly when

occupancy rates declined. In some cases, the work of the individual members of

the orders was not taken into account in setting the capitation rate. Payments by

local authorities were quite often late. An allegation has been made that local

authorities were billed for mothers and children after they had left the home. The

Commission has found no evidence of inappropriate billing. Local authorities were

usually billed monthly in arrears so it is reasonable that some would have left

before the payment was made.

35.5 The capitation rates were set on the basis of expenditure in the previous year. The

financial records seen by the Commission show that earnings from farms or the

letting of land were taken into account and the capitation rate reduced accordingly.

From a financial point of view, this method of setting the capitation rate seems to

have worked reasonably satisfactorily when there was relatively little inflation and

when the women stayed for longer periods. Even though the numbers in the

institutions increased in the 1960s, the women stayed for much shorter periods.

This combined with inflation meant that the finances became more difficult to

manage.

Payment by the women

35.6 Apart from Denny House and Bethany, there is no evidence that women who were

supported by public assistance/health authorities in other institutions were asked to

make a contribution towards their stay. Legally, they could have been charged if
they had an income. Before the introduction of maternity allowance in 1953, it is unlikely that they would have had an income. After that, those who had been employed would have had an income for 12 weeks. The Institutional Assistance Regulations 1954\(^1\) provided that people receiving institutional assistance in any institution could be required to make a contribution towards the cost. The health authorities could require people who had an income of more than 10s a week to make a contribution towards their maintenance. This was increased to £1 in 1965.\(^2\)

35.7 County home residents did have to contribute under these regulations. Older people who were resident in county homes would generally have been receiving either an Old Age Pension (Contributory) or an Old Age Pension (Non-Contributory). Generally people with disabilities in institutional care did not have an income; the Disabled Person’s Maintenance Allowance was not payable to people in institutions until the 1990s (when it was renamed Disability Allowance).

35.8 When unmarried mother’s allowance was introduced in 1973, there is no evidence that the large institutions sought payments from the women. At this stage some women in the institutions would have been receiving maternity pay from their employers; again, there is no evidence that they were expected to contribute in the large institutions. Later, some women in the institutions were receiving training allowances from AnCo; in general, these allowances were higher than the prevailing social welfare rates.

1920s

35.9 Until the introduction of Unemployment Assistance and Widows' Pensions in the 1930s, the only payment that a parent and child living in the community was likely to get was home assistance (see Chapter 1). The Report of the Commission on the Relief of the Sick and Destitute Poor in 1927 recorded that 632 widows with one child were in receipt of home assistance in 1926; only three were getting more than 12s 6d a week.\(^3\) The vast majority of all home assistance recipients were getting less than 12s 6d a week. The 1927 report recognised the inadequacy of this and recommended the introduction of pensions for widowed and deserted mothers but did not mention unmarried mothers.

---

35.10 The capitation rate at the time was £1 a week for a mother and child in Tuam and £1 1s for a mother and child in Bessborough. In 1925 an official from the public health section of the Department of Local Government and Public Health told the Commission on the Relief of the Sick and Destitute Poor that the cost of maintenance per person in Denny House (then called the Magdalen Asylum) was £1 12s 6d a week.

35.11 In December 1928, Frank Duff (see Chapter 21), who was a former senior official of the Department of Finance, considered that outdoor relief of 15s a week would be necessary to enable an unmarried mother and her child to live in the community. It is not known if he was aware of the capitation rates in the mother and baby homes but it seems likely that he was. This, interestingly, was the rate set for a mother and child when the Widow's Contributory Pension was introduced in 1935.

35.12 When St Vincent’s, Cabra was being established as a home for children with disabilities in 1925, the Daughters of Charity agreed to accept children from the Dublin Union at a rate of £26 a year (10s a week); Dublin Union children above that number and children from other areas would attract a capitation rate of £39 a year (12s 6d a week).

35.13 The payments for boarded out children varied widely between the various health authorities and sometimes within the same health authority. In March 1927, a number of counties were paying 5s a week; the highest rate was £1 10s a month and the lowest was 2s 6d a week.

35.14 Foster parents recruited by the Protestant Nursery Society received £1 14s 8d a month; foster parents recruited by Bethany received £1 10s.

35.15 In 1924, a superintendent in Pelletstown was paid an annual salary of £90. A temporary midwife (a lay person) was paid £2 5s a week for night duty in Pelletstown. In Kilrush, the General Attendant Porter was paid £104 a year, or £2 a week.
1930s

35.16 Unemployment Assistance was introduced in 1933. There were different rates depending on where the recipient lived. Until the 1990s, women qualified for lower rates than men. The rates quoted in this chapter are the highest rates available for one adult and one child. In practice, most women with small children did not qualify as they were regarded as not being available for work.

35.17 Widow’s Pensions (Contributory) and Widow’s Pensions (Non-Contributory) were introduced in 1935; by definition, unmarried mothers did not qualify.

35.18 The maximum Unemployment Assistance payable for one adult and one child was 12s a week from 1933 and 14s a week from 1938. The maximum rate of the Widow’s Contributory pension was 15s a week from 1935 and the maximum rate of the Widow’s Non-Contributory pension was 11s a week. The capitation rate in Tuam at this time was £1 for a mother and child and it was £1 1s in Bessborough.

35.19 In discussions over the change of status of Pelletstown in the 1930s, the Daughters of Charity were prepared to accept a capitation rate of 12s 6d for each child. At this time, the capitation rate for St Vincent’s, Cabra was 15s a week for each child.

35.20 As always, rates for boarded out children varied widely. In 1933 Tipperary North Riding paid a weekly maintenance rate of 7s for children aged two to four; 6s for children aged four to ten; and 5s for children aged ten to 15.

1940s

35.21 Children’s Allowances (now called Child Benefit) were first introduced in 1944 but only for the 3rd and subsequent children in a family; in 1952, they were payable for 2nd and subsequent children.

35.22 The maximum weekly rate of Widow’s Contributory Pension for a woman and child as £1 2s 6d from 1948.

---

5 Unemployment Assistance (Amendment) Act 1938.
35.23 The capitation rate in Tuam was £1 2s for a mother and child in 1944; £2 5s in 1948 and £2 7s in 1949. In 1946, Bethany was charging Monaghan county council 15s a week. It was claimed that this would cover approximately half of the maintenance cost of each mother.

35.24 In 1943, the capitation rate for each child in St Philomena’s was 12s 6d. Its capitation rate was increased to 17s 6d from 1 January 1948 and to 19s from 1 April 1948.

35.25 In 1945, the Cork board of assistance sought foster parents for boarded out children at a rate of £1 10s a month and a clothing allowance of £4 10 a year; there was a very poor response. In 1947 the average payment per child nationally was just under 7s, weekly payments to foster parents in Monaghan ranged from 8s 6d to 11s, the highest payment was for infants; Galway paid 5s weekly for children up to the age of ten, and 4s weekly for older children. In 1949, Limerick city paid foster parents 8s a week whereas Co Limerick paid foster parents 14s a week.

35.26 In 1944, a nurse in Bethany was on a £75 per year salary; the housekeeper had a salary of £52. They lived in the institution.

1950s

Maternity Allowance

35.27 Maternity Allowance was introduced in 1953. It was based on a woman’s or her husband’s social insurance contributions and was payable for six weeks before the birth and six weeks after. The initial rate was £1 4s a week.\(^8\)

35.28 The maximum weekly rate of Widow’s Contributory Pension for a woman and child was £1 11s from 1952.\(^9\) The maximum weekly rate of Unemployment Assistance for an adult and child was £1 3s from 1952 and remained at that level until 1960.

35.29 The capitation rate in Tuam in 1950 was £1 12s a week for a mother and child in 1950, £1 16s a week in 1952; £2 in 1953 and £1 5s for a mother and £1 for a child in 1956.

\(^8\) Department of Health, RM/INA/0/505478.
\(^10\) ibid
35.30 Gardeners in Dunboyne were being paid £5 a week in 1955.

35.31 In the mid-late 1950s Bethany was receiving £2 a week for each mother in the home from the Public Assistance Authorities. The capitation rate in the Sacred Heart homes was £2 a week for mothers and £1 a week for children in the early 1950s. In 1956 the capitation rates were £2 5s a week for mothers and £1 2s 6d for children.

35.32 In 1956, the weekly rate for boarded out children varied between 8s and £1 3s.

35.33 In 1953, general trained nurses in Pelletstown had a starting salary of £310 a year while people in charge of areas such as stores, laundry, kitchens, workrooms started at £130 a year. In 1957, Denny House recruited a qualified nurse at £150 a year; the matron recognised the ‘smallness of the salary’. This nurse left within a year.

35.34 In 1955, Denny House advertised for a porter, but the matron reported that ‘total wage of £4 with meals does not exceed unemployment benefit enough to make it worthwhile to do it 7 days a week’. In 1952, a man came to do polishing and cleaning in Denny for three hours most mornings was paid 5s a day.

1960s

35.35 The maximum weekly rate of Unemployment Assistance for an adult and child was £1 7s from 1960 and increased to £2 4s in 1965. The maximum weekly rate of the Widow’s Non-Contributory pension was £1 16s from 1960 and increased to £2 16s in 1965.\(^\text{11}\)

35.36 The capitation rate in Dunboyne for 1967/8 was 6s 5d a day for children (£2.5s per week) and 12s 10d a day (£4.10s per week) for women. In Dunboyne, the institutional records show that the private patients who were there in 1965–68 paid between £5 and £6 a week for their stay.

The 1970s onwards

35.37 In 1972, Denny House sought to have the capitation rate for mothers and children doubled from £4 and £2 (which had been the rates since 1967) respectively to £8

and £4. The Department of Health reviewed their accounts for the years 1970 and 1971 and concluded that the average weekly cost per patient in 1971 was £12.60; the department described the capitation rate of £4 per week for a mother as 'highly unrealistic'. The department decided on a rate of £7 for the mother. At this time, the rate for a mother in Bessborough was £10. Denny's rate was increased to £10 in 1973 when Bessborough's was £12 and to £12 in 1974.

35.38 The Unmarried Mother's Allowance was introduced in 1973 at the same rate as the Widow's Non-Contributory Pension - £8.15\textsuperscript{12} a week for a mother and child.\textsuperscript{13} It increased to £11.80 in 1975\textsuperscript{14} and to IR£27.90\textsuperscript{15} in 1980.\textsuperscript{16}

35.39 The capitation rates in Dunboyne were £2.10 a day (£14.70 a week) for mothers and £1.05 a day (£7.35 per week) for children in 1973/4 and £1.58 and £3.15 respectively (£11.06 and £22.05 per week) from January 1975.

35.40 In 1983 the capitation rate in Dunboyne was £9.75 a day (£68.25 per week) for mothers and £5 a day (£35 per week) for children.

35.41 In 1981, it was estimated that it cost between £6,000 and £7,000 for each mother and child maintained in Pelletstown. At this time the rate of Unmarried Mother's Allowance was £27.90 or approximately £1,450 a year.

35.42 In March 1978, the capitation rates at Bessborough, which were £3.00 per day for women and £1.50 per day for infants, were increased to £25.20 a week for mothers and £12.60 a week for infants.

Chapter 36: Human Rights

Introduction

36.1 Prior to the establishment of this Commission, the Irish Human Rights Commission (now the Irish Human Rights and Equality Commission) told the Government that ‘it is critically important that any such investigation should take place within a human rights and equality framework and in particular that it conforms with the State’s human rights obligations under the Constitution and under international human rights law’.

36.2 The Government did not opt for that approach in its mandate to the Commission. The Commission, cognisant of the many changes that have taken place during the period of its lengthy remit 1922-1998, nevertheless has considered some aspects of such rights. In particular, the Commission is concerned to place the development of human rights norms and laws in their historical context.

A: International Human Rights

36.3 During the period of the Commission’s remit, successive governments have ratified various conventions and other legal instruments from the United Nations and the Council of Europe. Other conventions post-date the Commission’s remit but may have implications for future government policies. The following is a summary of the relevant aspects of the various conventions and statements, the enforcement mechanisms available and their interaction with Irish law. The Irish Human Rights and Equality Commission has published a clear guide to human rights law which explains the interaction between the Constitution of Ireland and international human rights instruments and how international human rights instruments become part of domestic law.¹

League of Nations Declaration of the Rights of the Child (original)

36.4 The original Declaration on the Rights of the Child was adopted by the League of Nations General Assembly on 26 November 1924. The Irish Free State had joined the League of Nations on 10 September 1923. The declaration itself was very brief, did not impose any explicit obligations on member states and had no enforcement mechanism:

The child must be given the means requisite for its normal development, both materially and spiritually;

The child that is hungry must be fed, the child that is sick must be nursed, the child that is backward must be helped, the delinquent child must be reclaimed and the orphan and the waif must be sheltered and succoured;

The child must be the first to receive relief in times of distress;

The child must be put in a position to earn a livelihood and must be protected against every form of exploitation;

The child must be brought up in the consciousness that its talents must be devoted to the service of its fellow men.

Charter of the United Nations

36.5 The Charter of the United Nations was signed on 26 June 1945 and came into force on 24 October 1945. It is the fundamental Treaty of the United Nations. Ireland was not one of the founding members of the UN but became a member state, and accepted the obligations contained in the charter, on 14 December 1955.

36.6 Article 2(2) of the charter binds the State at an international level to comply with the charter. While it is mainly concerned with State relations, Article 55 does provide for some individual human rights, when dealing with international economic and social cooperation:

With the view to the creation of conditions of stability and wellbeing which are necessary for peaceful and friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples the UN shall promote:

Higher standards of living, full employment, and conditions of economic and social progress and development;

Solutions of international economic, social, health, and related problems; and international, cultural and educational cooperation;

Universal respect for, and observance of human rights and fundamental freedoms for all without distinction as to race, sex, language or religion.

36.7 The charter does not have any specific enforcement mechanism for breaches within member states and it has not been transposed into Irish domestic law.

Universal Declaration of Human Rights

36.8 The Universal Declaration of Human Rights (UDHR) was adopted by the UN General Assembly on 10 December 1948. The UDHR is not a binding treaty in itself but is clearly linked to the charter. It was adopted for the purpose of defining the terms ‘human rights’ and ‘fundamental freedoms’ contained in Article 55c (above) of the charter and setting down a common standard for the respect and observance of human rights. Despite its non-binding nature, UN member states have on a number of occasions declared that they are bound by the standards contained in the UDHR. It does not itself contain any enforcement mechanism but its norms are enforced by the covenants considered below.

Declaration of the rights of the child (expanded)

36.9 The expanded Declaration on the Rights of the Child was adopted by the UN General Assembly on 20 November 1959. Like the 1924 original it was a non-binding statement of principle but the preamble calls upon parents, upon men and women as individuals and upon voluntary organisations, local authorities and national governments to recognise these rights and strive for their observance by legislative and other measures progressively taken.

36.10 The declaration is as follows:

Principle 1
The child shall enjoy all the rights set forth in this Declaration. Every child, without any exception whatsoever, shall be entitled to these rights, without distinction or discrimination on account of race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status, whether of himself or his family.

Principle 2
The child shall enjoy special protection, and shall be given opportunities and facilities, by law and by other means, to enable him to develop physically, mentally, morally, spiritually and socially in a healthy and normal manner and in conditions of freedom and dignity. In the enactment of laws for this purpose, the best interests of the child shall be the paramount consideration.

Principle 3
The child shall be entitled from his birth to a name and a nationality.

Principle 4
The child shall enjoy the benefits of social security. He shall be entitled to
grow and develop in health; to this end, special care and protection shall be
provided both to him and to his mother, including adequate pre-natal and
post-natal care. The child shall have the right to adequate nutrition, housing,
recreation and medical services.

Principle 5
The child who is physically, mentally or socially handicapped shall be given
the special treatment, education and care required by his particular condition.

Principle 6
The child, for the full and harmonious development of his personality, needs
love and understanding. He shall, wherever possible, grow up in the care and
under the responsibility of his parents, and, in any case, in an atmosphere of
affection and of moral and material security; a child of tender years shall not,
save in exceptional circumstances, be separated from his mother. Society
and the public authorities shall have the duty to extend particular care to
children without a family and to those without adequate means of support.
Payment of state and other assistance towards the maintenance of children of
large families is desirable.

Principle 7
The child is entitled to receive education, which shall be free and compulsory,
at least in the elementary stages. He shall be given an education which will
promote his general culture and enable him, on a basis of equal opportunity,
to develop his abilities, his individual judgement, and his sense of moral and
social responsibility, and to become a useful member of society. The best
interests of the child shall be the guiding principle of those responsible for his
education and guidance; that responsibility lies in the first place with his
parents. The child shall have full opportunity for play and recreation, which
should be directed to the same purposes as education; society and the public
authorities shall endeavour to promote the enjoyment of this right.

Principle 8
The child shall in all circumstances be among the first to receive protection
and relief.

Principle 9
The child shall be protected against all forms of neglect, cruelty and
exploitation. He shall not be the subject of traffic, in any form. The child shall
not be admitted to employment before an appropriate minimum age; he shall
in no case be caused or permitted to engage in any occupation or employment which would prejudice his health or education, or interfere with his physical, mental or moral development.

**Principle 10**
The child shall be protected from practices which may foster racial, religious and any other form of discrimination. He shall be brought up in a spirit of understanding, tolerance, friendship among peoples, peace and universal brotherhood, and in full consciousness that his energy and talents should be devoted to the service of his fellow men.

36.11 There was no enforcement mechanism for this declaration but it did form the basis for the Convention on the Rights of the Child adopted in 1989 and which is considered below.

**International Covenant on Civil and Political Rights**

36.12 The International Covenant on Civil and Political Rights (ICCPR) is a treaty adopted by the UN General Assembly on 16 December 1966 and which came into force on 23 March 1976. Ireland signed the ICCPR on 1 October 1973 but did not ratify it until 8 December 1989. The State, as a party to the ICCPR, must:

- Ensure to all persons the rights contained in the Covenant;
- Take necessary steps to adopt laws and other measures to give effect to such rights;
- Ensure that persons whose rights under the Covenant are violated have an effective remedy determined by competent judicial, administrative or legislative authority or other authority provided for by the legal system;
- Ensure that the competent authorities enforce such remedies when granted.

36.13 Implementation of the ICCPR is monitored by the Human Rights Committee, a UN body of 18 independent experts from state parties. The Human Rights Committee considers reports which the states parties are required to submit when requested by the committee. The provisions of the ICCPR have not been directly adopted into Irish domestic law. The reasons for this are set out in the following passage

---

from the Ireland’s ‘core document’ which forms part of its reports to the Human Rights Committee.\(^5\)

In the case of Ireland, when a decision was made some years ago to accede to the International Covenants, a committee under the Chairmanship of the Attorney General was charged with examining Ireland’s domestic law in the light of the Covenant to identify any possible areas in which a conflict between the two might arise. As a result of this examination a number of amendments to domestic law were identified, notably the final abolition of the death penalty which disposed of a possible conflict between Irish law before abolition and Article 6.5 of the Covenant and the introduction of a new law on incitement to hatred (the Prohibition of Incitement to Hatred Act, 1989), which was necessary to ensure compliance with Article 20.2. In certain other areas reservations to the Covenant were identified as necessary.

It was considered that the existing domestic law which is, in the context of rights referred to in the Covenant, generally contained in the Constitution is in conformity with the Covenant.

36.14 However, on ratification of the ICCPR, Ireland did accede to the first optional protocol which established an individual complaint mechanism for the convention. Under this mechanism, the Human Rights Committee has considered a number of complaints made by individuals against Ireland. For example, in *Kavanagh v Ireland* the committee found that the State had failed to demonstrate that the decision to try Mr Kavanagh in the Special Criminal Court as opposed to the ordinary criminal courts was based on reasonable and objective grounds and that his rights under Article 26 of the ICCPR had therefore been violated.

36.15 The Supreme Court confirmed in *Kavanagh v Governor of Mountjoy Prison*\(^6\) that, given the clear position under Article 29.6 of the Constitution, the ICCPR is not part of domestic law and the Human Rights Committee views are not binding. Mr Justice Fennelly stated:

> the terms of the Covenant have not been enacted into Irish law. They cannot prevail over the provisions of the Offences against the State Act, 1939 or of a conviction by a court established under its provisions. For the reasons already stated the views of the Committee cannot be invoked to invalidate that conviction without contravening the terms of Articles 29.6, 15.2.1 and 34.1 of

\(^5\) HRI/Core/1/ADD.15

\(^6\) [2002] 3 IR 97.
the Constitution. I am prepared to assume that the State may by entering into an International Agreement create a legitimate expectation that its agencies will respect its terms. However, it could not accept such an obligation so as to affect the provisions of a statute or the judgement of a court without coming into conflict with the Constitution.

36.16 It should be noted that in recent years the views of the Human Rights Committee have been referred to in a number of cases, for example, A (KE) v Refugee Applications Commissioner [2008] IEHC 366, McCann v Monaghan District Judge [2009] 4 IR 200 and Spilla v Minister for Justice [2012] IEHC 336.

**International Covenant on Economic, Social and Cultural Rights**

36.17 The International Covenant on Economic, Social and Cultural Rights (ICESCR) was adopted by the UN General Assembly on 16 December 1966\(^7\). It came into force on 3 January 1976. Ireland had signed it on 1 October 1973 and ratified it on 8 December 1989. It has not been incorporated into domestic law.

36.18 From the Commission’s point of view the most relevant Article of this Covenant is Article 10, which states that the states parties to the Covenant recognise that:

The widest possible protection and assistance should be accorded to the family which is the natural and fundamental group unit of society particularly for its establishment and while it is responsible for the care and education of dependent children. Marriage must be entered into with the free consent of the intending spouses.

Special protection should be accorded to mothers during a reasonable period before and after childbirth. During such period working mothers should be accorded paid leave or leave with adequate social security benefits.

Special matters of protection and assistance should be taken on behalf of all children and young persons without any discrimination for reason of parentage or other conditions. Children and young persons should be protected from economic and social exploitation. Their employment in work harmful to their morals or health or dangerous to life or likely to hamper their normal development should be punishable by law. States should also set age limits below which the paid employment of child labour should be prohibited and punishable by law.

---

\(^7\) [https://www.ohchr.org/en/professionalinterest/pages/cescr.aspx]
36.19 The covenant requires the State to furnish reports to the Economic and Social Council (another UN body of 18 experts) on the measures it has adopted and the progress it has made in achieving the observance of the rights recognised in the covenant. Ireland issued only one such report before the end of the Commission’s period of investigation.

36.20 Complaints by individuals to the Committee on Economic, Social and Cultural Rights are provided for but the protocol which gave rise to the ability to make such complaints was not opened for signature until 24 September 2009 and came into force on 5 May 2013. Ireland has signed but not yet ratified this protocol.

**Convention on the Elimination of all forms of Discrimination against Women**

36.21 The Convention on the elimination of all forms of discrimination against women (CEDAW) is an international treaty adopted by the UN General Assembly on 18 December 1973. It came into force on 3 September 1981 and was ratified by Ireland on 23 December 1985.

36.22 The CEDAW has not been directly implemented into national legislation but the State considers itself to be in compliance with its provisions by virtue of the provisions of the Constitution and relevant legislation.

36.23 The Convention is overseen by the Committee on the elimination of discrimination against women which is a UN body of 23 experts elected by the states parties. The State submits reports to this committee similar to the reporting under other UN instruments. An optional protocol to this convention was adopted by the General Assembly allowing for individual complaints to the Committee. Ireland signed and ratified that protocol, however it post-dates the Commission’s period of investigation.

**Convention against Torture and other cruel, inhuman or degrading treatment or punishment**

36.24 The Convention against Torture and other cruel, inhuman or degrading treatment or punishment (Convention against Torture) was adopted by the UN General Assembly on 10 December 1984 and came into force on 26 June 1989. It was signed by Ireland on 28 September 1992 but not ratified until 11 April 2002. The

---

CHAPTER 36 HUMAN RIGHTS

Convention against Torture has a similar reporting mechanism to other UN instruments (and an inspection regime introduced by an optional protocol).

36.25 While Ireland was not bound to comply with its provision during the Commission’s investigation period, the Convention against Torture is regarded as an authoritative statement of human rights norms and is now frequently referenced and utilised by the courts in Ireland.

36.26 Such instruments are deemed by the UN as being of relevance to present day investigations of matters which occurred before they became binding on the states parties. This is clear from the consideration of Ireland's 2011 report under the Convention against Torture. The monitoring body, the Committee against Torture, made the following comments in relation to alleged abuse and ill treatment of women in Magdalen laundries (which predated Ireland's ratification of that convention):

The Committee is gravely concerned at the failure by the State party to protect girls and women who are involuntarily confined between 1922 and 1996 in Magdalene Laundries, by failing to regulate and inspect their operations, where it is alleged that physical, emotional abuses and other ill treatment were committed amounting to breaches of the Convention. The Committee also expresses grave concern at the failure of the State party to institute prompt, independent and thorough investigations into the allegations of ill treatment perpetrated on girls and women in the Magdalene Laundries (ARTS. 2, 12, 13, 14 & 16).

The Committee recommends that the State party introduce prompt independent and thorough investigations into all complaints of torture and other cruel inhuman or degrading treatment or punishment that were allegedly committed in the Magdalene Laundries and, in appropriate cases prosecute and punish the perpetrators with penalties commensurate with the gravity of the offences committed, and ensure that all victims obtain redress and have an enforceable right to compensation including the means for a full rehabilitation as possible.10

36.27 This makes clear that, as far as the United Nations monitoring committees are concerned, an international human rights instrument which was not binding on the

---

10 Committee against Torture, 46 session, 9th May – 3rd June 2011.
State during the period which the Commission is tasked with investigating may still have application to present day investigations.

36.28 As recently as February 2020 the United Nations decided to investigate a complaint from an individual complainant regarding her treatment in Magdalen laundries despite the fact that she had accepted compensation from the Irish State. The State has a right of reply to this complaint. Its initial view that the convention did not apply at the time she was in the laundries between 1964 and 1968 did not prevail and the State must now embark on a full defence.

**Convention on the rights of the child**

36.29 The UN Convention on the Rights of the Child (CRC) was adopted by the UN General Assembly on 20 November 1989 and came into force on 2 September 1990. It was signed by Ireland on 30 September 1990 and ratified on 28 September 1992. The following are its most important provisions from the Commission’s point of view:

**Article 2**

1. States Parties shall respect and ensure the rights set forth in the present Convention to each child within their jurisdiction without discrimination of any kind, irrespective of the child's or his or her parent's or legal guardian's race, colour, sex, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.

2. States Parties shall take all appropriate measures to ensure that the child is protected against all forms of discrimination or punishment on the basis of the status, activities, expressed opinions, or beliefs of the child's parents, legal guardians, or family members.

**Article 3**

1. In all actions concerning children, whether undertaken by public or private social welfare institutions, courts of law, administrative authorities or legislative bodies, the best interests of the child shall be a primary consideration.

2. States Parties undertake to ensure the child such protection and care as is necessary for his or her well-being, taking into account the rights and duties of his or her parents, legal guardians, or other individuals legally responsible for

---

him or her, and, to this end, shall take all appropriate legislative and administrative measures.

3. States Parties shall ensure that the institutions, services and facilities responsible for the care or protection of children shall conform with the standards established by competent authorities, particularly in the areas of safety, health, in the number and suitability of their staff, as well as competent supervision.

**Article 4**

States Parties shall undertake all appropriate legislative, administrative, and other measures for the implementation of the rights recognized in the present Convention. With regard to economic, social and cultural rights, States Parties shall undertake such measures to the maximum extent of their available resources and, where needed, within the framework of international co-operation.

**Article 7**

1. The child shall be registered immediately after birth and shall have the right from birth to a name, the right to acquire a nationality and, as far as possible, the right to know and be cared for by his or her parents.

2. States Parties shall ensure the implementation of these rights in accordance with their national law and their obligations under the relevant international instruments in this field, in particular where the child would otherwise be stateless.

**Article 8**

1. States Parties undertake to respect the right of the child to preserve his or her identity, including nationality, name and family relations as recognized by law without unlawful interference.

2. Where a child is illegally deprived of some or all of the elements of his or her identity, States Parties shall provide appropriate assistance and protection, with a view to re-establishing speedily his or her identity.

**Article 12**

1. States Parties shall assure to the child who is capable of forming his or her own views the right to express those views freely in all matters affecting the child, the views of the child being given due weight in accordance with the age and maturity of the child.

2. For this purpose, the child shall in particular be provided the opportunity to be heard in any judicial and administrative proceedings affecting the child,
either directly, or through a representative or an appropriate body, in a manner consistent with the procedural rules of national law.

**Article 16**

1. No child shall be subjected to arbitrary or unlawful interference with his or her privacy, family, home or correspondence, nor to unlawful attacks on his or her honour and reputation.
2. The child has the right to the protection of the law against such interference or attacks.

**Article 18**

1. States Parties shall use their best efforts to ensure recognition of the principle that both parents have common responsibilities for the upbringing and development of the child. Parents or, as the case may be, legal guardians, have the primary responsibility for the upbringing and development of the child. The best interests of the child will be their basic concern.
2. For the purpose of guaranteeing and promoting the rights set forth in the present Convention, States Parties shall render appropriate assistance to parents and legal guardians in the performance of their child-rearing responsibilities and shall ensure the development of institutions, facilities and services for the care of children.
3. States Parties shall take all appropriate measures to ensure that children of working parents have the right to benefit from child-care services and facilities for which they are eligible.

**Article 20**

1. A child temporarily or permanently deprived of his or her family environment, or in whose own best interests cannot be allowed to remain in that environment, shall be entitled to special protection and assistance provided by the State.
2. States Parties shall in accordance with their national laws ensure alternative care for such a child.
3. Such care could include, inter alia, foster placement, kafalah of Islamic law, adoption or if necessary placement in suitable institutions for the care of children. When considering solutions, due regard shall be paid to the desirability of continuity in a child's upbringing and to the child's ethnic, religious, cultural and linguistic background.
**Article 21**

States Parties that recognize and/or permit the system of adoption shall ensure that the best interests of the child shall be the paramount consideration and they shall:

(a) Ensure that the adoption of a child is authorized only by competent authorities who determine, in accordance with applicable law and procedures and on the basis of all pertinent and reliable information, that the adoption is permissible in view of the child's status concerning parents, relatives and legal guardians and that, if required, the persons concerned have given their informed consent to the adoption on the basis of such counselling as may be necessary;

(b) Recognize that inter-country adoption may be considered as an alternative means of child's care, if the child cannot be placed in a foster or an adoptive family or cannot in any suitable manner be cared for in the child's country of origin;

(c) Ensure that the child concerned by inter-country adoption enjoys safeguards and standards equivalent to those existing in the case of national adoption;

(d) Take all appropriate measures to ensure that, in inter-country adoption, the placement does not result in improper financial gain for those involved in it;

(e) Promote, where appropriate, the objectives of the present article by concluding bilateral or multilateral arrangements or agreements, and endeavour, within this framework, to ensure that the placement of the child in another country is carried out by competent authorities or organs.

36.30 Article 21(d) in conjunction with the Hague Convention requires the states parties to take all appropriate measures to ensure that adoption placements do not result in any improper financial gain for any of the parties involved.

36.31 The provisions of the CRC are indirectly implemented in the State in legislation, primarily the *Child Care Act 1991*, the *Children Act 1991* and the *Adoption Act 2010*. 
36.32 Compliance with the CRC is monitored by the UN Committee on the Rights of the Child. As with the other UN conventions, the State is subject to periodic review under the CRC.

**European Convention on Human Rights**

36.33 The European Convention on Human Right (ECHR) was adopted by the Council of Europe on 3 September 1953.\(^\text{12}\) Ireland was a founder member of that organisation and therefore was bound by the provisions of the ECHR upon its adoption. Thus, since 1953, the State has been bound, at an international level, to secure to all persons in the State the human rights provided for under the ECHR.\(^\text{13}\) The ECHR has probably had the most influence on domestic law of all the international human rights instruments.

36.34 Among its provisions with relevance to the Commission’s work are:

- **Article 3**
  - Prohibition of torture
  - No one shall be subjected to torture or to inhuman or degrading treatment or punishment.

- **Article 4**
  - Prohibition of slavery and forced labour
  - No one shall be held in slavery or servitude.
  - No one shall be required to perform forced or compulsory labour…

- **Article 5**
  - Right to liberty and security
  - Everyone has the right to liberty and security of person. No one shall be deprived of his liberty save in the following cases and in accordance with a procedure prescribed by law…

- **Article 8**
  - Right to respect for private and family life
  - Everyone has the right to respect for his private and family life, his home and his correspondence.
  - There shall be no interference by a public authority with the exercise of this right except such as is in accordance with the law and is necessary in a democratic society in the interests of national security, public safety or the

\(^{12}\) [https://www.echr.coe.int/documents/convention_eng.pdf](https://www.echr.coe.int/documents/convention_eng.pdf)

economic wellbeing of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others…

**Article 13**

Right to an effective remedy

Everyone whose rights and freedoms as set forth in this Convention are violated shall have an effective remedy before a national authority notwithstanding that the violation has been committed by persons acting in an official capacity.

36.35 The ECHR is enforced by the European Court of Human Rights (ECtHR). Parties to the ECHR undertake to abide by the final judgment of the Court in any case to which they are parties. Thus, the State is obliged, as a matter of internal law, to take steps to comply with any adverse decision of the ECtHR against it. Judgments of the court are transmitted to the Committee of Ministers, an intergovernmental body of the Council of Europe which can exert political pressure where it is considered that there is an issue in relation to compliance.

36.36 Decisions of the ECtHR can require that the State take individual measures in favour of the applicant whose rights have been violated, as well as general measures, such as amendment of national legislation. For example, in *Johnson v Ireland* a claim was brought to the court, primarily under Article 8, challenging the lack of divorce in the State and the legal status of ‘illegitimate’ children. The applicants were a man and woman who could not marry due to his being married to another woman, and their daughter. The court did not find that the State was obliged to introduce divorce, however, as regards the child’s status it held as follows:

…in the present case the normal development of the natural family ties between the first and second applicants and their daughter requires, in the Court’s opinion, that she should be placed, legally and socially, in a position akin to that of a legitimate child.

Examination of the third applicant’s present legal situation, seen as a whole, reveals, however that it differs considerably from that of a legitimate child; in addition, it has not been shown that there are any means available to her or her parents to eliminate or reduce the differences. Having regard to the

---

14 See, for example, *Airey v Ireland* (1979-1980) EHRR 305 which led to the State introducing a civil legal aid scheme.

particular circumstances of this case and notwithstanding the wide margin of appreciation enjoyed by Ireland in this area the absence of an appropriate legal regime reflecting the third applicant’s natural family ties amounts to a failure to respect her family life. Moreover, the close and intimate relationship between the third applicant and her parents is such that there is of necessity also a resultant failure to respect the family life of each of the latter… There is accordingly, as regards all three applicants, a breach of Article 8 under this head.

It is not the Court’s function to indicate which measure Ireland should take in this connection; it is for the State concerned to choose the means to be utilised in its domestic law for performance of its obligation…

36.37 That decision played a considerable role in the enactment of the Status of Children Act 1987 which gave equal rights to all children - see below.

36.38 In *WO’R v EH* (Guardianship)\(^\text{16}\) the Supreme Court rejected a submission that it was bound to apply the ECtHR decision in *Keegan v Ireland*\(^\text{17}\) to the effect that Article 8 of the ECHR was not confined to families based on marriage. The Supreme Court found that the family referred to in Articles 41 and 42 of the Constitution was based on marriage and the concept of a de facto family was unknown to the Constitution. It stated clearly that the Keegan decision was ‘not part of the domestic law of Ireland’.\(^\text{18}\) This stance is rooted in the separation of powers under the Constitution. If an adverse ruling of the ECtHR requires a change in Irish law that is a matter for the Oireachtas, not the courts.

36.39 Regardless of this, the ECHR plays an increasingly important role in the Irish courts, in particular in the interpretation of fundamental rights under the Constitution. However, an analysis of relevant case law suggests that most of the advances in this regard have taken place after the expiry of the period which the Commission is investigating. Furthermore, since the expiry of that period, the *European Convention on Human Rights Act 2003* has empowered the courts to make declarations of incompatibility with the ECHR and required them to interpret Irish law in a manner that is compatible with the State’s obligations under the

---

\(^{16}\)[1996] 2 IR 248.  
\(^{17}\)(1994) 18 EHRR 342.  
\(^{18}\)See also *Quinn v O’Leary* [2004] 3 IR 128 and *McFarlance v Director of Public Prosecutions* [2008] 4 IR 117.
ECHR and to take account of relevant ECtHR decisions. In addition, organs of the State are now required to perform their duties in a manner compatible with the ECHR. The Act of 2003 has undoubtedly led to far more engagement with the jurisprudence of the ECHR than occurred during the period which the Commission was investigating.

**European Convention on the Adoption of Children**

36.40 The European Convention on the Adoption of Children (ECAC) was open for signature by the Council of Europe on 24 April 1967 and entered into force on 26 April 1968. Ireland had already signed and ratified it on 25 January 1968. Under Articles 1 and 2 of the ECAC, the State undertakes to ensure the conformity of its law with the provision of part two and undertakes to give consideration to the provisions set out in part three. Thus, the essential provisions of the ECAC were binding on the State at an international level for the final third of the period the Commission was investigating.

36.41 Among the main provisions of this Convention are that:

- An adoption shall be valid only if it is granted by a judicial or administrative authority (the competent authority).
- An adoption shall not be granted unless at least the following consents to the adoption have been given and not withdrawn:
  - The consent of the mother and, where the child is ‘legitimate’, the father; or if there is neither father nor mother to consent the consent of any person or body who may be entitled in their place to exercise their parental rights in that respect.
  - The consent of the spouse of the adopter;
- A mother’s consent to the adoption of her child shall not be accepted unless it is given at such time after the birth of the child not being less than 6 weeks, as may be prescribed by law, or, if no such time is being prescribed at such time as in the opinion of the competent authority which have enabled her to recover sufficiently from the effects of giving birth to the child;
- The competent authorities shall not grant an adoption unless it is satisfied the adoption will be in the interest of the child;
- Provision shall be made to prohibit any improper financial advantage arising from a child being given up for adoption;

19 For the original convention see [https://www.coe.int/en/web/conventions/full-list/-/conventions/treaty/058](https://www.coe.int/en/web/conventions/full-list/-/conventions/treaty/058); the convention was revised in 2008.
Provision should be made to enable an adoption to be completed without disclosing to the child’s family the identity of the adopter;
Provision shall be made to require or permit adoption proceedings to take place in camera;
The adopter and the adopted person shall be able to obtain a document which contains extracts from the public record attesting the fact, date and place of birth of the adopted person but not expressly revealing the fact of adoption or the identity of his former parents.

36.42 A revision of the European Convention on the Adoption of Children was concluded in 2008. Ireland has not ratified the amended convention. The convention now includes provisions concerning:

- Consent to adoption by a father and by a child who has sufficient understanding to give it;
- The eligibility of registered partners and homosexual couples to adopt;
- The balance between the child’s right to know his/her identity and the right of the biological parents to remain anonymous;
- Minimum age of requirements for prospective adopters.

36.43 The ECAC does not contain any enforcement mechanisms.

European Convention on the Legal Status of Children born out of wedlock

36.44 This convention came into force on 11 August 1978. It was signed and ratified by Ireland in October 1988 and became binding on the State in January 1989. It provides:

Article 2: Maternal affiliation of every child born out of wedlock shall be based solely on the fact of the birth of the child.

Article 3: Paternal affiliation of every child born out of wedlock may be evidenced or established by voluntary recognition or by judicial decision.

Article 4: The voluntary recognition of paternity may not be opposed or contested insofar as the internal law provides for these procedures unless the person seeking to recognise or having recognised the child is not the biological father.

Article 5: In actions relating to paternal affiliation scientific evidence which may help to establish or disprove paternity shall be admissible.
Article 6: The father and mother of a child born out of wedlock shall have the same obligation to maintain the child as if it were born in wedlock. Where a legal obligation to maintain a child born in wedlock falls on certain members of the family of the father or mother, this obligation shall also apply for the benefit of a child born out of wedlock.

Article 7: Where the affiliation of a child born out of wedlock has been established as regards both parents, parental authority may not be attributed automatically to the father alone. There shall be power to transfer parental authority; cases of transfer shall be governed by the internal law.

Article 8: Where the father or mother of a child born out of wedlock does not have parental authority over or the custody of the child, that parent may obtain a right of access to the child in appropriate cases.

Article 9: A child born out of wedlock shall have the same right of succession in the estate of its father and its mother and of a member of its father’s or mother’s family, as if it had been born in wedlock.

Article 10: The marriage between the father and mother of a child born out of wedlock shall confer on the child the legal status of a child born in wedlock.

36.45 This convention does not contain any enforcement provisions.

The Hague Convention of 1993 on intercountry adoption

36.46 The Hague Convention (HC), building upon the principles set out in the CRC and other regional and international instruments, established a system of international cooperation between states to ensure that, when an international adoption takes place, it does so in the interests of the child, respecting the fundamental rights of all the parties concerned, and free of the abuses sometimes associated with intercountry adoption. It also ensures that the status of the adopted child is recognised in all convention states. The convention was concluded in 1993. It was implemented in Irish law by the Adoption Act 2010.

36.47 The Convention recognises the need for the two states involved in an intercountry adoption (the state of origin of the child and the receiving state) to share responsibilities within the intercountry adoption process, utilising a system of administrative cooperation based on ‘Central Authorities’ located in each state.

---

https://www.hcch.net/en/instruments/conventions/full-text/?cid=69
region within a state. To this end it sets out a basic procedure for intercountry adoption - one which is child focussed. Adoption is viewed, not as a means of finding a child for a family, but as a means of finding a suitable family for a child whose family of origin is unable to provide for his or her care. The following is a summary of the convention procedure, taken from the Guide to Good practice on the Implementation and Operation of the 1993 Hague Intercountry Adoption Convention,\textsuperscript{21} at p. 80:

The prospective adoptive parents must apply to the Central Authority in the State of their habitual residence. The Central Authority, if satisfied that the parents are eligible and suited to adopt, prepares a report on the family, and transmits the report to the Central Authority of the child’s country of origin. It is implicit in the Convention that the adoptive parents’ habitual residence country will have criteria in its laws and procedures to assess that the prospective adoptive parents are eligible and suitable to adopt a child. This assessment should be done by professionals with appropriate qualifications and expertise.

The Central Authority in the State of origin should have a register of children declared adoptable through intercountry adoption. The Central Authority undertakes the matching of the adoptable child with the adoptive parents who have the qualities and skills best suited to the needs of that child. It is implicit in the Convention that the country of origin will have criteria in its laws or procedures by which to determine if a child is ‘adoptable’. If it is satisfied that the child is adoptable, the Central Authority in the State of origin prepares a report on the child, ensures that proper consents have been obtained, matches the child with appropriate adoptive parents, and determines whether the envisaged placement is in the child’s best interest. The Central Authority then transmits the report on the child to the Central Authority of the receiving State, which must determine that the prospective adoptive parents agree with the proposed placement or entrustment, and may, if necessary, approve the proposed placement of entrustment. Provided that both Central Authorities have agreed that the adoption may proceed and the child has been authorised to enter and reside permanently in the receiving State, the entrustment of the child to the adoptive parents, and the adoption itself, may now go ahead, depending on the law of the State of origin. If the adoption must be finalised in the State of origin, in accordance with Article 28,

\textsuperscript{21} https://assets hcch.net/docs/bb168262-1696-4e7f-acf3-fbd85504af6.pdf
the legal procedures, including court procedures, for the adoption must be completed before the child is authorised to leave the State of origin.

The status of international agreements in Irish Law

36.48 Ireland has a dualist system under which international agreements to which it becomes a party are not automatically incorporated into domestic law. Article 29.6 of the Constitution specifically states that ‘No international agreement shall be part of the domestic law of the State save as may be determined by the Oireachtas’.

36.49 The effect of this is set out in the following passage from the judgment of Judge Fennelly in the Supreme Court in *Kavanagh v Governor of Mountjoy Prison*:

> The Constitution establishes an unmistakable distinction between domestic and international law. The government has the exclusive prerogative of entering into agreements with other states. It may accept obligations under such agreements which are binding in international law. The Oireachtas, on the other hand, has the exclusive function of making laws for the State. These two exclusive competences are not incompatible. Where the government wishes the terms of an international agreement to have effect in domestic law, it may ask the Oireachtas to pass the necessary legislation. If this does not happen, Article 29, section 6 applies.

36.50 Instruments which are not transposed into domestic law do not have direct binding effect within the State. Having said that, they are binding in international law and it is the general practice of the State not to ratify an international agreement unless it considers that the provisions of the agreement are already indirectly implemented in domestic law or can be so implemented prior to ratification.

36.51 Unimplemented international agreements are frequently employed by the courts as an aid in the interpretation of Irish law. In addition, where an international agreement has not been incorporated into Irish law, it may nonetheless act as a constraint on administrative decision making. This further indirect effect has manifested itself through the doctrine of legitimate expectations, which has been relied upon on a number of occasions by claimants seeking to hold an administrative decision maker to the terms of an international commitment given by

---

the State. However, it is clear from the decision in the Kavanagh case that this doctrine is founded on procedural fairness and does not guarantee anything more than that. The doctrine requires that decision makers take into account the provisions of a relevant unincorporated international agreement, however it cannot be relied upon to compel a decision maker to make a substantive decision in line with the international agreement relied upon where that agreement conflicts with domestic law.

36.52 It is widely accepted that the courts have become increasingly open to unincorporated international agreements having indirect effect in domestic law. However, it should be noted that the advances in this regard have, in the main, post-dated the period the Commission is tasked with investigating.

B: Human rights issues

Submissions relating to human rights

36.53 In addition to the submission from the IHREC the Commission also received submissions from the Clann Project and One Family.

36.54 The Clann Project is a joint voluntary initiative by the Adoption Rights Alliance (ARA) and Justice for Magdalenes Research (JFMR) in association with global law firm Hogan Lovells. The stated purpose of the Clann Project is to establish the truth of what happened to unmarried mothers and their children during the 20th century from the foundation of the State in 1922 onwards.

36.55 One Family is Ireland’s national organisation for one-parent families. One Family was established in 1972 as Cherish. At that time Cherish was Ireland’s first organisation for single mothers organised by single mothers and run on a human rights, rather than charity - benevolence base model.

36.56 One Family stated that it supported the implementation of the eight recommendations of the Clann Project, in particular the recommendations on access to data; inclusion of all stakeholders; redress and reparation through

---

24 See, for example, Fakih v Minister for Justice [1993] 2 IR 406.
26 https://onefamily.ie
material benefit and symbolic representation; and legal remit through legal aid, extension of the statute of limitations and criminal investigation.

36.57 The Clann Project want a transitional justice process which would include an investigative and truth telling mandate to address institutional and structural human rights violations in Ireland since the foundation of the State generally.

36.58 Among their recommendations as part of Ireland’s transitional justice process the State should enable the identification of the remains of children in mother and baby homes and related sites. The process they say should involve several sites containing remains including but not limited to Tuam, Sean Ross, Bessborough, Castlepollard, burial plots at Saint Finbarr’s and Saint Joseph’s cemeteries in Cork and the Angel plots in Glasnevin cemetery. Deaths, burials and exhumations at Magdalen laundries should form a key element of any investigation into deaths and identification of remains.

36.59 Furthermore they also feel that there should be a State apology, redress and reparations. In ARA’s experience, for most adopted people, redress predominantly means unfettered access to the institutional records held about them.

Statutory Rights and Services

36.60 As part of the transitional justice process the Clann Project strongly recommends the introduction of statutory rights and services for adopted people and birth parents all of whom they say have been deeply affected by Ireland’s treatment of unmarried mothers and their children. This should include:

- Access to information
- Centralisation of adoption records
- Access to the archive of the Commission of Investigation
- Tracing services
- The State should introduce statutory rights for people adopted from Ireland to the US and other countries
- The right to know that you are adopted
- Counselling
- Access to the Courts. The State should amend the Statute of Limitations 1957 to explicitly grant discretion to the courts to extend the normal limitation periods where it is in the interest of justice
• Establishment of a dedicated unit to investigate specific criminal allegations
• Memorialisation

36.61 While the Commission wishes to record its appreciation of these contributions it was disappointed that no attempt was made to quantify the costs involved.

Information Disclosure

36.62 The main issue raised by lobby groups and individuals born in mother and baby homes was information and tracing. Adopted people do not have a right to access their original birth certificate nor do they have the right to access information on their families of origin. Many adopted people have got this information but others have been unable to do so. It is clear to the Commission that many adopted people think there is considerably more information about them in institutional and other records than is actually the case. Having examined these records closely, the Commission knows that the information is very limited in many cases. The quantity and quality of the available information is not, of course, relevant to the issue of whether or not there should be a right of access.

36.63 Articles 7 and 8 of the UN Convention on the Rights of the Child established the important principle that children are entitled to the information necessary to preserve their personal identity. These Articles were considered by the Supreme Court in *IOT v B and the Rotunda Girl’s Aid Society* and *MH v Rev GD and the Rotunda Girl’s Aid Society.*

36.64 The Supreme Court recognised a person’s unenumerated constitutional right to know the identity of his or her birth mother but said that that had to be balanced against the birth mother’s right to privacy. It stated that neither set of rights was absolute and stated that access to adoption records might be appropriate in certain cases but it would depend on many factors including:

- The circumstances surrounding the birth mother’s loss of custody of the child;
- The current status and circumstances of the birth mother and the potential effect upon her of the disclosure of her identity;

---

• The birth mother’s own wishes and attitude regarding the disclosure and the reasons behind these wishes and the aforementioned attitude;

• The current age of the birth mother and child respectively;

• The attitude of the adopted child, including the reasons why he or she wished to seek disclosure of his or her birth mother’s identity;

• The present circumstances of the adopted child; and

• The opinion of the adoptive parents or other interested parties.

36.65 While the Supreme Court did find entitlement to information about one’s birth was compatible with the constitutional right to know the identity of one’s birth mother as guaranteed by Article 40.3 of the Irish Constitution it did lay considerable emphasis on the birth parent(s) privacy.

36.66 Attempts have been made to draft legislation that would give effect to the principles set out in the Supreme Court judgement but have not succeeded. The Adoption (Information and Tracing) Bill 2016 was shelved because as the press release from the then Minister Zappone stated:

Despite everyone involved making significant efforts to reach consensus on the issues of release of birth information it has not proved possible to reach agreement at this time.

36.67 It appears that the Attorney General had advised that it was constitutionally unacceptable to allow unrestricted access to birth information for adopted people. The current government and Minister O’Gorman have committed to introducing such legislation.

36.68 During the course of its investigation the Commission took evidence from people engaged in both sides of the argument. Those advocating a legal right to know one’s identity relied heavily on the UN Convention on the Rights of the Child. While the Convention does not provide children with the specific right of access to their biological information the Convention Committee did make a recommendation in the case of Bulgaria that it should legislate to guarantee children a right to know their origins.

30 Concluding observation of the Committee; Bulgaria, UN doc CRC/CBGR/CO 3-5 paragraph 37 (d).
36.69 The matter was also considered by the Grand Chamber of the European Court of Human Rights in the case of *Odievre v France* (2003). In that case the applicant had been abandoned by her mother at birth. The mother did not want her identity revealed to her. She was placed in care and some years later she sought information about her birth and her birth parents and any siblings she may have had. The Court took the view that the applicant had been given non-identifying information about her natural family which allowed her to trace her roots to some extent without violating third party rights. Article 8 of the European Convention of Human Rights was considered in the context of this case but the judgement was that the right had not been violated.

**View of birth mothers**

36.70 A number of social workers who had contact with birth mothers gave evidence to the Commission about the ramifications of their privacy rights being eroded if birth information was revealed without their consent.

36.71 They told the Commission that, when recent statistics gathered by them were analysed, it was noted that over 50% of birth mothers contacted as part of a search by an adoptive person did not wish to engage with their service. Many of the women told them of their terror at the prospect of the proposed legislation on tracing being implemented. They told the Commission that this group of women were a very vulnerable cohort and that their views were not being heard. One of the social workers produced a letter from one such woman which stated as follows:

> I am writing this in a secret place so as no one will see me. I implore you and beg you now not to get in touch with [name of husband] he doesn’t know about this as I could not tell him. He was in England at the time and I went through it on my own. I could not tell anyone then, I can’t tell anyone now. I am going through this on my own now. I was promised that no contact would be made. I am in a terrible dark place with no way out. This is putting me over the edge and I pray every day that it is all a nightmare and maybe Jesus will get me out of it. Please help me, I am desperate now. I was promised there would be no contact. I have nowhere to turn but to kill myself I can’t tell anyone.

36.72 The concerns of the social workers were also brought to the attention of the Commission by the Council of Irish Adoption Agencies:

---

31 Application number 42326/98 [2003].
There is a cohort of women about whom we know very little, and for whom we must have great concern. These are women who we, as social workers, believe were so shamed at the time of pregnancy and birth by the system and by those from whom they might have wished for support that they have never told anyone (including husband and other children) of the child or children to whom they gave birth and who live in fear of being found out and feeling their lives could be destroyed.

36.73 It is important to stress that the social workers who gave evidence to the Commission said that they were wholeheartedly in favour of the release of birth certificates and recognised the importance of this for adopted people who were equally their clients. They believe that the onus should not be placed on the birth mother to have to object to the release of a birth certificate. This was placing the woman in a position where she has to reject her child for a second time. Instead they suggested that, at minimum, a birth mother should be contacted and informed by an adoption social worker once a request is made. While she may not have a right to prevent the information being released she can be afforded the time to manage her feelings and her life circumstances around this with social work support offered.

36.74 They suggested that there be a 12-month consultation period after an individual request for the release of a birth certificate. This would give time to engage with the birth mother and provide the necessary counselling and support prior to her identity being released. Such an approach would afford women dignity and better facilitate both a holistic approach to family relationship building and a balance of rights for all. Among their recommendations were that people have at least three sessions of counselling with an accredited adoption agency prior to the release of identity information. Affording this measure would work to enhance the sensitive building of family relationships and prevent rejection and family breakdown. Their view was that historically the State had perpetrated an imbalance of rights in respect of the women in the cohort on whose behalf they were advocating. It was their view that such a position should not continue to be enshrined in legislation in the 21st century.
The Commission’s view

36.75 The Commission is of the view that adopted people have a right to their birth certificates and associated birth information and recognises that a person’s right to his or her identity is an important human right and should only be denied in exceptional circumstances. Medical information and adoption records compiled at the time of the adoption should also be available. If a mother, following support from social workers as expressed above, is still of the view that her privacy rights are being seriously eroded then the matter should be brought before the Circuit Court to determine the issues. The proceedings should be held in camera and both the birth parent(s) and the adopted person should have the right to legal representation and legal aid should be provided for all parties if required.

36.76 The issue of a birth mother’s and father's (if available) subsequent medical history would in the Commission’s view have to be matter of negotiation between the parties in the first instance. However if access to information on medical grounds is sought then the sections of the New Zealand Adult Information Act 1985 (as amended) dealing with this issue should provide useful guidance.

36.77 Developments in DNA should be helpful in this regard and consideration should be given to financially assisting those born in mother and baby homes/county homes who wish to avail of such a test. The development of technology and the existence of numerous ancestry sites has meant that access to birth information has become much easier to obtain for both mother/father and child. There can be problems for people who find very important information in this manner and who do not have any support system in place. It is important that legislation provide for such a support system. The Commission is of the view that the 12-month waiting period suggested by the social workers is too long and six months would be more appropriate.

36.78 If, as seems likely, a referendum is required to allow for the necessary legislation, then one should be held.

36.79 The Commission also considers that there should be a central repository of the records of institutions and adoption societies so that information can be obtained from one place. The Commission’s database of individuals could be expanded by adding adoption records to it. The Commission is aware that there is considerable criticism of the Child and Family Agency’s (Tusla) approach to information and
tracing. This criticism is, in the Commission’s view, unfair, as Tusla is implementing the law as it stands and cannot change it and any other agency would have to do the same.

Right to know where family members are buried

36.80 The report by Dr Geoffrey Shannon entitled Human Rights issues at the former site of the Mother and Baby Home, Tuam\(^{32}\) examines in detail the issue of the rights of families to information about burials. There are no clear absolute rights. The Commission understands the wishes of family members to know more. If such rights were established, there would need to be a clear statement of what family members were entitled to this information; it is difficult to see how any such rights could extend beyond siblings. In cases where the mothers were in the homes when the child died, it is possible that they knew the burial arrangements or would have been told if they asked. It is arguable that no other family member is entitled to that information.

36.81 The Commission considers that there would be enormous practical difficulties in establishing and implementing such rights. The costs involved would probably be prohibitive.

Illegitimacy

36.82 The existence of the status of ‘illegitimacy’ until 1987 was an egregious breach of human rights. It blighted the lives of the people concerned. This was the case for all ‘illegitimate’ people not just those born in mother and baby homes.

36.83 The following are extracts from evidence given to the Commission by people who were affected by being labelled ‘illegitimate’:

I was never allowed to serve mass; the parents weren’t married. There would be mass in the local house every Lent - called the stations. I wasn’t allowed to serve mass in that house and my school mate a neighbour would do it. How degrading was that?

I was an outcast.
The sad thing is not what happened to you but as soon as you mention the word ‘illegitimate’ you are labelled, they clamp up. You are not judged as a

\(^{32}\) [https://assets.gov.ie/25217/0abb576368b14e2081c447b417544fb2.pdf](https://assets.gov.ie/25217/0abb576368b14e2081c447b417544fb2.pdf)
person but you are judged as who you were. Illegitimate has a connotation ‘she is good for nothing’.

My mother said there is no way she is raising a bastard in her house.

I was called a bastard - if you go to the pub, there could be three seats and they would go up along the side even the old men. You were classed as a thing and a bastard, that is the nothing lad.

I was considered by the Roman Catholic Church to be the spawn of the Devil, by the State to be illegitimate and by society to be a bastard.

A woman was told by her father when she wanted to take the baby home ‘there is no bastard coming to stay in this family’. Another woman said that when she told her husband that she was ‘illegitimate’, it changed his view of her. He thought less of her and it changed their marriage entirely.

36.84 These are just some of the quotes from a number of men and women who as children were resident in mother and baby homes within the Commission’s remit and who to this day remember the impact of their ‘illegitimacy’ on their lives.

**Abolishing the status**

36.85 The concept was well established in most countries and legal systems for some time but it remained in existence for longer in Ireland. Serious discussions about its abolition started in the 1970s. At that stage, it had been abolished in other countries such as Norway, Sweden, Denmark, Germany and New Zealand.

36.86 In October 1974 Cherish, an Association of Unmarried Parents, ran a conference on ‘The Unmarried Parent and Child in Irish Society’ where the concept of ‘illegitimacy’ was discussed. The conference was held against a backdrop of rising rates of births outside marriage and greater use of abortion services in the UK by pregnant Irish women. The prevailing trends were described by Dr Dermot Walsh:

The number of illegitimate births in this country has risen steadily since 1959 and by 1971 had reached 1,842 births. In effect the number of illegitimate births in Ireland has roughly doubled between 1961 and 1971, and the illegitimate birth rate per 1,000 single and widowed women now stands at 6.3 as against 3.3 in 1961. This represented 2.6% of total births in 1971. In 1971
there were a further 1,510 illegitimate births to Irish-born women in the United Kingdom but we do not know the length of residence in the United Kingdom of those mothers and accordingly we cannot state how many of the conceptions leading to those births occurred in Ireland. There was no comparative data on illegitimate births in Britain by mothers' birthplace in 1961. Additionally, in 1971 there were 577 legally induced abortions on women giving the Irish Republic as their usual residence. By 1972 the number of terminations had doubled to almost a thousand, and it is interesting to reflect that the rate of termination of pregnancy among women who gave their normal place of residence as the Irish Republic in the age-group 25-29 almost equalled the number of live births to unmarried Irish women in Ireland in that same age-group. Put another way, of all conceptions to Irish unmarried in the 25-29 age-group not ending in spontaneous abortion and not leading to birth outside the country, 43% were terminated in England, a remarkably high proportion compared with only 29% of English unmarried pregnancies in the same age group.

The data indicate clearly that there has been a doubling of the illegitimate fertility, a recourse to legal termination of pregnancy in Britain with the introduction of 1967 Abortion Act, and the inevitable conclusion, since conception is the consequence of sexual activity, that there has been a considerable rise in extra-marital or pre-marital sexual activity in this country. Therefore the problem of the unmarried mother and her child is one that is now twice as great as it was in 1961, and the question arises whether the measures to cope with it have been doubled in this decennium, making the unlikely supposition that they were adequate then.

**Historical background**

Dr William Duncan (who is a member of this Commission) who also spoke at the Cherish conference outlined the historical basis for the disabilities attaching to ‘illegitimacy’. He said that the disabilities attaching to ‘illegitimacy’ had their origin in common law which itself appeared to have been influenced by the canon law of the Roman Catholic Church.

The Canon law initially did not regard illegitimacy as a defect. But during the middle ages Canon law doctrine underwent a change. The moral basis for this change is supposed to have been a desire on the part of the church to protect the institution of the family and in particular the institution of marriage. Fornication was a sin and adultery was an even greater sin because it was
forbidden in the Ten Commandments and because it involved a violation of the holy sacrament of marriage. The church decided therefore to draw a distinction between children born within and children born outside wedlock thus discouraging fornication and adultery. In the council of Poitiers 1087 sons of priests and others born of fornication were forbidden to be promoted to sacred orders, unless they either became monks or led a regular life in economical congregation.  

36.88 Dr Duncan went on to say that the development in moral thinking was ‘conspicuous for its absurdity’. The moral argument was in essence as follows: The child born out of wedlock must suffer discrimination because his parents have done wrong, and his suffering will be an example to other adults to deter them from sin. The child is seen as an object to be used in instilling more moral behaviour in others. The innocence of the child and any rights which he may have as an individual are ignored. This curious concept of deterrence had reached its observed culmination in modern Irish society which on the one hand stigmatises the illegitimate child as a social leper and on the other hand regards adultery and fornication as non-criminal forms of conduct.

36.89 He argued that there was little doubt that these rules of canon law influenced the development of the common law but they also ‘played a part in breeding into successive generations a non-critical acceptance of discrimination against illegitimate children’.

36.90 However, he pointed out that the Council for Social Welfare which was a Committee of the Catholic Bishops Conference had made an important contribution to the debate on illegitimacy in a report on family law issues published in 1974. This report had outlined the lack of legal situation of ‘illegitimate’ children and made detailed proposals for change. It provides a summary of the legal problems arising from the status of ‘illegitimacy’:

The child of an unmarried mother is considerably disadvantaged under our present legal system. For example, the child of an unmarried mother cannot have his paternity established; he has no rights of succession against the

---

33 During the debate on the Adoption Bill 1952, Archbishop McQuaid wanted a clause inserted which would force the GRO to disclose information about the adoption of a person ‘as illegitimacy is a bar to Holy Orders, without a dispensation from Rome, His Grace considered it desirable that there should be some simple procedure for disclosure of information in proper cases.’
property of his natural father, and only a limited right to succeed to the property of his mother, notwithstanding the changes introduced by the Succession Act, 1965; the law does not enforce effectively the maintenance responsibilities of putative fathers; such maintenance as the Court may award ceases when the child reaches 16 years of age.

If an unmarried mother is granted an affiliation order there are no means whereby she can require the putative father to contribute to her own upkeep and maintenance while she is rearing the child.

The Church acknowledges that there is a moral obligation on fathers to support their children whether legitimate or illegitimate.

Other countries have procedures to permit the voluntary acknowledgement of their child by a father and mother who do not intend to, or who cannot, marry. This permits paternity to be proved and the child to be given the same status as a legitimate child.

We are concerned with the rights of all children and that they should be treated equally. We regard it as unchristian that children born out of wedlock should, as a result of the actions of their parents, be victimised by legal distinctions between them and children born to married parents. Consequently, we wish to urge that the legal disabilities imposed on these children should be removed.

We would recommend that -

1. There should be no distinction between children before the law;
2. The law be amended to allow voluntary acknowledgement of a child born out of wedlock. It is considered that power to object to such an acknowledgement should be given to the spouse of either parent;
3. Children born out of wedlock be given rights of succession;
4. Provisions be enacted whereby the single mother could formally recognise her child so that if she were to marry a man other than the father of the child, that child would have equal rights of succession to her property with any legitimate children the couple might have. This equates the position of a child born out of wedlock to that of a step-child;
5. The procedure of voluntary acknowledgement should be extended to the wife who has an extra-marital child;
6. Children of a void or voidable marriage should not be bastardised but should continue to be regarded as legitimate offspring of the parties following a decree of nullity;
7. The Illegitimate Children (Affiliation Order) Act, 1930 be amended in the following respects:

- The time limit during which a mother may bring affiliation proceedings against the father of her child should be extended from 6 months to 3 years;
- Maintenance in respect of the child should continue until he has finished full-time education and not cease, as at present, at 16 years;
- Consideration be given to the introduction of genetic testing to establish paternity. Such tests have now become so sophisticated that the margin of error is minimal.

36.91 In her introduction to the conference report (published March 1975), the former President of Ireland, Mary Robinson, who was then a senator and president of Cherish, stated that the people of Ireland had failed to uphold the constitutional guarantee that ‘all citizens shall as human persons be held equal before the law’. Children born out of wedlock were not equal before the law:

- These young citizens are discriminated against in that they do not have property and succession rights to their father; in that their family relationship is not given full recognition and protection; and in that they are burdened with the social stigma implied in being called ‘illegitimate’.

36.92 Senator Robinson had introduced the Illegitimate Children (Maintenance and Succession) Bill) 1974 but withdrew it in February 1975 because of an undertaking she believed was given by the then Minister for Justice, Patrick Cooney, that a Family Law Reform Bill on the subject was at an advanced stage of drafting and would be introduced soon. The necessary legislation did not become law until 1987.

**Law Reform Commission Report on Illegitimacy**

36.93 In 1982 the Law Reform Commission produced a comprehensive report on ‘illegitimacy’ and said that a law that denies substantial rights to innocent children needed radical reform.\(^34\) This report led to the passing of the Status of Children Act 1987 which finally abolished ‘illegitimacy’.

\(^{34}\) [https://publications.lawreform.ie/Portal/External/en-GB/RecordView/Index/30550](https://publications.lawreform.ie/Portal/External/en-GB/RecordView/Index/30550)
During the Dáil debate on the Status of Children Bill 1986, politicians made a number of remarks, such as ‘the child born outside marriage - the illegitimate child as exists in Irish law today - is discriminated against in substantial areas’. Another expressed disappointment that the bill could not succeed in totally abolishing ‘illegitimacy’ because marriage was enshrined in the constitution and ‘all our attitudes are debated along the idea of the family’ which meant that there has always been a difference between the social position of a child born within and outside marriage. It was important to afford ‘equal rights to children born outside marriage as are afforded to those born within marriage’. It was remarked that it was good that the emphasis was now shifting towards caring for the child:

who is a completely innocent party in society. This Bill reflects a new perception about the status of children born outside marriage and reflects a new perception of the position of children and their treatment in society…If the social thinking of the last decade or so in relation to this legislation, and this legislation is a part of that thinking, is maintained we can look forward to the day when the distinction will be eliminated. I hope the social thinking of society will lead to this position.

Another criticised the insidious discriminations associated with illegitimacy and that it followed children right ‘into the heart of the homes of two parent families and is not just confined to the single parent family’. Another politician said that it had no place in the society that they wished to see in Ireland and that it was a stigma from which many Irish children suffered. One example was that many adoptive parents felt embarrassed and angry at first communion time because birth certificates were required by schools and these showed that the children were ‘illegitimate’ and it caused some upset for people. This politician welcomed the bill ‘which seems to remove the shameful tag of illegitimacy which has attached to so many children for far too long’. Another politician welcomed this desire to remove ‘the stigma of illegitimacy and regarding it as a duty on Members of the House through legislation to provide effective statutory provisions to place children in a position of legal equality and give mothers of children born outside of marriage as much protection as possible but are regarding the fathers of children born outside marriage in a somewhat different position’.

Another said: ‘We fully support the abolition of the stigma and concept of illegitimacy. Children born out of wedlock have been for far too long the victims of major acts of legal and social injustice. They have been the butt of cruel jokes, they have been discriminated against in the job market and, indeed, up to recently they were discriminated against in Church law’.

There were some who objected to the language used in the bill. For example, they was concerned that the proposal to remove the word ‘illegitimate’ and replace it with ‘non-marital’ was replacing an old offensive term with a new offensive term. Another said there had been an effective apartheid and stigma attached to unmarried others. They said that this was ‘society’s way of stating that the proper way to bring up a child was in the loving care and relationship of a father and mother and I have no doubt that that is still the best way to bring up a child. For that reason, society frowned on the situations where it was other than this’.

While the Dáil and Seanad debates on the bill were for the most part constructive, the Commission thought it striking that nobody thought to say sorry to all those, who as children and young adults, were so cruelly discriminated against by both society and state authorities because of the circumstances of their birth.
Mother and Baby Homes in the Netherlands in the 20th century

Report for the Irish Commission of Investigation: Mother and Baby Homes and Certain Related Matters (Order 2015)

31 August 2015

Dr. Nelleke Bakker (p.c.m.bakker@rug.nl)
Associate Professor of History of Education
Faculty of Behavioural and Social Sciences
University of Groningen
The Netherlands
Introduction

Since the mid-19th century in the Netherlands care for single mothers and their babies is in the hands of private initiative, particularly religious organisations. In 1847 the reverent Ottho Gerhard Heldring, a representative of the Dutch branch of the international protestant revival movement the Reveil, established the first home for ‘penitent fallen’ women, Asyl Steenbeek. In the asylum women and their children were taken care of and subjected to a moral-religious re-education aiming at prevention of (falling back into) prostitution.¹

This association between a single mother and a sinful life, or even prostitution, has continued to be the basis of all care arrangements provided to single mothers and their children up to the 1960s. This care was provided in specialized homes where a woman could give birth and was taken care of together with her baby during the first few months after delivery. Because of the short stay, these homes were called ‘transit homes’ (doorgangshuizen). Up to 1947 parental rights and guardianship were not given automatically to a single mother of age; she had to apply for it. Instead, all illegitimate children were put under legal guardianship of a society (voogdijvereniging) of the mother’s denomination (protestant or Roman Catholic) and, if necessary, after a few months, placed in a children’s home of this society. If the single mother was a minor who did not live with her parents any more, she herself was also put under guardianship. These guardianship societies did not particularly stimulate contact between the ‘sinful’ mother and the fruit of her sin. As a consequence, this had usually an incidental character. The idea was that caregivers had to protect the child against her ‘sinful’ mother.

In these children’s homes illegitimate children lived together with criminal and neglected children under state custody and they were taken care of and treated in the same way. Placement in a foster family instead of a home by one of the guardianship societies was possible; in post-war years it was a fifty-fifty chance. Probably the half of the children under guardianship that lived in a foster family was better off than the half that lived in one of the many crowded children’s homes under an authoritarian and often harsh regime, led by badly educated, and sometimes violent or abusive child care workers.² The single mother was supposed to make a fresh start in society, find a decent job and a place to live, and hopefully marry a decent man and either retrieve her child when conditions had improved or forget about her. Sometimes, mostly in cases of teenage motherhood, both mother and baby returned to the girl’s home to live there as part of the family. In those cases the child was raised as a late arrival of the aging mother of the family. In other cases, if the girl had more or less voluntarily abandoned her baby after birth, the management of a home gave away a baby at the back-door to a ‘decent’ childless couple to become either their legal foster child or their illegal would-be child. A notorious example are the small homes next to the Leyden hospital that sold babies for money.

Gradually, particularly from the 1930s, the philanthropic, mostly religious societies that ran the majority of the mother and baby homes started to stimulate pregnant single women to not abandon their baby and take care of it themselves. As a consequence, they also started to provide single mothers with whatever help was needed to be able to work and live as a single mother in a society in which an ‘incomplete’ family was not facilitated with child care and was generally looked down upon. Partly, the shift of focus toward single mothers taking care of their child instead of abandonment is associated with a more explicit fear of illegal abortion as an even more serious sin than single motherhood. At the same time in the professional discourse the emphasis shifted from these women’s sinful nature to their motherhood and the idea that a ‘natural’ bond existed between a mother and her child. Breastfeeding was strongly recommended. Therefore, care arrangements had to cover at least three months after birth. Next to the homes, advice bureaus were created to support women.
who had the courage to raise their illegitimate child alone in practical matters. From scattered information one gets the impression that in the 1930s and 1940s protestant organisations were more actively stimulating women to take ‘their responsibility’ and take care of their babies, whereas Roman Catholic homes and the religious orders that ran these homes were more often involved in old-style, hidden, and partly illegal actions to provide a childless couple with a baby, legal adoption being as yet impossible. We may guess that in many cases vulnerable and desperate young women, overwhelmed by feelings of guilt, have been ‘talked into’ abandonment of their baby.

From the mid-1950s the moral-religious discourse was replaced with a psychiatric discourse in which the single mother was no longer represented as a sinner who had to do penance, but as a woman suffering from psychiatric illness. As a psychiatric patient she was entitled to help and advice from professionals: a psychiatrist, a psychologist, a social worker, a clergyman, and a judicial advisor. The pregnant single woman received help in order to be able to take the ‘right’ decision as to the future of her baby. This decision, however, had become more complicated, as adoption was legalized in 1956. Irrevocable abandonment of a baby to be adopted by a family that was officially selected and approved of by professionals had become a serious option. It even became authoritative experts’ preferred option, as growing up in a ‘normal’ family was conceived of as in the best interests of the child. Therefore, despite the rhetoric of autonomy, the psychiatric view of pregnant single women meant that practices of being ‘talked into’ abandonment for adoption, preferably immediately after birth, did not stop. The organisations that ran the mother and baby homes and advice bureaus emphasised primarily the importance of professional help and the right of a woman to make her own choice.

Finally, in the 1970s, unmarried pregnancy and single motherhood lost their problematic character, as they were now generally accepted. The associations with sin and sickness disappeared. Part of the mother and baby homes became superfluous and closed down, others chose to focus on teenaged mothers and other groups that were more particularly in need of help, like single mothers from ethnic minorities. The advice bureaus have always remained active. Adoptions of illegitimate children were no longer encouraged. Instead, the number of crèches for infants to facilitate working mothers increased. Single mothers were finally free to make their own choice. Gradually, the concepts of ‘illegitimacy’, ‘forced marriages’, and ‘incomplete’ families became obsolete. At the same time, as a consequence of the more general use of reliable means of birth control like ‘the’ pill, the number of unwanted pregnancies greatly reduced. Consciously unmarried mothers (in Dutch bewust ongehuwde moeders) proudly presented themselves as BOM. As hardly any baby was abandoned from this time, childless couples could no longer adopt a Dutch baby and had to turn to the Third World if they wanted to adopt a baby. To facilitate international adoptions a new network of private organisations was established. From the 1980s the old organisations that supported single mothers and their children accepted a new task: helping adults who had been raised in a children’s home or a foster family to find their biological mothers, who had more or less voluntarily abandoned them when they were babies.

This brief outline of the history of mother and child care in the Netherlands is based on the only piece of literature that is available, a commemorative book on the history of the national association that coordinated the work of the private organisations that ran the homes and the advice bureaus for single mothers from 1930, the Federation of Institutions for the Single Mother and her Child (Nationale Federatie van Instellingen voor de Ongehuwde Moeder en haar Kind, FIOM). The book’s focus is on the history of this association and its policy and intentions, not on the topics that are central to the work of the Irish Commission investigating the history of the care arrangements in mother and baby homes: the living conditions and the
quality of the care arrangements provided in these homes, as well as the share of the illegitimate children that were taken care of in these homes.

Next to this FIOM-book, a number of sources are available on the basis of which an attempt can be made to reconstruct aspects of the history of the quality of the care that was provided in the mother and baby homes. From the 1930s up to the 1960s a series of surveys have been made by governmental and other committees or individual experts, reporting on the living conditions and other aspects of the lives of single mothers and their children in and outside these homes. These reports appeared particularly at times when consensus as to the preferred kind of care was disappearing and a new, generally approved approach of pregnant single women had not yet been reached, particularly the 1930s and 1950s. However, the most valuable knowledge about practices of care in Dutch mother and baby homes and children’s homes is to be obtained from oral history interviews with adults who have either been raised as an illegitimate child in a home or been accommodated in a home as a single mother during different periods of time and under different conditions.

For practical reasons this short report on the Netherlands is based on only a few original sources and on a critical reading of the available literature. The research question of the Irish Commission is taken as starting point: How were the living conditions and which was the quality of the care provided in the homes for mother and baby? In this report we first discuss developments in the numbers of illegitimate children and of mothers and children accommodated in homes for mother and baby in the Netherlands. Next, an outline is given of what is known about the care provided in the specialised homes for mother and baby between the 1930s and the 1970s. Finally, we discuss the debate on illegitimacy and single motherhood of the late 1950s and the 1960s, when the interests of the child were for the first time considered and science partly replaced Christian morality as source of inspiration in the provision of care. Placement of illegitimate children in a children’s home was now discouraged on science-based grounds. The debate accompanied the process by which, within a decade, adoption of an illegitimate child replaced upbringing in a children’s home or a foster family as alternative for – what used to require courage but from the 1970s became the rule – a single mother taking care of her child herself.

**Numbers**

During the first half of the 20th century the Netherlands had a relatively low level of illegitimacy, which is generally ascribed to the strong influence of the churches on family life. In 1925 only 1.8 percent of the living new-born babies were illegitimate as against 10.6 percent in Germany. In 1929 no more than 3,322 illegitimate children, or 1.8 percent of all new-born babies, were born alive. Ten years later this number was even lower, 2,365 babies or 1.3 percent. In the same year only 782 single mothers were accommodated in a mother and baby home of one of the organisations that had joined FIOM. It was estimated that about the same number of single mothers were receiving a kind of support from one of the societies but were not accommodated in a home, and that the rest of the single mothers did not need help. In the late 1930s the central advice bureau of the FIOM treated about 250 cases each year.

In 1939 there were 17 mother and baby homes, run by societies that had joined FIOM. Eight were Roman Catholic, seven protestant, and only two were neutral or non-religious. These homes accommodated a total of 781 women during on average three and a half months. These women gave birth to 1,196 babies, who were taken care of in these homes during on average a little shorter than seven months. This means that, apart from twins being born, some women chose not to be hospitalised themselves, at least not in one of these homes, but entrusted their child to a home nonetheless. The larger part of these must concern
babies that were more or less voluntarily abandoned before or immediately after birth. Another part will concern girls who stayed at home with their parents but could not or were not allowed to take care of their new-born baby themselves. The larger number of babies may also include the offspring of mentally retarded girls, who were either institutionalised elsewhere or lived with their parents. The number of babies accommodated for some time in the homes amounts to 50.6 percent of all illegitimate Dutch children born in 1939. We may assume that this half concerns primarily the babies of younger women, as widows and concubines had better chances than teenagers to receive help from family or friends before and after delivery.

A climax in the number of illegitimate children born alive was reached in 1945: 7,322 or 3.5 percent (as against 1.3 percent in 1939). This was one of the reasons why contemporaries were extremely concerned about a general ‘moral decay’ during the post-war years, especially among youths. As a reaction the churches initiated programmes to re-establish moral decency and family values. However, before any effect could become manifest the illegitimacy rate fell rapidly. The high rates in 1945/1946 were due to war time conditions and to conditions in the aftermath of the liberation from the German occupation in May 1945. In 1950 illegitimacy had fallen to less than half of the level of 1945: 3,429 babies or 1.5 percent. In terms of absolute numbers the post-war low was reached in 1955, when only 2,771 illegitimate babies or 1.2 percent were born alive. 57 percent of their mothers was younger than 25, a percentage that increased during the 1960s to almost 70 percent, half of which were teenagers. Three quarters of the illegitimate babies were first born, which corresponds with the young age of the mothers. As elsewhere, the problem of illegitimacy was concentrated in the larger cities and consequently in the West of the country. Roman Catholic and moderate Calvinist mothers were represented proportionally among the women who gave birth to an illegitimate child, whereas orthodox Calvinists were underrepresented and non-denominationals overrepresented. Again, in the late 1950s, by comparison with other European countries illegitimate rates were low in the Netherlands. At the time a Dutch sociologist estimated that they were three times as high in Norway, seven times as high in Sweden, and ten times as high in Austria.

In 1969 22 homes were accommodating mothers and their new-born babies, of which ten were Roman Catholic, six protestant and six neutral. Another five homes were taking care of illegitimate babies who had been abandoned for adoption before birth, two of which were Roman Catholic and three protestant. The modal seize of these mother and baby homes was between ten and 19 places for a mother and her baby. Among women seeking help from one of the organisations that worked together under FIOM’s wings during the 1960s religious groups were represented proportionally, but teenagers were clearly overrepresented, half of the women being minors (under 21). In 1968 the capacity of the 22 specialised homes for mother and baby had shrunk to 390 places for women and 952 places for babies, next to 310 places in the five baby-homes. On average this capacity was used for 64 and 86 percent respectively. Whereas the length of the stay of mothers decreased, that of the babies increased during the 1960s. Especially the need for ‘neutral area placements’ of babies abandoned for adoption grew rapidly. That is why in 1968 the average number of days a woman was taken care of in one of these homes was three times as high as the average number of days a baby was taken care of, as against two times in 1939. In 1968 974 women and 1166 children were newly accommodated in one of the homes for mother and baby. They were taken care of during on average three and eight and a half months respectively. The variability of the length of the babies’ stay had increased to such an extent that 41 percent stayed as long as 12 months or more and 23 percent stayed only six weeks. Of the total number of 4,953 illegitimate Dutch babies born alive in 1967, one quarter (1,212) was accommodated in one of
the homes coordinated by FIOM. Of the women accommodated in the homes 58.9 percent were minors.  

**Care provided in mother and baby homes**

How were the living conditions in the homes for mother and baby? The coordinating organisation to provide help and support to single mothers and their babies, FIOM (established in 1930), saw it as its task to guarantee a good quality of care for mothers and babies seeking help with one of the participating societies. That is why FIOM made an effort to be informed about this. Inspections on the spot, however, do not seem to have occurred frequently. In 1932 a committee was installed on behalf of the National Society for Poor Relief and Philanthropy (*Nederlandsche Vereeniging voor Armenzorg en Weldadigheid*) to investigate the quality of care provided in the homes that took care of, amongst others, illegitimate infants. At the time these were called ‘uncontrolled’ houses, meaning houses that took care of infants on a commercial basis. They were distinguished from ‘controlled’ homes, run by guardianship societies, that took care of orphans and children who were placed in a children’s home by the court on the basis of criminal or civil court custody and, consequently, received state subsidies.

In 1934 the committee reported on 120 uncontrolled, usually small homes, 28 of which were situated in one of the three big cities in the West (Amsterdam, Rotterdam and The Hague). As these cities had set up quality control on their own initiative, 28 were in fact controlled homes. Of the 92 uncontrolled homes some were exploited by persons who had been banned from the three big cities as entrepreneurs in this business. Nevertheless, about 95 of the 120 homes it was reported that ‘no complaints [were] known’. Their quality must have been satisfactory. Of the remaining 25 homes (of which 20 were situated outside the three big cities) 19 were qualified as of ‘dubious’ quality and six as ‘bad’. The conditions referring to ‘complaints known’ could be reconstructed mainly on the basis of the disqualifications given by the controlling civil servants working for the three big cities. An extreme case was a home reported to accommodate 12 infants, who were locked in a room behind a barrier during the day, creeping around without pants, stockings or shoes and without toys, with faeces lying around and even ‘being eaten … out of boredom’.

Although the quality of the majority of the homes was satisfactory, the committee advised introduction of legal control, preferably through legislation, or at least an extension of the kind of control that was practiced by the three big cities, if only to prevent entrepreneurs from moving their business from one place to another without being forced to improve the quality of care. Despite the presentation of a concept for a regulating law by the committee, no legislation was introduced, and the example of the three cities was not forced upon smaller towns. Therefore, the FIOM had reasons to continue the stimulation of research into the quality of the living conditions and care provided in homes that accommodated the infants of single mothers.

In 1937 a medical doctor, N. Knapper who was well acquainted with the quality of infant care in general, reported critically about the quality of hygienic care in mother and baby homes. He had visited 47 homes, including FIOM-homes, that took care of single mothers and their babies. Only 14 homes could avail of relatively new buildings, large playing fields, spacious sleeping and washing rooms, as well as rooms for play and gymnastics. The majority, however, was housed in old buildings in crowded inner city districts and had to do without all these necessary provisions. He observed an enormous lack of professional competence among those who took care of the infants and strongly advised a better education of the nurses and their assistants. He himself had taught courses in infant care to nursing assistants and single mothers in Amsterdam. Knapper full-heartedly supported FIOM’s
position that single mothers should not abandon their baby but take care of it themselves. This, however, required adequate training, he insisted. Like other experts he was of the opinion that there was a ‘natural bond’ between mother and baby and that taking care would provide a woman with a ‘goal for the rest of her life’. Breastfeeding was indicated. It required a period of at least three months of being free from labour for the mothers, which was often impossible because of financial reasons. That is why he advised the homes to organise jobs inside or next door to the institution, such as the laundry he had spotted at one of his visits. In all other cases women would not be able to earn money and take care of their baby at the same time. Research like this, inspired by concern about hygienic conditions in the homes, was not repeated afterwards. Like child hygiene in general, hygienic conditions in infant care seem to have improved greatly as local authorities extended their hygienic inspections in the 1950s to include philanthropic and commercial homes.

After the war FIOM shifted attention from the quality of care in homes for mother and baby to more specific themes like mentally retarded single mothers, foster parenting, adoption, and the development of methods like social case-work to support women in need of help. More than before the FIOM tried to reach as many single pregnant women as possible. Around 1960 estimations of its success varied between 50 and 70 to 80 percent of these women seeking help through one of FIOM’s societies. FIOM consistently emphasised the importance of professional help for both mothers and babies. Though FIOM was an outspoken champion of single mothers taking care of their child themselves after a period of support from one of its societies, FIOM leaders were aware that social reality was different. A large part of the single pregnant women did not seek professional help and another part made a more or less deliberate choice for abandonment and placement of their baby in a children’s home or with foster parents through judicial guardianship.

With the introduction of a revised Children’s Act in 1947 the rights of both the single mother and foster parents were reinforced. A family relationship in the judicial sense between a single mother of age and her child was now created automatically and she also became automatically her child’s legal guardian. At the same time the rights of foster parents were reinforced indirectly in that the court was given more freedom to judge the natural mother’s child-rearing capacities if she went to court to reclaim her rights. Henceforth a family judge had to consider her mental state from the perspective of the ‘interests of the child’. A further step toward recognition of foster parents’ rights, legal adoption as possibility, was not yet taken but it was put on the agenda and remained there until matters were settled in 1956 with the introduction of the Adoption Act, which enabled legal, irreversible adoption.

Although FIOM itself set up a Central Committee for Abandonment that mediated between a mother who was incapable of taking care of her child and the many childless couples who volunteered as foster parents, at first FIOM could not compete with the uncontrolled channels in terms of speed and chances that a child could stay with her foster parents. In cases of FIOM mediation a child could be kept in a home for over three years, before she was finally placed in a foster family, as FIOM-officials proceeded along bureaucratic lines, made high demands of foster parents, and went to the edge to be sure that the natural mother was unwilling or incompetent to raise her child. In the early 1950s, however, it became increasingly clear that the remains of the old-style hidden flow of babies from desperate single mothers to equally desperate childless couples – enabled by doctors, nurses, and priests – would not disappear unless adoption was legalised.

Protagonists of legal adoption and defenders of the status quo alike produced reports that supported their positions. In 1954 the FIOM issued a report based on a survey into 136 placements by its Central Committee for Abandonment covering the years 1930-1951, 127 of which had followed the official procedures. It was emphasised, however, that at the same time another 400 mothers had revoked their original decision to abandon their child. Nonetheless,
101 out of 127 placements were considered successful. During the next years another, more limited survey was carried out covering the cases of 50 single mothers, who had given birth between 1935 and 1938 and had raised their child on their own. This arrangement turned out to be equally successful according to the researchers, in that 45 out of the 50 children were successful as adults in society. Responding women demonstrated both anxieties and feelings of guilt: ‘I will always work hard for my family to make up for what I did.’ Remarkably, in this research only ten women never married. Of the 40 who did, nine married the father of their illegitimate child. In other words, with time a large majority of single mothers became ‘normal’ mothers.

Apart from positive reports about foster parenting, the concept of a ‘natural unity’ of mother and baby, as propagated by FIOM, was further undermined by the growing influence of psychiatry and psychology in the domain of social work. During the 1950s and 1960s they gained influence as professionals, first in legal child protection and gradually also in homes and care arrangements for single mothers and their babies. These experts shifted the focus of attention from the ‘sinful’ mother of an illegitimate child to the developmental needs of a young child and the incapacity of relatively many single mothers to meet these requirements. In 1955 a plenary meeting of FIOM was devoted to the theme of the ‘seriously disturbed’ mother. Lecturers agreed that seriously mentally deficient and emotionally disturbed women could not become good mothers, no matter how much professional help was provided. This meeting turned out to be a turning point in the history of FIOM, as the membership spoke out in favour of the best quality of care for the child and stressed the importance of family ties, including foster families, instead of ‘blood ties’ or the ‘natural bond’ between a mother and her child.

From Christian morality to science (1955-1970)

References to science played and even more important role in the debate on single motherhood and adoption that followed in the wake of the introduction of the Adoption Act in 1956. During the 1950s across the West sociologists studied the social characteristics of single motherhood. It was usually described as ‘sociopathology’. These scientists were confident that their approach was way ahead of the penalising moral-religious approach of the past, which had consistently blamed the individual single mother for her ‘sins’. Instead, they considered single motherhood as part of a larger and alarming social problem, extending from increased extramarital sexual activity of both sexes (estimations ran up to 50 percent) to a rising frequency of ‘forced marriages’, and a most dangerous positive attitude toward abortion. In their analyses the sociologists linked these problems to post-war prosperity, as well as to social disruption in general and disruption of the families of the lower classes in which the majority of the sexually active young people grew up in particular. A Dutch sociologist reported for example in 1960 at a FIOM meeting that extramarital sexual activity was widespread among working-class youth, a danger that might in the future extend to include bourgeois youth as well. According to his research, in 1948/49 no less than 21 percent of all marriages were ‘forced’.

Whatever the analysis of the causes of single motherhood was, from the mid-1950s advice bureaus and transit homes aimed no longer at penitence but at rehabilitation of the mother and protection of the mother and her child. New care arrangements were staffed with a multidisciplinary team with a psychologist, a social worker, a clergyman, a judicial advisor and a social psychiatrist as head of the team. The latter profession also led the centres of study and expertise that developed out of a small number of advice bureaus. This professionalization of care arrangements is likely to have brought an overall improvement of the care provided in homes.
The psychiatrists in charge of the new arrangements of care expanded, likewise, on the ‘sociopathology’ of the single mother. Unlike the sociologists, they did not seek the causes of the problem in society at large but in the woman’s smaller environment, particularly her family of birth. They were the first experts who did not overlook the biological father, but conceived of him as part of the problem. Psychiatrists emphasised that a single mother often came from a broken home or an otherwise dysfunctional family. The woman’s background had to be investigated by a social worker and taken into consideration by the multidisciplinary team that guided a pregnant woman in the process of making a decision about her child’s future. Part of the woman’s psychopathology was that she was not capable to make the ‘right’ decision because of a lack of self-reflection and insight into her unconscious motives.

Referring to the assumed psychopathology of single women, psychiatrists usually spoke out in favour of abandonment for adoption. They assumed an insufficient capacity to truly love a baby. A single mother often showed what they called ‘false’ love for an ‘object’ instead of a person, which made her either spoil her baby or neglect its most fundamental desires. Inspiration for this point of view was particularly found with research by psychiatrists and psychologists from the Anglo-Saxon world. They pointed consistently into the direction of a negative evaluation of care provided in a home. John Bowlby’s famous report for the World Health Organization (WHO), Maternal Care and Mental Health (1951), which was translated in its abbreviated edition into Dutch in 1955, became most prominent in this respect. His statement that for a baby even a bad family was to be preferred to a good home, was rephrased by Dutch psychiatrists to mean that a home could never be good enough, certainly not if legal adoption by a selected and approved couple was possible. And they interpreted Bowlby’s idea that a permanently available mother during the first few years of a child’s life was a precondition for mental health as an argument that disqualified single mothers as caregivers. As breadwinners of an ‘incomplete’ family they were simply not available and, perhaps even worse, their psychopathology would harm a baby. Especially teenagers were not fit for sensitive mothering, they claimed. Therefore, abandonment for adoption, preferably after no more than two months, was their preferred option.

While FIOM staff continued to favour the other option, a woman taking care of her child herself, the debate among experts, as well as public opinion, shifted towards the psychiatrists’ view. Their negative attitude toward care in a home may, paradoxically, have stimulated FIOM to further improve its quality. One participant in the debate stands out as particularly influential, the Roman Catholic professor of psychiatry Cees Trimbos. He had first tackled the problem in a chapter of a popular book on children at risk in 1955, but increased his efforts to convince professionals involved with single mothers and their babies of the desirability of abandonment for adoption after this was legalised in 1956. He lectured for example on a FIOM meeting in 1961 and published an authoritative book in 1964 together with his kindred spirit and colleague psychiatrist H.F. Heijmans, who headed the Roman Catholic bureau for ‘mother help’ in Amsterdam.

Trimbos was a leading figure in the Roman Catholic movement for mental health. Apart from his scientific work and his textbooks he was well known and very popular with the larger public because of his radio talks, in which he attacked traditional Roman Catholic views on issues that had been covered with a taboo for a long time, like birth control and (homo)sexuality. In the dynamic 1960s these things had to be discussed in the open and dealt with, instead of forbidden, he learned. A happy marital life, including satisfying sex, contributed greatly to people’s mental health, he explained. The negative approach of essential human faculties such as sexuality of the old Roman Catholic ideology was unnecessarily sickening people, he warned. These ideas were welcomed as liberating and fitting the age of the television and the upcoming Sexual Revolution, even outside the Roman Catholic community, which included a 40 percent minority at the time.
The psychiatrist Trimbos’ key argument against the approach of FIOM, stimulating the single mother to take care of her baby herself, was that the single mother was usually mentally ill and was not able to give her child the motherly love and stability that were necessary to become a healthy member of society. The child itself was proof of it. According to him, references to ‘blood ties’ were expressions of romanticism. He called the argument of a ‘natural bond’ between a mother and her child an unproven axiom and referred to research into single mothers’ and their relatives frequent psychiatric trouble as proof of his thesis that the FIOM’s approach was not serving the interests of the child. Even more serious was the overrepresentation of children living with their single mothers among the child guidance clinics’ patients: ‘according to me it is impossible that in such a situation a child develops undisturbed.’ The argument that a single mother would learn to give motherly love in the right way simply by doing it, or with some help, was discredited by Trimbos by discriminating – in the spirit of Bowlby’s developing attachment theory - between biological motherhood and affective motherliness. The latter was hard to reach: ‘The child needs motherliness. It develops only gradually and independently of motherhood. Biological motherhood needs many psychological extra’s to become true motherliness.’

However, at the end of the 1960s the cultural climate changed profoundly in the Netherlands. The so-called Sexual Revolution, exemplified by the hippy slogan ‘Make love not war’, student activism, and a new feminist movement manifested themselves. These forces worked together to make single motherhood acceptable in the larger part of society. Under these conditions FIOM found more support than ever before. In the rapidly secularising society of the 1970s unmarried pregnancy and single motherhood were no longer looked down upon on moral-religious grounds. With the disappearance of the taboo the need to consider abandonment for adoption disappeared. Whereas the number of single mothers increased, the number of women who had to take refuge in a home for mother and baby decreased sharply. At the same time, thanks to feminist activism day-care provisions for young children multiplied and part-time jobs were generally accepted. In case a woman could not find a job or day-care was not available, she was from 1965 entitled to social security (bijstand). As a consequence, single motherhood lost its problematic character. Since the 1980s teenagers from ethnic minorities make up the larger part of the remaining clients of the FIOM homes and other kinds of support.

Conclusion

The quality of the care provided in the Dutch homes for mother and baby seems to have been at least acceptable, especially in the homes that were supervised by FIOM. The post-war professionalization of care arrangements is likely to have improved the quality of care in the homes. Even psychiatrists inspired by Bowlby’s WHO-report may, with their negative attitude toward institutional arrangements for young children, have stimulated further improvement of the quality of care in homes. From the 1950s, uncontrolled homes of dubious quality have disappeared.

About the living conditions of single mothers and their babies after the initial period during which they stayed in a home, we have to guess. From 1965 in the Netherlands unemployed adults were entitled to social security. This has enabled single women to more often take care of their child on their own. From the 1970s single women with a job could more often use day-care arrangements for their child, as the feminist movement pressed successfully for more créches. They could now, moreover, often work part-time. Recent research into the history of sexual abuse in judicial child care, both homes and foster families, makes clear that children under legal guardianship (among whom part of the illegitimate children of the 1950s and 1960s) were often treated harshly and unkindly and have too often
been victims of violent or abusive regimes. However, in the Netherlands they have certainly not been subjected to the kind of illegal practices that are mentioned in the *Terms of Reference* for the Irish Commission, such as vaccine trials and post-mortem anatomical examinations.

Introduction

As increasing numbers of children who were brought up in care or who were adopted seek to learn more about their past, the historic changes in the concept of the family have come under scrutiny and even be linked to broader societal changes. History about the social context of the family and the different providers of services for mothers and their babies can aid in understanding why people behaved as they did. It can also reveal how people were cared for. However, it can only accomplish these goals if it is accurate. The media highlights the victims from the past who, rightly, deserve explanations and justice. Yet the media rarely reflects on the wide variety of service providers, service provision or peoples’ experiences of these services. This study focuses on Scotland’s Mother and Baby Homes in their social, cultural, political and economic context during the twentieth century. Mother and Baby Homes provided health care, accommodation and food for pregnant women who lacked sufficient family or friendship support networks. Primarily, they served unmarried women. While such homes have been connected with adoption scandals, this study reveals a more complex relationship between Scotland’s past and illegitimacy, as well as with Mother and Baby Homes and the mothers and infants they sought to help.

Key Messages:

- The social acceptance of unmarried mothers and their children in Scotland has varied widely
- Century old cultural differences between east and west Scotland influenced acceptance of the unmarried mother and her child
- Scottish society was more accepting of unmarried women and their children than English or Welsh society
- Mother and Baby Homes provided accommodation and healthcare for pregnant, unmarried women, who often had nowhere else to turn, and occasional married women escaping abuse
- Mother and Baby Homes were run by voluntary organisations
- Women were free to leave Mother and Baby Homes at any time, but the normal stay was between 6 weeks and 3 months before and after birth.
- Most providers of Mother and Baby Homes offered additional short-term accommodation for the unwed mother and her baby after the 3 month postnatal period if necessary
- Most women who stayed in Mother and Baby Homes and who kept their baby returned home
- Most Mother and Baby Homes did not promote abortion
- The regime in the Mother and Baby Homes was primarily non-punitive
At the turn of the twentieth century, improving the health of the British nation and national efficiency fuelled both political and social initiatives to improve maternal and infant welfare. Politicians, social reformers and medical professionals sought to both prevent population ‘degeneration’ and tackle high maternal and infant mortality rates. For Scotland, this agenda included tackling illegitimacy. In the run up to 1917, the Scottish illegitimacy rate was consistently higher than that in England and in 1900, on average, the rate was also higher than in most of Europe. While infant death rates declined during the first quarter of the twentieth century, they still remained high, with death rates for illegitimate births in Glasgow in 1925 being higher than the rate for legitimate births in 1875 (see Table 1). While overall these figures had decreased by 1925, they still worried the Scottish government, its public health doctors, the Medical Officers of Health (MOH), and social reformers. Similar to in many Western countries, Scotland’s solution to reducing its high infant mortality rates centred on the mothers, both married and single.

The unmarried mother posed a particular cause for concern because a high proportion of illegitimate children came to the attention of local authorities. This related to the ingrained unwillingness of Scots to enter the poor house and which left the majority of unmarried mothers trying to manage on their own or with the help of their families, and to the reforms to the Scottish Poor Law in the 1870s which left the mothers of illegitimate children ineligible for relief. Well into the twentieth century, these women and their children were dependent on families, friends and charities for survival. More so than England or Wales, Scotland relied on a range of charities to provide both health and social
care. And, charities were vital to providing health and welfare services for the unmarried mother and her child.

Equally important in the case of the unmarried mother were social attitudes towards illegitimacy. These varied considerably by area. Into the twentieth century, illegitimacy was socially accepted in some Scottish communities. Illegitimate children were absorbed into their immediate and extended family and the community without prejudice. This was more common in certain rural areas, particularly the northeast. Families helped raise an illegitimate child or a child’s parents lived together without being married. The community accepted the family in the same way it did where the couple was married. Elsewhere in Scotland, illegitimacy was socially inacceptable because it broke historic and religious codes of moral behaviour. Here, the mothers of illegitimate children were more likely to have been abandoned by their families and she was left to try and support herself and her child.3

The varying attitudes towards illegitimacy related, in part, to legislation and the local economy. ‘Informal marriages’ or marriages contracted by mutual consent of the parties involved, either verbal or written, but without the intervention of Church or State, was outlawed in England in 1753 but remained legal in Scotland until 1940. In contrast, civil marriages were introduced in England and Wales in 1836, but it was 1939 before civil marriages were allowed in Scotland, coinciding with when ‘informal’ or ‘irregular’ marriages became illegal. Even then, however, ordinary people had a more flexible definition to what comprised marriage than did official codes and norms.4 In addition, divorce was easier to obtain at an earlier date in Scotland than it was south of the border. As early as 1643, Scottish law allowed men and women to divorce on equal grounds, namely adultery or desertion. In contrast, in England and Wales, divorce was unobtainable until 1957, after which a man could only divorce his wife for adultery, while a woman had to prove desertion, cruelty, incest, rape, sodomy or bestiality. Desertion alone was not grounds for divorce. It was 1923 before England and Wales introduced gender equality in divorce. Yet while divorce was easier, earlier in Scotland, remarriage was more difficult because most Scottish churches would not marry divorced people.5 Hence, before 1939 remarriage was often impossible until a previous partner had died, while divorce discriminated against the poor and women due to cost. Moreover, it was 1950 before Legal Aid was made available for divorce proceedings which greatly helped poorer couples. Consequently, cohabitation was probably more common in Scotland than in England and Wales and possibly more secret due to widespread disapproval of cohabitation through much of Scotland via Church channels – although the rates of cohabitation have been contested.6 However, while the actual numbers of couples who cohabited in any of these countries are impossible to access, the numbers reported to the Registrar General between 1855 and 1939 accounted for twelve per cent of all Scottish Marriages.7 Moreover, Scottish marriage traditions and associated legislation make more complicated both classifying an ‘unmarried’ mother and an ‘illegitimate’ child.

Economic changes also influenced illegitimacy rates and the acceptance of the unwed mother and her child. In the late nineteenth century, changing agrarian capitalism meant that unlike under the old order, unmarried farm servants now ate and slept separately from their employers. Hence, the employers’ moral oversight no longer extended past working hours. Yet the nature of agricultural work required workers in the northeast and Ayrshire to regularly move jobs. With agricultural accommodation usually for groups of single men or women in farm outbuildings, incentives to marry were few.8 Illegitimate children born in these communities were frequently raised by grandparents
who played an important role as surrogate parents so that the mother could continue agricultural work. These children were accepted into the family and little, if any, moral shame was attached to either the mother or the illegitimate child, with the child absorbed into the existing family structure.

In the northeast there was also a correspondingly high incidence of illegitimate births where the paternity was acknowledged at registration. Indeed, in Aberdeen, there were many instances of parents living together without getting married, but who readily acknowledged paternity. No moral shame was attached to such arrangements. Unlike in England, for centuries in Scotland, as in most European Countries, the law stated that if the parents of an illegitimate child later married, that child became legitimate on the marriage of the parents. Therefore, in parts of Scotland, family support networks made it possible for committed couples to have children while young, but also to continue working to save enough money for marriage. In contrast, it was 1926 before English law was changed so that a child could be legitimated by the subsequent marriage of the parents, provided that neither had been married to someone else at the time of conception. Even then, take up was limited because re-registration was public, expensive and time consuming. It could also result in the child being classed as ‘legitimated’ rather than legitimate. It was 1959 before the Legitimacy Act made legitimate all children born to unmarried parents whose parents subsequently married.

In comparison, the nature of agricultural work in parts of the Highlands and Islands did not greatly impact illegitimacy rates. Instead, marriage ages were relatively advanced. The crofters, or farmers, had to wait for fathers to die before son’s acquired the land. This arrangement resulted in fewer children. Moreover, the subsistence nature of crofting meant that not only were families unable to afford to care for additional, illegitimate children, but also that abstinence outside of marriage was preferred.

In the central belt of Scotland, illegitimacy and marriage followed a different pattern. In the mining and industrial areas, it was common for people to marry younger. Fertility rates were also high. While employment was not secure, the cities provided more employment opportunities than did rural communities. At the same time, however, family support networks were weaker from fear of the moral shame that an illegitimate child might bring to the family. In addition, urban migration patterns meant that for many younger people, the practicalities of family support was less than in smaller, rural communities. Nevertheless, huge urban populations made it easier to hide the fact that a woman was an unmarried mother rather than an abandoned wife or widow, particularly during and after the two World Wars. Hence, both unmarried mothers and their illegitimate children only came to the attention of authorities if they failed to support themselves and their children. In England, this type of poverty could result in the unmarried mother and her child being sent to the workhouse and in later years, moved to mental hospitals, where some unwed mothers remained in 1971. In Scotland and England, those women who managed to support themselves and their child, or who lived with the father without getting married, or where the father or family provided financial or other help probably remained officially undetected and do not appear in the statistics. These regional differences in Scottish illegitimacy rates, marriage norms and any associated stigma or shame remained in Scotland throughout much of the twentieth century. During the 1950s, one-third of the illegitimate children of older women in Aberdeen were living with their cohabiting parents, with no attached shame to either parents or children. And, in parts of Scotland until at least 1970, the illegitimate child was absorbed into the mothers’ parental home. Through the 1990s, unmarried motherhood continued to be tolerated in parts of Scotland much more so than in
most of England and Northern Ireland, where the levels were lower. Elsewhere in Scotland, hastily
arranged marriages remained common in the 1970s.\(^{15}\)

Table 2 provides official live birth rates to unmarried mothers in Scotland. However, not all births
which would have been formally classed as illegitimate will appear in these figures. These figures
suggest that after a distinctive period during the 1940s and 1950s when the illegitimacy rate in
Scotland was declining, reflecting the moral climate of the time, illegitimacy rose sharply during the
decade before the contraceptive pill became available to single women in 1968.\(^{16}\) Table 3 provides
the changing rates of illegitimate births in Scottish towns demonstrating continued regional
variations within Scotland into the twentieth century, with Aberdeen in the northeast shifting from
having particularly high levels of illegitimate births to comparatively low levels.\(^{17}\)

Table 3, n.p.

The cultural divide between eastern and western Scotland also impacted on abortion patterns. Prior
to the passage of the 1967 Act which legalised abortion in Great Britain, abortion in Scotland was
not actually illegal, but in most areas its availability was very limited, except in the northeast. Here, prior to this legislation and the NHS (Family Planning) Act 1967, which made birth control available to all women and which was extended to Scotland in 1968 under the Health Services and Public Health Act, abortion levels were highest in the Aberdeen region and lowest in the west and west central regions. This pattern related to the greater willingness of consultants who had been trained and who practiced in the northeast to perform abortion procedures, stemming from the greater cultural acceptance of intercourse outside of marriage and the historical acceptance of children born out of wedlock and their mothers. While by the mid-1990s the uptake of abortion had increased dramatically throughout Scotland, inter-regional differences in abortion rates remained noticeable. Abortion rates were higher for all maternal age groups in eastern Scotland than in the West or central belt.19

This brief summary of the social, cultural and legal differences surrounding the prevalence of and social acceptance of unwed mothers and their babies throughout Scotland suggests the difficulties in generalising about illegitimacy in Scotland or about the voluntary provision of services for these groups.

The Political Context of Illegitimacy in Scotland before the Welfare State

Scotland did not share the improvements in maternal and child health in England and Wales that were introduced by pre-World War I liberal governments and adapted postwar.20 Nevertheless, a series of Scottish legislation was introduced to try and lower infant death rates and improve maternal health. It was within this rapidly changing legal environment that many Mother and Baby Homes first opened in Scotland, and under which they operated and in which an the unwed mother could find herself living. In 1903, the Report of the Royal Commission on Physical Training (Scotland) recommended significant improvements to feeding children and their environment. Considered the Scottish equivalent to the Inter-Departmental Committee on Physical Deterioration, the legislation resulted in the creation of milk depots to manage the artificial feeding of infants. In 1907, the Notification of Births Act required that all births be registered and was made compulsory in 1915.
with the Notification of Births (Extension) Act, with the mother of an illegitimate baby being responsible for registering the birth. In 1908, the Children’s Act tackled the neglect and abandonment of children and required the registration of foster parents in an attempt to end baby-farming and infanticide. The Medical Officers of Health (MOH) certainly believed this Act was instrumental in contributing to the declining death rate of illegitimate children. Starting with the 1914 National Conference on Infant Mortality, the MOsH campaigned to improve antenatal care as a method of tackling both infant and maternal health.

During the Great War, increasing attention was turned toward the health of mothers. The 1915 Midwives (Scotland) Act reflected the English 1902 Midwives Act and sought to both improve and standardize midwifery training. At the end of the war, the Maternity and Child Welfare Act (1918) empowered local authorities to borrow money for maternity and child welfare initiatives. Shortly thereafter, the 1919 Local Government Board Scotland (LGBS) replaced the Scottish Board of Health. This new Board could require local authorities to provide food and milk for pregnant women, nursing mothers and their children, and provide money for maternity and child welfare. However, despite its broad remit and the potential for action, there was little uptake, particularly in poor communities. Moreover, the post war need for economy led to delays in maternity and child welfare centres, supply of food and milk and delays in building maternity homes.

The year 1919 also marks the year when the National Council for the Unmarried Mother and Her Child was founded in England with the explicit aim of keeping the unmarried mother and her child together in order to safeguard the mother from having a second illegitimate pregnancy when she realised the responsibility and cost of caring for a child. That same year in Scotland, a Circular to the Maternity and Child Welfare Act highlighted the same aim of keeping the unmarried mother and her child together. While some operators of Mother and Baby Homes, including the Church of Scotland and Salvation Army, followed this practice with this goal being central to their founding such homes, less is known about the operations of the many private lying-in homes operated by charities or a few philanthropic individuals. These homes were more common in the first two decades of the twentieth century when the ‘problem’ of unmarried mothers received significant public attention and before the Homes were regulated. The MOsH believed these Homes targeted unwed mothers and emphasized adoptions. These homes fade from record during the interwar years and may relate to the 1927 Midwives and Maternity Homes (Scotland) Act which mandated the licensing and inspection of all maternity homes. The Act also strengthened official control over the training and certification of midwives. These regulations were further tightened with the Nursing Homes Registration (Scotland) Act of 1938 which required greater details about the records kept about both patients and procedures. While enforcement of this legislation varied, as did the efforts of staff in encouraging women to keep their babies, this legislation provided an important first step in ensuring a basic quality of care for all mothers, including those unmarried. Such regulations also provided a stark contrast to England and Wales, where the 1974 Finer Report on One-Parent Families highlighted that no registration or inspection of Mother and Baby Homes was required in England.

1 The father’s name could only be recorded if he accompanied the mother to the registrar’s office and declared himself willing to have his name added to the birth certificate or a court had determined him to be the father and therefore responsible for maintaining the baby. The compulsory registration of a birth was difficult to enforce, especially in remote parts of Scotland.
During the 1930s, Scottish attention to maternal and infant welfare increased. At the same time, an urban-rural divide in maternal and infant health and welfare services was increasingly notable, with more and better provision in the cities than in rural areas – something that the 1934 Maternal Mortality Report noted was also the case in England. To go some way to addressing maternal health, in 1936, the *Report of a Committee on the Scottish Health Services*, or the Cathcart Report, outlined the need for a unified national health policy to cover a broad range of statutory services to enhance the public health service. It also argued that the high maternal mortality rate in Scotland in comparison with other European countries and particularly England proved the necessity for the provision of a comprehensive maternity service (See Table 4). The only one of the core recommendations to be introduced before the 1948 National Health Service was the Maternity Services (Scotland) Act of 1937. The Act intended to provide state funded comprehensive health care provision for all women and was to be under local authority control. It required a midwife, GP, anaesthetists (where recommended by a medical practitioner) and a consultant obstetrician to work together to provide comprehensive and coordinated healthcare for all expectant mothers during pregnancy, childbirth and for four weeks after birth. It did not distinguish between married and unmarried women. Payment for such services was based on ability. Inability to pay was no longer a barrier to maternity care. The Act also disbarred untrained women from acting as maternity nurses, believing that this would improve care. While implementation of the Maternity Services (Scotland) Act was limited, it made some inroads into addressing maternal mortality.

The Maternity Services (Scotland) Act proved a significant challenge for the country. In 1937, the PEP *Report on the British Health Services* noted poor ante-natal supervision in Scotland compared to England. Only 35 per cent of Scottish expectant women attended ante-natal clinics, compared with 73 per cent in London and 63 per cent of expectant women in county boroughs and 36 per cent in Wales. Nevertheless, the aggregate Scottish figure was double that of English counties where only 17 per cent of expectant women attended antenatal clinics. Yet in the northeast and Dundee, a comprehensive and coordinated maternity and child welfare service was introduced. And, in St Andrews, the Maternity and Child welfare centre was a model of preventive care by the late 1930s. However, in 1943, a *Report on Infant Mortality in Scotland* emphasized the lack of progress in addressing infant mortality during the interwar years and that Scotland’s provision of maternity and child welfare services lagged behind that of England, with expenditure per birth in Scotland only two-thirds that in England and Wales. Unmarried mothers were the women who were most likely to avoid the maternal and child welfare initiatives, unless they utilized a Mother and Baby home. Indeed, during the 1930s and 1940s, many unmarried mothers and children continued to vanish from the official records through absorption into the mothers own family and because birth registration did not require the child to be identified as illegitimate. Moreover, in many cases, the mother formally adopted her own illegitimate child in order to give the child legal rights, including inheritance rights if the mother died.

During World War II and post war, childcare options declined as women could find better paid jobs elsewhere, meaning day care was a problem for unmarried mothers without family support. There was a housing shortage and domestic service was declining, a core job for many unmarried mothers wanting to keep their child. In addition, council housing preferred married couples, thereby discriminating against single women wishing to keep their child. It was 1977 before local authorities were required to house all homeless people regardless of their background, including unmarried mothers. However, the latter were often allocated the worst housing. These factors all contributed...
to a rise in adoption rates after the war. However, while the next section traces changes in adoption legislation, many adoptions were by one or both parents of the child.

Adoption

Boarding out was a distinguishing feature of the Scottish Poor Law. However, while boarding out and de facto adoptions had long been the practice in Scotland, these practices had also long caused anxiety amongst both social reformers and government officials. Dr A. Maxwell Williamson, MOH for Edinburgh, had founded the first Adoption Society in 1923 in an attempt to formalise adoption
transactions and end baby farming. However, until the Adoption Act of 1926, child adoption had no legal status in Britain. Even then, the Act only applied to England and Wales. It was 1930 before the Adoption of Children (Scotland) Act was passed. Seeking to formalise adoption transactions for the safety of the child and to prevent baby farming. It forbade any payment with respect to the adoption of a child, prohibited certain classes of persons from adopting and sought to end private adoption arrangements. It also set up an Adopted Children’s Register. However, neither the English nor the Scottish Act prevented a woman giving a baby away for an informal adoption. Since then, additional legislation has been passed to try and tighten procedures for the benefits of the child and to try and completely eliminate all remnants of past activities that abused or resulted in the death of unwanted children.

The 1939 Adoption of Children (Regulation) Act sought to regularise and standardise the activities of adoption societies so that only they or local authorities could arrange adoption. It also intended to restrict advertisements for adoptive parents or sending children abroad for adoption. While it was not brought into force until 1943 due to the onset of war, it did require the registration of all voluntary adoption agencies. This same year, the Scottish Council for Unmarried Mothers was formed with the aim of dealing with issues surrounding the difference in legislation and its administration in Scotland compared with England. World War II only highlighted the need to address adoption law in both England and Scotland, particularly for the sake of unmarried mothers and their children without financial support.

While in Scotland, a shortened birth certificate which omitted the parents’ marital status and hid the word ‘illegitimate’ or ‘adopted’ had been available since 1919, it was 1947 before England allowed shortened birth certificates. In 1949, the Adoption Act made adopted children the inheritors of their adopted parent’s estate rather than their birth parents, while also requiring that all adoptions be sanctioned by law and would-be adopters assessed. In addition, a mother could no longer consent to adoption until the child was six weeks old, provided she was capable of giving consent. And, a three month probationary order under local authority supervision was required before an adoption order could be granted. However, it was 1964 before the Succession (Scotland) Act provided that the adopted child could be treated as the child of the adopter, not any other. This was only revised in 2005.

Additional legislation through the Adoption Act 1958 consolidated the Adoption Act 1950 and the Children’s Act 1958. It gave local councils the authority to arrange adoption for children who were not in their care as well as those who were. It regulated requirements for adopters, the requirements for adoption agencies and the procedure that was to be followed when making or appealing a court decision. This Act also confirmed the Adoption Act 1950 which envisaged and permitted the mother of an illegitimate child to adopt her own child. The 1976 Adoption Act and the 1978 Adoption (Scotland) Act replaced the 1958 Act throughout Britain and made the use of an adoption agency a requirement. From this time, adoption records were required to be more complete and detailed. The 1978 Adoption (Scotland) Act made it the duty of every council to provide approved adoption services to meet the needs of children who have been or may be adopted, parents and guardians of these children, and people who have adopted or who may adopt.

---

2 The information was still recorded for official purposes. People born before 1919 could ask for the word ‘illegitimate’ to be removed from their birth certificate.
a child. It was 1988 before all English councils were required to provide adoption services and 2000 before council provision came under the same inspection regime as voluntary adoption agencies through the Care Standards Act. The Adoption and Children (Scotland) Act 2007 repealed the 1978 act and provided additional support and guidance for all those affected by and involved in an adoption. It was the late twentieth century before the adoption process provided significant support for the unmarried mother. Throughout much of the century, women who for any reason put a child up for adoption had little guarantee about the process or safety of their child. Since the peak in the late 1960s, the number of adoptions in Scotland has been declining, as evident in Table 5.

*The primary reason for re-registering a birth was to add the father’s name to the birth certificate

State Welfare and the Unmarried Mother

**Key Points:**

- State welfare for unmarried mothers and their children lagged behind healthcare
- Welfare benefits for unmarried mothers and their children have gradually improved since 1948, although discrimination remains in certain areas, particularly housing
- Conservative rhetoric about unmarried mothers did not match social attitudes

While during the 1930s, Scotland had increased the health services available to unmarried mothers, social welfare was different. When in 1942, William Beveridge wrote his report on social insurance that went on to influence the construction of the post-war British welfare state, he recognized the widespread poverty amongst unmarried women and divorced and deserted wives as well as their lack of access to public support. He also recommended that the government investigate the ways in which the state could support unmarried mothers. The initial welfare state did not provide full support for unwed mothers, nor did it implement Beveridge’s recommendation for further investigation into the best methods the state could adopt for supporting unmarried mothers and
their children and nor did it seriously consider providing a benefit specifically for them. Nevertheless, the health, social services and social security system of the post war welfare state provided better state support for unmarried mothers and their children than had been available earlier.

The foundation of the National Health Service (NHS) in 1948 provided all mothers and children with free healthcare. In addition, all employed women could claim sickness benefit. And, unmarried mothers were eligible for the same maternity grant as married mothers. The Maternity Allowance paid all mothers from £4 - £12.10s plus thirteen weeks of maternity benefit at 36s per week. This meant that no longer did unsupported pregnant women need to work almost until childbirth and which was perceived to contribute to higher than average death rates from childbirth for unmarried mothers and their children in infancy. In addition, both sickness and maternity benefits could be supplemented in cases of need by the National Assistance Board (NAB). Yet, Maternity Allowance was means tested. Not only was this demeaning, it disqualified women suspected of living with a man. In order to enforce the regulations, the NAB regularly visited, which many women found intrusive and belittling.

Other benefits included that no longer were women required to register for work in order to claim means-tested assistance. While in 1948 these benefits were called National Assistance, they were renamed Supplementary Benefits in 1966 and Income Support in 1988. Moreover, both the eligibility rules for benefit and the levels of benefit became nationally uniform for the first time, providing a notion of equality. In addition, the household means test was abolished. This greatly benefitted unmarried mothers as they could live with their parents and still claim benefit.

Responsibility for social care was divided between the central state and local authorities. However, local authorities did not need to provide social care ‘free at the point of need’. The 1948 Act made local authorities responsible for providing lodgings for the homeless. However, it did not stipulate that facilities for unmarried mothers and their children should be separate from that of other homeless people. While Mother and Baby Homes, hostels and voluntary services went some way towards filling this gap, there was only a temporary arrangement. It was 1977 before local authorities were required to house all homeless people regardless of their background, including unwed mothers. Even then, discrimination occurred as many authorities preferred married couples or allocated the unmarried mothers the worst housing. The situation of unmarried mothers was not helped by the tabloid press and some Conservative politicians who pilloried unmarried mothers for taking up housing. For example, in 1988, Prime Minister Margaret Thatcher accused young girls of becoming pregnant simply to get a house and benefits without understanding that the reason there were more unmarried women were in council houses in the 1980s than earlier was because they had previously been excluded.

Despite negative conservative rhetoric, by the 1970s and 1980s social attitudes towards unmarried mothers had changed. The rising levels of unmarried cohabitation during the 1960s and 1970s, as well as the rising number of illegitimate births that were jointly registered by unmarried parents indicates a changing social acceptance of childbirth outside of wedlock. And, in 1987, the term ‘illegitimate’ was by law removed from official discourse. However, by this time, the Mother and Baby Homes in Scotland had closed.
It is within this complex social and political process and mixed economy of health and welfare that Mother and Baby Homes operated in Scotland. The early twentieth century Scottish emphasis on keeping the mother and child together persisted through mid-century. In 1943, the Ministry of Health issued circular No. 2866 on the Care of Illegitimate Children to all local authorities. Two years later, the Ministry reported that 81 per cent of such children remained with their mothers, but argued there was room for improvement.\(^29\) In 1952, and influenced by Psychoanalyst John Bowlby and his work on attachment theory,\(^30\) the British Medical Association reiterated the view that the illegitimate child should remain with the mother. Most Mother and Baby Homes seem to have adopted that goal as their initial mantra. However, they also had to respect the mother’s wishes and sometimes those of her family. The latter was particularly awkward during the 1960s and 1970s when adoption rates throughout Britain rose and some women were pressurised into placing their baby for adoption, often by families, but also by staff in certain Homes, adoption and social services. This section seeks to provide an overview of the Mother and Baby Homes, including their location, dates of operation (when feasible), who operated them and their regime. The data is inconsistent. Much of the information about these homes and their operation was not written down and the information remained only with the matron. Due to the nature of the births and in some cases adoption, the home’s records were frequently destroyed after mother and baby left. Perhaps the most complete information comes from the Salvation Army who operated twenty homes throughout Britain.

The term Mother and Baby Home has changed through the course of the twentieth century. In the early years of the twentieth century they were called maternity homes, during the First World War this switched to Mother and Children’s Homes. In 1920, the Salvation Army’s Homes were renamed Homes for Mothers and Infants, which remained in use until after World War II. Postwar, the homes were simply called Maternity Homes until 1976 when Mother and Baby Home became standard for the Salvation Army Homes. Homes run by other providers, including the Church of Scotland, used similar names, Maternity Home, Home for Unmarried Mothers and lastly, Mother and Baby Home, which became standard by the end of the Second World War. Despite the different names, these homes provided similar services, namely shelter and maternity care for unmarried mothers and their new-born infants who either could not or would not turn to family and friends. Mothers usually entered the homes when their pregnancy became very apparent, at about six months pregnant, had

### Key points

- Most Mother and Baby Homes run by religious affiliated organisations
- The Homes were located in the big Scottish cities
- Few records remain from these Homes
- Women usually stayed between 1-3 months before and 3-4 months after confinement
- The regime in the Homes was predominantly non-punitive
- Only one home (Perth) was formally tied to adoption
their baby either at the home\textsuperscript{3} or in a hospital and returned/stayed at the home for one to three months afterwards. Sometimes they remained longer if a mother had nowhere else to go, or she moved to a hostel or home where unwed mothers and their children could stay for a short while and which was frequently operated by the same charity as the Mother and Baby Home.

From the interwar years, religious groups were the primary operators of Mother and Baby Homes, including the Salvation Army, the Church of Scotland, the Episcopal Church of Scotland and the Roman Catholic Church. However, a few independent voluntary providers remained with Richmondhill House (formerly Aberdeen Mother and Baby Home) being the most notable. The Homes closed in the 1970s and 1980s due to the increased options available to unwed mothers and changing social attitudes towards unmarried mothers. The Salvation Army was one of the last to formally end its maternity work with single mothers in 1982 with the Catholic operated St Gerard’s being the last to close its doors in 1985.

Table 6 lists the known Mother and Baby Homes operating between 1920 and 1990 and where known, their dates of operation. Some of these homes changed names over the years and moved addresses. The name changes have been included in the same listing rather than as a separate listing.

Information on the destination of the mothers and their babies after leaving the homes is also incomplete. Of the homes, only regular data from the Salvation Army Homes remains. However, as they operated more homes than any other provider in Scotland, with three homes, their data is presented in Tables 7-10 as it provides a rough idea of destination patterns of mothers and babies. They highlight the decline in domestic service as a destination for mothers with their baby and which corresponds with a rising number of women going home. However, correlation does not necessarily indicate a positive relationship. Table 11 provides a broader snapshot of destinations of mothers and babies from 1970-72.

The length of stay in Salvation Army homes varied for mothers. There is no specific data for the babies, but they left the home within a day or two of their mothers. Table 9 provides detail on the length of stay for mothers before the birth and Table 10 the length of stay after birth.

\textsuperscript{3} The Salvation Army Homes delivered babies either in their homes or in another building on site.

| Perth           | Perth Factory Girls Club and Training House for Servants, then National Vigilance Association Scotland (NVAS from 1939) then Family Care | Melville House Girls Hostel and Adoption Society | 1929-72 | Registered adoption agency. Provided other services and seems to have only been mother and baby home for girls planning to have baby adopted. Gained international reputation in adoption.  

Notes: In addition to the Mother and Baby Homes, many of these providers also operated Rescue Homes which sometimes accommodated unmarried mothers and the Magdalene Institutions also took some pregnant unmarried women for the earlier part of this period. Those homes included in the table are only those whose primary purpose was to be a Mother and Baby Home. This table also does not include flatlets where unmarried mothers could live with their babies – primarily in the 1960s and 1970s, including the YWCA, Castlehill Housing Association, the Church of Scotland, the Salvation Army via the Knowe and the Catholic Church. Gaps in data meant it was unobtainable. A ‘?’ means the date was either inferred and a ‘/’ indicates two dates were found, but no confirmation of an exact date was identified.

---

⁵ My thanks to Major Kevin Pooley, Social Historian for the Salvation Army, for the data on the Salvation Army Homes in Scotland.

⁶ Most situations found for the women leaving Salvation Army Homes were in domestic service, but some went to hospitals, hotels and occasionally an upper-class household.

⁷ From 1951, 'address only' destinations became more numerous and hence, it was harder to categorize between home and situation.

⁸ Included in this category are those babies who were adopted direct from the home or sent to nursing/foster mothers, children’s homes or into local authority care. It is unclear what such placements represent or if they were permanent. Nursing/foster mothers is especially difficult because while this could be a stepping stone to adoption (formal or otherwise), a Homes’ officer was required to keep in touch with the women for at least three years after discharge. Intermittent surviving records show that some women worked to support their children, maintained contact with them or even reclaimed them entirely (much of this information is for the period pre-1948).

Notes: Not all homes distinguished between fostering and adoption and some records were unclear, so these figures have been grouped together for clarity. The quantity and type of ‘other information’ also varied by home. Records for St. Gerard’s Bishopton ended in July 1972. Figures from other homes include Jan 1970-December 1972.

Source: Glasgow Caledonian University (GCU) Archives, One Parent Families Scotland.
Regime

The regime in the Mother and Baby homes is difficult to determine and probably varied considerably between providers and over time as different matrons held different priorities. However, for the most part, the regime in the Mother and Baby Homes does not appear to have been intentionally punitive, although some women found it so. Only snapshots remain from different home operators. The Salvation Army maintains that the regime in all its homes would have been similar due to the structure of the organisation. The Women’s Social Work (WSW) wing was in charge of the Mother and Baby Homes, as well as other social work centres. It operated as a self-contained unit, but under strict, written guidelines that sought to standardise every area of work undertaken by the WSW. The Salvation Army’s Orders and Regulations for Social Offices (Women), from 1916 stated that ‘In exceptional cases, however, it will be found desirable to procure adopting parents for homeless children. These may be – (i) Orphans and (ii) The illegitimate children of women who have been taken charge of by The Army, and who are unable to bear the burden of their support. All such cases must be the exception and not the rule...’ The WSW Supervision was regular and senior officers regularly visited the homes. The regulations, and indeed the ethos of the Salvation Army, were to provide non-judgemental care and support for the women and their baby. Interviews with former residents confirm the non-punitive regime and the fact that Officers’ did not try and force adoption, even in later years, although adoption rates did still increase.

Lansdowne House, the Church of Scotland’s Glasgow Home, was also non-punitive, as evidenced by the regular return of former residents to the Home to visit the matron and who often brought their baby with them. If their experience had been in any way unpleasant, it is unlikely that they would have returned or maintained contact with the matron. Adoption was never formally part of their social policy, but adoption rates in their Home increased in the late 1930s, with nearly half the babies born in the Home in 1939 being adopted, while in 1940 just over one-third of babies born went home with their mother. The rising adoption rates then and post war may simply relate to the women’s individual circumstance. Moreover, the fact that the women frequently maintained contact with the matron suggests that she probably encouraged the women to make their own decisions rather than trying to impose her will upon the client. Family pressures to have a baby adopted may also have contributed to rising adoption rates.

Less is known about the regimes in other homes. However, blog posts by women who were resident in St Gerard’s Mother and Baby Home in Bishopton during the late 1960s suggest that the women were well treated, despite a fairly strict regime and sometimes being expected to work in the laundry. The Good Shepherd nuns who operated the home also operated a complex which included the Dalbeth Approved School and St Euphrasia’s Training Centre which operated a laundry. The women in these different homes did not mix. Some women remembered their time at St Gerard’s fondly, particularly the friendships made and the care provided by the nuns, while others found the regime punitive. At St Ronan’s in Dundee, some women felt pressurized to put their baby up for adoption. It is unclear whether these accounts are the exception or the rule. However, what is clear from the blog posts and testimonies of women who were in the Mother and Baby Homes during the 1960s and 1970s, as well as the records of One Parent Families, Scotland, was that family support was central to their being able to keep their baby. Familial pressures could also persuade or force a young mother to put her baby up for adoption. Hence, the role of Mother and Baby Homes in adoption is complex because it is unclear whether families were influencing the
Home’s actions. Moreover, the lack of available information has left many women and children needing help to resolve their past in relation to adoption. Only when a full investigation is made of Scottish Mother and Baby Homes and adoption in Scotland, particularly during the 1960s and 1970s, will the full relationship between Mother and Baby Homes and adoption become clear.

In 1973, the Annual Report of the Scottish Council for Single Parents noted that at end of that year, there were seven Mother and Baby homes in Scotland with a total of 104 beds; compared with 12 homes and 242 beds in July 1969 when survey started. This was also the year of the Council’s name change from the Scottish Council for the Unmarried Mother and her Child. The latter was deemed no longer appropriate or reflective of the services provided. By this time too, the Mother and Baby Homes were struggling to find suitable staff to run the homes. Both the Homes and the Scottish Council for Single Parents were noting the need for more flexibility in helping single parents. By this time too, social attitudes towards unmarried mothers had changed and greater state support was available for a woman seeking to keep her child, but who did not have the support of her family or that of the putative father.

**Conclusion**

While Scottish attitudes towards unmarried women and their children have changed considerably during the course of the twentieth century, there is not, nor has there been, a consistent ‘Scottish’ attitude towards childbirth outside of marriage. The regional patterns of acceptance or judgement of the unwed mother and her children have persisted through the centuries. While overall, social attitudes in Scotland are more accepting of both the unwed mother and her child today than they were one hundred year ago, moral codes and associated pressures still remain in some families.

For the first three quarters of the twentieth century, Mother and Baby Homes provided shelter and healthcare for both unmarried mothers and their children and formed part of the complex matrix of health and welfare provision in Scotland. However, by the late 1960s the Homes struggled for staff, while the group of women for whom the Homes had been planned, no longer wanted to or had a social or financial need to utilize Mother and Baby Homes. The patchwork of surviving records from Scottish Mother and Baby Homes suggests that by the time the homes closed in the 1970s and 1980s, about half the women kept their babies, while the other half put the baby up for adoption. Those women who kept their baby usually returned home, with some marrying the putative father. However, throughout the twentieth century, family support was an important factor in enabling women to keep their baby, including for acceptance of themselves and their baby and with practical financial support.

While the regime in Mother and Baby Homes was primarily non-punitive, with staff seeking to help the mother decide her own course in life and while many women remembered fondly the care provided and the friendships formed, other women were less happy. Some of these women left the Home before the baby was born or did not return to it after giving birth. Yet for those women who returned to the Home with their baby, if they had nowhere else to go or sought independence, many of the voluntary agencies who ran the Homes also provided additional services and accommodation,
including childcare to allow the mother to work.\textsuperscript{10} Hence the experience of unmarried women having children in Scotland has been diverse and Mother and Baby Homes provided only one part or one type of experience. Further research is needed if Scotland is to fully understand the role of the Mother and Baby Home in the lives of unmarried women and their children and for those affected by adoption, to comprehend their heritage.

\textsuperscript{10} This was more common immediately after World War II.
The term illegitimacy was removed from official discourse in 1987. The term ‘illegitimate’ is used in this document in the context of the time under discussion.

Explanations for this are unclear, but it could well relate to the greater ease of abortions in the Aberdeen area.

Registrar General for Scotland, *Annual Reports*, various years.

However, there are indications that boarding out might also have happened in parts of England.

Chapter 38: Addendum to Burials report

Introduction

38.1 The Commission’s 5th Interim report, which was finalised in March 2019, described all that the Commission then knew about the burials of children who died in the main mother and baby homes. Since then, a number of individuals and organisations have contacted the Commission with information and submissions about the issues raised. Most of the information provided was already known to the Commission or is entirely anecdotal and impossible to prove. With the exception of the report on Sean Ross, there is very little extra known to the Commission about infant burials. The Commission remains convinced that there are people who have further information but they have not come forward.

Sean Ross

38.2 In its 5th Interim Report, the Commission stated in respect of Sean Ross:

There is a designated child burial ground in the grounds of the institution. The Commission was made aware of concerns about this burial ground and decided to undertake a geophysical study and subsequently a test excavation of the site. The results of this excavation are currently being examined.

38.3 The Report of Forensic Archaeological Investigations at Sean Ross Abbey Mother and Baby Home was completed in September 2019 and is published in full as an Appendix to this chapter. The following paragraphs give a very brief summary of the report:

38.4 The objective of the forensic archaeological investigation was to establish if human remains were present at the designated child burial ground and, if so, had these remains been disturbed by potential later insertion of utilities or drainage works at this location.

38.5 The investigation commenced with the least intrusive methods to inform a subsequently more intrusive, targeted test-excavation. A desktop review was conducted which surveyed historical mapping, aerial photography, and Tipperary County Council planning files that were relevant to the site. A geophysical survey took place in January 2019 and an independent inspection of the existing drains in proximity to the site was conducted in February 2019. The test excavation took place in February and March 2019. Seven trenches were opened during the test
excavation, representing about 10% of the total available area within the designated burial ground.

**Human remains**

38.6 Buried infant human remains were located during this excavation; all individuals were less than one year old. The skeletal remains of 21 individuals were uncovered. The remains of a further 11 coffins, indicating undisturbed burials, were evident. Four potential grave cuts were also identified and at least six individuals were identified through disarticulated skeletal remains. Therefore, the potential minimum number of possible individuals identified through the test-excavation was 42.

38.7 Coffins or evidence of coffins were located with the majority of skeletal remains (84%). Burials appear to have some organisation, in terms of layout, and there appears also to be concentrations of interments in particular locations within the burial ground. A number of the coffins appear to have been painted white. There were no coffin or name-plates in evidence.

38.8 Radiocarbon dating of 13 samples of skeletal remains provided estimated dates-of-death for those individuals in the 1930s, 1940s, 1950s and 1960s, the time of the operation of the mother and baby home in Sean Ross.

38.9 The Commission is satisfied that the report provides clear evidence that the coffined remains of children under the age of one are buried in the designated burial ground. There can be little doubt that they are the remains of children who died in Sean Ross. Without complete excavation it is not possible to say conclusively that all of the children who died in Sean Ross are buried in the designated burial ground. The Commission does not consider that further investigation is warranted.

**Disturbance of remains by drainage**

38.10 An independent survey of the waste-water drains in the vicinity of the burial ground was conducted by a drain specialist. This survey found that there had been upgrading and redirection of some pipe work in close proximity to the burial ground. This correlated with information from council planning files that saw the rerouting of waste water into a newly inserted main drainage pipe in around 1996. A salt glazed ceramic pipe was found on the geophysical survey and in the drain
inspection survey that skirts the southern corner of the site. The drain inspection found this pipe to be now defunct. A more modern junction had been inserted to the northwest that reroutes this drainage to run parallel with the burial ground toward the northeast where it eventually joins the local drain network to the north of St Anne’s Sean Ross Abbey building complex.

38.11 The evidence indicates that the human remains that have been uncovered were not disturbed by the insertion of drainage works, field-drains or waste-water pipes.

**Bessborough**

38.12 The Commission remains perplexed and concerned at the inability of any member of the Congregation of the Sacred Hearts of Jesus and Mary to identify the burial place of the children who died in Bessborough. The concern of the congregation about marking the graves of the children who died in Castlepollard (see below) does not seem to have applied to the children who died in Bessborough.

38.13 A number of people and organisations have made suggestions about possible locations for children’s graves both in the area which is currently part of the Bessborough estate (roughly 60 acres) and in areas which were sold in earlier years (the total area was once about 200 acres). During 2019, the Commission followed up on some of these suggestions.

38.14 In April 2019, the Commission’s solicitor and archaeologist walked the grounds of Bessborough with a man who had lived nearby. He pointed out the area in the grounds where he believes he saw a graveyard marked with white crosses. He subsequently swore an affidavit setting out his recollections. A similar exercise was conducted in October 2019 with a man who had played in the grounds as a child. He pointed out an area where he said he had seen open graves with the bodies of young children exposed. This was marked on a map and he subsequently swore an affidavit to this effect.

38.15 Also in April 2019, a man who had done building work in Bessborough in 2008 told the Commission that there was a cavern/chamber underneath the church on the site. The work had been carried out on behalf of the HSE so the Commission issued a direction to the HSE seeking minutes of the meetings between the HSE and the builders involved in the site. These minutes were provided by the HSE in
August 2019. The minutes note that the space was referred to as an underground tank and was found to contain water and petrol-contaminated silt. It appears there was no archaeological significance to the tank.

38.16 A detailed submission was received from the Cork Survivors and Supporters Alliance in March 2020. This dealt with two aspects of the Commission’s 5th Interim report - the law on burials (see below) and the issue of the Bessborough burials. The submission dealt in considerable detail with the available mapping of the Bessborough estate, the interpretation of that mapping and its potential to identify possible burial grounds.

38.17 The Commission and its forensic archaeologists had been aware of all these possible locations when the 5th Interim report was compiled. The Commission recognised then and still recognises that it is highly likely that burials did take place in the grounds of Bessborough. The only way that this can be established is by an excavation of the entire property including those areas that are now built on.

Burial records relating to St Finbarr’s Hospital held at Cork University Maternity Hospital

38.18 The Commission continued its efforts to establish if any of the Bessborough children were buried in other locations. In its 5th Interim Report, the Commission reported that a ‘Burial Book’ relating to deaths in St Finbarr’s Hospital may have been held in Cork University Maternity Hospital (CUMH). The Commission issued a discovery order in respect of these records. In May 2019, HSE South informed the Commission that they had located records relating to St Finbarr’s Hospital including burial records and mortuary records. Three of the collections located at CUMH were relevant to the Commission’s work.

Mortuary Book (1969-79)

38.19 The Commission undertook a line by line search of this book and identified a number of children born in Bessborough who subsequently died in St Finbarr’s Hospital.

Folder of Burial Records/Burial Index Card Box

38.20 These records were the mortuary index cards flagged by a former administrator of St Finbarr’s Hospital. The collection comprised physical Burial Index Cards created by the mortuary attendant at St Finbarr’s Hospital and a folder detailing the
information recorded on the cards. The collection of mortuary index cards held at CUMH covered the years 1968-85. The Commission has established that mortuary index cards relating to the 1940s and 1950s were held in St Finbarr’s Hospital in the late 1990s but have not been located to date. The Commission analysed the extant mortuary index cards and identified 26 infants and children born in Bessborough who subsequently died in St Finbarr’s Hospital. The Commission also identified 11 stillborn infants delivered in St Finbarr’s Hospital to women transferred from Bessborough.

38.21 The mortuary index cards compiled at St Finbarr’s Hospital recorded patient details including name, last address, date of death, name of undertaker and place of burial. Index cards relating to ‘illegitimate’ infants who died in St Finbarr’s Hospital in this period stated that all were buried in St Michael’s Cemetery. The Commission examined the burial registers at St Michael’s Cemetery on two occasions but found no burial record for the infants identified on the mortuary index cards. Further analysis of the mortuary index cards revealed that in some instances deceased infants were buried in the coffins of deceased adult patients. In other instances, infants were buried in coffins containing amputated limbs. The Commission established that the Cork health authorities were buying burial plots in St Michael’s Cemetery since its opening in 1948. These burial plots were used to bury the unclaimed remains of patients who died in Cork County Home/St Finbarr’s Hospital. The Commission has not established when the health authorities began the practice of burying ‘illegitimate’ infants in coffins with adult remains or with amputated limbs. The Commission has also not established why the names of infants buried in this manner were not recorded in the burial register at St Michael’s Cemetery. However, it is clear from a collection of correspondence between the health authorities and staff and administrators of maternity hospitals in Cork that the practice was commonplace.

Box file of miscellaneous emails/Southern Health Board plot purchases/cemetery plans

38.22 As part of the Inquiry into Post Mortem Practices and Organ Retention, a Post Mortem Enquiry Helpline was set up at Cork University Hospital (CUH) in 2001. It appears that maternity records from hospitals in Cork were transferred to CUH at

---

1 HSE, Cork University Maternity Hospital, Burial index card box/folder of burial records 1968-85.
2 The Report of Dr Deirdre Madden on Post Mortem Practice and Procedures is at https://www.lenus.ie/handle/10147/43373
that time. The helpline was to assist parents of stillborn children and parents of deceased infants who were the subject of post mortem examination. Most letters from parents related to instances where a hospital had arranged the burial of a deceased child and where parents requested information on the place of burial. It is clear from this collection of correspondence that Southern Health Board officials did not know how hospitals in the city dealt with foetal and infant remains. A letter from a consultant obstetrician/gynaecologist to the Secretary, Erinville Maternity Hospital, in 1984 acknowledged that foetal remains from Cork Regional Hospital (CUH) were ‘normally placed in a coffin with other corpses’ and subsequently buried in consecrated ground. The doctor stated that he found the practice ‘unsatisfactory’ as parents would never locate or visit their child’s grave. The Commission has established that health authorities in Cork engaged in such burial practices from at least the 1960s and had continued to do so until the late 1980s. In 1992, the Southern Health Board made arrangements for the burial of foetal and infant remains at Kilcully Cemetery, Cork. The administrator, St Finbarr’s Hospital, advised the Secretary, Miscarriage Association of Ireland, that when requested by parents, foetal and infant remains were placed in a small coffin and buried in Kilcully, where the cemetery supervisor kept a register of such burials. Parents who sought information on the burial of a child prior to 1992 received a standard letter from the Southern Health Board which read:

Following discussions with relevant staff and an exhaustive search to locate the burial place of Baby X, it was the practice at that time for St Finbarr’s Hospital to bury babies on behalf of the parents in St Finbarr’s Cemetery, Glasheen Road, Cork. The cemetery records are unable to pinpoint the actual burial place as there were a number of different plots.

38.23 The Commission examined Burial Records relating to St Finbarr’s Cemetery on two occasions and found burial details recorded for three ‘illegitimate’ children associated with Bessborough. Two related to child deaths which occurred in 1923 and the third to a child death in 1989. All three children were buried in ‘poor ground’ local authority owned burial plots. If it was the case that the Cork Health Authority/Southern Health Board did ‘bury babies on behalf of parents in St Finbarr’s Cemetery’ it appears that their burials were not recorded in the cemetery burial records. The Commission found that details relating to burials of ‘illegitimate’

---

3 HSE, Dr E.P.J McGuinness to A. Gosnell, Secretary, Erinville Hospital, 13 August 1984.
children are conspicuously absent from burial records associated with cemeteries with local authority burial plots.

38.24 In 2001, the Southern Health Board endeavoured to locate the burial places of five infants whose parents had contacted the Post Mortem Enquiry Helpline. The infant deaths had occurred on dates between 1973 and 1985 and the place of death was St Finbarr’s Hospital or the Erinville Hospital, Cork. Senior Southern Health Board staff engaged with cemetery supervisors in Cork city and hinterland and former administrators of maternity hospitals in the city in a bid to establish the location of the infant burials. Following intensive inquiries, the Southern Health Board stated, based on anecdotal evidence, that it was likely that infants who died in the 1980s were interred in St Finbarr’s Cemetery, but concluded that ‘cemetery staff are unable to pinpoint the actual burial place’.

38.25 The Commission has encountered similar difficulties in locating the burial places of children who died in the Cork institutions under its remit: Cork County Home/St Finbarr’s Hospital and the Bessborough Home/Sacred Heart Maternity Hospital. As highlighted above, it appears that the practice of burying deceased infants in coffins with adult remains was common practice in the city’s main maternity hospitals until the late 1980s. Furthermore, the associated practice of neglecting to record such infant burials in cemetery Burial Registers appears to have been common practice also. The Commission spent considerable time and resources trying to establish the burial places of more than 1,400 infants and children who died either in Cork County Home/St Finbarr’s Hospital or the Bessborough Home/Sacred Heart Maternity Hospital in the period 1922-98. The Commission identified the burial places of 101 infants who died in one or other of these institutions. While most burial places were confirmed by an actual burial record (mainly in the 1920s) others were identified through disparate historical sources created by Cork health authorities or hospital personnel. Given the burial practices adopted by maternity hospitals in Cork in the mid to late twentieth century, the Commission considers the task of locating the burial places of the remaining 1,300 plus infants and children who died in Cork County Home/St Finbarr’s Hospital and the Bessborough Home/Sacred Heart Maternity Hospital to be a difficult one.
38.26 Castlepollard

In its 5th Interim Report, the Commission stated that it had no reason to doubt that the children who died in Castlepollard were buried there in the marked burial ground. After the publication of that report, the Congregation of the Sacred Hearts of Jesus and Mary provided the Commission with copies of correspondence between it and the Midland Health Board in the 1990s which further clarified what occurred in the 1990s. In 1994, the congregation contacted the Midland Health Board (which had owned the site since 1971) to say that it wanted to remove the wall between the Sisters’ and the children’s burial plots and wanted to install a memorial to the children. The congregation pointed out that, while there was a memorial stone to the Sisters who died there and to the mother who died there, there was nothing to mark the fact that children were also buried there. The congregation was concerned about this. The Midland Health Board agreed to the congregation’s proposals. It seems that the works were not carried out until 1996/7 and they were then carried out by the health board. The congregation agreed to pay the costs involved. This correspondence corroborates what local people told archaeologists in 2017 and which is reported in the Commission’s 5th Interim report.

38.27 Tuam deaths and anatomical studies

In its 5th Interim Report, the Commission reported that a number of infant remains had been sold to the Galway Medical school by the porter in the Central Hospital, Galway. The Commission did not report that these bodies were those of children from the Tuam Children’s Home. The Commission did consider this possibility as it was obliged to do under its Terms of Reference but, as the names of the children are not known, it is not possible to establish where they were from. The dates of their deaths makes it highly unlikely that any of them were former residents of the Tuam home.

In the chapter on anatomical studies, the 5th Interim Report stated at paragraph 7.35:

The current head of the Galway Anatomy Department told the Commission that, when he took up this post in 1995, there were many “wet” infant anatomical subjects preserved in the department. These unidentifiable infant remains were buried together in Rahoon Cemetery, Galway in 1995 with full funeral rites and with the permission of the Coroner.
38.29 This was based on information supplied to the Commission at an earlier date. The errors in this statement were brought to the Commission’s attention by the head of the anatomy department but, regrettably, the Commission did not correct it. The correct information is as follows:

The current head of the Galway Anatomy Department told the Commission that, when he took up this post in 2005, there were many “wet” infant anatomical subjects preserved in the department. These unidentifiable infant remains were buried together in Bohermore Cemetery, Galway in 2005 with full funeral rites and with the permission of the Coroner.

38.30 The Commission apologises for its failure to correct this before submission of its 5th Interim report and acknowledges the assistance of the head of the Galway Anatomy Department in its investigation.

The law on burials

38.31 The Cork Survivors and Supporters Alliance submission argued that the common law placed various obligations on the Congregation of the Sacred Hearts of Jesus and Mary in respect of burials and these obligations had not been met. The Commission’s 5th Interim report outlined only the statutory provisions and the submission argued that these did not replace the common law duties. The Commission accepts that the common law may have placed obligations on the congregation in respect of burials but it is not clear what exactly those obligations were and in what way, if any, they were different from the statutory obligations.

38.32 The submission further argued that it was wrong to conclude that burial grounds operated by religious institutions (such as at Bessborough) were not regulated by the 1878 Act. The submission makes an arguable case for this but it is clear that the 1888 Rules and Regulations did not apply to burial grounds such as Bessborough.

38.33 The points raised by the submission in relation to the law on burials are interesting. However, the Commission decided not to pursue the matter further because of time constraints (the submission was received in March 2020 when this report was almost complete) and because its primary concern was to try to establish where the children were buried.
Report of Forensic Archaeological Investigations
at Sean Ross Abbey Mother and Baby Home
Children’s Burial Ground,
Roscrea, Co. Tipperary

On Behalf of:
The Mother and Baby Homes Commission of Investigation

Report submitted to:
Judge Y. Murphy

Executive Summary

The Mother and Baby Homes Commission of Investigation requested a forensic examination be conducted of the site of the current Children’s Burial Ground at St Anne’s Sean Ross Abbey, Roscrea, Co. Tipperary.

There were two primary matters requiring investigation:

i) whether human remains are present at this location,
ii) if present, had these remains been disturbed by potential later insertion of utilities or drainage works at this location.

The Sean Ross Mother and Baby Home was in operation from 1931 – 1969 and operated under the care of the Order of the Sisters of the Sacred Hearts of Jesus and Mary.

This investigation commenced with the least intrusive methods to inform a subsequently more intrusive, targeted test-excavation.

A desktop review was conducted which surveyed historical mapping, aerial photography, and Tipperary County Council planning files that were relevant to the site.

A geophysical survey took place in January 2019 and an independent inspection of the existing drains in proximity to the site was conducted in February 2019.

The test excavation took place in February and March 2019 under full forensic control under a warrant issued by Judge Y. Murphy.

Seven trenches were opened during the test excavation, representing circa 10% of the total available area within the current burial ground.

Buried infant human remains were located during this excavation; all individuals were less than one years old. The skeletal remains of 21 individuals were uncovered in situ. The remains of a further 11 coffins, indicating undisturbed burials, were evident. Four potential grave cuts were also identified and at least six individuals were identified through disarticulated skeletal remains. Therefore, the potential minimum number of possible individuals identified through the test-excavation was 42.

Coffins or evidence of coffins were located with the majority of skeletal remains (84%). Burials appear to have some organisation, in terms of layout, and there appears also to be concentrations of interments in particular locations within the burial ground.

Radiocarbon dating of 13 samples of skeletal remains provided estimated dates-of-death for those individuals in the 1930s, 1940s, 1950s and 1960s, the time of the operation of the Sean Ross Abbey Mother and Baby Home.

There were no significant subsurface structures located.
Land reclamation works were evident in the form of introduced deposits above the peat and through the presence of stone field drains, all of which were stratigraphically earlier that the burials located in the seven test trenches opened.

A waste-water pipe was found to transect the southern corner of the site. Stratigraphy here indicates that the pipe was inserted prior to any burials at this location.

Disarticulated remains were found in the area where it had been indicated ploughing had occurred in the 1980s.

The excavation here was limited by the test or sample nature of the approach and results reflect this procedure. Results cannot be applied generally to parts of the site that remain unexcavated. Infant human burials were located across the site and these have not been impacted by any utilities or drainage works.
1. Introduction

This report presents the results, in full, of a forensic investigation, including test excavation, undertaken at the site of the reported Children’s Burial Ground in the grounds of the estate of St Anne’s Sean Ross Abbey, Roscrea, Co. Tipperary. This research and excavation was undertaken at the request of the Mother and Baby Homes Commission of Investigation. The Forensic Archaeology team was on site for four weeks in February and March 2019. This report presents the desktop review of the site, a summary of results of a geophysical survey, the excavation methodology, excavation results in full, including stratigraphic report, and the results of testing and analyses of human remains that were uncovered at this site, as well as an investigation into the utilities that are in proximity to the burial ground.

1.1 Background

The burial ground under investigation was associated with the Mother and Baby Home in the grounds of St Anne’s Sean Ross Abbey. The Home was in operation between 1931 and 1969. During the time of the operation of the Home, approximately 1000 infants died. Since 1969, the wider site has provided for services for intellectually disabled adults and children. The Mother and Baby Homes Commission of Investigation is not aware of anyone being interred in the burial ground after the closure of the Sean Ross Abbey Mother and Baby Home in 1969.

The term ‘exposed’ will be used throughout this report to describe graves encountered during excavation. Human remains were not disturbed for the purpose of this investigation. The Mother and Baby Homes Commission of Investigation has no authority to exhume human remains. When skeletal remains or apparent coffin timbers were uncovered, they were carefully exposed for the purpose of the forensic archaeological record but were not exhumed or disturbed. Analyses of skeletal remains were conducted in situ by the project Osteoarchaeologist. Human remains that were previously disturbed, or out of original context, were analysed on site and returned to their original position.

According to the Register of Deaths, the majority of children who died, while the Home was in operation, were under the age of one year. Just 41 recorded deaths (3.8%) were aged over one year and all recorded deaths denoted individuals under the age of five years (see Section 7.3).

On site there are crosses indicating the burial of two older individuals; these individuals appear in the Maternal Deaths Register, aged 28 and 14, having died in 1937 and 1944 respectively. The indicated locations of these graves are marked by two metal crosses on the southern boundary of the burial ground. The crosses are identical in style to those marking graves in the Nuns Graveyard elsewhere on the grounds of the estate. These two potential graves were not disturbed during the course of this investigation.

The team was asked to consider two pieces of information that were received by the Mother and Baby Homes Commission of Investigation in the course of this investigation. The first, and most significant, was an assertion that the graveyard, when still in use, had drainage works inserted through it. Secondly, based on the previous assertion, that there may be a complete absence of in situ human remains in this location to begin with; that it may never have been used as a burial ground.
Although not a specifically-requested consideration, an eyewitness account was also shared with the investigation team that centred around the witness being present on site in the 1980s while ploughing took place and that bone was brought to the surface during this work.

1.2 Aims and Objectives of the Excavation

The Commission identified two principal matters for investigation at the site known as the Children’s Burial Ground at St Anne’s Sean Ross Abbey:

1) To determine the presence of infant human remains at the location

2) To determine the presence of utilities or services at the location

The excavation methodology addresses these issues for investigation, while taking into account that any human skeletal remains uncovered at the site, whilst of evidential value, must, and are, treated with dignity and respect.

The site was investigated through forensic archaeological principles of investigating in a priority-based approach; utilising the least intrusive methods and moving towards a targeted response with more intrusive methods. This process begins with a desktop review and non-invasive survey work. A desktop assessment, reviewing cartographic sources and records of planning associated with the site, was conducted in order to aid with the understanding of utilities that appear in close proximity to the site. Furthermore, a drain inspection survey was independently conducted by experts while on-site.

1.3 Authorisation

This test excavation took place at the request of the Mother and Baby Homes Commission of Investigation, hereafter MBHCOI, under the Commissions of Investigation Act 2004, Sections 8, 26 and 28. The Director of the site, N. McCullagh, was issued a warrant by Judge Yvonne Murphy to investigate the site in accordance with Section 26 of the Commission of Investigations Act 2004. This warrant authorised N. McCullagh to exercise the powers given under Section 28 of the Act in relation to premises known as ‘the Children’s Burial Ground located in the grounds of St Anne’s (Sean Ross Abbey), Roscrea, Co. Tipperary’. The full warrant is given in Appendix B.

An Augustinian Abbey (Record of Monuments and Places (RMP) number TN012-014001) and an associated burial ground (RMP TN012-014002) lie to the west of the burial ground. The proximity of the site under investigation required a query to be raised in relation to proposed works to the National Monuments Section (NMS) of the Department of Culture, Heritage and the Gaeltacht. It was determined that an archaeological excavation licence was not required due to the time span under consideration, 1922 to 1998. The burial ground was determined by the NMS to be outside the zone of notification around the RMP associated with the Abbey and Graveyard. It was further determined by the NMS that the abbey and burial ground are not owned by the Minister for Culture, Heritage and the Gaeltacht, or in her guardianship, and are not subject to a preservation order. The NMS advised that if in the course of the work, an archaeological object was found, then the provisions of Section 23 of the National Monuments Act 1930 would apply and necessitate reporting to the NMS and the National Museum of Ireland.
1.4 Site Conditions & External Personnel

An Garda Síochána (AGS) were in attendance for the duration of the excavation, specifically when human remains were exposed. They were present to provide assistance if required, to agents of the Commission, N. McCullagh, and the team. AGS provided site-cordon supervision and maintained a log of those accessing the site. The site director, as holder of the warrant, held sole responsibility for permitting access to the site. The site under investigation, including the facilities compound, were surrounded by Herris fencing covered with black nylon sheeting to inhibit line of sight. Individual tents covered the trenches where human remains were exposed during excavation works; this afforded physical protection and maintained ethical considerations with regard to preventing public access and the opportunity for unsolicited imagery. These conditions kept the site and human remains secure and protected the continuity and the integrity of evidence collected.

On three occasions throughout the site investigation, the Sisters of the Sacred Hearts of Jesus and Mary engaged an impartial observer (a consultant geophysicist), to monitor excavation works. This individual was permitted unlimited access to the site while excavation was under way but was not permitted to generate a photographic record.

The Coroner for Tipperary, Mr J. Kelly, had been notified of the potential to find modern human remains that would be considered from a timeframe relevant to his jurisdiction. The protocol agreed with AGS and the Coroner was that once human remains were located N. McCullagh would inform the local Gardaí, who would in turn inform the Coroner. A Garda ‘Scenes of Crime’ photographer, on behalf of the Coroner, would be deployed to photograph the remains and the context in which they were found.

The Coroner provided permission for remains to leave his jurisdiction for radiocarbon dating at the Scottish Universities Environmental Research Centre (SUERC) laboratory. The results from this testing are detailed in Section 7.1.

1.5 Forensic Archaeological Excavation

The timeframe under consideration on behalf of the MBHCOI is from 1922-1998; the Sean Ross Abbey Mother and Baby Home was in operation from 1931-1969. One human lifetime, or 70 years, is considered relevant to the duty of the Coroner. This modern period under investigation would normally be considered ‘forensic’, as it gives rise to the potential for it to become a crime scene, although in this case no specific crime has been identified. Therefore, a forensic control has been maintained so that, should it become necessary in the future, all evidence has been collected to a standard that is required by forensic casework and that is submissible in a court of law.

Generally, traditional archaeology focuses on a cultural interpretation of the past as opposed to specific events. Standards of evidence and subsequent interpretation are not subjected to the scrupulous standards required by a court of law. While methods used are similar, the interpretations are not, and neither are the records maintained on site or the forms of evidence gathered secured.
2. Historical & Cartographic Assessment

The former Mother and Baby Home at Sean Ross Abbey is within the townland of Corville. This is within the parish of Corbally, the barony of Ikerrin (Lewis, 1837), centred at ITM co-ordinate 615374, 688553. The current landscape of the former Mother and Baby Home consists of well-maintained lawns and small amounts of woodland. An active quarry, over 13 hectares in extent, is immediately west of the main building complex. A watercourse extends across the southern part of the former grounds before joining another tributary at east. These flow northwards, eventually joining with the Moneen River at Roscrea. The terrain is generally low-lying with occasional rises or knolls. One such relative height is where the medieval ecclesiastical buildings are located.

2.1 Historical Background

An Augustinian Abbey (RMP TN012-014001-) and an associated graveyard (RMP TN012-014002-) lie 140m to the west of the burial ground under consideration here. Although founded in the seventh century by St Crónán, there is no surface trace of the original early medieval site (Farrelly and O'Brien, 2015). The surrounding lowland, known as *Locha Cré*, meant that this was a secluded parcel of land (Healy, 1912) and St Crónán relocated to Roscrea during the seventh century. An Augustinian Abbey had been established at Monaincha (TN018-001001-), 1.7km to the east in 1140 and this relocated to Corville, referred to as Corbally, *circa* 1485 (Gwynn and Hadcock, 1970; Stout, 1984). After the dissolution of the monasteries in the 1560s, Corbally was included in a grant to William O’Carroll (Nicholls, 1994). By the mid-seventeenth century, the Earl of Roscommon was the listed landowner, and the church was described as being in a ruinous state (Simington 1931, 13). Nevertheless, the church is shown as Corbally on the Down Survey maps, 1656-1658 (*Figure 1*).

At present, the remains of the church date from the twelfth to sixteenth centuries and it is *circa* 15m x 6.5m in extent (Farrelly and O’Brien, 2015). Repairs to the church building appear to have been carried out in both the nineteenth and twentieth centuries (*ibid.*). The graveyard (RMP TN012-014002-), adjacent to, and southwest of the church, contains mostly nineteenth and twentieth century memorials (O’Brien, 2008).

Just one other archaeological site is recorded within Corville townland. This is a mound (RMP TN017-017--), of which no visible surface trace survives, and is situated over 400m to the southwest of the latter site (Farrelly and O’Brien, 2002).
The estate of St Anne’s Sean Ross Abbey was named ‘Corville House’ estate, after the townland of the main house. Although a vast estate was granted to a Cromwellian Colonel, Henry Prittie, in 1666 (NUI Galway, 2011), it is unclear whether it included Corville. However, it was recorded as the seat of Lord Dunalley’s brother, Hon. F. A. Prittie, in 1837 (Lewis, 1837; NUI Galway, 2011). The manor house, which is still extant, was built circa 1750 (National Inventory of Architectural Heritage Registration No. 22401211). It was most likely built by the Birch family in 1770 and is now a registered structure of regional importance (Reg. No. 22401211). In the 1780s it was leased to John Kilpatrick, and then to the Prittie family (Coughlan 2015). Following the death of Hon. F.A. Prittie, in 1853, the lands at Corville were put up for sale in 1858. It was purchased by Count Patrick O’Byrne, who subsequently sold the Corville Estate to the Order of the Sacred Hearts of Jesus and Mary in 1931 (ibid.). Sean Ross Abbey Mother and Baby Home operated as such until 1969 when the Home closed. At this time the complex was repurposed towards providing care for vulnerable children and adults in the community, eventually being formally renamed ‘St Anne’s Sean Ross Abbey’ in 2006 (Land Registry Folio 33388).

2.2 Cartographic Analysis

A desktop review was conducted of the mapping and photography available for this location. These were managed as layers within a GIS and ground points were secured through a GPS (GNSS) survey of the site. It was important to assess the recorded evolution of the site in order to interpret the geophysical survey and implement a strategy for subsequent excavations. A list of cartographic sources that were consulted are provided at the end of this section in Table 1.

Prior to the mid-nineteenth century, cartographic sources were limited by scale and accuracy. The first accurate map covering this area was surveyed in 1840. This is the first edition six-inch Ordnance Survey map, and shows Corville House, with buildings extending to the rear (south) and forming an enclosed courtyard. The church at this time is annotated ‘Corbally Abbey’ and the associated medieval graveyard is also noted. The immediate area is demesne land and a large wooded area with formal walled gardens and walkways set out to the east of the house. To the south of the wooded/walled garden and stream is what appears to be a complex of farm buildings. Between the main house and the farm complex the stream widens to a pond. An icehouse is 25m south of the main building.
complex, as is an unlabelled rectangular structure, possibly a folly, 280m to the west. The general picture is one of a landed estate.

![Figure 2: Extract from the first edition 25-inch Ordnance Survey map (1901), with the subsequent position of the burial ground indicated (© Ordnance Survey Ireland)](image)

The Estate was again mapped in 1901 at a greater scale (i.e. 25-inch to one mile). The complex of farm buildings had expanded by this time, while some of the ancillary buildings to the rear of Corville house had been removed (Figure 2). The icehouse is replaced by a lime kiln, marked disused, and the pond between the main house and the farm buildings has been channelled. The rectangular structure to the west, is in this map marked ‘Black Castle (in ruins)’, while the church is still marked ‘Corbally Abbey’ but now noted as ‘in ruins’. The map largely depicts the evolution of the partially-gentrified estate into a working farm. However, the area under consideration here is the walled garden and wooded area to the east. Much of the detail from the 1840 map had been retained, but the 1901 map shows the development of a wide promenade through the area currently occupied by the burial ground (Figure 3). This wide pathway – 120m in length – extends northeast, parallel to the stream, and was of variable width (5.5m - 9.5m). It terminates at a circular area marked ‘F.S.’, denoting a flagstaff. A small path continues to the stream as it had done in 1840.
The most relevant cartographic source is the Ordnance Survey Cassini 6-inch map, created in 1954 (Figure 4). At that time, the Mother and Baby Home was operational and the whole complex termed ‘Sean Ross Abbey’. There were multiple additions to previous buildings and those at the previous farm complex, south of the stream, are shown as ‘Hospital’. Two burial grounds are outlined and marked as such. One is east of the Abbey, known as the ‘Nun’s Graveyard’, the other is the burial ground under consideration here now known as the Children’s Burial Ground (Figure 5). This is surveyed as approximately 43m in length, and 14m in width, widening slightly at the northeast end.
Figure 5: Detail from the 3rd edition six-inch Cassini Ordnance Survey map (1954), showing the current burial ground boundary in blue and the earlier pathways/routes in red dashed lines

Figure 6: Vertical aerial black and white image from 1974 (© Irish Defence Forces Archive)

An aerial photograph from 1974 is the earliest imagery of its kind to include the area of the burial ground (Figure 6). This image shows the position of the current Children’s Burial Ground as largely overgrown with a delineated area in what would now be the northeast part. An analysis of this area
shows that it equates to the area that is currently northeast of the central memorial and it possibly signifies a wall, hedge or line of trees at this location in 1974 (Figure 7).

In 1999, the site was again covered by Ordnance Survey Ireland aerial photography. There is recent tree planting seen to the north of the burial ground boundary by this time, and the trees surrounding the burial ground are more mature.
The first colour aerial photography is from 2000 and appears to show ground works taking place along the line of the current sewage pipe to the north of the burial ground (Figure 9). This is likely to be in relation to the redirecting of sewage services discussed in Section 8. The boundary kerb denoting the southwestern boundary of the burial ground is also clearly visible. An aerial image from 2003, Figure 10, shows little change except for building alterations to the Saoirse Day services centre (the former Hospital), as per the planning permission granted (see Section 8).
The most recent imagery from Ordnance Survey Ireland is from 2015 and shows no notable changes in recent years (Figure 11). However, it is the first visual indication, from aerial imagery, of memorials within the burial ground. Similarly, satellite imagery from 2009 – 2018, accessed on Google Earth, shows no significant alterations to the site under consideration here.

2.3 Receiving Environment

Prior to site investigations commencing, a full record was created. The site is an approximately rectangular area, 43m in length by 14-16m in width, widening to the northeast. It is accessed through an opening in the boundary at southwest (Plate 1). The fence comprises a block/concrete kerb with upright concrete posts. A chain-link fence joins each post. External to the fence are mature coniferous trees along the northwest, northeast and southeast (as seen in Figures 8-11). The interior is laid out as grass lawn (Figure 12).

Along the internal edges of the boundary, are small memorials, mostly surrounded by semi-circular arrangements of stone. There are 12 of these and four smaller memorials, but also a wooden sculpture in the south corner, a commemorative inscribed stone at the west corner, and a cross and plinth (referred to at the central memorial here). Two memorials demarcate the postulated burial locations of two women (Plate 2). These are shaded in yellow in Figure 13 and were not impacted by any investigation. An isolated memorial exists at the furthest north corner, while all others are southwest of the central memorial. The central memorial cross, Plate 2, is of concrete construction, surrounded by a plinth approximately 2m x 2m, finished with loose gravel. Bedded plants are located at the north corner and the western corner.

Plate 2: A memorial cross for one of two adults from northwest (left) and central memorial from southeast (right)
3. Geophysical Survey

A geophysical survey was undertaken on the 23rd and 24th of January 2019. The results of this survey were provided in draft form on the 5th of February to permit excavation preparation. These results indicated anomalies that would require further, more intrusive, investigation or ‘ground truthing’ to determine their nature.

The survey results may be summarised as follows (Carrick Utsi and Birtwistle, 2019 Appendix C):

The site is characterised by large areas of disturbance, consistent with burials having taken place over a length of time. There is signal patterning in the vertical sections consistent with the presence of coffin remains both of child and adult proportions, although it should be understood that this patterning might potentially also be produced by other subsurface features, particularly in the case of smaller burials.

The evidence for these burials comes in the form of the potential outlines of pits and horizontal patterning at depths close to the surface. The survey results indicate that burials are near the surface, within 40cm of ground level, with no burials evident in the survey results over 1.1m in depth. There is also evidence of stone inclusions and potential field drains. Taken together these results indicate the presence of mass burials or mass graves as well as individual graves over an undetermined period.

At the north of the site the magnetometry survey produced a strongly responsive linear anomaly, stronger than any other feature on the site. This feature can also be seen in the Ground Penetrating Radar (GPR) results for the area and forms a subsurface curvilinear feature. Also, in this northern area the Geophysical survey results interpreted a subsurface rectangular structure with footings close to the central cross.

A ceramic pipe whose outlet can been seen in the south bank of the stream was traced westward by the geophysicists using a cable avoidance tool (CAT) and signal generator (genny) and a flexitrace. The trace could go no further than 14m along the pipe indicating a blockage. The pipe was seen to transect the south eastern boundary of the current burial ground. The GPR data indicates the presence of an anomaly at the entrance to the burial ground and this was offered as a potential reason that it was not possible to insert the flexitrace any further along the pipe.
4. Methodology

4.1 Forensic Archaeology & Test Excavation

The investigative strategy that was utilised here is what is termed a ‘test excavation’ approach. The aim is that both principal matters (Section 1.2) requiring investigation by the Commission are addressed while excavating only a sample of the site. This ensures the majority of the site remains undisturbed and available for future investigation if required. However, the strategic placement of test trenches provides insight into the stratigraphic nature of the site and allows relevant evidence to be recovered. This method allows for the investigative goals to be pursued with minimal disturbance to the burial ground and therefore mitigating any unnecessary disturbance to burials.

The methodology proposed is designed to specifically address the two principle matters requiring investigation as requested by the MBHCOI (see Section 1.2). It must be noted, however, that there are limitations associated with this approach. The fact that it is a test excavation and not a complete excavation of the entire burial ground, is the principle limitation. The evidence and stratigraphy that remains within the unexcavated portion of the site (90%) may only be inferred and does not provide a conclusive base line. Consequently, projecting an overall assessment of burial practices at this location and on the analysis of any human skeletal remains uncovered, would be to assume homogeneity across the site. How representative this investigated portion is, within the entire burial ground, will be an open question and, as such, introduces an unavoidable potential bias to the analysis. Any demographic profile of skeletal material recovered during this investigation relates only to those remains identified, and samples recovered, from excavation. The skeletal remains of other individuals, possibly of other age groups, in greater or lesser quantities, may be contained within the areas of the site not covered by this test excavation.

4.2 Trench Location

The selection of exact trench location is based primarily upon historical mapping, aerial imagery, and the results of geophysical survey (Carrick Utsi and Birtwistle, 2019). The trench design required a level of flexibility that would be influenced by initial findings, the preservation of existing memorials, and adverse weather conditions as the excavation proceeded. The purpose of the trench design was to: a) determine if there were skeletal remains across a sample coverage of the site; b) if there were skeletal remains or burials that had been impacted by the insertion of a utility pipe that was identified during geophysics; and c) to determine if there was a drainage system across the site and what relationship this had to potential burials on site.

The trench design proposed consisted of seven trenches, 0.60m to 1.5m in width, and of varying lengths from 2.6m to 20m, see Figure 14. These trenches were inserted in areas where anomalies were identified by the geophysical survey. The result was a total excavation area of 78 m², or 9.91% of the current available area within the site boundary.

Initially, a trench had been placed outside the current north-western boundary of the burial ground to determine if human remains or burials extended beyond present day limits. However, this area is
now under separate ownership and was not covered by the MBHCOI warrant and so was excluded in the course of investigation.

Figure 14: Test trench locations
4.3 Excavation Methodology

The trenches were initially opened using a track machine. This was fitted with a grading bucket to remove the sterile overburden. This removal of overburden was monitored by archaeological personnel. Once significant strata or anomalies were encountered all mechanised excavation ceased and excavation proceeded manually.

In adherence with best practice, manual archaeological excavation conformed to the Museum of London Archaeological Standards (MoLAS), the Codes of Practice of the Institute of Archaeologists of Ireland (IAI), and the Chartered Institute for Archaeologists (CiFA) Standard and Guidance for Forensic Archaeologists (2014). This necessitated the use of single context archaeological recording, through written description, scaled photographs, and surveyed drawings. The written descriptions of soils, scaled photography, and scaled section and plan drawings (at 1:10 and 1:20) were archived by register on site, a practice referred to as preservation-by-record.

The site was recorded through drone aerial photography before, during, and after the excavation. This allows for a surface model of the site to be maintained at each stage. Furthermore, each trench was digitally recorded through photogrammetry.

The test trench approach should have minimum impact on the site while allowing relevant evidence to be recovered. This is a minimally invasive approach making the requirement for a full and comprehensive record an imperative to the results of the investigation.

4.3.1 Note on Health & Safety

The archaeological team maintained compliance with the Health and Safety at Work Acts (1989 to 2005) and the Construction Safety, Health and Welfare Regulations throughout this excavation. This consisted of a commitment to the safety, health, and welfare of all investigators while at work, as well as the health and safety of the public and persons not directly involved in the investigative works but that may be affected by its activities. A site-specific Safety Statement and Risk Assessment was distributed to all employees, supervisors, and administrative/office staff and was available at the location of work.

All those engaged on site held a valid Safety Pass and a commitment to adhere to the Safety Policy of the principle Contractor on a given site. Personal Protective Equipment (PPE) was issued to all staff.
5. Results of Excavation

5.1 Stratigraphic Evidence

The following section/chapter describes the stratigraphy found in each of the seven trenches, the order of events, and where features were evident. Traditionally, archaeological stratigraphy is detailed from the earliest deposits or strata, to the latest, within a given cutting or trench. Context numbers are attributed to each deposit, fill or layer and cut feature, and also to positive features such as walls etcetera. These context numbers are presented as matrices for each trench, detailing the rational development of the stratigraphy, or event timeline, of that trench, that is, the stratigraphic matrix. Each context is described here in terms of colour, compaction, composition and extent. A full register of contexts is presented in Appendix D.

The layout of the trenches discussed is given in Figure 14. Full excavation was not always realised, instead preserving burials in situ. Where burials could be avoided, the stratigraphy was investigated fully.

5.2 Trench 1

This trench was located to the southeast of the monument. Orientated northwest-southeast, it measured 5.75m in length and 1.5m in width. It was excavated to a maximum depth of 0.56m at the north-western end, but elsewhere had an average depth of 0.29m.

The stratigraphic matrix is shown in Figure 15. The earliest layers encountered were those of natural subsoils. At the southern part of the trench, a band of compact grey sand and stone was exposed (C.3). This was found to be at least 0.28m in thickness where tested at southwest. Two burials were found directly on this layer (SK01 and SK02). The subsoil (C.3) was covered by a yellowish grey sandy clay at south (C.13) and a mottled grey clay to the north (C.4). Both are natural subsoil layers which were
The mottled grey clay (C.4) appeared to extend northwards where it was recorded as context 7 (Figure 16).

A remnant of a disused sod-line/surface was identified at the northern end of the trench directly above C.7. This comprised dark greyish brown silt (C.15). This was preserved beneath an introduced deposit at the northern end, where the natural slope is to the north-northwest (see Figure 17). The introduced
deposit was soft orangish brown silt loam, with frequent fine pebbles, exposed at the northernmost 1.53m of the trench (C.8). This material was archaeologically sterile, up to 0.44m in thickness, but a

Figure 17: Northeast-facing section of Trench 1 (A1-A2) and profile B1-B-2 as indicated in Figure 16
A burial was found to have been inserted into the top of this deposit (SK03). It was also found to include lenses of redeposited natural clays and darkened soils (C.8a). On examination these lenses indicated disturbance caused by root-activity, with a tree-bowl likely positioned at the northern corner of the trench (see Figure 18).

![Figure 18: Southeast-facing section of Trench 1 (C1-C2 as indicated in Figure 16)](image)

The stratigraphy here reveals that subsequent to the introduction of the latter deposit, a linear cut feature was created, crossing the trench roughly northeast-southwest (C.12). A length of 0.53m was excavated at the southwestern side. The linear was 0.27m in depth, 1.28m in width at the top, and 0.34m in width at the base, forming a roughly U-shaped profile, with moderately sloped sides and irregular base. It was filled with soft greyish brown silt with moderate inclusions of stones and pebbles (C.5). The base of this fill indicated that the orangish brown silt to the north (C.8) had initially washed-in before the main silting-up occurred. The distinctive fill was traced across the trench for a length of 1.49m. No burials were identified within the fill C.5.

Three burials were identified within this trench (SK01, SK02 and SK03). In all instances, no distinct grave deposit or cut could be identified surrounding the skeletal remains, but all remains were in situ and associated with coffin material (i.e. metal nails and timber). All three burials are of limited depth in relation to the current surface; 24cm, 21cm and 26cm respectively (see Figure 17 Profile B). The burial at northwest (SK03) was aligned southwest-northeast, while the others were perpendicular, orientated southeast-northwest. Burials are discussed further in Section 6.

Two further deposits were identified in the southern half of the trench. These both proved to be formed by stone sockets - brownish grey sandy silt (C.2) and brown sandy silt (C.6). They may indicate previous ground works to this level.

The entire trench was covered by a surface layer of topsoil (C.1). This is soft dark greyish brown silt loam with very occasional fine-medium sub-angular pebbles. It is 0.08-0.14m in thickness and contained no disarticulated human remains.
5.3 Trench 2

Trench 2 was situated at the north-eastern end of the site, orientated northeast-southwest. It extended from the base of the monument to the boundary at northeast. Therefore, it covered a line from the central monument for 12m (Trench 2a), it was then offset (and overlapped) to the northwest for the remaining 5.65m (Trench 2b). This was to maintain a centreline cross-section and to address concerns of testing a single, potentially misrepresentative line. Therefore, it measured 16.9m in total length and 1.55m in width. It was excavated to a maximum depth of 1.2m at the north-eastern end.

The stratigraphic matrix from Trench 2 is shown in Figure 19. The earliest layers encountered were those of natural subsoils. Here the lowest layer encountered was firm whitish grey clay (C.35). This was consistently found beneath the water-table level during excavation. A short section of this clay was exposed at southwest, while approximately 6m from the monument, this layer was identified at the base of the trench (Figure 20). Another consistent natural layer was that of peat (C.11), formed directly on top of the grey clay. It was firm, very dark brownish black fibrous peat (C.11), 0.24-0.52m in thickness (Figure 21). The surface of this peat had likely been the original surface for a considerable period.

Directly on the peat surface, the collapsed remains of a drystone wall were found to traverse the trench northwest-southeast, 5.51m from the south-western end of the trench (Figure 21). This comprised largely rounded grey sandstone rubble, up to 0.55m x 0.38m x 0.2m in size (C.34), set as a drystone wall. No coursing or faces were evident, and it was found in a collapsed state, 2.13m in width and 0.28-0.38m in height.

At the northeastern end of the trench, a layer of compact mottled brownish grey gravelly coarse sand (C.47) was identified directly over the peat layer. This was an intermittent deposit of gravelly sand, up to 3.7m in length and averaging 0.08m in thickness (Figure 21 and 22).

The above described deposits were all preserved beneath an introduced deposit of soft mid-orangish brown coarse sandy clay (C.10). This was found universally across the trench and ranged from 0.16m
Figure 20: Trench 2 plan drawing (left) and photogrammetric plan view with water logging at base of trench (right)
Figure 21: Northwest-facing section of Trench 2 (A1-A2) as indicated in Figure 20
to 0.35m in thickness (Figures 20 - 22). It contained frequent fine and medium pebbles but was archaeologically sterile. Such a homogeneous layer is suggestive of land reclamation.

Three burials were identified at the south-western end of Trench 2 (Figure 20). All are inserted into the aforementioned layer C.10. The first is 1.47m from the southwest end and is orientated southeast-northwest and comprises articulated skeletal remains and evidence of in situ coffin timbers (SK04). These remains are contained within a sub-rectangular grave fill (C.38), 0.5m in length by 0.28m in width, and 0.27m below current ground level. The fill deposit is very soft mid greyish brown clayey silt with occasional inclusions of medium rounded pebbles (C.38).

At 1.63m further northeast, burial SK05 was identified as in situ articulated skeletal remains. These remains are orientated southwest-northeast and associated with metal nails indicative of coffin use. The grave cut is highlighted by a sub-rectangular deposit of very soft reddish-brown clayey silt with moderate inclusions of sub-angular and sub-rounded pebbles (C.39). This is 0.58m in length by 0.35m in width and the burial is 0.36m below current ground level. At the northeast end of the deposit, one small shard of glass was noted.

Less than 0.1m north of SK05, and with the same orientation but with the head to the northeast, is SK06. This consists of in situ human remains and associated coffin materials (i.e. metal nails and timber). A surrounding grave fill of very soft dark brown silt with medium rounded pebbles and very occasional charcoal flecks (C.40) defines a sub-rectangular cut, 0.65m in length by 0.29m in width. This burial occurs at 0.3m below current ground level. This burial, SK06, is the northernmost grave identified during testing, 0.92m southeast of the wall C.34 and over 12m southeast of the end boundary.

These burials are discussed further in Section 6 and have not been excavated and remain in situ.

A potential grave deposit was identified to the west of, and possibly cut by, both C.39/SK05 and C.40/SK06. This comprises an area, 0.68m in length by 0.38m, of soft mottled reddish-brown/dark brown silt with frequent small pieces of peat (C.45). This was excavated to 0.32m below current ground level and no skeletal remains were identified. It does not continue to the southeast of C.39 and if a grave, it is of similar orientation to that of SK04.
At the northeast end of the trench a layer of loose grey gravelly sand (C.42) was found directly over the extensive orange layer C.10 (Figures 21 and 22). This extended southwest for up to 1.9m, was the full width of the trench, and up to 0.2m in thickness. This homogeneous and sterile deposit was probably part of a path. A deposit of very soft dark greyish brown sandy silt (C.41) is directly over the previous layer at the north-eastern end of the trench. It extends 0.62m to the southwest and is 0.27m in thickness, shallowing to the southwest. The sandy component within this deposit is likely the result of disturbance of the underlying layer C.42 and the deposit is possibly a disused flowerbed.

The entire trench was covered by a surface layer of topsoil (C.9). This is soft dark greyish brown silt loam with occasional fine-medium pebbles. It is 0.15m in thickness and contains no disarticulated human remains.

5.4 Trench 3

Trench 3 was located at the southern corner of the site, with an approximate north northeast – south southeast orientation. It extended from the boundary corner northwards for a length of 5.75m. It measured 1.6m in width and was excavated to a maximum depth of 0.93m at the southern end, where a ceramic waste-water pipe had been inserted.
Figure 24: West-facing section of Trench 3 (A1-A2) and South-facing section (B1-B2) as indicated in Figure 25
The stratigraphic matrix for Trench 3 is shown in Figure 23. The earliest layers encountered were those of natural subsoils. At the southern end, the lowest layer is firm greyish-yellow clay (C.61), into which a pipe trench has been cut. At the northern end, a comparable natural subsoil was identified, a stiff whitish grey sandy clay (C.49). At the southern end, this clay subsoil is covered by a layer of depleted peat (C.44). At the northern end the clay subsoil is covered by soft greyish-brown sandy silt (C.60), 0.05m in thickness, over which a depleted peat layer (C.57) was identified and this was up to 0.18m in thickness (Figure 24, A1-A2).

At the northern end, a sterile deposit of soft yellowish-brown (i.e. orange) clayey silt (C.36) was directly over the depleted peat. Although up to 0.15m in thickness, it dissipated to the southeast. It seemed to extend to the north and west beyond the limits of the trench and is a likely redeposited subsoil used in land reclamation. A thin deposit of loose grey coarse sand (C.53), 0.05m in thickness, was confined to the northwest corner of the trench – 0.47m x 0.3m in extent – but like C.36, appears to extend beyond the trench in this direction.

An extensive deposit of firm yellowish-brown silty clay with frequent medium pebbles (C.43) was found across the northern part of the trench (Figure 24, B1-B2). This is a redeposited natural subsoil with very occasional sherds of terracotta ceramics. It is 0.22m in thickness and overlies the clay and gravel ‘build-up’ layers at the north (C.36 and C.53). The deposit is clearly truncated 2.3m from the southern end of the trench (Figure 25). This is a moderately sloped edge (C.55) of a presumably linear cut, the depth and width of which remain unknown. The edge is orientated northeast-southwest, and the cut is filled by material into which burials have been inserted (i.e. C.48). No corresponding south-eastern edge was identified within the trench. At the southern end of the trench, above the depleted peat layer, a firm dark reddish-brown silt (C.56) is 0.18m in thickness. Where excavated, this deposit presented as a sterile silting layer, possibly owing to stagnant water, and could be seen to extend beyond the southern end of the trench (Figure 24, A1-A2).

One extensive deposit C.48 was found throughout the trench. This is a soft mid-dark brown sandy silt with frequent sub-rounded fine/medium pebbles and much effected by root activity. It is up to 0.29m in thickness, although just 0.06m in thickness at the northern end. It may have been introduced to level the linear ditch or gully created by the cut C.55.

A pipe trench was inserted at the southern end of the trench. This was orientated west northwest – east southeast and exposed for a length of 0.32m (C.51). The pipe trench was 0.5m in width at the base and likely greater than 0.75m in width at the top, with steep to vertical sides (Figure 24, A1-A2). The base was 0.93m below current ground level. A six-inch salt-glazed clay pipe was set on a concrete footing at the base (C.52). It is not central but displaced within the trench slightly to north (Figure 25). The concrete footing was 0.12m in thickness and sloped away from the pipe to either side. It functioned to maintain the gravity fall of the pipe and is suggestive of ‘soft’ ground elsewhere at the base of the pipe trench. The fill directly over the pipe comprised large loose stone, up to 0.18m x 0.11m x 0.1m, in a matrix of soft greyish brown silt (C.54); this was 0.33m in thickness. Soft greyish brown sandy silt with frequent fine angular pebbles (C.58) was backfilled over the stone deposit. This was 0.36m in thickness and the sides of the cut (C.51) were still well-defined at the base of this fill. However, as the edges of the cut rise they become more indistinct due to the similarity with surrounding layers. A redeposited natural clay (C.59) was then backfilled into the pipe trench. This was
soft mottled yellowish-brown sandy clay with angular pebbles, 0.15m in thickness. The final fill of the pipe trench comprised what was likely topsoil material at the time the trench was created.

This is effectively a redeposited C.48, termed C.48b, almost the same but with a slightly greyish hue. The edges of the trench cut (C.51) were largely undisguisable at this level but C.48 could not have been
entirely deposited prior to the insertion of the trench (as evidenced by C.58/C.59). Therefore, the surface material at the time of pipe-laying was C.48.

All burials identified within Trench 3 were inserted into layer C.48/C.48b. A total of 10 burials were recorded. Two instances of skeletal remains, SK07 and SK08, were partially above the pipe trench, but remained articulated and in situ. They are likely the same individual with cranial fragments to the northwest and lower limbs at southeast (the number ‘SK08’ was subsequently discarded and the individual is hereafter only referred to as ‘SK07’), total length circa. 0.47m (Figure 25). There is much subsidence at this location, again suggestive of trench fill C.48b, and nails indicate coffin-use, but no coffin timber is evident. This burial is 0.44m below ground level.

A sondage, a test trench within a trench, along the western side of the trench exposed burials SK09 and SK10. Notably, SK07, SK09, and SK10, all have northwest-southeast orientations, are at similar depths, with heads at the northwest and may suggest an organised row of burials (Figure 25). Burial SK011, orientated south-north, may also have been partially above the pipe cut, and remained in situ. Burial SK12 is mostly represented by the flexed lower limbs but appears orientated northwest-southeast, while the orientation of SK13 is difficult to determine. The latter is probably a burial, although it may be displaced from a nearby burial (e.g. SK11). Although no cut was evident at a centrally located burial, SK19, the soil here had multiple voids surrounding the remains, an area approximately 0.55m in length by 0.26m in width, aligned northwest-southeast. There were several nails and very fragmentary timbers evident. A possible coffin timber at its western end and voids within the soil defined the grave area of in situ burial SK20. Several nails surrounding the remains were also indicative of a coffined burial within a cut, measuring circa. 0.73m in length by 0.25m in width, aligned southeast-northwest. In situ burial, SK21, was 0.3m further north, also aligned southeast-northwest. The general area of this burial measured 0.55m in length by 0.22m in width, and there was no evidence of a coffin. Burial SK22 was partially exposed and in situ, aligned southeast-northwest. Collectively, the orientations and positions of SK19, SK20, SK21 and SK22 may suggest another organised row of burials (Figure 25). These burials have not been excavated and remain in situ. Burials are discussed further in Section 6.

The entire trench was covered by a surface layer of topsoil (C.50). This was soft dark greyish brown silt with moderate fine-medium pebbles and frequent root activity. It was generally 0.15m in thickness and contained no disarticulated human remains.

5.5 Trench 4

Trench 4 was located at the western corner of the site, with an approximate northeast-southwest orientation. It extended a total length of 7.15m. It measured 0.6m in width for the westernmost 4m (to preserve a memorial-stone positioned here), after which the trench widened to 1.53m. The trench was excavated to a maximum depth of 0.54m.

The stratigraphic matrix for Trench 4 is shown in Figure 26. The lowest layers encountered were those of natural subsoils. At the centre of the north-eastern part of the trench was firm light brownish yellow clay is a natural subsoil (C.32), only with slight disturbance by root activity. Associated with this is an
area of firm mid-brownish yellow clay (C.31) at the north-western side of the trench. This is a natural subsoil but with more root activity throughout. The roots had displaced some overlying peat through this clay. This overlying peat (C.33) occurs intermittently across the trench (Figure 27) and has formed above clay (C.31/32). It consists of firm dark reddish-brown fibrous peat. Likely a universal layer, the peat has been depleted by drainage and/or compaction and truncated by at least two instances of ploughing. The first probable plough furrows are evidenced by narrow (circa. 6cm) parallel linear features, orientated northwest-southeast. Several short lengths of these probable furrows, up to 0.28m, are found mid-trench (Plate 3). The second instance of ploughing activity appears to have occurred later and is discussed in sequence below.

Figure 26: Stratigraphic Matrix of Trench 4

Four skeletal records were applied to definite in situ burials with Trench 4. A further three recorded features were very likely in situ graves, and three more are likely to represent grave cuts/deposits – therefore, up to 10 burials and potential burials were identified within this trench.

At the northeast end of the trench, in situ but partially disturbed skeletal remains were identified (SK14). These remains appeared to have been rotated by overlying soil action, probably ploughing action (Figure 27). Disarticulated remains of infant lower limbs are found to the northeast and potentially originate from this individual. A devotional medal was found in close association with these remains (see Section 7.2) and there is no evidence of a coffin. This burial is orientated southwest-northeast. The grave fill, approximately 0.64m x 0.42m in extent, consisted of soft, mottled dark brown/yellowish-brown silty peat and occasional fine pebbles (C.29).
Figure 27: Trench 4 plan drawing (left) and photogrammetric plan view (right)
Adjacent to the latter burial, the end-plate and side-panel timbers of a coffin (SK15) were found in situ against the edge of the trench near the eastern corner (Figure 27). The northwest side-panel of the coffin was 0.38m in exposed length and the end-plate was 0.14m in exposed length. The grave cut was approximately 0.04m outside the coffin and may have truncated burial SK14. The grave fill (C.28) consisted of soft, mottled dark brown/mid reddish-brown silty peat with occasional pieces of peat and redeposits of natural clay (i.e. C.33 and C.32). This fill was 0.61m in exposed length by 0.18m in exposed width and occurs at 0.54m below ground level.

Located 0.3m southwest of the latter burial are the skeletal remains and coffin timbers of SK16. These remains were only exposed to a minimal extent to confirm an in situ burial. A coffin was present and represented by an end-plate at southwest (0.16m in length, 0.02m in thickness), and two pieces were laid horizontally on the top of the burial (Figure 27). The timber at the centre was likely part of the coffin lid (0.19m x 0.11m) and had traces of white paint over green paint. At the north-eastern end, the timber is found horizontal but the dimensions, 0.16m x 0.06m x 0.02m, are suggestive of a possible endplate for this coffin. Skeletal remains and the coffin indicate a south west-northeast burial. The grave was defined as a rectangular area of fill, 0.68m in length by 0.33m in exposed width. The fill comprised of very soft, yellowish/greyish-brown fine gravelly silt (C.27). The only inclusions appeared to be that of bone, timber and fine pebbles.

In situ burial SK17 had been heavily truncated by ploughing and only the left torso and left arm were represented. The right side appeared truncated, while the left ulna is reversed (proximal end to the distal end) indicating disturbance/rotation. These skeletal remains were positioned at the western side of the grave fill (C.26) orientated northeast-southwest. The fill formed a sub-rectangular area aligned almost north-south, 0.82m in length and 0.42m in width (Figure 27). The fill material was soft, yellowish/greyish-brown clayey silt with frequent fine pebbles and pieces of redeposited natural soil (i.e. C.32).

Along the north-western edge of the narrow part of the trench, a series of rectilinear deposits appeared to represent burials. At the southwest end of the trench, a rectangular deposit, 0.64m in exposed length by 0.27m in exposed width, consisted of soft yellowish-brown silty clay (C.21). This grave has been impacted by ploughing activity, particularly at the northeast end and the deposit was noted at a depth of 0.3m below current ground level (Figure 28, A1-A2). It was orientated northeast-southwest.

To the northeast, another rectangular deposit consisted of very soft yellowish-brown coarse sandy clay (C.22). This was 0.82m in length and 0.3m in exposed width, 0.45m from the burial to the southwest (Figure 27). It was also orientated northeast-southwest. The fill had frequent fine angular pebbles and a single piece of timber was exposed. This timber, centrally placed, had remnants of white paint and appeared to be a coffin lid. The north-western end of the burial was inserted through the peat layer and therefore well-defined as 0.31m in total width. The grave had been impacted by ploughing activity, particularly at the southwest end. The deposit was excavated to 0.42m below ground level – where the coffin timber was found – but the grave fill (C.22) was 0.24m below the surface at the northeast end.

Separated by the peat layer, 0.24m further to the northeast another rectangular deposit was found (Figure 27). This comprised very soft, yellowish grey coarse sandy clay with frequent pebbles (C.23). It
Figure 28: Southeast-facing section of Trench 4 (A1-A2), northeast-facing section (B1-B2) and southwest-facing section (C1-C2) as indicated in Figure 27
was orientated northeast-southwest and measured 0.73m in total length and 0.3m in exposed width. The north-eastern end was disturbed by ploughing and/or root activity. The deposit was excavated to 0.38m below ground level but the grave fill (C.23) was encountered 0.28m below the current surface.

Immediately to the north was another regular deposit/fill with a suggested orientation of north-south (Figure 27). A limited portion of this material was exposed within the trench, measuring 0.24m north-south by 0.14m, and was separated from C.23 by undisturbed peat (Figure 28, A1-A2). The material consisted of very soft, greyish-yellow coarse sandy clay with fine pebbles (C.24). The southern end was disturbed by ploughing/root activity. Therefore, the upper surface of the probable grave fill undulated from 0.27m to 0.38m below current ground level.

Where the trench widened to 1.53m, a probable grave was identified as C.25 (Figure 27). This was a sub-rectangular fill/deposit extending beyond the south-western trench edge at this location. The material consisted of very soft, greyish-yellow sandy clay with some silt, fine pebbles and occasional timber. The exposed portion measured 0.5m in length and 0.36m in width, orientated northeast-southwest. The centre of the fill had voids within and a sizable piece of timber, 0.1m in length and 0.02m in width was orientated northeast-southwest at the side of the deposit. This was likely a part of a side-panel of a coffin. The grave was cut through the peat layer at east and the fill truncated by ploughing activity (Figure 28, B1-B2). The upper surface of the remaining grave deposit was between 0.33m and 0.4m below the current ground level.

Finally, a rectangular deposit was identified at the northeast end of Trench 4. This was not exposed in its entirety but measured 0.49m in length and has an exposed width of 0.15m (Figure 27). It was orientated northwest-southeast. Notably, this was smaller and of different orientation than other burials within the trench. The potential grave fill was firm, yellowish-brown clay, containing voids, and with inclusions of metal nails (C.30). The shape of the deposit and presence of nails was suggestive of a coffined burial. The upper portion of this grave cut was truncated, most likely by later ploughing activity, but had been inserted through an introduced layer, C.18, and into the underlying natural subsoils (Figure 28, C1-C2).

These burials have not been excavated and remain in situ. Burials are discussed further in Section 6.

The introduced layer mentioned above, C.18, was not apparent throughout the trench. A small area of this material was identified in the southern corner of the wide part of the trench, above the peat layer (Figure 28, B1-B2). It was also intermittently identified in the north-easternmost 0.4m of the trench (Figure 27 and 28, C1-C2). This consisted of a firm-soft, yellowish-brown (orange) clayey silt (C.18). It had occasional inclusions of charcoal flecks and fine angular pebbles. It had a maximum thickness of 0.15m. Although this potential layer had been heavily impacted by ploughing activity, it could be seen that burial SK15/C.28 was inserted through the introduced material, as was the potential burial C.30.

The main soil disturbance within Trench 4 was represented by an undulating deposit, that formed deep but indistinct linear traces, generally aligned north-south (C.17). These were created as a result of ploughing. There were at least five furrow-lines, and although poorly defined in places, they appear parallel. Three of these intersected the trench diagonally in the narrow south-western section (Figure 28, A1-A2). Two more plough furrows were found in the wider part of the trench (Figures 27 and 28,
B1-B2/C1-C2). The result of this activity was the formation of C.17, soft, mottled dark greyish-brown clayey silt, with frequent inclusions of pebbles and occasionally disarticulated human bone. It was not clear whether the plough traversed the area one or more times or whether the direction of ploughing was consistent. However, the predominant orientation was north-south. The large central furrow truncated burial SK17/C.26 and probable grave C.25. Furthermore, the disarticulated lower limb bones north of SK14, potentially originated from that burial - a burial which showed evidence of rotation of the skeletal remains - again indicating a north-south soil movement. The thickness of the plough layer varied from 0.07m to 0.34m in thickness. The disarticulated skeletal remains from this deposit are discussed further in Section 6.

A curvilinear deposit of very soft dark brownish-grey silt (C.19) extended from the north, arcing to the southwest, where it terminated. A length of 1.2m was evident within the trench. This was 0.33m in width and up to 0.11m in thickness. It had formed in a depression with concave sides and a rounded base (Figure 28, A1-A2). It was not deemed a cut feature, but more likely caused by the impression of a tree-limb, or similarly curving object, in the soft plough-soil, which was subsequently removed. The depression silted-up with the finer particles of the surrounding soil, i.e. C.19, and contained no items of interest.

The entire trench was covered by a surface layer of topsoil (C.16). This was soft dark brown silt with moderate fine-medium pebbles. It was generally 0.15m in thickness and contained no disarticulated human remains.

5.6 Trench 5
Trench 5 was located at the northern side of the central monument, between Trench 2 and Trench 6. It was therefore orientated northeast-southwest and was a total length of 2.85m. It measured 0.6m in width and was excavated to a maximum depth of 0.7m.

The stratigraphic matrix for Trench 5 in shown in Figure 29. At the time of excavation, the water-table within this trench was approximately 0.6m below the ground surface. A sump or sondage for drainage purposes was created in the north corner at a location clear of burials (Figure 30). Here, the lowest natural subsoil was clay, but this was almost continuously beneath the water-table and therefore not recorded in detail. The peat layer (C.100), as found in Trenches 2 and 6, was also identified here as a universal natural subsoil. It comprised firm, dark brown fibrous peat with silty inclusions at the interface and was identified at the south of the trench, in the sides of the central cut, and within the sondage at north.

A layer of soft, reddish/yellowish-brown (orange) clayey silt with occasional pebbles (C.99) was identified at the northeast and southwest of the trench (Figure 31). This was up to 0.5m in thickness but more usually 0.3m in thickness and overlay peat. Correlating to C.8, C.10 and C.79 – in Trenches 1, 2 and 6 – this appeared to be a sterile redeposited natural subsoil, introduced from elsewhere.
Figure 29: Stratigraphic Matrix for Trench 5

Figure 30: Trench 5 plan drawing (left) and photogrammetric plan view (right)
Three burials were identified within the trench, although no articulated skeletal remains were exposed. An infant humerus was found alongside a substantial fragment of coffin lid (SK18) at the southwest. The coffin lid, orientated southwest-northeast, measured 0.4m in exposed length by 0.17m in exposed width. The upper surface of the coffin lid appeared to have been painted white and a metal nail was positioned 0.04m to the southeast of the timber. This was cut though the introduced layer, but the fill of the grave was largely indistinguishable from that layer except that it was softer in compaction (C.101). The coffin lid was 0.45m below current ground level.

Occupying much of the trench was a portion of a large burial pit (C.46). The western edge of this pit was identified and is 1.3m in length. From the north corner, the pit extended 0.7m east-southeast, and the entire feature continued beyond the limit of the trench to east (Figure 30). Therefore, this cut was rectangular, or sub-rectangular, in plan with rounded corners and steep, near vertical, sides (C.46). The base of the pit cut was not excavated. At the northern side, a large part of a coffin lid was exposed, measuring 0.49m in exposed length by 0.23m in exposed width, and orientated northwest-southeast. Part of the grave fill was unexcavated to retain this fragile coffin timber in situ.

To the south, at approximately the same level, a second probable coffin timber was identified. This was also orientated northwest-southeast and measured 0.4m in exposed length and 0.1m in exposed width. Both coffin timbers extended further to east and had no indication of paint or other treatment. Both were approximately 0.66m below current ground level (Figure 30). Two further overlapping timbers, 0.19m and 0.2m in exposed length extended from the eastern trench edge further south. These were both more substantial in thickness than might be expected for coffin fragments (Figure 31). They may relate to the securing of the burial cut between interments and, once the pit was disused, they were deposited here. The base of the burial pit cut (C.46) was not reached during excavation, owing to the water-table and the fragility of the in situ coffins. The burial pit had filled with firm, dark brown sandy clay, mottled with pieces of peat, pebbles, and occasional timber fragments (C.37). This was up to 0.7m in thickness and occupied the entirety of the exposed burial pit. However, the uppermost fill of the pit was concrete (C.102). This was indurated/set, sand and gravel mix, 0.8m in length northeast-southwest, and extended further east beyond the trench edge. The concrete did not extend to the edges of the burial pit (C.46/C.37) and therefore should not be considered a contemporaneous sealing layer. Instead, it was likely positioned to counter later...
The burials identified have not been excavated and remain in situ. Burials are discussed further in Section 6.

The entire trench was covered by a surface layer of topsoil (C.98). This was very soft dark brown silt with occasional fine-medium pebbles. It varied from 0.12m–0.22m in thickness and contained no disarticulated human remains.

5.7 Trench 6

Trench 6 was located centrally within the southwest part of the burial ground. It was orientated northeast-southwest and extended from the central monument, for a length of 19.77m, towards Trench 7 (see Figure 14). The north-eastern part of the trench (9.55m) was 1.56m in width, while the south-western part was 0.6m in width. The trench was excavated to varying depths from 0.25m to 0.94m below ground level.

The stratigraphic matrix for Trench 6 in shown in Figure 32. The earliest deposits encountered in Trench 6 were those of natural subsoils. Natural clay subsoil was reached across a 6m length at the centre of the trench and intermittently through 2.5m at the southwestern end (Figure 33). This consisted of firm, light yellowish grey clay (C.97). This was consistently found below a layer of peat (C.96). This natural layer was firm, very dark brown fibrous peat with frequent pieces of wood and frequent disturbance by root activity. It was generally 0.3-0.5m below ground level and up to 0.35m in thickness (Figure 34).
Figure 33: Trench 6 plan drawing (left) and photogrammetric plan view (centre), with details of NE and SW ends enlarged (left)
Figure 34: Northwest-facing section of Trench 6 (A1-A2), as indicated in Figure 33
A layer of introduced clay was found across most of the trench, it lay directly on peat (C.79). This comprised soft to firm, mid brownish-yellow silty clay with occasional rounded pebbles. The surviving thickness of the layer varied, 0.14m-0.35m, and it extended 13m to the southwest. Here, about 6m from the southwest end, the layer terminated where there was evidence of substantial root activity into the peat layer below (Figure 34). Notably, although found across the mid-point of the trench it became intermittent along the south-eastern trench edge here, for about 3.3m. This was also the position at which the subsequent layer began (i.e. C.91). Approximately 14m from the southwest end, a layer of soft coarse silty sand, mottled dark grey to dark greyish-yellow in colour, extended to the southwest (C.91). This clearly overlay the introduced clay C.79, and had inclusions of lime mortar flecks, with a concentration of mortar where the trench narrowed, c.10m from the end (Figure 34). No ‘sod-line’ was evident where this layer and C.79 overlapped and several modern shards of pottery and glass were noted. It appeared that this deposit served the same function as that of the clay, raising up the ground level, albeit with a different source material. Although a stratigraphic relationship was evident, it is likely that both layers (C.79 and C.91) were broadly contemporaneous with one another. At the northern end of the trench, a discrete area of loose grey coarse sandy gravel (C.77) was found on the surface of C.79. This was 0.82m x 0.76m in extent and likely truncated by the drain to the north (C.80). This was probably path/surface material due to its orientation and composition.

A series of field drains were identified at Trench 6. Crossing the trench northwest-southeast, a drain was found (C.95) 1.8m from the southwest end (Figure 33). This had demonstrably cut through the build-up layer (C.91) and excavation ceased where the stone fill of the drain (C.75) was encountered (Figure 34). The cut was a linear feature, 0.53m in width at the top and 0.38m in width at the lowest level excavated (C.95). The sides were steep and slightly concave, and a depth of 0.37m was excavated. The basal fill appeared to comprise rounded stones – up to 0.18m x 0.16m x 0.8m – in a matrix of very soft dark brownish-grey silt (C.75). This fill was at least 0.18m in thickness. A secondary fill of soft dark brown silt with occasional pebbles and pieces of redeposited clay (C.93) completed the backfilled drain. This was about 0.3m in thickness and had been truncated by a grave cut (C.95) on the northeast side.

The greatest length of drain was witnessed in the northwest-facing section of Trench 6. This drain was not within the trench and was only represented by the stone fill material (C.92). Orientated northeast-southwest, the stone-filled drain was measurable for an exposed length of 3.36m and this portion is between 0.17m and 0.41m in thickness (Figure 34). The drain fill was loose rounded and sub-angular stone – up to 0.2m x 0.15m x 0.1m in size – in a matrix of yellowish-brown silt (C.92). The drain had cut through the silty-clay build-up layer (C.79). The upper parts of the sides of the drain retained this material, which occasionally fell away exposing the stone fill. At the southwest end, the line of the drain diverged from that of the trench. It did not appear to end here or change direction significantly. At the northeast end of the exposed drain, it likely continued to join drain C.80 but the juxtaposition of these alignments would place any such junction beyond the area of the trench.

Traversing the trench, northwest-southeast, and 1.2m from the north-eastern end of the trench, C.80 was a linear drain cut (Figure 33). It was 1.53m in exposed length and 0.55m in width at the top, although it did widen to 0.7m in places. It was 0.48m in depth with steep sides that rounded or stepped to a rounded base, giving a general U-shaped profile (Figure 34). This had been filled with loose rounded or sub-rounded stone in a matrix of yellowish-brown silt (C.78). The silt component of the fill
was likely derived from the surrounding orange clay, C.79. There were stark similarities between this drain (C.80) and that perpendicular to the southwest (C.92), in terms of fill but also the base levels of the drains. Therefore, although any stratigraphic relationship was beyond the limits of the trench, these drains are likely contemporaneous with one another.

A cross-section of drain C.80 was excavated at the southeast end of the exposed portion. This was potentially a misrepresentative part of the drain, as it seemed to have been truncated by a pit cut (C.103). The pit was inserted creating an edge aligned northeast-southwest, 0.22m from the trench edge on this side. A 0.37m length of this upper edge of the pit survived with a vertical side to a flat base (C.103). The base extended into the area of the drain C.80 and an arc of the corner of this postulated pit was visible at the base of the drain (Figure 33). Should this be the case then a 0.75m length of the base was evident. It is plausible that once the pit truncated the drain it was abandoned and backfilled. The backfill material was firm mid yellowish-brown silty clay with frequent large pebbles (C.104). The drain fill, i.e. stone, may then have been reinstated along the line of the drain. Alternatively, the pit was created and backfilled prior to the drain being implemented. However, the pit contained no evidence of use and unless it was a section of drain excavated in error, the interpretation presented here is most likely. The backfill material (C.104) was truncated by the insertion of a burial at the north-eastern side (C.86).

A single burial occurred within Trench 6 where skeletal remains were partially exposed (SK23). These remains were abutting the south-eastern trench edge where the drain, C.95/75, traversed the trench. The remains were within a rectangular grave cut (C.94) orientated northeast-southwest and measured 0.82m by an exposed width of up to 0.24m. The northern end was well defined with a sharp right-angled corner (Figure 33). The sides were moderately steep concave and the base was not exposed. It was evident that the skeletal remains at southwest end were higher and positioned over the drain fill, C.75 (Figure 34). Here, the depth of the remains from the top of the grave cut was 0.3m, while further north the skeletal elements were 0.37m from the top. The cranial remains were 0.48m below current ground level. The grave cut (C.94) also truncated the upper fill of the drain (C.93) in addition to the grey sandy layer (C.91). These stratigraphic relationships indicated that the burial post-dated the stone-filled drain. Hydraulic action surrounding the drain appeared to have impacted the positioning of skeletal remains at this end. Similarly, although two metal nails were identified at the southwest end and two more at the northeast end, no coffin timbers survived. The grave was filled with very soft, dark brown silt with frequent fine pebbles and occasional pieces of yellow clay (C.76). Further details on this burial are given in Section 6.

A further five burials were evident at the north-eastern end of Trench 6. Although no skeletal remains were exposed, each of the five burials were indicated by coffins (Figure 33). Three of these were identified at the eastern corner. The earliest of these was represented by a presumed coffin timber – probable lid – within a partially exposed sub-rectangular pit (C.87). The pit was truncated but a short length (c. 0.2m) of the northwest side was preserved, as was part of the southwest edge, 0.27m in length. What survived of the burial pit showed it had vertical sides, and the cut was at least 0.5m in length by 0.27m and a minimum of 0.43m in depth. The coffin timber extended into the northeast and southeast trench edge but the portion exposed measured approximately 0.15m x 0.12m. It was difficult to assign an exact orientation to the potential coffin. The coffin timber was within grave fill, soft mottled brown silty clay with frequent redeposited reddish-brown clays and pieces of peat (C.88).
The exact edge of this grave fill material was defined only at the lowest levels (Figure 34). This burial was 0.65m below current ground level.

A sizable burial pit truncated the latter grave. This pit cut extended to the northwest and was only partially exposed within the trench (Figure 33). The exposed portion measured at least 0.88m in length by 0.35m in exposed width, and 0.36m in depth (C.89). The western corner was rounded, and the sides were near vertical to a flat base, as found at the western part. The centre of the pit was occupied by a coffin, the upper edges of which were 0.15m above the adjacent base to northwest. The coffin extended beyond the limits of the trench to northeast and was orientated northeast-southwest. Three timbers were evident; two side panels and an end-plate. The southeast side and the end-plate were in a vertical position and together with the northwest side panel defined a coffin, 0.18m in width and at least 0.25m in length. The coffin lid was not evident, and the timber used was approximately 15mm in thickness. The upper edges of the coffin were 0.45m below the current ground surface. This was maintained on a pedestal of grave fill (C.90). The fill material was soft mid reddish-brown silt clay with occasional peat inclusions. It filled the entire area of the pit, even where no burials were identified.

As previously mentioned, a burial intersected/truncated the backfilled pit, C.104 (Figure 34). This burial (C.86) truncated the fill to the north (C.88), and therefore post-dated the latter. The grave was orientated northwest-southeast and only 0.3m of the north-western end was exposed within the trench (Figure 33). The near vertical sides defined the cut as 0.41m in width, although it did splay towards the top of the northern side. The base was not reached due to three in situ coffin timbers. These represented the side panels and end-plate of a coffin that had collapsed outwards. The coffin lid was not evident but may have degraded into the central void. The endplate measured approximately 0.2m in length by 0.06m in width, the northern side panel was exposed to 0.22m in length by 0.05m and the southern side panel was exposed to 0.20 in length by 0.06m. Each timber was 16mm in thickness and both side panels extended beyond the edge of the trench. The grave fill was firm reddish-brown silty clay, mottled with peat, and at least 0.39m in thickness (C.86). The uppermost edge of the northern coffin timber was 0.28m below the upper edge of the cut, and 0.54m below current ground level.

On the opposite side of the trench a substantial pit cut was identified (C.83). This appears to have been sub-rectangular, orientated north-south (Figure 33). The eastern edge was slightly irregular and exposed for a length of 1.06m. The southern edge of the pit cut was largely defined by coffin timbers and a length of 0.42m was exposed. The corner here was rounded and the sides steep/concave but only a limited amount of the sides was excavated, 0.07m. It was not deemed necessary to excavate the entirety of the fill within the pit as the upper parts of a coffin were present at south. The coffin was orientated east-west and consisted of both the north and south parts of the coffin lid which had collapsed along the centreline. There was a void in fill material between these two timbers. The remnants of the coffin lid measure 0.25m x 0.05m and 0.34m x 0.03m, defining a coffin 0.17m in width by at least 0.35m in length. The coffin lid extended into the trench edge at west and is 0.44m below the current ground surface. The coffined burial rested within the burial fill, a soft reddish-brown silty clay, with occasional pebbles (C.84).

A final burial identified in Trench 6 was located 1m to the southwest of the latter, C.84. This grave consisted of a single coffin and associated grave fill (C.81) within a grave cut (C.82) orientated northeast-southwest (Figure 33). The cut was sub-rectangular, with rounded corners, and measured
0.54m in length by at least 0.22m (C.82). This was excavated to a depth of 0.02m at which point the coffin was exposed. The limited sides of the cut appeared to be vertical. The grave fill consisted of firm, dark reddish-brown silty clay (C.81). The coffin was represented by the partially exposed lid, measuring 0.44m in length by at least 0.18m, and the end-plate at northeast, measuring 0.12m in exposed length and 10mm in thickness. The centre of the coffin had subsided/slumped, and the upper edges of the coffin were 0.44m below current ground level. The burials discussed here have not been excavated and remain in situ.

The entire trench was covered by a surface layer of topsoil (C.74). This comprises very soft, dark greyish brown silt with occasional fine-medium pebbles. While occasionally it was up to 0.25m in thickness, it was generally found to be 0.16m in thickness and contained no disarticulated human remains.

5.8 Trench 7

Trench 7 was located at the southwest of the site and passed through the present entrance. It was orientated northeast-southwest and excavated for a total length of 6.4m. The trench was offset to the northwest half of the entrance and was 3.2m in either direction from the entrance posts. It measured 0.6m in width and was excavated to a maximum depth of 0.87m.

The stratigraphic matrix for Trench 7 is shown in Figure 35. The lowest natural subsoil encountered was firm brownish yellow clay, which is generally 0.8m below current ground level and exposed across a large part of the north-eastern half of the trench (Figure 36). A layer of natural peat overlay the clay. This was firm, dark reddish-brown to black fibrous peat with inclusions of silt, iron pan flecks and roots disturbance (C.70). This was exposed over a 5.45m length of the trench and excavated in the north-eastern half, where it was found to be up to 0.39m in thickness. These natural layers were archaeologically sterile. The water-table was found to fluctuate within these layers during excavation, between 0.8m and 0.6m below current ground level.

A substantial layer of soft brownish-grey gravelly silt (C.69) was excavated in the north-eastern 4.2m of the trench. It contained frequent inclusions of coarse sand, occasional large rounded pebbles – up to 0.07m x 0.05m x 0.04m in size – and an oyster shell and some glazed ceramics were recovered. It varied between 0.17m and 0.32m in thickness (Figure 37). This may be considered a series of lenses of gravelly deposits laid directly on the peat surface to build-up the ground level. At the northern end of the trench a soft, greyish brown silt (C.71) was above the latter. This was only evident in the northernmost 1.4m of the trench and reached a maximum thickness of 0.18m. Similar to this, was a deposit of very soft, dark brown silt, with moderate flecks of stone throughout (C.67). This commenced to the southeast of the entrance posts and was truncated by a pipe cut (C.64). It was evident for 1m in length and was up to 0.25m in thickness. Above both silty deposits was a layer of soft yellowish-brown clayey silt, with occasional patches of fine gravel (C.68). First noted at the centre of the trench, it dissipated before the northeast end, 3.25m in length (Figure 37). It was up to 0.16m in thickness and appeared to be similar to other clay build-up layers in surrounding Trenches 3, 4 and 6 (C.36, C.18 and C.79 respectively).
The northern side of a pipe trench truncated deposits C.67, C.69 and C.70. The linear cut (C.64), traversed the trench in east/southeast-west/northwest direction, and was 1.27 in width at the top, 0.75m in width at the base (Figure 36). The northern side was vertical while the southern side was stepped with moderate slope (Figure 37). The base, where excavated, was flat and the cut was a maximum 0.62m in depth (C.64). Within the cut lay a six-inch salt-glazed clay pipe (C.65). A collar at the connection of two pipe sections was stamped with a brand mark ‘H’ within a double concentric circle. The pipe was set as much as 0.07m off the base of the trench cut. The primary backfill material surrounding the pipe was of regularly placed rounded and sub-rounded stones – between 0.1m x 0.07m x 0.05m and 0.28m x 0.18m x 0.16m in size (C.63). Above and to the side of the pipe at southwest, the stones were larger and more angular. Only one large stone was noted to the northwest of the pipe and this had been dragged out of position by the machine during excavation (see Figure 36). These stones were within a matrix of very soft, dark greyish brown silt with occasional patches of lime mortar and angular pebbles (C.63). This backfill material (C.63) was the full width of the pipe trench at the base, but only filled the south-eastern half of the pipe trench to the top. It may be assumed that this material was backfilled from this side. A second fill material was deposited into the remaining void at the top of the pipe cut. This upper fill, confined to the northeast side, was yellowish-brown silty clay, of variable compaction, with occasional pieces of lime mortar (C.73). It spanned the full length of the exposed pipe-cut, 0.75m in width and 0.4m – 0.5m in thickness. This could have been backfilled from the north-eastern side.
Figure 36: Trench 7 plan drawing (left) and photogrammetric plan view (right)
Figure 37: Northwest-facing section of Trench 7 (A1-A2), as indicated in Figure 36
Sealing the pipe trench was an expansive layer of loose coarse sand, with frequent fine-medium pebbles (C.66). This varied in colour from yellowish-brown at south to grey at north and extended 4.85m from the southeast end of the trench. It was between 0.08m and 0.13m in thickness and was not fully excavated southeast of the pipe trench. Although a likely surface material, this deposit and all others were covered by a universal layer of topsoil. The topsoil (C.62) consisted of soft, mid-brown silt with moderate amounts of fine pebbles throughout. It was generally 0.11m in thickness, and less where gravelly sand C.66 was directly beneath, and it contained no human remains or other items of significance.
6. Human Remains: Evidence and Analysis

Evidence of burials was identified in all except one of the seven trenches excavated during this investigation. This exception was Trench 7, located at the current main entrance to the site. Human skeletal remains, all juvenile (<18 years old at time-of-death), were identified most typically associated with coffins. Other coffins were identified where the wooden surface was largely intact and, in those instances, no attempt was then made to expose the interiors: the logical assumption is that these are intact burials, and this is the assumption that will be made for the purposes of this report. In addition, where soil changes indicated the presence of other possible graves, none of these were examined further in order to minimise damage to any extant skeletal remains (see Section 5.5). Bone samples were selected from 12 of the identified burials with exposed skeletal remains and these samples were submitted for radiocarbon dating, along with one disarticulated human bone (see Section 7.1 for results and discussion). Apart from the bone samples for dating, no other skeletal remains were removed from the site. During the excavation, once skeletal remains were uncovered, the Osteoarchaeologist undertook minimal cleaning of the area to confirm, or otherwise, the presence of an in situ burial. This was then recorded in as much detail as possible, while ensuring minimal disturbance to any surviving skeletal remains. Disarticulated human skeletal remains were uncovered exclusively in Trench 4. Much of this bone was retrieved from excavated spoil, while some other bones were identified embedded, but in a disarticulated state, during hand excavation.

In general, the skeletal remains, particularly those from in situ graves, were in an excellent state of preservation. The exception was SK17 in Trench 4 where there was visible erosion of bones. This latter burial was truncated, which may have accelerated decomposition. The grave of SK03 in Trench 1 appeared to have also suffered some disturbance (involving collapse), apparently related to the presence of a tree-bowl in the immediate vicinity. In Trench 3 the skeletal remains from a number of burials, such as SK07 and SK19, were collapsing into voids, at least some of which were directly associated with a service trench for a waste-water pipe (C.51/C.52). Root activity was also significant in this latter trench. In comparison to the well-preserved bones in many of the burials, numerous disarticulated remains in Trench 4 had suffered erosion and were incomplete. Three cranial fragments and a long bone had breaks which occurred post-mortem, when the bones were still relatively fresh, that is, still containing much of the organic content (see Trench 4 below).

6.1 Methodology

As mentioned above, once the presence of an in situ burial was established no further excavation took place in that particular area. In addition, minimal bone was actually exposed in order to preserve the integrity of the preservation. The Osteoarchaeologist recorded in detail the exposed skeletal remains of any in situ individuals, with the primary focus being on establishing age-at-death. This was determined particularly from long bone lengths, based on the established standards (Scheuer et al. 1980, Scheuer and Black 2000, Schaefer et al. 2009). Only loose bones were measured: no embedded, or semi-embedded, bones were disturbed in order to obtain measurements. In some instances, for example SK03, the age-at-death was determined on the basis of the size of other skeletal elements, again using the aforementioned standards. The methods used are listed below with each individual
burial. In addition, the assessment of dental development and/or eruption was also utilised (after Moorrees et al. 1963a, Moorrees et al. 1963b), though less frequently. All assessible skeletal remains, both in in situ burials and in the disarticulated assemblage, were from individuals aged less than 1 year at the time of death, that is, infants. Measurements were taken using a Powerfix® electronic digital calipers and the measurements are provided in the details of the individual burials below and in the disarticulated catalogue in Appendix F. Osteological terms are provided in Appendix E. The term ‘juvenile’ refers to any individual who has not reached maturity in terms of skeletal and dental growth. An ‘infant’ is defined as any individual aged less than 1 year at the time of death. Very young infants may be divided into ‘pre-term’ (<37 foetal weeks) and ‘full-term’ (37-42 foetal weeks). The more general term ‘perinate’ refers to an individual aged anywhere between 24 foetal weeks and 7 postnatal days. ‘Neonate’ refers to an individual from birth to 28 days. These are based on paediatric definitions (Scheuer and Black 2000, 468). No individual aged greater than 1 year at the time of death was identified from the skeletal remains during the current investigation.

A single bone sample was taken for radiocarbon dating from each of 12 burials, along with a single disarticulated bone from Trench 4. These samples are detailed in Section 7.1.

All of the details recorded on the identified in situ burials is provided below, on a trench-by-trench basis. Disarticulated human remains were only present in Trench 4 and the assessment of those remains is provided in the section pertaining to Trench 4 below. The disarticulated bones were recorded by hand on-site and later compiled into a database. Most individual bones, and teeth where relevant, were allocated an individual identification or ‘ID’ number (nota bene no bone was physically marked during the process). However, in some instances, multiple fragments were grouped together (for example, ID1017 comprises six cranial vault fragments). A total of 78 individual entries (ID1001-1078) were recorded in the inventory, representing 128 individual fragments of bone or teeth.

The disarticulated inventory lists 13 individual fields. The unique identifier (‘ID’) is the first, followed by ‘Trench’, ‘Context’, and ‘Other Info’, with the latter pertaining to any other contextual information. The next field records whether a bone was recovered out of context or in situ. The actual ‘Bone’ is then recorded, followed by a simple relevant code (based on Chamberlain and Witkin 2000), and the ‘Side’. The age-at-death is recorded under three sections: ‘Age1’ identifies whether the remains are juvenile (‘JUV’, <18 years) or adult (‘AA’, 18+ years), ‘Age2’, specifies the general age group (in this instance, all remains were infant ‘INF’ or <1 year), while ‘Age3’ provides the specific age, if determined. The field ‘Details’ then allows a more detailed written record of the bone, while the number of fragments is also recorded.

6.2 In Situ Skeletal Remains

Skeletal remains were identified in six of the seven excavated trenches, the exception being Trench 7. Twenty-three skeleton numbers were allocated, running from SK01 through to SK23. Most of these represent individual in situ burials; however, this was not always the case. A summary of these initial 23 numbers is provided in Table 2. (more complete details of each burial are provided below). It must be iterated that further probable/possible coffins and/or grave cuts were identified in Trenches 2, 4,
5 and 6: however, as no skeletal remains were exposed, they are not examined in detail here (see Sections 5.3, 5.5 – 5.7).

6.3 Human Remains Trench 1

Three in situ burials were identified in Trench 1: SK01, SK02, and SK03. No disarticulated human remains were present in this trench. The first two burials were in graves which cut into the subsoil C.3, while the third burial was buried within C.8, a layer that had been introduced into the site.

SK01 Plates 4-6

The skeletal remains of this individual were visible within a wooden coffin. The burial was orientated southeast-northwest, with the head to the southeast. The remains were located 0.24m below current ground level. The individual appears to have been laid largely supine, with at least the right leg flexed to the left lateral. This suggests an approximate ‘foetal position’ with at least the lower legs turned onto the left side. The exposed bones included the sphenoid from the cranium, and the right humerus, ilium (from the hip), femur, tibia, and fibula. The exposed bones were in an excellent state of preservation. The right femur was selected for radiocarbon dating.

The age-at-death of this individual was estimated at 38.0+/-2.08 foetal weeks, based on the right femur.

Long bone measurements were recorded on the right femur (73.96mm) and the right humerus (65.42mm).
SK02 Plates 7-9

The skeletal remains of this individual were visible within a wooden coffin. The burial was orientated southeast-northwest, with the head to the southeast. The remains were located 0.21m below current ground level and were 0.54m from SK01. The individual appears to have been laid supine. There was some disturbance to the skeletal remains during excavation. The exposed bones included cranial remains, the right humerus, the femora, the left tibia, and a fibula. The exposed bones were in an excellent state of preservation. The right femur was selected for radiocarbon dating.

The age-at-death of this individual was estimated at 37.4+/-1.87 foetal weeks, based on the left femur and tibia.

Long bone measurements were recorded on the right femur (69.97mm), the left femur (70.11mm), and the left tibia (61.71mm).
SK03 Plates 10-11

The skeletal remains of this individual appear to be associated with a wooden coffin, although the remains were slightly out of alignment with the apparent/supposed line of the coffin. The burial was orientated southwest-northeast, with the head to the southwest, and were located 0.26m below current ground level and were 3.15m to the northwest of SK02. The individual appears to have been laid supine. It is possible that the burial suffered some disturbance due to the interpreted presence of a tree-bowl (C.8a), immediately to the northwest of SK03. The exposed bones included cranial remains (including the right petrous portion), a collection of possibly left ribs, and some arches of the cervical vertebrae. The exposed bones were in an excellent state of preservation.

The age-at-death of this individual was estimated at between 38 and 40 foetal weeks, based on the size of the petrous portion.

The petrous portion provided a length of 36.68mm and a width of 16.35mm.
6.4 Human Remains Trench 2

Three *in situ* burials were identified in Trench 2: SK04, SK05, and SK06. No disarticulated human remains were present in this trench. The graves of all three individuals were within an introduced layer, C.10. One possible grave deposit C.45, truncated by the burials of SK05 and SK06, was also identified (see Section 5.3).

**SK04 Plates 12-14**

The skeletal remains of this individual appear to be associated with a wooden coffin, which particularly survived at the ‘foot’ end of the individual. The burial was orientated southeast-northwest, with the head to the southeast and were located 0.27m below current ground level. The individual appears to have been laid supine. The legs appeared bent out at the knees to their respective sides, as an infant’s limbs may normally fall, but the individual may have slipped slightly towards the foot end of the coffin, presumably during burial. The exposed bones included the cranium, the left scapula, ribs, humerus, ilium, ischium (both from the hip), vertebrae, the femora, tibiae, and left fibula. The exposed bones were in an excellent state of preservation. The left femur was selected for radiocarbon dating.

The age-at-death of this individual was estimated 36.3+/-2.08 foetal weeks, based on the size of the left femur.

Long bone measurements were recorded on the left humerus (60.7mm) and the left femur (68.99mm).
SK05 Plate 15

Although no actual timber was apparent with this burial, at least one metal nail was present in the immediate vicinity, suggesting a coffin. The burial was orientated southwest-northeast, with the head to the southwest, were located 0.36m below current ground level, and were 0.60m from SK06. The individual appears to have been laid supine. The exposed bones included cranial remains, the left ribs, scapula, and humerus, and the right femur. The exposed bones were in an excellent state of preservation.

The age-at-death of this individual was estimated at 38.1+/−2.08 foetal weeks, based on the size of the right femur.

Long bone measurements were recorded on the right femur (74.37mm) and the left humerus (65.92mm).

SK06 Plates 16-18

No actual timber was immediately apparent around this individual, although a number of metal nails were present, suggesting a coffin. The burial was orientated northeast-southwest, with the head to the northeast, were located 0.30m below current ground level, and were 0.60m to the north of SK05. The individual was laid supine. The exposed bones included numerous cranial elements (left frontal, parietals, occipital, and possibly the left maxilla), the right humerus and ulna. The exposed bones were in an excellent state of preservation. The right humerus was selected for radiocarbon dating.
The age-at-death of this individual was estimated at 36.7+/-2.33 foetal weeks, based on the right humerus.

The long bone measurement of the right humerus was recorded as 61.17mm.
6.5 Human Remains Trench 3

A total of ten in situ burials were identified in this trench: SK07, SK09, SK10, SK11, SK12, SK13, SK19, SK20, SK21, and SK22. One skeleton number, SK08, was initially allocated to skeletal remains that was a possible burial but this was later identified as being part of SK07. No disarticulated human skeletal remains were present in this trench. All burials in this trench were contained within C.48/C.48b, interpreted as an introduced layer.

SK07 Plates 19-24

Although no timber remains were immediately apparent with this individual, numerous metal nails were recovered, indicating a probable coffin. The burial was orientated northwest-southeast, with the head to the northwest. The burial was located 0.44m below current ground level. This individual was identified in two stages. The cranium and torso elements of SK07 were initially identified during the targeted excavation of the northwest edge of Trench 3. Subsequent excavation, targeting the line of pipe C.52 exposed legs bones, initially recorded as SK08, just to the southeast of SK07. Subsequent on-site analysis indicated that SK07 and SK08 were likely to be the same individual, ‘SK08’ was voided from the excavation record, and ‘SK07’ was subsequently used to record this individual.

There was some disturbance to the left side of the exposed remains: this was linked with collapsing voids and the extensive presence of roots, which were all associated with the pipe C.52. The cranium in particular had clearly collapsed into the voids. The evidence indicates that SK07 was buried sometime after the works associated with the insertion of pipe c.52.
SK07 was buried in a supine, extended position. The exposed bones included numerous elements of the cranium, the left arch of the first cervical vertebra, the right clavicle and humerus (both disarticulated), right ulna, ribs, and femur, and the right tibia, first left and right first metatarsals, and other metatarsals (all disarticulated). The exposed bones were in an excellent state of preservation. The right humerus was selected for radiocarbon dating.

The age-at-death of this individual was estimated at 40.7±1.87 foetal weeks, based on the right femur and tibia.

Long bone measurements were recorded on the right humerus (66.2mm), the right femur (77.69mm), and the right tibia (69.67mm).
SK09 Plates 25-27

No timber remains were immediately apparent in association with this individual. However, numerous metal nails were found in the immediate vicinity of SK09 and are likely indicative of a coffin. The remains of this individual were located 0.50m below current ground level and were approximately 0.50m to the northwest of SK07. SK09 was exposed during the targeted excavation of the northwest edge of Trench 3. The exposed remains, which were in an excellent state of preservation, comprised elements of the cranium, including both frontals, fragments of the parietals, and the squamous of possibly the occipital, as well as the right arch of the first cervical vertebra. Given the limited exposure of the remains, it is difficult to assess burial
position. However, this presumed-coffined burial was likely interred in a northwest-southeast direction, with the head to the west.

The age-at-death of this individual was estimated as a young infant, less than 3 months old at the time of death, based on the size of the cervical vertebra.

The length of the right arch of the first cervical vertebra was 20.64mm.
SK10 Plates 25, 28-29

Similar to SK09, while no coffin timbers were directly associated with this individual, numerous metal nails were identified, which are likely indicative of a coffin. The burial was orientated northwest-southeast, with the head to the west: the orientation was more definitively evident than in SK09 due to the presence of torso remains. The burial was supine. The right arm may have been positioned over the torso as, although the lower half of the skeleton was not exposed, the bones of the lower part of the arm were recovered. The individual was 0.46m below current ground level and was located 0.24m to the northeast of SK09. This burial was identified during the targeted excavation of the northwest edge of Trench 3. The exposed bones included cranial remains (including the right frontal), the left and right mandible and maxillae, the right humerus, radius, and ulna (slightly disturbed during excavation), the right scapula, clavicle, and ribs, and the left humerus.

The age-at-death of this individual was estimated at 40.9+/−2.12 foetal weeks, based on the right humerus, radius, and ulna (after Scheuer et al. 1980). However, the individual may have been up to 1.5 months old (based on Maresh (1970)).

Long bone measurements were recorded on the right humerus (71.58mm), the right radius (53.91mm), and the right ulna (62.3mm).

SK11 (see also, SK13) Plates 30-32

No timber remains were uncovered during the examination of this individual although a number of metal nails were present, suggesting a coffin was likely used. The individual was buried supine and was orientated south-north, with the head to the south. The left arm was bent out slightly to the left lateral. The burial was 0.28m below current ground level and was 0.50cm to the southeast of the
exposed bones of SK09. The bones were in an excellent state of preservation. The exposed bones included a portion of the cranial vault, the left humerus, radius, and ulna, a collection of ribs and vertebrae, as well as some metacarpals and hand phalanges. The left humerus was selected for radiocarbon dating.

The age-at-death of this individual was estimated at 36.4+/−2.12 foetal weeks, based left humerus, radius, and ulna.

Long bone measurements were recorded on the left humerus (59.18mm), the left radius (49.72mm), and the left ulna (56.49mm).

SK12 Plate 33

No timber was identified associated with this individual although metal nails, suggestive of a possible coffin, were present. The orientation of the burial was difficult to determine as the exposed remains were relatively loose in the ground. It is possible the burial was orientated northwest-southeast, with the head to the west, or it may have been on a similar orientation with SK11. The remains were 0.49m below current ground level and SK12 was 0.35m to the southeast of the exposed remains of SK10 and 0.30m to the northeast of SK11. SK13 was immediately (5cm) to the southeast. The legs of SK12 were
bent to the right lateral. The exposed bones, which were in an excellent state of preservation, included vertebral bodies and ribs, the left ilium (from the pelvis), the femora, the tibiae, and an unsided fibula.

The age-at-death of this individual was estimated at 38.6 +/- 1.87 foetal weeks, based on the left femur and tibia.

Long bone measurements were recorded on the left femur (74.89mm), the right femur (74.58mm), and the left tibia (62.69mm).

SK13 (see also, SK11) **Plate 34**

The remains of this individual were recovered in a relatively loose state. The bones, a left femur and tibia, lay immediately (5cm) to the southeast of SK12 and 0.20m to the northeast of SK11. The age-at-death was estimated at 37.4 +/- 1.87 foetal weeks, based on the left femur (70.13mm) and left tibia (61.55mm). While these bones are likely to represent an individual burial, it is possible that they originate from SK11. The bones were in an excellent state of preservation.
SK19 Plates 35-38

This burial was initially identified due to the occurrence of a void in the earth and the presence of timber, presumably a coffin. On closer examination, the void contained a disarticulated right tibia and possibly a right fibula. A second void, again with roots, located to the northwest of the first void, was found to contain cranial remains. The maximum length between the two extremes of these bone finds was 0.55m and they are interpreted as the remains of a single buried individual, located 0.48m below current ground level. The burial was orientated northwest-southeast, with the head to the northwest. The bones were in an excellent state of preservation. The right tibia was selected for radiocarbon dating.

Based on the lengths of the right tibia (72.69mm) and the possible right fibula (67.66mm), this individual was estimated to have been between 1.5-3 months at the time of death.
SK20 Plates 39-40

The remains of this individual were located just 0.30m to the northeast of SK19 and were 0.36m below current ground level. Cranial remains were exposed with a vertical metal nail immediately adjacent, while approximately 0.73m to the northwest was a right-angled void, surrounding by numerous metal nails. A large quantity of metal nails was uncovered during the examination of this area. The void and the cranial remains are tentatively interpreted as the remains of a single individual, buried largely parallel to SK19, but with the head at the opposite end; that is, SK20 appears to have been orientated southeast-northwest, with the head to the east. The apparent length of the burial (0.73m) possibly suggests an older infant as modern full-term foetuses (37-42 weeks) range in crown-to-heel length between 48-53cm (see Williams and Bannister 1995, 345). This individual may have been up to 1 year old.

No measurements were possible.

SK21 Plates 41-44

The remains of this individual were located just 0.35m to the northeast of SK20 and were 0.22m below current ground level. No timbers were identified directly associated with the burial, but a number of metal nails were uncovered. The burial was orientated southeast-northwest, head to the southeast and the individual was buried supine and largely extended: the legs may have been slightly flexed. Extant arm bones suggest they were largely parallel to the body. The bones were excellently preserved, if a little soft. The exposed bones included a fragment of the cranial vault, the left ribs, possibly the right ulna, the ilia and ischia (from the pelvis), the femora, a tibia, and a collection of vertebrae, metacarpals, and hand phalanges. The left femur was selected for radiocarbon dating.
The age-at-death of this individual was estimated at *circa* 3 months, based on the length of the left femur.

Long bone measurements were recorded on the left femur (99.93mm).
SK22 Plate 45

The remains of this individual were identified 0.70m to the northeast of SK21 and was 0.25m below current ground level. The burial appeared to be orientated southeast-northwest, with the head to the southeast. The exposed bones, which were well preserved, included portions of the cranium, including the left frontal, and the right humerus.

The age-at-death of this individual was estimated at 40.2+/−2.33 foetal weeks, based on the right humerus (after Scheuer et al. 1980), but s/he could have been up to 1.5 months old (after Maresh 1970).

The length of the right humerus was 68.86mm.

Plate 45: SK22 in situ, from SE

6.6 Human Remains Trench 4

Four ‘Skeleton Numbers’ were applied in Trench 4, and these (SK14-17) are detailed below. In addition, exposed deposits and/or features within the trench indicated the presence of a further six potential burials (no skeletal remains exposed, see Section 5.5). Disarticulated remains were also identified and recovered. None of the latter were removed from the site, apart from a single disarticulated bone that was selected for radiocarbon dating (see Section 7.1).

SK14 Plates 46-48

The skeletal remains of this individual were partially exposed close to the northeast corner of Trench 4. No immediate evidence of a coffin was apparent. However, a small vertical wooden peg was present immediately to the left lateral of the left humerus – it is possible that this is a wooden dowel. The burial was orientated southwest-northeast, with the head to the southwest. The individual was supine and

Plate 46: SK14 in situ, from NW (note outline of coffin of SK15)
the surviving bones were in an excellent state of preservation. It was 0.47m below current ground level. The exposed bones included a portion of the cranium (probably the occipital), the left mandible, the left clavicle and humerus, the scapulae, the left and right ribs, and some vertebrae. Although the burial was clearly supine, the right ribs were lying prone, as if ‘flipped’ over. It was difficult to ascertain the cause, although the evidence of ploughing in this area may be very relevant (Section 5.5). The ribs partially overlay the adjacent coffin of SK15: perhaps the latter disturbed the older burial of SK14. A medal was present on the left shoulder. The left humerus was selected for radiocarbon dating.

The age-at-death of this individual was estimated at circa 3 months, based on the length of the left humerus.

The length of the left humerus was 81.2mm.

SK15 Plates 49-50

No skeletal remains were exposed in this instance. However, a clear outline of what may be interpreted as a coffin was uncovered. It is location 0.54m below current ground level and is immediately adjacent (to the southeast of) SK14: the latter may have been truncated by the interment of SK15 but this is not definite. The coffin of SK15 is orientated northeast-southwest, but the location of the head is
unknown. The minimum length of coffin exposed was 0.43m (the northeastern end of the coffin was not exposed), while the minimum width of the coffin was 0.19m (the side of the coffin was within the northwest-facing baulk.

The age-at-death of this individual is unknown. It is assumed to be that of a juvenile (<18 years) and possibly that of an infant (<1 year), although this is not definite. SK16 is located just 0.30m to the southwest and both are on the same alignment.

**SK16 Plates 51-52**

SK16 was located just 0.30m to the southwest of SK15, with the southeastern side extending into the northwest-facing baulk of the trench. The burial was identified through the presence of the remains of a coffin, with cranial remains exposed at one end. The burial was orientated southwest-northeast, with the head to the southwest. The maximum length of the coffin exposed was approximately 0.64m, suggesting this is the burial of an infant (<1 year, see SK20). Apart from a small area of the ectocranial (outer) surface of the cranium, no other skeletal remains were exposed. The burial was 0.46m below current ground level.
SK17 Plates 53-56

The skeletal remains of SK17 were located close to the centre of Trench 4. There was no immediate evidence of a coffin. The individual, located at a depth of 0.45m below current ground level, was buried supine and orientated northeast-southwest, with the head to the northeast. While the bones were generally well-preserved, there was erosion to the proximal end of the left humerus. In addition, the left ulna had been truncated (post-burial) and was uncovered in a disarticulated state with the broken end close to the distal end of the humerus and the proximal end facing distally (essentially broken and ‘flipped’). The right side of the skeleton appears to have been truncated, possibly by ploughing (see Section 5.5). The left humerus was selected for radiocarbon dating.

The surviving humerus measured 77.45mm in length suggesting the individual was aged between at least 1.5-3 months, or possibly a little older, at the time of death.
Disarticulated Skeletal Remains

A total of 128 disarticulated bones, fragments of bones, and teeth were recovered during the excavation of Trench 4. Many of these were recovered from the spoil that was excavated from Trench 4 (Plates 57-58), while some were identified in the ground and still in a disarticulated state (see below), during further hand excavations in the trench. As noted earlier, it was apparent that many of the disarticulated bones from Trench 4 had suffered post-mortem erosion, in contrast to the exposed bones in many of the in situ burials. For example, the right humerus (ID1039) of a young infant had significant erosion of the both the proximal and distal ends of the bone. This erosion was likely a process that was considerably accelerated by the actual disturbance of these bones from their original place of deposition, presumably from in situ burials in the immediate area.

A small number of skeletal elements exhibited somewhat unusual breaks. At least two left parietals (the bones which form most of the left and right side of the cranium, ID1014 (Plates 59-60, Figure 38), and ID10158 (Plate 61 and Figure 39) exhibited relatively sharp-edged breaks. Similar breaks were identified in another cranial fragment (ID1015 in Plate 59) and obliquely through a possible right humerus (ID1004 in Plate 59). However, while the edges are sharp, they are also clearly roughened, indicating these resulted from a post-mortem (after the time of death) event, and not ante- or
peri-mortem (before or around the time of death). Such breaks have been termed ‘dry’, in contrast to ‘peri-mortem’ fractures, ‘mineralised’ breaks, which occur on dried bone with little collagen, and ‘recent’ breaks, which occur around the time of excavation and afterwards (Knüsel et al. 2016, 172-173) (nota bene the convention of using ‘break’ for post-mortem events and ‘fracture’ for ante- and peri-mortem events originates in forensic science (see, for example, Wescott 2019)). Both peri-mortem fractures and dry breaks are distinguishable from the others by the fact that there is still collagen in the bone, albeit in declining quantities after death. The classic ‘dry’ breaks have been recorded from five months after death (Wieberg and Wescott 2008) to up to a year after death (Knüsel et al. 2016, 173). However, the timings may be significantly variable. For example, wetting of bone, including water saturation (such as was evident at the present site), can extend the period of plasticity in bones post-mortem (Wescott 2019). Notwithstanding the precise timing, it appears some bones were broken in the ground relatively soon after burial. It may be surmised that the breaks may be related to ploughing and/or subsequent gravedigging perhaps inadvertently disturbing older burials.

Most of the disarticulated material (114/128 fragments) was recovered as loose bones from the spoil. However, some disarticulated remains were also uncovered within unexcavated ground. Fourteen bones, or fragments of bones, were uncovered within Trench 4 during archaeological hand excavation. All were from infant individuals, with the oldest individual aged
approximately 3 months at the time of death. Fragments include a number of rib fragments (ID1019) from the northern end of the trench, a left radius and a humerus (ID1023-4, Plates 62-63), and a rib (ID1078) from C.17 at the northern end of the trench, which appear to be largely from a full-term infant, as well as a left tibia and a cranial fragment (ID1025-6) from C.17, which again may be from a full-term infant. In addition, a femur, a left and right tibia and an unsided fibula (ID1066-9), all from an individual aged approximately 1.5-3mths, were recovered at the northern end of the trench (Plate 64), while a right femur (ID1077), of an infant aged approximately 3 months at the time of death, which was recovered from the baulk near the south end of the trench. Some bones also appeared to occur as associated elements. For example, ID1023, a left radius, was recovered with a left humerus (ID1024, Plates 62-63), and the aforementioned group of leg bones (ID1066-9) were recovered together but in a disarticulated state (Plate 64). A number of cranial elements, recovered loose from the spoil heap, refitted together resulting in the identification of the incomplete crania of a minimum of two infants. These included the left and right frontals (ID1010-1) and the left and right parietals (ID1013-4) of an infant approximately 6 months old, and the left and right frontals...
(ID1056-7), the left parietal (ID1058), and the left temporal (ID1070) of an infant of a similar age-at-death to the former (see Figures 38-39).

Two clumps of earth were also recovered from the spoil which contained bones that were still in an articulated state. These included a left humerus, scapula, and three left ribs (ID1020-2) of an infant aged approximately 6 months old at the time of death (Plates 65-67), as well as the left radius, three other left ribs, and a vertebral fragment (ID1064-5, 1076) of an infant aged between 3-6 months at the time of death (Plates 68-69). It is possible that these are actually from the same individual.

All the disarticulated remains were assessed as a single unit, in order to particularly determine the minimum number of individuals represented by the bones (both recovered from the spoil and uncovered in the ground). The evidence indicates the presence of at least six individuals, all infants aged <1 year at the time of death, in the disarticulated material, see Table 3.
Plate 68: ID1064-5, 1076, infant 3-6 months old, left radius, ribs, and vertebral fragment still articulated but truncated

Plate 69: ID1064-5, 1076, infant 3-6 months old, left radius, ribs, and vertebral fragment

</tbody>
</table>

The tibiae indicate a minimum of five individuals: a full-term infant; three young infants; and an older infant. However, four right femora suggest there may actually be four individuals aged between 1.5-3 months, in addition to the full-term infant and the older infant. Therefore, the MNI may be as high as six individuals. It should be noted that the aforementioned two incomplete infant crania were estimated to be from two individuals of approximately the same age. However, one cranium (ID1056-8 and ID1070) was more incomplete than the other (ID1010-1 and ID1013-4), and the age at death of the former (at approximately 6 months) is simply an estimate. In essence, there is no substantial evidence of more than six infants in the disarticulated from Trench 4.

One disarticulated bone was selected for radiocarbon dating; a right tibia, from an individual aged between 6-9 months at the time of death.
6.7 Human Remains in Trench 5

The remains of a single *in situ* burial (SK18), with exposed skeletal remains, was identified in Trench 5, while two further burials were identified through the presence of apparent coffin timbers (see Section 5.6) No disarticulated human remains were present.

**SK18 Plates 70-72**

The remains of this burial were identified in the southwest corner of Trench 5, primarily through the presence of horizontal timbers with apparent white paint. The southwestern end of the probable coffin extended into the northeast-facing baulk. A right humerus was uncovered on one side of coffin. Assuming a supine burial, this suggests that this southwest-northeast burial had the head to the southwest. This was 0.45m below ground level. The right humerus was selected for radiocarbon dating.

The right humerus was slightly incomplete at the proximal end. The surviving length was 74.18mm: it is unlikely to have been originally much more than 80mm. It was certainly smaller than the disarticulated left humerus (ID1020), whose age-at-death was estimated at 6 months. It is probable that SK18 was aged between 1.5-3 months, or a little older, at the time of death.
Plate 71: SK18 in situ from SW, with details highlighted

Plate 72: SK18 right humerus for radiocarbon dating
6.8 Human Remains in Trench 6

A single *in situ* burial, with exposed skeletal remains (SK23), was identified in Trench 6. A further five probable coffins were identified, though no skeletal remains were exposed (see Section 5.7). No disarticulated skeletal remains were present.

**SK23 Plates 73-75**

The skeletal remains of this individual were recovered along the northeast-facing baulk of Trench 6. It was 0.48m below ground level. No coffin remains were conclusively identified. The burial was supine and extended, orientated southwest-northeast, with the head to the southwest. The exposed bones included elements of the cranium, the mandible, the left ribs, and the left femur. The bones were in a relatively good state of preservation although the left femur was incomplete. The left femur was selected for radiocarbon dating.

The minimum surviving length of the left femur was 93mm, and the distal end was slightly incomplete. Certainly, this individual was over 1.5 months at the time of death, and could have been up to three months old. The mandibular symphysis was fused, which typically occurs in the first year of life. Indeed, a disarticulated fused mandible was recovered from TR4 (ID1063), with an estimated age-at-death, based on dentition, of 4-6 months (see above). This might suggest that SK23 was indeed *circa* 3 months old, if not a little older.
6.9 Minimum Number of Individuals (MNI)

In total, the skeletal remains of 21 in situ individuals, with exposed skeletal remains, were identified, with an additional coffin (SK15) identified in Trench 4 but from which no skeletal remains were exposed. Archaeological evidence further indicates a number of other probable graves – indicated by coffin fragments – and possible graves – suggested by deposit type, shape and orientation (see Section 5). These include a possible single burial in Trench 1, six burials in Trench 4, two burials in Trench 5, and five burials in Trench 6. This indicates that potentially 36 in situ burials were identified during the present investigation. In terms of additional skeletal evidence, the disarticulated remains, recovered exclusively from Trench 4 provided evidence of six individuals. These bones may have originated from in situ, but truncated, burials previously identified or may indicate further additional burials.

The total MNI from the present investigation is 32; 21 in situ individuals and 11 coffins indicating probable burials. There are an additional four possible burials indicated by grave deposits and six individuals represented in the disarticulated remains bringing the total possible number of individuals represented in this excavation to 42. The ages-at-death of all 27 individuals represented by skeletal remains were less than one year at the time of death. The ages-at-death of those in the probable coffins and possible graves cannot be confirmed.
7. Analysis of Evidence

7.1 Radiocarbon Dating

After Professor Gordon T. Cook, May 2019, see also Appendix G.

On the 14th of March 2019, 13 samples were presented for analysis to SUERC Radiocarbon dating laboratory in East Kilbride, Scotland. Each sample was presented evidentially secure, appropriately packaged and sealed with an accompanying continuity log. The samples had been released from Irish jurisdiction with the permission of Mr J. Kelly, Coroner for Tipperary and their delivery to SUERC had been accompanied by an agent of the MBHCOI until their submission to the laboratory. Please see Table 4 below for sample details.

Table 4: Details of 13 samples submitted to SUERC

14Carbon is radioactive substance, or isotope, contained within the atmosphere and is exchanged to the biosphere and via photosynthesis and the food chain and can be found in all living organisms. Once
the organism ceases to live the $^{14}\text{C}$ begins to decay by a quantifiable half-life, specifically the Libby half-life. It is this that is used to calculate radiocarbon ages. $^{14}\text{C}$ can be extracted via the protein collagen in bone in human remains.

The quantification of $^{14}\text{C}$ in an organism versus the atmosphere at a known point in time can give accuracy to this dating method. Since the 1960s this method has been used to date biological remains to century and millennia time frames; in more recent years this method has been proven successful in what is considered the modern era, in this case, post 1890.

The Industrial Revolution marks the first significant period of human influence on the natural $^{14}\text{C}$/stable carbon ratios into the environment resulting from the burning of fossil fuels. This release of CO$_2$ into the atmosphere caused a dilution of the $^{14}\text{CO}_2$ activity creating what is known as the Seuss Effect. The consequence of this effect is that it is not currently possible to distinguish between a radiocarbon date from the seventeenth century and a sample that was formed during the period 1890-1950 whose activity was influenced by the Seuss Effect. This needs to be born in mind when looking at the calibrated dates as will be presented below. Nuclear programmes from the 1950s onwards in the form of weapons testing caused a significant and quantifiable increase in the $^{14}\text{C}$ in the atmosphere, this is referred to as the ‘bomb curve’. These levels begin to decrease sharply, again in a quantifiable manner, from 1963/64 onwards with the test ban treaty. Comparison with these levels can provide the backdrop for $^{14}\text{C}$ dating evidence in the twentieth century.

In a case such as Sean Ross Abbey Mother and Baby Home Children’s Burial Ground, where skeletal remains are those of neonates or infants, the bone samples can achieve high precision estimations on year of birth. The bone collagen in infants is formed from the mother’s dietary intake, resulting in $^{14}\text{C}$ being relatively close to equilibrium with atmospheric levels. Atmospheric levels during the bomb peak after 1955 provides chronologically concise information. This can be seen in some of the samples returned in Sean Ross Abbey Mother and Baby Home. The same is not true of adult remains from this period; the turnover of collagen is much slower making the dateable collagen return results present over a number of years. This allows for more limited information than with infants, informing whether or not the person died during the nuclear era. This evidence and these processes provide us with confidence that this dating method was the most appropriate to use due in the specific context of the infant remains recovered during this investigation.

As all remains dated in this sample were of individuals of less than six months of age it is recommended that a delay of 1-2 years be applied to each date. This allows for the carbon to travel to the bone collagen through the process of human consumption of carbon via plants and its appearance in the blood and thus bone collagen. $^{14}\text{C}$ measurements will therefore represent the $^{14}\text{C}$ in the atmosphere 1-2 years previously.

In order to measure this collagen protein it must be isolated. Collagen, the organic fraction of bone, is extracted and prepared via a process of solubilising the bone by adding hydrochloric acid, heating to 80°C, and passing the resulting liquid through a filter. This is then freeze-dried until the collagen is extracted in crystalline powder form. The collagen is then combusted to graphite for measurement via accelerator mass spectrometry. Samples are run alongside the $^{14}\text{C}$ primary standard SRM-4990C for modern reference samples for comparison.
Stable isotope measurements were also taken of the samples as part of this process. Stable isotope and radiocarbon results combined allows for an assessment of sample suitability for dating. Collagen samples were deemed within the range of collagen that is accepted as unaltered and therefore were suitable for reporting.

All 13 individuals were aged from foetal to less than a year old and are feeding at a trophic level above their mothers. The stable isotope values of 12 samples represent a typical terrestrial resourced diet while sample SK01 isotope values suggests marine resources formed part of the mother’s diet.

All samples present estimated years of death within the range 1918–1963. Four samples, SK01, SK02, SK18, and C17, are all clearly from the within the nuclear era (1956-1961) and also all present with later 20th Century ranges. Based on the knowledge that the Mother and Baby Home at Sean Ross Abbey was in operation from 1931 to 1969 Professor Cook discounted this later age range. For the purposes of the final report of this investigation it is not possible to discount these dates in such a manner due to the possibility that this burial ground continued in use post-1969. However, when the dates are also correlated against the stratigraphic evidence and osteological evidence (Sections 5 and 6), the mid-twentieth century dates are further supported, giving these the highest likelihood. The same can be said of the earlier dates that are present in some samples. Site stratigraphy and the archaeological evidence does not support the possibility of seventeenth, eighteenth, or nineteenth century dates. Please see Table 5 below for calibrated age ranges of each sample.

7.2 Artefactual Evidence

Throughout the excavation phase, objects or artefacts were identified within certain contexts. These artefacts can further inform the date of origin and the potential function of given deposits and features. A selection of significant artefacts is discussed here and detailed in Table 6 below.

Discounting nails and timbers, indicative of coffins, only one artefact was found in association with a burial. This was a devotional medal at burial SK14/C.29, in Trench 4, found positioned on the left shoulder of the skeletal remains (Plate 47). Although corroded, with minor damage to part of the edge, the face depicts the Virgin Mary, while the rear shows an apparition scene (Plate 76). The style of the front depiction, with flowers to the left and portions of an inscription at the right is consistent with that of a ‘virgo virginum’ medal from Lourdes, France. Similarly, the grotto scene on the rear face is also that commonly associated with Lourdes (Plate 77). The medal measures 20mm in diameter and 1mm in thickness. The association of this artefact correlates closely with the radiocarbon date range for this burial, in that this medal likely dates to the first half of the twentieth century. The medal was returned to the position on the skeletal remains in which it was found before the trench was back-filled.

As mentioned, coffin timbers and associated metal nails were encountered in at least 11 separate locations, as well as throughout the plough-soil (C.17) in Trench 4. These were recorded in situ and were unlikely to yield further information if removed. From those nails that were not within timber, an array of types had been used. However, all were wire or steel nails, or brads, with round and flat heads, and of various lengths. Animal bone was recovered from Trenches 2 and 7, one fragment in each, from the introduced orange clay (C.10) and backfill surrounding the pipe (C.63). These were both examined by the on-site Osteoarchaeologist.

Sherds of pottery were occasionally identified within the ‘orange’ introduced clay layers (i.e. C.10, C.43, C.79) and similar build-up layers (i.e. C.69). These include modern plate and terracotta pots and a rim from a glazed earthenware vessel. These indicate that the layers were deposited in relatively modern times and when accompanied by the animal bone and shell, exhibit a minor domestic refuse element within the introduced soils. At Trench 3, a ditch or gully appeared to have been infilled.
this material was two fragments of earthenware vessel and two pieces of glass bottle. Of the glass, the first was thick, with air pockets within, suggesting manufacture in the nineteenth century or earlier, while the second piece is finer and would appear to be part of a drinking glass, perhaps from the nineteenth century. Again, all artefacts indicate a date no later than the end of the nineteenth or beginning of the twentieth centuries. Similarly, a blue-print ‘china’ sherd was uncovered from the ploughed soil in Trench 4 and two late nineteenth/early twentieth century pottery sherds from the back-fill over the pipe in Trench 7. These were all within disturbed contexts and therefore are likely residual in nature.

A ceramic waste-water pipe was found in both Trench 3 and Trench 7. From the alignment and measurement in the drain inspection (Section 8) this could be seen to be the same pipeline. However, the pipe itself is also identical in each trench – a 6-inch salt-glazed clay pipe. A collar join in this pipeline was located in Trench 7, where a brand mark ‘H’ within a double circle was identified (Plate 78). This is the mark of Hurlford Fire Clay Works, J & R Howie Ltd., in Ayreshire, Scotland. Founded in 1857, the clay works, through mergers in the 1960s and 1970s, eventually closed in 1978 (https://www.scottishbrickhistory.co.uk/hurlford-fire-clay-works-kilmarnock-history/). The pipe is therefore likely to belong to the earlier part of the 20th century, and although unlikely, re-use must also be allowed for.
Plate 78: Brand mark as seen in Trench 7 (left) and standard Hurlford brand mark (right) (from https://www.scottishbrickhistory.co.uk/howie-or-hurlford-waterdrainage-or-sewer-pipe/)

7.3 Summary of Death Register for Sean Ross Abbey Mother and Baby Home

7.3.1 Infant and Young Child Deaths

There are a total of 1078 children on the death register of individuals who died at the Sean Ross Abbey Mother and Baby Home. It was possible to determine the age-at-death for 999 of these individuals. The significant majority were very young infants; 71.5% (714) were aged 3 months and under. The remainder were as follows: 15.5% (155) were aged four to 6 months, 8.4% (84) were aged 7 to 12 months and 4.6% (46) were over one year of age. In the latter group just eight were aged over two years at the time of death, representing 0.8% of the total. The figures clearly indicate that the overwhelming majority of the deaths (87%) occurred early in life, specifically in the first 6 months.

It was not possible to compare the death register with the number of living children in care in the Home over the relevant period. However, it is possible to see that the annual numbers of infant deaths were high in the early years of the operation of the Home. In 1936 and 1942 in particular, 92 and 80 infant deaths were recorded respectively, see Table 7 below for an annual break down of the numbers of deaths of infant and young children that occur at the Home. Interestingly, and relevant to the radiocarbon dates for this investigation, four individuals returned dates from the nuclear era, post-1955. These individuals (SK01, SK02, SK18, and C17) were from periods when the rate of deaths had slowed to approximately one per month. Pre-1945 deaths were occurring at rates of one per week, with circa two per week in the peak years.

Figure 40: Number of infant deaths by year
7.3.2 Maternal Deaths

During the operation of the Sean Ross Abbey Mother and Baby Home, twenty-seven maternal deaths occurred. As mentioned above, two of these individuals appear to be buried in the Children’s Burial Ground, see Section 2.3. No adult remains were identified or excavated during this investigation.

The early years of the operation of the Home recorded the highest number of maternal deaths, with 1932 being the most significant year (five) and 1937 returning the next highest number of deaths (four). The rate slowed down to an average of one per year from 1938 onwards, until 1965 when the last maternal death was recorded here before the Home closed in 1969. The age range of these individuals is from 14 to 35 years, with the majority being in the late teens and early 20s, and with the age group 20-24 years returning the highest rate, see Tables 8 and 9, and chart below (Figure 41).

8. Utilities in the proximity of the Children’s Burial Ground

Investigation of Utilities

To comprehensively understand the development of utilities, possible subsurface pipework and drainage in the proximity of the Children’s Burial Ground an on-site inspection and survey was conducted alongside a review of development and planning permissions on the site of St Anne’s Sean Ross Abbey since 1968. Tipperary County Council shared files relevant to this research. The results are presented here in chronological order of the evidence.

2019

While on-site, the MBHCOI initiated an independent drain inspection survey. The purpose of this survey was to determine the current positioning of the utilities/drainage system that is in proximity to the burial ground. There were two principal outcomes required of this survey: a) to create an evidential record of the current drainage system; and b) to trace the position of the disused pipe that intersects the south corner of the site.

The survey began at the manhole nearest the ‘Nuns Graveyard’ in the north west, labelled Manhole 1, see Figure 42. There is a full CCTV record of this survey available for inspection.

Current waste/foul water drainage system

The current system flows from Manhole 1 to Manhole 3 uninterrupted. At Manhole 3 the pipe joins an inlet from the southwest, coming from the direction of Saoirse Day Services/The Stables, and then continues directly northeast, running parallel to the burial ground. The fabric of this pipe work appears to be modern; an exact construction date is not possible. However, an examination of the planning records indicates that the pipework was upgraded in 1997. This appears to have included a diversion of the system, from Manhole 1 due south to the river bank, altered to turning 90 degrees at Manhole 3, to continue east, where it crosses Manhole 4, and meets Manhole 5, and turns 90 degrees extending north, following the river bank here. At Manhole 5 there is an additional access chamber that appears to have been inserted reportedly to carry electrical cabling however no cables are present.

Currently, the pipe fabric changes from clay to uPVC at Manhole 2 before it reaches Manhole 3, supporting the evidence that this section was upgraded when diverting the system. At Manhole 3 the pipe changes from uPVC to a 0.23m diameter concrete pipe.

Salt-glazed pipe

The survey of this pipe began at the river bank in the south, where the pipe has an access chamber that allowed for insertion of survey equipment. From the access chamber, the pipe appears to have
continued along the river bank to east for at least the extent of the burial ground. This pipe is 0.10m in internal diameter and appears to be aligned with Manhole 3. Cracking begins to appear in the pipe at 9.50m from the river bank and it has collapsed approximately opposite the current entrance to the burial ground, c. 13.5m from the southern access chamber on the river bank. It was the drain surveyor’s opinion that this pipe used to connect with the clay pipe extending from Manhole 1 and
was, at some stage, diverted, with Manhole 1 now running into the modern concrete pipe, see report at Appendix H.

2017

In 2017 Tipperary County Council (TCC) received a complaint in relation to possible waste water contamination of the site (PC-25 36917). This complaint alleged that that there were “issues with waste water treatment on the site particularly in the area close to the Angels Plot burial ground and the stables area across the stream on site” (O’Dwyer, TCC, 06/09/2017).

On foot of this, a thorough investigation was conducted by the Environment Section of TCC, consisting of a desktop review and on-site investigations. TCC reported that among the investigations conducted was a review of the 17 planning files that relate to the St Anne’s Sean Ross Abbey complex from 1969-2000, and on-site dye testing was conducted of the current sewage network (ibid).

TCC reported that research of planning files revealed that prior to 1997 sewage was treated on-site via septic tanks and was then discharged to soakaways or adjacent streams (O’Neill, TCC, 05/10/2017). It is stated that “in Ireland, pre ’75, the normal practice would have been to discharge treated septic effluent to soakaways” (O’Dywer, TCC, 06/09/2017). This research revealed that circa 1996 upgrading works had taken place to the existing system at that time. These upgrading works consisted of rerouting foul and greywater to a uPVC gravity main sewer. These works involved the joining up of a section of an old disused surface water (salt glazed) drain, that had previously discharged to the Verdanthill stream, to a new uPVC sewer. It was noted during the 2017 investigations that the 1996 “groundworks did not involve any drainage works that trespassed through the Angels Plot burial ground” (ibid).

This 2017 report by TCC states that the old salt glazed drain may have carried sewage (from septic tanks) to the stream in the distant past (ibid) and it was their opinion that while the drain does skirt the corner of the ‘Angels Plot’ it would have predated the existence of the plot. No direct evidence is provided to support this opinion as to why the pipe would have predated the plot, however, radiocarbon dating of remains above the pipe trench, conducted during current MBHCOI investigations, does evidentially support this presumption.

This particular line of 6-inch salt glazed pipe work is referred to on the 2017 TCC site investigation map as an ‘old storm water drain’, it is unclear why this is believed to be storm water. The pipes early relationship (1968) to a septic tank (Punch, 1997) suggests it is an early, now defunct, sewage waste pipe.

The Royal Commission into Sewage Disposal of 1898-1915 legislated for the requirement of certain dilutions of waste water into free-flowing streams and rivers. The position of the pipe outlet at a point on the stream where the dilutions are not satisfactory may have prompted the redesign to a point in the stream where the dilutions would have been greater (O’Dywer, TCC, 06/09/2017).

1996-1998

Tipperary County Council provided details to the MBHCOI from the planning files in relation to drainage works in the vicinity of the Children’s Burial Ground from 1969-1998. Within these files, a
significant issue that was identified in relation to the foul water sewer contaminating the stream that circumnavigates the site to the south and north east.

Figure 43: Extract from 1997 Report illustrating “Existing Foul Drainage Areas” showing tanks A, B and C, existing sewers and proposed sewers
A memo, dated 13th January 1998, reported the placing of a gravity sewer in the grounds of ‘St Anne’s Home’, Roscrea. It is reported that these works were complete in mid-December 1997 and ‘should now eliminate any potential to pollute the stream running through the estate and will provide sufficient waste water drainage for any future development at this complex’ (O’Connor, TCC).

It appears that prior to 1997 there was a septic tank system that then flowed directly into the watercourse. A survey conducted in early 1997 mapped the foul drainage system and illustrated the existing and proposed drainage. At this time two septic tanks existed in proximity to the Children’s Burial Ground, ‘A’ c. 32m to the south west across the stream and ‘B’ c.98m uphill to the north (Figure 43). At the time of this survey, 14th January 1997, both these tanks were reported to be ‘undersized for present use’ and connected to outflow in the watercourse (M Punch & Partners, 24th January 1997).

On the 3rd of June 1997, TCC served a Section 12 notice on ‘St Anne’s Home’ to immediately commence the implementation of measures to prevent the discharge of polluting matters from the premises. The foul water sewers were being discharged into the watercourse going through the grounds and the council directed the institution to alter this immediately. This event, in all likelihood, accounts the subsequent upgrading works that appear in the concrete and uPVC pipework evident in the drain inspection.

In November 1996, the Maintenance Department of St Anne’s Sean Ross Abbey compiled a report detailing the foul water drainage on-site. This report shows the position of septic tanks in different

![Figure 44: Extract from report of ‘Foul Water Drainage at St Anne’s Sean Ross Abbey Roscrea, November 1996’](image)
locations to those in the 1997 report. In this 1996 report septic tanks A, B and C were all south of the stream within the grounds of the current ‘Saoirse Day Services’ complex (Figure 44). This is corrected in the 1997 report, see Figure 43.

1969

Planning file number PLC 1418, dated to 1969, also shows the position of this septic tank at location 3, which is uphill to the north of the Children’s Burial Ground, number 3 of four located on site at the time (Figure 45). This provides evidence that the foul water from Septic tank number 3, uphill of the current Manhole 1, did enter the stream via the now defunct salt glazed pipe that skirts the current boundary of the Children’s Burial Ground pre-1998.

![Figure 45: Extract from 1969 Planning file PLC1418 illustrating ‘Location 3’](image)

Summary

The evidence gathered here in relation to the current foul water drainage system indicates a high likelihood that the foul or waste water did enter the stream via the now defunct salt-glazed pipe. This pipe appears to skirt the current boundary of the Children’s Burial Ground. This pipe was defunct by 1998. It is not possible to discern the exact date at which this pipe-line was originally constructed, although it must pre-date 1969. Radiocarbon dates from undisturbed burials in the strata above the trench for this pipe further refine the construction date securely pre-1955.
9. Discussion

Introduction

There were two principal matters under investigation during this excavation. The first was to determine the presence of burials at this site and the second was to determine that, if burials were present, what was their relationship to any utilities that may also be present at the site. The investigations outlined in previous sections have described the methodology designed to answer these questions and the results of the subsequent investigations. This following section will discuss the findings of the investigation and what may be determined about the burial practises at this location and site the history with specific reference to drainage and utilities.

Burial Practises

The evidence of burial practise reported here is based on the uppermost strata of graves and so inherent bias is present. In addition to vertical bias, trenches are limited in a horizontal sense also. Therefore, the results of test trenching are always simply indicative of the potential subsurface remains at any given site. However, despite this bias it is possible to determine a number of important factors in relation to burial arrangements and burial practice at this site, based on the results of the test trenching.

Burial Distribution

Evidence of burials were uncovered in all but one of the seven trenches excavated at the site. The exception was Trench 7, located at the current entrance to the site. However, while burials were uncovered in the other six trenches, the nature of the distribution was variable. This distribution is shown in Figure 46. This was primarily highlighted in Trench 1 and Trench 2, where both confirmed and possible burials were limited to a total of just seven (six actual burials with skeletal remains, plus one possible grave). In Trench 2, burials were only uncovered in the southwestern end, relatively near the present monument. None were uncovered in the remaining 13.1m of trench. In Trench 6, where a single definite burial and five probable burials were exposed, the single burial was near the southwest end, while the remainder were concentrated near the existing monument over 14m to the northeast. In contrast were the minimum of ten burials identified in Trench 3, a trench just 5.75m in length, and the four definite and six other probable/possible burials in Trench 4, which also had evidence of the disarticulated remains of up to six infants, in a trench just over 7m in length. Both trenches were located at corners of the southwestern end of the present site, suggesting particular concentrations in these areas.

Burial Distribution and Age-at-death

There is some evidence to indicate variation in terms of who was buried where. There was no evidence, from any of the skeletal remains recovered in this excavation, for any individual aged over 1 year. It was quite apparent that all six of the individuals uncovered to the northeast of the present monument were very young infants. In fact, all three infants in Trench 1 and one of the infants in Trench 2 were full-term infants (defined as an infant between 37-42 foetal weeks), while the remaining two infants in Trench 2 were likely very late pre-term (SK04 36.3+/−2.08 foetal weeks, SK06 36.7+/−2.33 foetal weeks). In Trench 3, at least one infant (SK11) was a possible pre-term infant and at least four others were full-term infants, while the remainder, with the exception of SK20 (possibly
6-12 months), were all less than 3 months old at the time of death. The four individuals in Trench 4 and the single burials in Trench 5 and Trench 6, where all infants, with no evidence of pre-term or full-term infants (Figure 46). This evidence may suggest that specifically, the area to the northeast of the present monument was reserved for the burial of perhaps still-births or those who died very close to the time of birth.

**Figure 46: Distribution of burials; labels alongside in-situ burials give maximum age-at-death in months**

**Burial Organisation**

The general lack of intercutting or truncation of burials may suggest graves were perhaps marked, however, there did not appear to be a consistent pattern in terms of burial plots. Perhaps the clearest evidence was in the two trenches which contained the most burials, Trench 3 (ten individuals) and Trench 4 (four individuals, plus six other probable/possible burials). In the former trench, certainly some individuals appeared to be in approximate rows: SK19 through to SK22 appeared to be in aligned in a row, albeit SK19 had her/his head at the opposite end of the grave to the other individuals. SK07, SK09 and SK10 also appeared to be approximately in another row (Figure 47). In Trench 4, SK15 and SK16 were also apparently aligned lengthways, with SK14 forming an approximately row widthways with SK15. There thus appears to be some evidence of attempts at organisation in terms of placing burials in rows but significant variations were also recorded.
It appears that where the ‘head end’ of the coffin was placed in the grave also exhibits variation. The lack of rigid organisation in terms of burial plots may follow on to the actual placement of the coffin. In the case of the burials at this site, the variation may be partly linked to whether the head and the foot of the coffin was identifiable. If the coffins comprised simple rectangular boxes, with no breast-plates or other markers, then the gravedigger may not actually know at which end of the coffin the head was.

**Presence of Coffins**

In terms of methods of burial, the vast majority of identified burials had evidence of coffins (Figure 48). This may have been in the form of the remains of coffin timbers surrounding and/or covering skeletal remains or by the presence of metal nails in the immediate vicinity of an in situ skeleton. There were exceptions SK02 in Trench 1, SK13 in Trench 3, and SK14 and SK17 in Trench 4. In these cases coffins may have decayed over time and perhaps nails were not always used.
Burial Position

Where possible to assess, all individuals appeared to be buried supine (i.e. lying on the back). Some of the skeletal positions reflected the fact that many were very young infants: SK04 was buried with legs bent out respectively to the left and right, as an infant would normally lie with on its back. SK01 may have been turned slightly on their left side, while the legs of SK12 appeared bent to the right side, almost in a foetal position. However, there was also evidence of what may be interpreted as accidental displacement of the body, likely during the processes of carrying the coffin to the site and the burial itself. The knees of one individual in particular, SK04 in Trench 2, would essentially have been tight against what was interpreted as the foot board of the coffin (Plate 12).

Disarticulated Remains

Disarticulated human remains appeared in just one trench, Trench 4, in the southern corner of the site. This assemblage provides evidence of a minimum of six infants. Trench 4 was also the only trench where remains clearly indicated disarticulation before the present excavations began. Some of the disarticulated bones that were found occurred in what appeared to be associated groups (such as leg bones ID1066-9), indicative of mechanical disturbance.

Many of the disarticulated bones were noted in particular for the degree of post-mortem erosion and breaking: in contrast, the exposed skeletal remains, in almost all in situ burials, were in an excellent...
state of preservation. The disturbance of these bones from their original primary point of deposition (presumably a grave) would have significantly accelerated their disintegration. This can be a strong indicator of disturbance in the past. In addition, the sheer quantity of disarticulated bone in Trench 4 was in stark contrast to all other trenches. The circumstances of recovery indicate that most, if not all of the bones were loose within the upper levels of the soil. A number of dry breaks, identified in two crania and a long bone, were suggestive of truncation relatively soon after burial. This may have occurred during ploughing or grave digging activity. It has been noted that it is possible that graves were not individually and/or substantially marked and so, in the area of Trench 4 in particular, earlier burials may have been inadvertently truncated by subsequent gravedigging.

![Figure 49: Distribution of median date of burials from radiocarbon dated samples](image)

**Radiocarbon Dating**

Radiocarbon dating produced significant results (see Section 7.1). Burials in Trench 1 were radiocarbon dated from the late 1950s to early 1960s, while those in Trench 2 had dates spanning from 1918 through the mid-1950s. In Trench 3 the estimated years of death spanned from 1929 through to 1955, while in Trench 4 the span was 1939-1955. In Trench 5, very close to the extant
monument, SK18 returned a date of death of between 1960-1963, while SK23 in Trench, returned a
date of 1938-1955. The median year of each of these date ranges is applied in Figure 49. Thus, some
of the earliest burials may appear to be to the northeast of the existing monument. The 1960-1963
dates returned by both SK02 in Trench 1 and SK18 in Trench 5 may suggest a focus in this area in later
years. The limited nature of the collection prevents significant interpretation, however, the estimated
years of death returned by the radiocarbon dating were all within the timeframe of operation for the
Mother and Baby Home at Sean Ross Abbey.

Utilities

The second of the principal matters requiring investigation was the potential presence of utilities,
specifically in the form of drainage and waste-water drainage, at the site of the burial ground. It has
been illustrated in Sections 2.1 and 2.2 from historical mapping and aerial photography research, that
the boundary of what is now known as the Children’s Burial Ground was not always so clearly defined
as it is at present. Specifically, the aerial photo dated 1974 (Figure 6) illustrates that the boundary that
currently exists has not been persistent since the operation of the Home. This may account for the 6-
inch salt glazed utility pipe that now intersects the southern corner of the current boundary.

An examination of the history of planning applications and the development of the drainage facilities
on-site, sheds some light on the presence of utilities in close proximity to the Children’s Burial Ground
and has been presented in detail in Section 8. Investigations carried out on-site provide evidence for
the absence of currently operational utility pipes traversing any part of the Children’s Burial Ground;
none that were detectable by geophysical survey, by test excavation or by drain inspection survey.

The drain inspection and the excavation did however locate a now redundant salt glazed waste-water
pipe; this pipe was shown as present on the 1997 map accompanying the report, see Figure 43. This
map confirms that at some point the pipe carried waste water from a septic tank. It is evident that as
early as 1969 sewage was treated on-site, via septic tanks (Figure 44), and discharged to soakaways
or nearby streams. The 2019 drain inspection clearly provides evidence that this utility pipe has been
redundant for some time, the exact time-frame is unknown, however, it would appear from upgrade
works carried out in around 1996, that it had once discharged directly into the adjacent stream.

The 1996 record of upgrade works explicitly states that the ‘groundworks did not involve any drainage
works that trespassed through the Angels Plot burial ground’ (O’Dwyer, TCC, 06/09/2017. The location
of in situ burials in the material filling this pipe trench indicate that the pipe was laid prior to the use
of this space as a burial ground. These particular burials have been dated to pre-1955 by radiocarbon
dating and so it does in fact support the contention that the insertion of this pipe predates the burial
ground. This is further supported by the archaeological evidence that demonstrates no burials were
disturbed by the insertion of this pipe. This utility pipe may have been related to septic tanks recorded
on site in 1968 and again in 1996. There is a high likelihood that the pipe would have been in operation
at the time that the Sean Ross Abbey Mother and Baby Home was in operation and may have been
inserted to manage an increase in loadings from the increased population when the facility was
opened. The pipe itself is demonstrably of a pre-1970s type, see Section 7.2. Combined with the
stratigraphic evidence the pipe clearly pre-dates burial activity and also pre-dates the present
boundary of the burial ground.
Other drainage that appears on site is that which is referred to in this report as ‘field drains’. The test nature of the excavation did not allow for a full exploration of the extent of these field drains. However, the location of a burial stratigraphically above one such drain (SK23, estimated year of death 1938-1955) indicates that these drains pre-date the use of the site as a burial ground. Evidence of land reclamation works, in the form of introduced soil deposits, above naturally formed peat sub surface suggests that these drains were efforts to reclaim waterlogged areas of the site. Mapping evidence that illustrates a pathway to a flagstaff around the turn of the twentieth century further indicates that these reclamation works pre-date the twentieth century.

The cumulative results of the investigations conducted here do not support the disturbance or displacement of any infant burials in the pursuit of drainage of the area now defined as the Children’s Burial Ground. The investigations presented here provide a cross-sectional understanding of the burial ground. While informative, they must not be used to establish the minimum number of individuals interred here. Similarly, age-ranges and other metrics of *in situ* remains should not be extrapolated to any wider interpretation. The marked locations of both adult graves were not investigated, and several well-preserved coffins restricted the overall sample that could be analysed. It should also be noted that only at the current entrance was a test trench permitted to extend beyond the existing boundary of the burial ground.
10. Conclusion

10.1 Condition of the Site post excavation

Extensive work was carried out to return the site to its original condition, in so far as was possible. All trenches excavated were infilled and levelled, first by machine and then by hand. All soil was returned to the trench from which it had been excavated. The entire site was reseeded with grass seed (Figure 50).

![Figure 50: Aerial image of the site post-excavation, showing the back-filled and re-seeded trenches (3rd April 2019)](image)

10.2 Summary and Conclusion

The Mother and Baby Homes Commission of Investigation (MBHCOI) requested that an investigation be conducted into the site known as the Children’s Burial Ground in the grounds of St Anne’s Sean Ross Abbey, Roscrea, Co. Tipperary. This burial ground was reportedly the site of the graveyard for the Sean Ross Abbey Mother and Baby Home that was in operation here from 1931 to 1969.

The MBHCOI was in receipt of information that indicated the potential for drainage to cross through the site. If such was the case, then either the graveyard had been disturbed by the insertion of this drainage or there were no human remains present at this location to begin with (with the argument being that evidence of burial would have been noted during the drainage works). Information had also been received by the MBHCOI that in the 1980s ploughing had taken place on site that did resulted in bone being brought to the surface. In response to this the MBHCOI requested that two principle matters be investigated at this site through the use of the field of forensic archaeology.

The first and primary matter requiring investigation was the question of whether buried human remains exist at this reported graveyard and the succeeding question; if remains exist here, have they been disturbed by the insertion of drainage though the graveyard.

The forensic archaeological investigation of this site was dealt with through the principle of a priority-based approach. This approach operates through first engaging in the least intrusive methods and moving towards producing a targeted response that allows the application of more intrusive methods in a strategic manner. The value of this type of investigation allows a site to be investigated through a...
test or sample method that will not disturb the entirety of the site and specifically in this case, the human remains that have been interred here. This was deemed the most appropriate investigative response for this case.

**Investigation**

During the initial non-invasive stages of the investigation a geophysical survey was undertaken to investigate potential anomalies that may be isolated for further investigation. A complete desktop review was also conducted of the location to determine the site history through the aerial photography and mapping records that exist in Ordnance Survey Ireland and in the Planning files of the Environmental Section of Tipperary County Council.

The desktop review included cartographic analysis that identified the development of the site from the mid-nineteenth century to the twentieth century (1901), when a pathway to a flagstaff appears at the site prior to the opening of the Sean Ross Abbey Mother and Baby Home. The near-rectangular boundary of the present burial ground first appeared in mapping dated 1954; however, the 1974 imagery indicates that the site boundary had been altered or perhaps was not clearly visible on the ground. In this image, an additional boundary or feature appears at what is now the area to the northeast of the central memorial. It may have been a hedge, wall or line of trees. By the 1990s it can be seen that the current boundary is well-defined, and some planting has occurred on the periphery. The site appears unchanged from this to present day.

An independent survey of the waste-water drains in the vicinity of the burial ground was conducted by a drain specialist. This survey found that there had been upgrading and redirection of some pipe work in close proximity to the burial ground. This correlated with information from council planning files that saw the rerouting of waste water into a newly inserted main drainage pipe in around 1996. A salt glazed ceramic pipe was found on the geophysical survey and in the drain inspection survey that skirts the southern corner of the site. The drain inspection found this pipe to be now defunct. A more modern junction had been inserted to the northwest that reroutes this drainage to run parallel with the burial ground toward the northeast where it eventually joins the local drain network to the north of St Anne’s Sean Ross Abbey building complex.

The geophysical survey identified a number of anomalies that informed the basis for the insertion of seven test trenches over significant anomalies or areas that indicated burial or other significant subsurface features. These trenches were selected also to achieve a cross-section of the site in order to determine the nature of the subsurface and potentially answer the matters under investigation; the potential for burials and indications of drainage. Each test trench ranged from 0.6m to 1.5m in width and from 2.6m to 20m length. This 78 m² represented just less than 10% of the total available area within the site boundary.

Excavation took place over four weeks in February and March 2019. The excavation took place under a warrant issued to N. McCullagh by Judge Y. Murphy of the MBHCOI dated 1st of February 2019. The site cordon and log was maintained by An Garda Síochána while human remains were exposed on site.
This type of test excavation is limited by its nature in that it is a test approach and not a complete excavation of the entire burial ground. As such the findings that result from this excavation cannot be applied conclusively to other matters. Evidence and stratigraphy that remains in the unexcavated parts of the site can only be inferred from the results of these test trenches. Equally, projecting the analysis of human remains from these test trenches to the remaining unexcavated 90% of the site would be to assume consistency across the entire site. The demographic profile of skeletal material recovered here relates only to those remains identified and samples recovered. The skeletal remains of other individuals, possibly of other age groups, in greater or lesser quantities, may be contained within the areas of the site not covered by this test excavation. There persists and unavoidable bias in the results of this test excavation approach.

Findings

The results of this excavation indicate that this site was at some point a wet, waterlogged or boggy location that was subsequently reclaimed by drainage works in the form of stone field drains and the introduction of organic material from an alternative location. This can be seen in the site stratigraphy where there is an orangish coloured silty clay deposit overlying the natural peat. This land reclamation predated the burials that were exposed during this investigation. Burials were found in the strata above both the stone field drains and the salt glazed drainage pipe that transects the southern corner of the burial ground.

Within the test trenches the skeletal remains of 21 infants were recorded. The evidence from the skeletal remains here indicates that all excavated infants were under the age of one year old with the majority of individuals in the early weeks and months of life. In the majority of burials there is clear evidence of timber coffins and suggestive evidence of coffins in most other cases. There were also coffined burials undisturbed by excavation that allow for the presumption of another 11 individuals this allows for and MNI of 32 individuals. Archaeological evidence and evidence from disarticulated skeletal remains indicates a further 10 possible individuals represented in the results of this excavation.

A number of the coffins present appear to have been painted white however there were no coffin- or name-plates in evidence here. There was an absence of grave markers or headstones and the distribution of burials does not appear to be consistent; however, some evidence exists for the linear organisation to these burials and in places there appears to be more significant concentrations of burials.

Thirteen samples of bones were submitted for radiocarbon dating. The results from these dates, when correlated with the archaeological record, indicate a most likely mid-twentieth century date for each sample. The range of estimated years-of-death for these samples are in the 1930s, 1940s and 1950s. This clearly falls within the period of the operation of the Sean Ross Abbey Mother and Baby Home.

The register of infants deaths records a wide range of annual figures, for example, from one death in 1962 to 92 deaths in 1936. The peak of infant deaths occurred at the Home from 1932 to 1947 when the numbers of deaths occurring per year varied from 30 up to 90 individuals. After this period the
number of deaths occurring in a given year were greatly reduced, falling to single figures in the latter years of the Home.

The total number of infant deaths which recorded as having occurred here are 1078. Without complete excavation it is not possible to say conclusively that all of these individuals are buried within the present site of the Children’s Burial Ground. There may have been dense concentrations of burials in other areas of the site that were not excavated. This excavation recorded evidence of a minimum number of 32 individuals and a further four possible graves and six disarticulated individuals across 10% of the ground surface. It was not possible to determine if other tiers or layers exist beneath these burials.

No young adult or adult remains were exposed during this excavation; however, there are two memorials to older individuals. These individuals are recorded in the maternal death register indicating that the burial ground was not exclusively designated for infants and young children who died while in the care of the Home.

These investigations took place as a direct response to two specific queries on behalf of the Mother and Baby Homes Commission of Investigation. These queries were answered in accordance with the limits of a test excavation approach. There are human remains, specifically those of young infants, present in this burial ground. The evidence indicates that the human remains that have been uncovered were not disturbed by the insertion of drainage works, field-drains or waste-water pipes.

Appendix A: Qualifications and Experience of Contributors

Niamh McCullagh, BA MA MSc. MIAI, MCSFS, Director, Forensic Archaeologist

Niamh has been practising in the field of professional Archaeology since 1999 and became a specialist in Forensic Archaeology in 2007. The search for, and excavation of, graves under forensic standards is her primary area of expertise. As an independent professional consultant she remains the primary advisor to An Garda Síochána in such matters. She is also the Senior Forensic Archaeologist with the Independent Commission for the Location of Victims Remains and has lead numerous searches and recovery operations since 2010. Niamh directed excavations at the Tuam Mother and Baby Home on behalf of the Mother and Baby Homes Commission of Investigation and was subsequently invited to direct the Expert Technical Group to advise the Minister for Children and Youth Affairs. With an established and proven track record Niamh has provided assistance, advice and training to a number of police forces and government agencies in the UK and Ireland.

Niamh has a primary degree in Archaeology, a Master’s degree in Theories, Methods and Practices of Archaeology (2002), a Master of Science in Forensic Archaeology and Crime Scene Investigation (2007) and is currently a PhD Candidate at Queens University Belfast. She is a member of the Institute of Archaeologists of Ireland, of the Chartered Society of Forensic Sciences and is listed in the Expert Witness Directory of Ireland.

Aidan Harte, BA MA MIAI ACSFS, Senior Archaeologist

Aidan Harte is a qualified archaeologist and geographer, with over 18 years’ archaeological experience in Ireland, the UK and France. Aidan comes to the team as a License Eligible Archaeologist and thus expertise in the field of archaeological excavation as recognised by the Department of Culture, Heritage and the Gaeltacht. He is also a Senior Team member on a consultation basis with the Independent Commission for the Location of Victims Remains through his company Munster Archaeology. He has been involved in a number of excavations and subsequent recoveries with the ICLVR since 2010.

As a professional published archaeological consultant and surveyor/GIS analyst, he is a full member of the Institute of Archaeologists of Ireland since 2007 and is currently Vice-Chair of that Institute (IAI). He has also served on the Board of Directors for the Cork Historical and Archaeological Society (2013-2019). Awarded a licence to direct archaeological excavations in 2005, Aidan has lead excavations and surveys of over 35 archaeological sites, of various type, size and period, in a variety of locations and conditions. Aidan has excavated and recovered humans remains of various levels of preservation – from skeletal to soft-tissue – from a wide range of periods and locations. He is proficient in the use of GPS mapping systems, photogrammetry and the integrated use of GIS for archaeological and environmental data.
Linda G. Lynch, MA PhD MIAI, Human Osteoarchaeologist

Linda is a professional, licence-eligible, archaeological consultant and human Osteoarchaeologist with over 20 years’ experience in Irish archaeology. She has a significant profile as an accomplished and published specialist. Linda comes to the team as an excavation expert but also as a leading professional in the field of Irish Osteoarchaeology. One of her major areas of research is in relation to juveniles. In 1998 Linda completed a Masters Degree focusing on archaeological neonate and infant remains, and has continued the interest since then. More recently, she has worked as the Osteoarchaeologist in the test excavations in the former Tuam Mother and Baby Home in Co. Galway and was also on the Expert Technical Group for the same site. In 2014 Linda was awarded a PhD in research that focused on human remains from various social strata in eighteenth and nineteenth century Ireland.

She is a member of the Irish Post-Medieval Archaeology Group and the Institute of Archaeologists of Ireland, where she served on the Board of Directors from 2006-2009 and is currently a Committee member with the Irish Association of Professional Osteoarchaeologists. Linda has published and lectured extensively, on skeletal remains dating from over 9000 years ago to the very recent past.

Electromagnetic Location (EML) Survey Methodology

Date of the Geophysical Surveys

Further Information
Purpose of the Geophysical Surveys

The Mother and Baby Home Commission of Investigation wishes to investigate the area reported to be a burial ground within the precincts of the former Sean Ross Abbey, Roscrea, Co Tipperary. The purpose of the investigation is to locate any graves within the area and also any utilities, if the latter are present. The graves were expected to be primarily of young children although some adult burials might also be present. Forensic archaeologists will carry out an investigation on the basis of the findings of this report.

Geophysical Methods Applied

Three geophysical methods of investigation were applied to the site. Ground penetrating (or probing) radar (GPR) and Magnetometry were used to investigate the area of the designated graveyard. In addition, electromagnetic location was used to determine the line of a former waste water pipe, now no longer in use.

The evidence from the two geophysical methods applied confirms the existence of burials and also of a substantial structure towards the North end of the site, probably of brick construction, but whose purpose is currently unknown. The results from the two methods are consistent. The detailed results, particularly with respect to variation with depth, were given by the GPR survey.

Summary of Findings

The site is characterised by large areas of disturbance, consistent with burials having taken place over a length of time. There is signal patterning in the vertical sections consistent with the presence of coffin remains both of child and adult proportions although it should be understood that this patterning might potentially also be produced by other subsurface features, particularly in the case of smaller burials (see also GPR Detection of Burials).

The primary evidence for the interpretation as burials rests on:
- the outline of pits in vertical section around the majority of these anomalies,
- the horizontal patterning of the groups of anomalies which indicates designated areas used for this purpose,
- the levelling visible in the 2-dimensional data over the top of the burial areas, as well as
- the degree of disturbance in the near surface.

The burial areas are mostly very shallow i.e. their upper surface lies within 40cm of ground level but there are also some slightly deeper burials in the central area to the South of the memorial cross. None of the burials are below 1.1m in depth. The juxtaposition of the base of at least one of the pits with the land drains visible in Figure 14 provides one explanation for the shallow nature of all of the burials. This image also illustrates that equally strong signals may represent more than one anomalous material. Burials, stone inclusions, field drains and other stone structures may only be distinguishable from each other on the basis of the patterning and not solely from one set of signals.

Taken together these factors suggest the presence of mass graves as well as individual ones and a long enough period of time for the difference in burial depth to emerge.
In the North section of the area, the magnetometer results show a strongly responsive anomaly of approximately linear outline. The responses are much stronger than any other material in the survey area and therefore dominate the North end of Figure 16. The strength of response is consistent with a brick built structure. The same feature can be seen in detail within the GPR data where it can be seen to form a curvilinear path across the site from the wooded area along the western edge towards site East. There is an associated rectangular structure immediately adjacent on the southern side and the footings appear to be unusually shaped and discontinuous. As such it appears more ornamental than would be expected for a waste water outlet.

A combination of observation, use of a cable avoidance tool (CAT) and signal generator (genry) and a flexitrace was used to verify that a known waste water pipe was no longer in use. It was tracked across the edge of the South end of the survey area. The GPR data indicates the presence of a possible chamber at the entrance to the survey area which may be the reason that it was not possible to insert the flexitrace any further along the pipe (cf. EML p24).

The Presentation of the GPR Data

In the commentary which follows, evidence from both 2-dimensional and 3-dimensional GPR is presented (see also How GPR works, p19). GPR is not an optical method and the 2-dimensional data, although it presents the same information as would an archaeological vertical section, cannot and does not present the data in the same visual format.

It is important to understand that signals returned to the radar antenna represent a change in materials rather than a specific material. The stronger the signal amplitude, the greater the change in the electromagnetic properties of the two (or more) materials. Although it is possible to observe that anomalous material is present, it is not possible to ascertain the nature of these materials because the strength of the signal is the product of the change between two or more materials. The strength of signal amplitude is given by the degree of black and white, grey indicates continuity of materials and a lack of anomalous material.

The 2-dimensional survey profiles have been assembled into a 3-dimensional data block from which horizontal plans, known as time slices, have been extracted at a range of depths. The precise depths have been chosen in function of changes in the data patterning. In the time slices which have been produced in colour, anomalous material is highlighted in black only. White indicates homogeneous material and pale green represents minor differences. The colour scale used is shown in Figure 1.

Figure 1: Amplitude Colour Scale

GPRs measure depth extremely accurately in nanoseconds time. Since radio waves do not travel at a constant speed but are transmitted at a velocity which depends on the material under investigation, this velocity has been calibrated on site to 0.09m/ns (see also Velocity Calibration). This velocity has been applied uniformly to the data in order to produce depths in metres and centimetres.
Orientation of the Survey Area and the Time Slices

All 2-dimensional data are depicted running from (site) South to (site) North from left to right. All time slices extracted from the 3-dimensional data show (site) West at the top of the page. Because of the orientation of the presumed burial ground, site North is approximately North East and site South approximately South West. The lower edge of each time slice lies on the same side as the adjacent stream and the main approach route (path) lies parallel to the left hand side of each time slice.

The magnetometer data has been corrected for orientation. The time slices have not been similarly adjusted in order to preserve easy measurement from the site grid for the forensic archaeologists to plan their trenches.

GPR Detection of Burials.

The success or failure of GPR in detecting burials depends on the method of burial, the electromagnetic properties of the surrounding environment and the period of time which has elapsed since the burial took place. Shortly after death, burials may be located by detecting the products of decomposition, specifically fluids and gases for which the electromagnetic properties are sufficiently different from the surrounding soil to be distinguishable by GPR. Over time, the detectability will diminish as fluids and gases dissipate into the soils around the burial.

Bones are not good targets for GPR as they do not remain inert. Mineralisation results from interchange between them and the surrounding soil so that, after a certain time, they become indistinguishable from their immediate environment on the basis of their electromagnetic response. The smaller the bones, the greater the problem since the size restrictions of the radar will also come into play (see also How GPR works).

However, two of the radar’s most easily distinguished targets are air and water. In a dry environment such as below the floor of a church, air will become the principal content of any burial, making these detectable. Outdoors, as in this case, organic remains, pits and coffins tend to retain water in greater quantity or for a longer period than the surrounding soil. It is the differential water content which makes the burial detectable by the radar. Depending on the water content, the level of groundwater, recent weather patterns and the length of time since the burial, it is sometimes necessary to time surveys of this type so as to make use of the peak season of differential water content. Although that strategy was not an option in this case, the results show a satisfactory level of distinction in water content between the burial areas and the surrounding environment.

The Burial Evidence

The 2-dimensional data demonstrates a crowded subsurface which contains a certain amount of layering (cf the black and white horizontal stripes) but also the outline of pits and signal patterns consistent with coffin cross sections. In figure 2 there are at least two burial pit outlines, clearly delineated in line 25 and more faintly in line 30. Anomalies 1 to 3 lying within the first burial pit could potentially be the cross sections of three small wet coffins. They vary in size but all of them conform to the type of pattern corresponding to coffins-containing waterlogged remains. This is not a definitive interpretation since any one of them could potentially be (for example) a large stone rather than a coffin but the presence of these
anomalies within the outline of a pit is strongly suggestive. Other anomalies are visible both within the pit outline and at its base. This suggests that there is a range of burial practices represented by this data. For example, either many of the coffins have disintegrated or not all of the burials were placed inside coffins.

Anomaly 4 is a signal pattern typical of the cross section of a buried adult coffin. It should be contrasted with anomaly 5 which is more typical of building material. It is possible that the burial pit seen in survey line 25 could extend as far as anomaly 4, the base of the feature is not clearly discernible beyond the area marked. Similar features are visible in the lower trace from survey line 30. Anomaly 6 is dealt with in the section on field drains.

The variation in burial practice is illustrated by survey line 24 (Figure 3). The first burial area marked in this survey line shows the outline of a burial pit, but the remainder of the data shows numerous signals which would be consistent with the presence of coffins of different sizes. The data in line 59 is similar. This also illustrates that much of the dark area towards the South of the site contains burials rather than building materials.

These areas correspond to many of the darkened areas in the time slices. Figure 4 shows the time slice extracted at the ground surface. The dark patches indicate the areas retaining more water than the average across the site, being the first indication of the position of some of the graves. Figure 5, extracted at c. 19cm, illustrates the top position of the shallowest graves, again on the basis of differential water retention. The exception is where the radar has crossed the adjacent path, to the South of the site, where the strong signals indicate the difference between the grass and the path material (Figures 4 and 5). On the East side of the site (towards the stream) there are graves which extend below the level of the small memorials placed at the side of the cemetery on the surface (Figure 5).

A broad swathe of slightly deeper burials appears at c. 40cm depth: see Figure 6. The layout is more systematic than the previous burial evidence and it is possible that this represents a different phase of use of the burial area. The beginnings of a large linear feature has also become visible at this depth, running in a (site) West/East line from the (0,0) position. This is discussed in Other Features: the Brick structure. Although the large linear feature looks as though it may continue to the eastern edge and possibly follow along it in a southerly direction, this does not appear to be the case. The 2-dimensional data is largely indeterminate due to the proximity of other material i.e. it could be consistent with the presence of small coffins with water content or it could be remains of a partially destroyed built structure.

Burial areas continue to be visible in the remaining time slices up to and including Figure 14, as discussed in Other Features: Field Drains. The two principal time slices illustrating the burial locations are provided in addition to this report in ROS-01 and ROS-02.
Figure 2: Survey Lines 25 and 30 showing burial areas and other features.

Figure 3: Survey Lines 34 and 59 showing burial areas.
Figure 4: Surface Time Slice showing areas of differential water retention.

Figure 5: Time Slice at c. 18cm depth (4.2ms) showing the outlines of shallow burial areas.
Figure 6: Time Slice at c. 40cm (1.3 ft) depth showing a broad central band of lower burials.
Other Features: The Brick Structure

In addition to the burial areas within c. 50cm depth, a large curvilinear feature has also become visible (Figure 7). This is the same feature partially visible in Figure 6 as the beginnings of a curvilinear line. In Figure 7 the line is complete, and its position corresponds to that of the large anomaly in the magnetometer data (See Figures 16 and 17). The magnitude of the magnetometer response suggests that this is the remains of a brick structure.

The difference between this feature and the burial evidence is obvious when viewed in section. Survey lines 6 and 64 and also 13 and 45 illustrate this (Figures 8 and 9).

The adjacent rectangular outline visible in figure 7 also appears to be part of the structure. The underlying signals do not resemble the burial evidence and are more consistent with the brick structure. They appear to connect with that feature.

The question still remains as to whether the apparent continuation of the brick structure along the eastern boundary is genuinely part of the construction of the brick feature or whether this still represents potential burial material (Figure 7). Figure 10 illustrates survey line 72, the data collected along the line y = 16.5m in the time slices. The first part of the data is disturbed ground, potentially burials, below levelled off material (evidenced by the continuous black and white banding). At 1, there is a large anomaly which could potentially be the cross section of an adult sized coffin although, unusually, there is an echo effect directly below one half of it. Section 2 contains two similar anomalies without any echo effects. It is not possible to completely rule out building material in this location, however of the difference between area 2 and the material up to point 1. Directly to the North of area 2 is the signal pattern, marked as 3 in Figure 10, which indicates the position of the brick feature. On the other side of the brick feature, the signals suggest potential structural material. The probability is that there are burials to the South of point 1 and structural material to the North of 3 with area 2 in between being indeterminate in the absence of other supporting evidence.

Deeper down, at c. 69cm (15.2ms), the brick structure separates out into a series of near rectangular footings at regular spacing. The overall outline follows that of the layer above (Figure 11). This curvilinear outline does not suggest a purely functional purpose for the feature. Immediately adjacent on the South side are two small rectangular areas of strong signal (marked 1 and 2 in Figure 11). The evidence differs both from the main brick structure and also from the rectangular feature observable in Figure 7. The signals in these areas are much smaller and difficult to interpret. They could be structural remains but, if so, are badly damaged. They could also potentially be associated with burials. There is no obvious continuity with the rectangular feature definitely associated with the brick structure in Figure 7. Figure 7 has also been reproduced as drawing ROS-03 to accompany this report.

The areas of strong signal in the centre of the time slice appear to be associated with burials. The possible chamber marked on the South side is discussed in Other Features: Possible Foul Water Chamber.
Forensic Archaeological Investigations at Sean Ross Abbey,
Mother and Baby Home Children’s Burial Ground

Figure 9: Survey Lines 13 and 45 showing the structural feature close to x = 0.

Figure 10: Survey Line 72 showing the possible continuation of the brick structure along the eastern border of the cemetery.

Figure 11: Time Slice at c. 65 cm (15.2ms) depth showing the brick structure, two rectangular areas and a possible foul water chamber.
Other Features: Foul Water Chamber

The dark area, marked as a possible chamber on Figure 11, appears likely to be a chamber on the foul water system. Viewed in 2-dimensional data, there is a very strong banded signal in the near surface with echo effects directly below (Figure 12). Survey line 33 is longer than line 31 because extends over the area of the path adjacent to the cemetery.

This type of response would mark the chamber and where its manhole cover would formerly have been located. Although the existence of a chamber might have been what prevented the flexitrace from being inserted further into the foul water system, this chamber is not directly aligned with the path of the pipe which was traced during the survey. It lies a few metres to the North, within the area of the cemetery.

Other Features: Linear Features visible at c. 25cm depth

At approximately 25cm depth, two additional linear features were observed (Figure 13). One leads at a diagonal towards the North from the eastern edge. This is very shallow in nature and is formed by layers of material, overlying similar evidence to the obvious areas of burial. There are signals consistent with small coffins below. This can be seen in survey line 64 at x = -12.9m (Figure 8).

The other, fainter line runs from site West towards site East along x = c. -14m. The data shows a small hyperbola at this position, crowded among many other signals. It is not possible to determine what this feature represents.

Other Features: Field Drains

At a depth of a little over 1.25m, a series of lines across the survey area become visible (Figure 14). Both from vertical and horizontal viewpoints these appear to be field drains. The lines are incomplete and may therefore be blocked and/or damaged.

The shallow nature of the burials on site may be due to the placement of the field drains. The red “x”s in Figure 14 mark where the first burial pit visible in survey lines 24 and 25 meets the line of the field drain, restricting the depth to which the burials could be lowered (Figures 2 and 3).

Anomaly 6 in survey line 30, comprising three separate signals typical of pipes, is part of the field drain system. It is very likely that parts of the field drain system have been damaged by the use of the field for interment.

Figure 13: Time slice at c.25cm depth (5.6m) showing additional linear features.
Figure 14: Time Slice at c. 1.36m depth (30.2m) showing the position of field drains.
**How GPR works**

GPR works by emitting a series of electromagnetic pulses (radio waves) from the transmitter. Portions of these signals are returned to the receiver antenna each time a material with different electromagnetic properties is encountered. The signal is always from the change from one material to the next, never solely from one material. It is therefore not usually possible to characterise materials on the basis of signal strength alone.

GPRs can only resolve targets in function of the wavelengths emitted. There needs to be a space of 1 wavelength between adjacent objects for them to show as separate objects so that it is possible for certain features to be masked if they are in the vicinity of large amounts of other material. The blocks of signal visible in the 2-d data presented in this report are formed by a combination of 2 signals. The first of these indicates the movement of the signal into the material and the second the movement back out into the surrounding environment. Unless the object is equivalent to or greater than the size of the wavelength, these two signals cannot be separated. This is what forms what appear to be blocks of signal. They cannot be taken as indicators either of size or of shape.

Interpretation of the returned signals relies on understanding the subsurface conditions and the materials to which the GPR is responding. It is not always possible to distinguish between specific materials on the basis of signal strength (amplitude). In this survey, that means that individual large stones within the soil matrix may not be distinguishable from, say, a small coffin with water content as both could potentially produce signals of similar strength (amplitude).

GPRs measure very accurately in nanoseconds time. They cannot automatically measure depth in metres and centimetres because radio waves do not travel at a constant speed. The transmission velocity is determined by the electromagnetic properties of the material being surveyed. It is therefore necessary to calibrate transmission velocity for every site surveyed.

In order to be able to locate the detected features accurately, two parallel survey reference lines were laid out across the survey area, line 1 to the North of the site, at the (0,0) position and line 2 to the South. The data was collected orthogonally to these reference lines.

The position of the survey reference lines was established using RTK-GNSS. The survey datum was established at 52°56′50.08″N, 007°46′17.25″W. Survey lines were set between the following points:

- 52°56′50.08″N, 007°46′17.25″W and 52°56′50.72″N, 007°46′16.84″W
- 52°56′51.71″N, 007°46′16.21″W and 52°56′51.31″N, 007°46′15.59″W

**GPR Equipment and Survey Parameters**

The GPR surveys were carried out using a GroundVue 3 GPR in single channel mode and a 400MHz antenna. Burial depths were unknown but presumed to be less than 2m and the site was known to be wet. Since water slows down the transmission of radio waves and, depending on the electromagnetic properties of the soil, can result in loss of signal, this was the highest frequency of antenna which could be used. Before starting the survey, a meandering line was carried out across the site to ensure that sufficient depth penetration was achievable.
The position of the field drains, below the level of the burials (cf anomaly 6 in Figure 2) verifies that signal was not being lost within the depths of interest. This implies that the blank data below this level represents undisturbed, natural deposits.

The survey parameters were:

- A survey depth of 60ns, equivalent to 3m in dry soil or 2.33m in the site conditions;
- A sampling interval along the line of travel of the radar of 2.7mm;
- A transect spacing of 25cm between successive survey lines.

The sampling interval was set in order to maximise efficient data collection without prejudicing the detection of smaller targets. The transect spacing was set in order to optimise the images produced in time slice. This has been essential for the understanding of this particular site.

**Velocity Calibration**

As explained above in *How GPR works*, it is necessary to calibrate the transmission velocity of the electromagnetic pulses on site. The default image produced by a radar of any given target is a hyperbolic curve. The shape of this curve reflects the transmission velocity as well as the radar characteristics. Curve fitting has been used to determine the transmission velocity.

A total of 8 calibrations were made at data points across the site. Seven of these gave a value of 0.09m/ns and the eighth 0.085m/ns. The transmission velocity of 0.09m/ns has therefore been used to translate depths in nanoseconds into centimetres.
The Magnetometer Survey

Methodology

The method used for this particular geophysical investigation was magnetometry. The system used was a MXPDA five-sensor fluxgate magnetometer array manufactured by Sensys.

The sensing elements of a fluxgate magnetometer consist of one or more cores of magnetic alloy, around which are wound coils through which an alternating current can be passed. Variations in the electrical properties of the circuits with magnetization of the cores can be converted into voltages proportional to the external magnetic field along the vertical core axis.

The Sensys MXPDA has a measurement range of ±8,000nT (nano-Tesla)

The sensors were mounted on a wheeled frame/cart c.0.25m apart.

The measurements acquired by the sensors are digitised and fed into a small ruggedized field computer (PDA) and saved for future download and subsequent analysis.

The Sensys MXPDA does not require a linear grid to be marked out prior to the survey. It acquires spatial information directly from an RTK-GNSS receiver mounted on the array frame.

For this survey a GeoMax Zenith 25 GNSS system was used that acquired NTRIP RTK corrections via GSM, removing the need for a static base-station.

The Zenith 25 is capable of measurement accuracy of ±10mm (X,Y) and ±25mm (Z)

The cart was manoeuvred across the survey area by hand in a series of parallel transects.

This is a rapid non-invasive survey technique, meaning no part of the equipment is inserted into the ground and that it is designed to cause minimum disturbance.

Figure 15: Magnetometer Array
The results of the magnetometer survey do not reflect the detailed results of the GPR survey as they measure different properties of the ground.

The dominant response surrounding the burial ground was identified as the effect of the chain-link perimeter fence on the magnetometer. The main area of burial ground can be divided into four discrete areas of response.

Area 1. The area northeast of the memorial cross shows a considerable magnetic anomaly. This response is typical of buried brick or masonry construction. These responses correspond with anomalies identified within the GPR data.

Area 2. The area beneath and surrounding the memorial cross shows an a poorly defined rectilinear anomaly. This may be associated with the responses observed in Area 1.

Area 3. The area immediately southwest of the memorial cross shows numerous strong responses which are typically c. 1m in diameter. Three significant dipolar responses are seen in the data suggesting buried objects with a significant magnetic signature. Numerous subtle anomalies can also be observed in the data suggesting disturbed ground.

Area 4. The area near the entrance of the burial ground shows subtle responses probably associated with ground disturbance. A long rectilinear response can be seen along with a dipolar response possibly associated with a memorial in this location. The drainage pipe located in the EML survey can be seen as a weak rectilinear response in this area.

![Magnetometer Results](image.png)
Figure 17: Annotated Magnetometer Results

The magnetometer results are provided in addition to this report in drawing ROS-04.
Electromagnetic Location (EML) Survey Methodology

EML is used to detect and trace sub-surface utilities comprising electrically conductive materials.

A Radio Detection RD8100 Cable Avoidance Tool (CAT) and associated signal transmitter (Tx5) were used in conjunction with a Radiodetection FlexiTrace; a 50m long, copper cored glass-fibre rod which is threaded into drains and ducts and enables accurate tracing.

The equipment was used in “active” mode using a transmitter to apply an artificially generated electromagnetic field to the FlexiTrace which was inserted into a disused drain that was found in the bank of the stream to the east of the site.

A single disused drain was traced from the stream and cutting through the southeast corner of the burial ground. The location was marked on the ground surface with biodegradable temporary marker paint.

It was not possible to push the FlexiTrace beyond the entrance of the burial ground suggesting the pipe has collapsed or the rod has entered an access chamber. The ease of threading the FlexiTrace to the point of refusal suggests it would be possible to use a drain inspection camera through this corner of the burial ground. This would also provide evidence as to why it was not possible to thread the FlexiTrace further into the pipework.

Date of the Geophysical Surveys

The surveys were carried out on 23rd and 24th January 2019.

Appendix G: Radiocarbon Dating Specialist Report

Radiocarbon Dating Report on Human Remains from Sean Ross Abbey to the Mother and Baby Homes Commission of Investigation

Author: Professor Gordon T Cook

Date: 9th May 2019
INTRODUCTION

This report relates to the radiocarbon dating of 13 foetal and infant bone samples (see Plates 1-13 below) submitted to the SUERC Radiocarbon Dating Laboratory by Aidan Harte on the 14th March 2019, on behalf of the Mother and Baby Homes Commission of Investigation in Ireland. The remains are from Sean Ross Abbey which operated as a mother and baby home between 1931 and 1969.

Plate 1: Right femur (Sample SK01) – estimated age of 38.0 foetal weeks ± 2.08 weeks. Our Laboratory Ref: GU-51072. Our Analysis Ref: SUERC-85647.

Plate 2: Right femur (Sample SK02) – estimated age of 37.4 foetal weeks ± 1.87 weeks. Our Laboratory Ref: GU-51073. Our Analysis Ref: SUERC-85648.
Plate 3: Left femur (Sample SK04) – estimated age of 36.3 foetal weeks ± 2.08 weeks. Our Laboratory Ref: GU-51074. Our Analysis Ref: SUERC-85649.

Plate 4: Right humerus (Sample SK06) – estimated age of 36.7 foetal weeks ± 2.33 weeks. Our Laboratory Ref: GU-51075. Our Analysis Ref: SUERC-85650.

Plate 5: Right humerus (Sample SK07) – estimated age of 40.7 foetal weeks ± 1.87 weeks. Our Laboratory Ref: GU-51076. Our Analysis Ref: SUERC-85654.
Plate 6: Left humerus (Sample SK11) – estimated age 36.4 foetal weeks ± 2.12 weeks. Our Laboratory Ref: GU-51077, Our Analysis Ref: SUERC-85655.

Plate 7: Left femur (Sample SK21) – estimated age of 3 months. Our Laboratory Ref: GU-51078, Our Analysis Ref: SUERC-85656.

Plate 8: Right humerus (Sample SK18) – estimated age of 1.5-3 months. Our Laboratory Ref: GU-51079, Our Analysis Ref: SUERC-85657.
Plate 9: Right tibia (Sample C17) – estimated age of 6 months. Our Laboratory Ref: GU-51080. Our Analysis Ref: SUERC-85658.

Plate 10: Right tibia (Sample SK19) – estimated age of 1.5-3 months. Our Laboratory Ref: GU-51081. Our Analysis Ref: SUERC-85659.

Plate 11: Left humerus (Sample SK17) – estimated age of 1.5-3 months. Our Laboratory Ref: GU-51082. Our Analysis Ref: SUERC-85660.
Plate 12: Left humerus (Sample SK14) – estimated age of 3 months. Our Laboratory Ref: GU-51083. Our Analysis Ref: SUERC-85664.

BASIC RADIOCARBON PRINCIPLES AND ASSUMPTIONS IN THE METHOD

Radiocarbon, or $^{14}\text{C}$, is cosmogenic, i.e. it is produced as a result of cosmic activity. The primary cosmic radiation is predominantly high energy protons (up to $10^{18}$ eV), which interact with atmospheric gases producing neutrons, protons, $\alpha$-particles, etc. The neutrons are thermalised and captured by atmospheric nitrogen in the upper atmosphere, resulting in $^{14}\text{C}$ production by the following reaction:

$$^{14}\text{N}(n, p)^{14}\text{C}$$

$^{14}\text{C}$ is radioactive and decays by $\beta^-$ decay ($E_{\text{max}} = 156$ keV) back to $^{14}\text{N}$. The physical half-life is 5730 years. The Libby half-life, which is used to calculate radiocarbon ages, is 5568 years. The natural rate of production is not constant but is subject to short-term (century scale) and long-term (millennia scale) fluctuations. The short-term fluctuations are usually attributed to heliomagnetic modulation of the primary cosmic-ray flux (Stuiver 1961; Damon et al. 1989), i.e. changes in the solar sunspot activity where periods of high activity result in decreased cosmic ray incidence on the earth and hence a reduced $^{14}\text{C}$ production rate. The longer-term
fluctuations are attributed to geomagnetic modulation, i.e. the charged cosmic rays which create $^{14}$C are deflected to a greater or lesser degree depending on the earth's dipole moment (Elasser et al. 1956; Sterberg 1992). The $^{14}$C produced in the upper atmosphere is rapidly oxidised to $^{14}$CO$_2$, which mixes with the stable CO$_2$ ($^{13}$CO$_2$ and $^{12}$CO), resulting in an atom ratio for the three isotopes of approximately:

$$\frac{^{12}\text{C}}{^{13}\text{C}} : \frac{^{13}\text{C}}{^{14}\text{C}} : \frac{^{12}\text{C}}{^{14}\text{C}} = 10^{12} : 10^{10} : 1$$

With the onset of the Industrial Revolution came man's first significant perturbation of the natural $^{14}$C/stable carbon ratios in the environment. The massive burning of fossil fuels which, because of their age, contain no $^{14}$C has resulted in the release of only stable CO$_2$ to the atmosphere ($^{12}$CO$_2$ and $^{13}$CO$_2$), thereby diluting the $^{14}$CO$_2$ activity (Suess 1953, 1955). This dilution, commonly known as the Suess Effect, was measurable in post-1890AD tree rings and by 1950AD the atmospheric activity was reduced by about 2% and 3% in the southern and northern hemispheres, respectively. The consequence of this from a radiocarbon dating viewpoint is that it is not possible to distinguish between a sample (organism) that died in the 17th century and whose activity has undergone around 300 years of decay and a sample that formed during the period 1890 to 1950 whose activity is influenced by the Suess Effect.

From the early 1950s came the onset of major programmes of atmospheric nuclear weapons testing which caused a significant increase in the atmospheric concentration of $^{14}$C such that by 1963 the activity in the northern hemisphere was approximately double the natural level (Figure 1). However, following a test ban treaty, the atmospheric concentration has continuously decreased from around 1963/64 onwards as the excess $^{14}$CO$_2$ has been taken up by the oceans and the biota.

![Figure 1: Atmospheric $^{14}$C activity in the N Hemisphere during the period 1950–2015](image-url)
Regardless of the route of formation, $^{14}C$ becomes incorporated into the food chain via photosynthesis by the primary producers, according to the following reaction.

\[
6\text{CO}_2 + 6\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2
\]

*Photysynthetic pigments*

Subsequent transfer through the food chain results in radioactive labelling of all living organisms.

---

*Plant carbohydrates*  
*Transfer through food chain*  
*Animal life*

N.B. As a consequence of atmospheric nuclear weapons testing, any short-lived sample that has a fraction modern value greater than 1 must have been alive after 1955 (see Figure 1). However, a problem arises when dealing with human bone. The dateable fraction is a protein termed collagen (see below) which, particularly in adults, turns over relatively slowly (Hedges et al. 2007). Consequently, it is not the $^{14}C$ within bone collagen formed during the year of death that is measured but an integration of collagen from formation and turnover processes over a number of years. Therefore, in the absence of other information, the use of single $^{14}C$ measurements on bone collagen from juveniles and adults can only provide very limited information, i.e. whether or not the person died during the nuclear era (because their $^{14}C$ activity was enhanced relative to the natural equilibrium living value).

There is one exception in which dating of single modern-period (i.e. within the nuclear era) bone samples can produce high precision estimations of year of birth. This is where the skeletal remains are of new-born or close to new-born babies. The shape of the $^{14}C$ bomb peak has been well constrained through extensive measurements of $^{14}C$ activities (Levin et al. 1994; Levin and Kromer 1997; Manning and Melhuish 1994; McGee et al. 2004) and the rapid annual changes provide the potential for a chronologically precise methodology (This also applies to components of human remains that exhibit very fast carbon turnover). The bone collagen in infants is formed from the mother’s dietary intake, and here, the $^{14}C$ will be relatively close to equilibrium with atmospheric levels. Broecker et al. (1959) derived an average value of <1 year for the period between initial fixation of carbon by plants and human consumption and a maximum lag of <6 months between carbon consumption and appearance in the blood. Therefore, a radiocarbon measurement made on the bone collagen should represent the $^{14}C$ activity of the atmosphere 1-2 years earlier than the year of death. The samples we analysed were all from children of <6 months of age and therefore a delay of 1-2 years should apply to them.

Under equilibrium conditions where the rate of production = rate of decay, every living organism in the terrestrial biosphere is labelled with the same $^{14}C$ activity. On death, no more $^{14}C$ uptake occurs and only the decay process operates (see Figure 2).

\[
^{14}C \rightarrow ^{14}N + \beta
\]
This follows First Order Kinetics. For $^{14}$C dating, re-arranging the first order decay equation ($A(t) = A_0e^{-\lambda t}$) for $t$ gives:

$$t = \frac{1}{\lambda} \ln \frac{A_0}{A_t}$$

Where $t$ = time elapsed since death, in years B.P. (Before Present, where present is the year 1950)

$A_0$ = equilibrium living activity

$A_t$ = activity remaining after time $t$

$\lambda$ = decay constant = $\ln 2/5568 = 0.693/5568$

$A_0$ cannot be measured directly as this is the equilibrium living activity. The $A_0$ activity is related to that of a reference standard whose activity is measured in the lab. $A_t$ is the activity of the sample material now and is also measured in the lab. The primary standard used in radiocarbon dating is wood growing in the year 1890, which is pre-Suess and pre-nuclear weapons testing effects. The $^{14}$C activity of this material was 13.56 dpm/gram of carbon (226 Bq kg$^{-1}$ of carbon). This was measured in the mid-20th century and corrected for 60 years decay to the year 1950. This material was very limited and now a secondary standard is used. This is currently oxalic acid (termed Oxalic acid II or SRM 4990C) produced by the National Institute of Standards and Technology (Maryland, USA). This oxalic acid was synthesised from beet molasses in 1977 and 0.7459 x oxalic acid activity = 1890 wood activity = A0 when both the wood and the oxalic acid are corrected for fractionation. SRM 4990C is commonly referred to as the primary standard.
Figure 2: The decrease in $^{14}$C activity of a sample organism with time.

Assumptions in the Method

There are 4 main assumptions in the radiocarbon method as follows:

1. The rate of production in the upper atmosphere has been constant throughout time.
2. The $^{14}$C activity of the atmosphere and hence the biosphere, with which it is in equilibrium, has remained constant throughout time.
3. The rate of $^{14}$C transfer between different reservoirs of the carbon cycle is rapid with respect to the average lifetime of $^{14}$C.
4. The half-life is accurately known.

None are strictly correct!

For 1: Long term (millennia scale) and short term (century scale) fluctuations have occurred as discussed above.

For 2: The above variations in the rate of production will influence the $^{14}$C activities of the atmosphere and biosphere. In addition, there can be changes in reservoir size, e.g. due to temperature changes causing increases and decreases in polar icecap cover.

For 3: The oceans are depleted relative to the atmosphere and hence organisms living in the oceanic environment will be depleted. They have a "reservoir age."
For 4: The original Libby half-life is still used to calculate \(^{14}\text{C}\) ages, even although we know it to be incorrect.

For 1, 2 and 4: Dendrochronological curves and macrofossil samples from varved lake systems solve many of the problems. The dendrochronological curves are derived by radiocarbon dating 10-year spans of tree rings from absolutely dated tree ring sequences, which are continuous from present day to approx. 13,900 years BP (before present where present is 1950AD). Absolute age is plotted against radiocarbon age to produce a calibration curve against which radiocarbon ages of samples can be calibrated on a calendar year timescale. Beyond approx. 13,900 BP these data are supplemented by the addition of the Lake Suigetsu macrofossil data, regarded as the only other bona fide atmospheric record, from 13,900 cal BP to the end of the range of the dating method (Reimer et al. 2013).

For 3: This reservoir effect has been measured in many locations. For the UK, the apparent age on death appears to be around the global average of 400 years but is variable through time (e.g. Ascough et al. 2004).

SAMPLE PREPARATION

Bone consists of two basic fractions. The inorganic fraction is primarily calcium phosphate with an apatite-like structure but incorporating a small percentage of carbonate (0.5-1% by weight) as a substitute for phosphate in the crystal lattice. The organic fraction is primarily a protein termed collagen.

Where the bone has not been cremated, our preferred procedure is to extract the collagen as a partially hydrolysed fraction (gelatin), followed by freeze drying.

Sub-samples were removed from each of the 13 bones, cleaned thoroughly and subjected to the collagen preparation process illustrated in the following flow diagram.
**Preparation of bone collagen**

1. Weigh and record the total weight of sample.  
   Minimum weight 1 g  
   Optimum weight 5 g

2. Select a reasonable section of bone, weigh and record the total weight.  
   Clean the bone surface to remove any adhering soil and additional contaminants using the Dremel multi-tool (any internal surface of the bone must also be cleaned).

3. Crush the bone into small fragments (approx. 1 cm or less) and place into a 250 ml beaker, cover with a watch glass, weigh and record the weight of sample. If humic acid contamination is suspected, add 0.5M NaOH for 1-2 hr, decant and rinse bone with water.

4. Add 100 ml of 1 M HCl and leave for 24 hrs.  
   Dissociates carbonates  
   Solubilises structural mineral material (i.e. Bioapatite)  
   Removes acid soluble contaminants

5. Decant the acid solution.  
   Bone material should appear ‘jelly like’?  
   NO  
   Remaining acid within the bone should make the solution slightly acidic.  
   Denatures and solubilises bone collagen
   YES  
   Addition of 100 ml of Ultra Pure distilled water.  
   Heat in a sand bath at approx. 80°C for 3 hr

6. Allow the solution to cool slightly and filter using a GF/A filter paper.

7. Retain filtrate (i.e. Collagen) and transfer to 100 ml beaker.  
   Dry the total volume to 5-10 ml.  
   Transfer the collagen solution to a pre-weighed 20 ml vial.

8. Retain and oven dry the remaining bone fragments.

9. Freeze the vial and collagen solution, replace cap with filter paper.  
   Transfer to the freeze drier until all the solution is removed and the collagen, a crystalline powder remains. The vial is re-capped, weighed and the sample stored for combustion.
Conversion of collagen to graphite for accelerator mass spectrometry (AMS) radiocarbon measurement

Combustion of the collagen samples for radiocarbon dating was undertaken according to the method of Vandeputte et al. (1996). Approx. 20 mg sub-samples of collagen were weighed into quartz combustion tubes containing copper oxide as a source of oxygen and silver foil to mop up halides and other contaminants. The combustion tubes were then evacuated, sealed and placed in a furnace at 850°C overnight. The CO₂ produced during the combustion was cryogenically purified and 3 ml sub-samples were converted to graphite for subsequent AMS measurement using the method of Slotta et al. (1987).

SAMPLE MEASUREMENT

Radiocarbon (¹⁴C) Measurements

¹⁴C measurements on the graphite preparations were undertaken using our 250 kV Single Stage Accelerator Mass Spectrometer (SSAMS), manufactured by National Electrospectrics Corporation. This spectrometer features a high intensity sputter ion source with a 134-sample capacity. The SUERC Radiocarbon Laboratory does not have certification under the BS5750/ISO9000 Quality Assurance schemes, however, the laboratory takes part in all the major international inter-calibration studies and has been at the forefront in organising six of the last seven. In addition, we have a fully implemented Quality Assurance manual which details all the procedures employed in the laboratory and demonstrates how each sample is tracked through the laboratory. Details recorded include pre-treated sample yields, sample carbon graphitisation yields, etc.

The laboratory uses the primary ¹⁴C standard, SRM-4990C, for all estimates of modern reference standard activity. Wheels of up to 134 samples, including standards, are measured and since measurements of such large numbers of samples can last several days, our procedures must cope with changes in measurement conditions. To this end, samples are measured to completion in groups of 10 in only a few hours, with Oxalic Acid II primary standards spanning groups for inter-group consistency. Each group of 10 samples contains: (i) one Oxalic Acid II primary standard, (ii) one humic acid secondary standard of less than 1 half-life in age (used in three international intercalibration exercises, with an overall consensus value of 3370 ± 51.5 y BP), (iii) either a modern secondary standard material from the Third International Radiocarbon Inter-comparison (TIRI Sample A which is a barley mash from the whisky industry with a consensus value from the study of F¹⁴C = 1.1635 ± 0.0082... N.B. When the activity is higher than the modern value it is expressed as a fraction modern (F¹⁴C) rather than a radiocarbon age), or a background standard (interglacial wood, infinite age bone or geological carbonate depending on the type of unknowns being measured), and (iv) 7 unknowns. Such rapid analysis is relatively insensitive to longer-term drifts and changes are quickly apparent in the fast repeat measurements of individual samples, including primary and secondary standards. Operator intervention, to adjust the spectrometer or to change sample measurement parameters, can be immediate; each sample is automatically repeatedly measured in intragroup rotation until the sample total counting statistics and the scatter of the repeat ¹⁴C/¹²C measurements exceed a quality threshold of typically 3‰, disregarding early inconsistent measurements as necessary.

Finally, time trends remaining in the completed data sets can be compensated for in subsequent data reduction and normalization.
**Stable Isotope Measurements**

Approximate 0.6 mg sub-samples of collagen were weighed into tin capsules for stable isotope analysis (\(^{13}\)C and \(^{15}\)N and C/N ratio) using a Delta V Advantage continuous-flow isotope ratio mass spectrometer coupled to an IsoLink elemental analyser via a Conflo IV (Thermo Scientific, Bremen, Germany). The samples were combusted in a single reactor containing tungstic oxide and copper wires at 1020°C to produce \(N_2\) and \(CO_2\). The gases were separated in a 0.8 m GC column heated to 70°C. Helium was used as a carrier gas throughout the procedure. \(N_2\) and \(CO_2\) entered the mass spectrometer via an open split arrangement within the Conflo IV\(^{138}\) and were analysed against their corresponding reference gases.

For every ten unknown samples, in-house gelatine standards, which are calibrated to the international reference materials USGS40, USGS41, IAEA-CH-6, USGS25, IAEA-N-1 and IAEA-N-2, were run in duplicate. Results are reported as per mil (‰) relative to the internationally accepted standards VPDB and AIR with 1σ precisions of better than ± 0.1‰ for both \(^{13}\)C and \(^{15}\)N. Any results for bone samples that have molar C/N ratios outside the range of 2.9-3.6 would be discarded as they would be deemed to represent collagen that has undergone post-depositional alteration (DeNiro, 1985).

**RESULTS**

We analysed the \(^{14}\)C, \(^{81}\)C and \(^{815}\)N, and determined the C/N ratio in the samples of collagen that were isolated from our samples referenced GU-51072 to GU-51084. The results are presented in Table 2 and the quality assurance results for the batch of analyses that included GU-51072 to GU-51084 are shown in Table 1.

Table 1: Radiocarbon QA results for the batch of samples containing samples GU-51072 to GU-51084.

The QA data demonstrate that results in the batch of analyses are accurate as both the mean Humic Acid and Barley Mash secondary standard values are well within error of the consensus values produced by the worldwide radiocarbon community. The data are also precise as the standard deviation on the Humic Acid values is 30 years while the standard deviation on the fraction modern values for the Barley Mash standards is 0.0041.

Table 2. Radiocarbon and stable isotope results for the 13 bone samples.

The C/N ratios for the samples of isolated collagen are within the limits for collagen that is unaltered (accepted range is 2.9-3.6) and are therefore deemed suitable for radiocarbon and stable isotope measurements.

DISCUSSION

Given the age of these children, from foetal to a maximum of a very few months, they have been deriving their food from their mothers’ dietary intake and so they are effectively feeding at a trophic level above their mothers. Therefore, the stable isotope ($\delta^{13}$C and $\delta^{15}$N) values are fairly typical of diets that are very dominantly derived from terrestrial resources, apart from SK01. In this case, both the $\delta^{13}$C and $\delta^{15}$N values are elevated and would suggest that marine resources formed part of the mother’s diet. This introduces a reservoir effect and has the effect of making radiocarbon ages anomalously old. It is not possible to allow for this during the nuclear weapons era and it is my opinion that the effect would be small anyway. Those samples with F$^{14}$C values greater than 1 were calibrated using OxCal 4.3.2 (Bronk Ramsey 2017) and the post-bomb atmospheric Northern Hemisphere Zone 1 curve (Hua et al. 2013). Those with values less than 1 were calibrated using OxCal 4.3.2 and the IntCal 13 atmospheric curve. The results are shown in Figures 3 to 15 and the data are collated in Table 3. The results clearly demonstrate that samples SK01, SK02, SK18 and C17 are from within the nuclear era. For SK01, the result calibrates to either 1957 or 1999-2002 (Figure 3). This is a feature of this type of calibration where a value can correspond to a year (or years) on both the up- and down-slope of the curve. However, since the home only operated between 1931 and 1969, the more recent range can be ignored. Also, the probabilities associated with the age ranges should be ignored as they are a function of the steepness of the curve. Based on the earlier discussion that a radiocarbon measurement, made on the bone collagen of babies that are close to birth in age, should represent the F$^{14}$C activity of the atmosphere 1-2 years earlier than the year of death, this would put the year of death at between 1958 and 1959. Similarly, for SK02, the year of death would be between 1960 and 1963. For SK18, the year of death would be between 1960 and 1963 and for C17, the year of death would be between 1957 and 1959. For all other results which had F$^{14}$C values less than 1, there are a number of age ranges that can be ignored since they are significantly too early. For those that fall within the correct time range, I would not be prepared to quote years of death that are more precise than are given in the calibrations. The year 1955 would certainly be the most recent that any could be
as beyond 1955, F^{14}C values of >1 are the norm. SK11 is anomalous in that calibration produces two age ranges, both of which are much too early. We repeated this result and got a similar value. I note that SK11 has the highest δ^{13}C value apart from SK01 and this may be indicative of a small marine effect which can be accounted for in pre-nuclear era samples. I re-calibrated the F^{14}C value using the mixed marine / terrestrial curve within OxCal 4.3.2 ( Bronk Ramsey 2017). The percentage marine diet was calculated using a linear interpolation of δ^{13}C values between -12.5% for someone with a totally marine diet and -21.0% for someone with a wholly terrestrial diet (Arneborg et al. 1999). For GU-51077, I used a value of -19.9% (assuming about a 1% trophic level shift given that the baby was feeding at one trophic level higher than the mother). This value corresponds to 13 ± 10% on this plot. In addition, a ΔR value is also required to complete the calibration. ΔR is the local deviation from the global average surface water marine reservoir effect. I used a value of 0 ± 50 that would be fairly representative for the UK marine coastal environment. The calibration is illustrated in Figure 8a.

CONCLUSIONS

Of the thirteen bone samples from foetuses and babies of 6-months or less that were analysed, four produced F14C values that clearly places their years of death post-1955 and within the period that the Sean Ross Abbey Home operated. The others have values significantly <1 and all have multiple, possible calibrated age ranges, which is typical for fraction modern (F14C) values around 0.97-0.98. These produce calendar age ranges in the pre-modern, 1650-1950 AD period as defined by Taylor et al. (1989). However, it is important to note that again, they all produce age ranges within the period when the Sean Ross Abbey Home operated.

Appendix H: Drain Inspection Report

Inspection Report

KAG BUILDING CONTRACTORS LTD.

St. Annes Sean Ross Abbey

Roscrea

Dated: 07/03/2019
Summary Report

• This document may be used to establish any of the drainage system
  in various areas of the cemeteries. It is intended to provide a
  clear understanding of the drainage system in the cemetery.

• The survey was started below the main entrance to the cemeteries
  and continued through the various areas.

• At Man 2, the pipe changes from clay to PVC.

• At Man 3, the pipe turns 90 degrees to the left and changes from
  clay to a 4-inch concrete pipe with a connection coming from the
  right. This pipe runs parallel to the grave yard.

• At Man 5, the pipe turns 90 degrees to the left at the cemeteries.
  There are two further manholes which appear to have been in
  the cemeteries.

• The pipe work from these manholes also turns away from the
  grave yard.

• The final manhole is at the main entrance to the cemeteries. This
  pipe is 100mm in diameter and has a 150mm diameter. This pipe
  runs towards Manhole 3 and has collapsed approximately in front
  of the entrance to the grave yard. It appears that this pipe used to
  connect with the old pipe coming from Manhole 2. At some stage
  it was diverted and now runs into the concrete pipe.

Report of the Confidential Committee
to the
Commission of Investigation into
Mother and Baby Homes
October 2020
Contents

- Introduction
- Circumstances of Pregnancy and Admission
- Conditions in the homes
- The Birth experience
- Adoption and Consent
- Fostering and Boarding out
- The Adoption experience
- Exit and Aftermath
- Tracing
- Acknowledgment
Introduction

The Commission’s Terms of Reference required it to establish a Confidential Committee to provide a forum for people who were formerly resident in the institutions under investigation or who worked in these institutions during the relevant period ‘to provide accounts of their experience in these institutions in writing or orally as informally as is possible in the circumstances’.

The Confidential Committee was required to

(a) operate under the direction of and be accountable to the Commission;
(b) provide in its procedures for individuals who wished to have their identity remain confidential during the conduct of the Commission and its subsequent reporting; and
(c) produce a report of a general nature on the experiences of the single women and children.

The Commission was established in February 2015. The first hearings of the Confidential Committee were held in June 2015 but it was September 2015 before it was fully in operation. This was because staff had to be recruited; procurement processes had to be put in place for services such as advertising and IT; and arrangements had to be made for the payment of expenses to witnesses while maintaining strict confidentiality.

The Commission appointed Ms Lucy Scaife and Mr Kevin Healy as members of the Confidential Committee. They were assisted by Commission researchers Ms Roni Buckley, Ms Meg McMahon, Ms Sarah Lea and Ms Maeve DeSay. Ms Nóra Ní Dhomhnaill was appointed as Witness Support Officer.

Training
The Commission organised training for the committee members and the staff who were dealing with the former residents. The Commission is grateful for the assistance of Ms Norah Gibbons1 who had been a member of the Commission to Inquire into Child Abuse (the Ryan Commission) and of the Acknowledgement

---

1 Regrettably, Ms Gibbons died in April 2020 RIP.
Forum of the Historical Institutional Abuse Inquiry in Northern Ireland. All staff members who were likely to interact with witnesses, for example, reception staff, were included in the training. The major emphasis was on preserving the confidentiality of the witnesses and ensuring that they were comfortable and had a satisfactory experience.

Advertising
After a tendering process, an advertising campaign was conducted in June/July 2015 in national and local press and local radio. A commission representative gave a number of interviews on local radio stations encouraging relevant people to come forward. Further advertising and media interviews took place in June 2016 after the Commission had chosen the representative sample of county homes. Information was provided to Irish organisations in the UK and the USA. Information leaflets and posters were provided to doctors’ surgeries, the constituency offices of TDs and to the Irish Country Women’s Association and all information was later available on the Commission’s website.

Contacting the Confidential Committee
A dedicated Freephone number to call the Confidential Committee team was installed. This was the main way that people contacted the Committee although some used the email service which was available on the Commission’s website and some got in touch by post. Some people contacted the Commission to express a desire to give evidence but thought that they were ineligible as they did not have any complaints. They were assured that the committee wanted to hear all the available evidence and was not confined to hearing complaints.

An information leaflet about the Confidential Committee was drawn up and provided to anyone who made an inquiry. This set out in detail exactly what the Confidential Committee could and could not do. A hard copy of the Commission’s Terms of Reference was provided to anyone who requested it.

The commitments made by the Confidential Committee
The information leaflet explained the role of the Confidential Committee as follows:

---

The main purpose of the Confidential Committee is to listen to the experiences of those who have spent time in Mother and Baby Homes. These can include mothers, children, nuns, workers, occasional workers (e.g. delivery men, painters etc.) and visitors to the home.

Applicants were told that the hearing before the committee would be heard in private and that the committee:

may be suitable for you if you wish to have your experiences heard in a sympathetic atmosphere by experienced people and you do not want any person or institution to know that you are giving evidence to the Commission. The evidence you give will not be open to challenge.

The leaflet set out the core commitments of the Confidential Committee:

- We will treat everybody equally whatever their circumstances, age, disability, race, religion, beliefs, sexual orientation or civil status.
- We will listen to you and support you in telling us about your experiences.
- We will give you time to tell us your experiences.
- We will understand if you get upset when describing your experiences.
- We will not judge you.
- We will be honest with you about what we can and cannot do.
- We promise you will remain anonymous, even when we bring your experiences to public attention so that they can be understood and acknowledged by all.

Reports to the Authorities

The leaflet explained that no report on anything a person told the Confidential Committee would be made to the authorities except if the Committee had reason to believe that:

- A serious crime had been committed;
- A serious risk to a person’s life existed; or
- Abuse of a child was ongoing.

It was explained that, in any of those situations, the Committee would be obliged to report the matter to the Gardaí or to the Child and Family Agency (Tusla). In fact a small number of reports were made.
What the Confidential Committee could not do

It was clearly explained that

- Neither the Confidential Committee nor the Commission itself could award redress or compensation;
- Neither the Confidential Committee nor the Commission itself could assist an individual in tracing relatives.

It was also explained that the Commission would not provide counselling but would provide a list of counselling sources if this was requested.

Applying to the Committee

Everyone who expressed a wish to speak to the Confidential Committee was issued with an application form. Some people requested that the form be sent to an address other than their home address and this was done. The application form asked for basic information about the person such as name, date of birth, contact details, the institution(s) in which they were resident, the years in which they were resident, how they wished to be contacted by the Commission (phone, email, post) and whether or not they wished to be accompanied at the hearing. They were also asked if they would need any special assistance because of, for example, problems with hearing, mobility or serious health problems.

It was made clear that all this information would be dealt with on a strictly confidential basis. Anyone who had a problem with the form could call the Freephone number.

Every witness who wanted to give evidence was facilitated. In November 2016, the Commission announced that the closing date for applications to speak to the Confidential Committee was 1 March 2017. In practice, the Commission did not enforce this deadline and continued to accept applications beyond that time and heard witnesses up to February 2020.

Organising the Confidential Committee meetings

All arrangements with the witnesses were made by the Witness Support Officer. She made the arrangements for the hearings, assisted with travel arrangements for the witnesses where required and organised the payment of expenses.
The majority of the witnesses were seen in the Commission’s offices. Meetings were also held in Birmingham, Carlow, Cavan, Cork, Donegal, Dublin, Galway, Kilkenny, Laois, Leitrim, Limerick, London, Manchester, Meath, Monaghan, Offaly, Roscommon, Sligo, Tipperary, Waterford, Westmeath, Wexford and Wicklow. Those witnesses who said they would have difficulty travelling were seen in their own homes while others were met in disability accessible premises. A number of hearings were conducted electronically, in particular with USA residents. Some people who could not come to the committee submitted letters.

Confidentiality was rigidly adhered to in all these arrangements. All staff and all service providers in the Commission’s office had signed confidentiality contracts (this included the Commission members). The arrangements for meetings were made in such a way as to ensure that witnesses did not meet each other. Hotels which were booked for hearings were booked in the name of a staff member and the name of the Commission did not appear in any public area.

Many of the witnesses were particularly concerned about maintaining confidentiality and specifically asked that their names not be known outside the Confidential Committee. As is clear from the report, many witnesses had never discussed their experiences with any other person; this included witnesses who had not told family members such as their husbands and/or their other (now adult) children. A few who were in this position subsequently told the Confidential Committee researcher that their experience at the Confidential Committee had given them the courage to go home and tell family members.

Arrangements were put in place to enable the Commission pay expenses to witnesses who came to the Confidential Committee. The officially preferred method of payment - electronic funds transfer - was not suitable for many of the people for a number of reasons, the most important of which was the need to maintain their confidentiality. It took some considerable time to get approval to open a bank account in the Commission’s name and to get a cheque book. This was eventually issued in September 2015. Witnesses and persons accompanying them were reimbursed their reasonable expenses. In some cases, this included overnight stays in hotels which, again, were booked in the name of a staff member. The name of the person receiving expenses was known only to the Witness Support Officer and the second cheque signatory (either the researcher who had met the person or the Commission’s solicitor or director; neither the solicitor nor the director met the people involved).
Numbers

A total of 886 people who seemed to be within the Commission’s remit contacted the Commission and were sent information about the Confidential Committee. (Ten others also contacted the Commission but they had been resident in county homes which the Commission was not investigating.) The vast majority were resident in Ireland; 12% were resident in the UK and 3% in the USA with a small number in other countries. Of these, 673 completed the application form; 19 gave evidence to the Commission and not to the Confidential Committee and 550 met the Confidential Committee. Some people who met the Confidential Committee also gave evidence to the Commission. The 104 who completed the application form but did not meet the Confidential Committee were offered appointments but, for various reasons, did not take up the offer.

One of the 550 people who met the Confidential Committee was not in one of the scheduled institutions and so was outside the Terms of Reference. Of the 549 who were within the terms, 304 were resident as mothers; 228 were resident as babies/children and 17 were involved in other ways.

The mothers came from 12 different institutions; the children also from 12 different institutions but not the same 12 as the mothers. A small number of the mothers and children had been in more than one of the institutions. The 17 others were associated with seven different institutions.

The vast majority of the mothers who met the Confidential Committee entered the institutions between 1960 and 1989; not surprisingly, there was no one from the 1920s or 1930s and very few (five) from the 1940s. There were 13 from the 1950s and 13 from the 1990s. Virtually all were over the age of 45 when they met the Committee with almost 60% being over the age of 60.

The vast majority of the former child residents who gave evidence were in the institutions in the 1940s, 1950s and 1960s. There was one from the 1920s, eight from the 1930s, 14 from the 1970s and four from the 1980s.

How the hearings were conducted

At each hearing, there was one member of the Confidential Committee and one researcher. The researcher took notes of the hearing. Applicants could be accompanied by any adult of their choosing other than a person who was planning to
speak to the Confidential Committee or give evidence to the Commission. It was explained that the reason for this was ‘to protect both individuals and the process, from allegations that each has been influenced in what they say by hearing the account given by the other’. Applicants could be accompanied by a legal advisor if they wished but the Commission would not cover the legal costs.

Witnesses were asked for permission to record their evidence on the clear understanding that the recordings would be used only as an aide memoire for the researcher when compiling the report and would then be destroyed. All such recordings were destroyed after the report was added to the Confidential Committee electronic repository of information.

The committee member asked questions in order to elicit further information but did not ever challenge the account given. There was no investigative questioning and no challenge or disbelief expressed. This was the case even when it was absolutely clear that the person’s recollection was incorrect, for example, a witness who was in a small institution talked about the large number of babies there or a witness who named a particular person as being involved many years before that person actually worked in the institution. Some brought prepared statements and/or documentation. These were copied and the originals returned.

The length of the meetings varied considerably. Witnesses were given as much time as they wanted. They were offered refreshments and breaks.

Some witnesses contacted the Commission offices after their hearing because they remembered something else that they wanted to say. These calls were taken by the Witness Support Officer or the researchers who had been present at the hearing and the person’s record was amended accordingly.

**The information gathered by the Confidential Committee**

An electronic repository of information was set up to record the information provided by witnesses to the Confidential Committee. This repository contains the application form of the witness and the account of the experiences described by the witness to the committee. The Commission proposes to redact the names and other identifying information before submitting this repository as part of the Commission’s archives to the Minister for Children, Equality, Disability, Integration and Youth unless the particular witness wants the name retained. The person’s full story is retained in this process.
Information about witnesses who came to the Committee was not accessible by anyone other than the Committee members, the researchers assisting them and the Witness Support Officer. Other staff, including the Commission members, did not have access. A number of witnesses to the Confidential Committee subsequently gave evidence to the full Commission. In these cases, the witnesses were asked for permission to allow the full Commission to see the Confidential Committee records. This permission was given in all cases.

The information gathered in this way was used to compile the Confidential Committee Report. This report is a compilation of what the witnesses told the Confidential Committee. It is expressed largely in the words used by the individual themselves. It does not identify the witnesses or the institutions involved.

**Limitations of this report**

This report outlines the experiences of those who chose to recount their experiences. They are not a representative sample of the residents of the institutions under investigation. The Commission has no doubt that the witnesses recounted their experiences as honestly as possible. However, the Commission does have concerns about the contamination of some evidence. A number of witnesses gave evidence that was clearly incorrect. This contamination probably occurred because of meetings with other residents and inaccurate media coverage.
Circumstances of Pregnancy and Admission

1940s

To begin with the 1940s: a witness born in a mother and baby home late in that decade, told the Confidential Committee that she discovered it was her birthmother’s parents, her grandparents, having discovered that their daughter had been raped on her way home from school, who had put her into the home - and at one month old, she herself had been transferred from this Home into an orphanage.

The father of this next witness died when she was four years old, and her mother placed her and some others of her six siblings into an industrial school. When she left it, her mother had a domestic job arranged for her, which she started. Then at the age of 18, she developed a relationship and became pregnant - not divulging this to the birthfather or to anyone. However, when her employer noticed her condition, the local priest was told and arranged for her to enter a mother and baby home.

Four years later, the witness again became pregnant - with the father of the first child - but on this occasion her mother reported this to the Gardai, who brought the witness in front of a judge. This judge ‘demanded’ to know who the father was, saying, the witness told the Committee: ‘You’d better answer me now or I’ll put you away where nobody will see you again’. The witness said she was transferred from the court to another home and then to yet another: back to where she had stayed during her first pregnancy.

Meanwhile a witness born in 1948 recounted that as a ‘boarded out’ child in early life, she suffered ‘horrific’ sexual and physical abuse until the age of 12 and was then sent to an industrial school. When she was 18 years old, she met her birthmother, to learn that never having revealed to the witness’s father that she had had a child for him previously, she married him and went on to have nine more children. The reason for her deception, she told her daughter, was her fear that a revelation of the witness’s existence ‘would break up the family’.
This story was partially replicated when the witness herself married a man from a ‘staunch Irish Catholic family’ keeping from him for some time that she was ‘illegitimate’. When she did tell him the truth it ‘changed his view of her’: ‘He thought less of me and the marriage changed entirely’.

1950s

During the 1950s a 16-year old suffered rape, the perpetrator was a man with whom she went for a drink following an encounter with him. ‘He must have put something in my drink, next thing I remember I was standing up and brushing myself off’. At the time she was working for a family and when it emerged that she was pregnant, it was this family who organised her entry to a mother and baby home where, she said, she was ‘treated well’. (She had been fostered and believes she may have herself been born in a home.)

It was in the same era that a 22-year-old woman became pregnant with a man who worked nearby. ‘He would pass the house every evening and we would have the chats - I was bold, I suppose!’ It was her mother who noticed the pregnancy and she was sent to a neighbour’s house while her brother arranged for her to go to a mother and baby home and drove her there. She had no say in the arrangements and never told the ‘father’ that he was one.

Another witness said her birthmother had lived in a ‘two-roomed thatched cottage’ and when she was eight months’ pregnant, the witness’s grandparents, who were ‘supportive’ of their daughter, drove her to the mother and baby home in a pony and trap. ‘Unfortunately’, the witness told the committee, they did not have the money to help their daughter keep the witness although, she said, her birthfather did pay £100 to the home. He was told it was for ‘baby clothes’.

A pony and trap also featured in the story of another witness some years later in this decade. This man came to tell not just his own story but that of his birthmother, who, he told the Committee, was 11 years old when she was raped by a family member in the 1950s and became pregnant with him. She too was brought by horsepower to a mother and baby home to give birth and had remained with him in the home, he said,
until she was 16 years old, to be placed then in another institution while he was ‘boarded out’, sadly to suffer (along with another ‘boarder’) many beatings and sexual abuse at the hands of their ‘boarded-out father’.

Three generations, three single mothers - it was in the mid-1950s that a witness, born in a mother and baby home, was later told by her mother that she had become pregnant having been raped by a priest. She said to the Committee that her own mother, the witness’s grandmother, had also been born to an ‘unmarried mother’.

When she was just 15 years old, this next witness told the Committee, she was returning home from a funfair when ‘a boy of 17 or 18 years old grabbed me and had sex with me’. She said she had thought this was like ‘kiss and chase’ and didn’t question it at the time as ‘that happened regularly to lots of other girls’. In school, however, the nun ‘noticed’ her, called her mother in and she was taken to see a doctor, having ‘no idea’ for what reason - and not being privy to the conversation, didn’t realise that the doctor’s verdict was that she was seven months’ pregnant. When this was repeated to her, the witness told the Committee she didn’t understand what that meant - and when it was explained, she could not figure out how it had happened.

But soon, the parish priest was called to the house and after his visit, the witness was ‘bundled’ into the van of a local man who drove her, with her father, straight to the mother and baby home. (She had an aunt who was a nun and now believes that this nun had been involved in the arrangements.) All she knew, she said to the Committee, was that she had been ‘plucked’ out of her family and had never returned. ‘Whenever I would come back to Ireland from the UK, I wasn’t allowed to return home. I couldn’t be seen’.

That 15-year old was not the only witness to testify that she had been entirely ignorant in sexual matters before falling pregnant. It wasn’t until she was reading an article in a magazine that a 17-year old of that era was made aware of the facts of life - and having digested the article, thought she might be pregnant. She explained to the Committee that a local boy had ‘forced himself’ on her and when she went to him to break the news, his response was that if she was ‘up the spout’ she could ‘go to the UK’.

Instead, she wrote to an aunt in the UK asking for help but her mother found out and it was she who confronted the birthfather who denied everything. A local priest came into the picture, organising accommodation for this girl in a hostel but a short time later
she was ‘just told’ she was going to a mother and baby home. In the meantime, her parents took the birthfather to court to claim for the loss of her earnings and to ‘get him’ for what he did, but they lost the case and had to pay costs. They also paid 30 shillings a week to the home for her keep and continued to pay after she left. She ‘carried that guilt for years’.

An 18-year old who had spent most of her childhood in a convent, became pregnant after a casual encounter with a man she met at a carnival. She too was uneducated in matters of sex and seven months after that encounter it was an aunt who noticed she might be ‘expecting’. As before, this witness did not know what the word meant - but the aunt brought her to a doctor who confirmed the pregnancy, recommending that she be sent to a mother and baby home. It was the aunt, with the brother of the witness, who drove her to the home.

In the last year of that decade, a woman sent to a mother and baby home at the age of 16, became pregnant by an older, married man (who, when he found out, wanted her to go to the UK.) Her mother had noticed she was pregnant, however, her mother died when the witness was eight months pregnant. The day after she died, a priest arranged for an ambulance to take the witness to a mother and baby home. After giving birth, she remained in the mother and baby home for four years and was then sent into another institution for the following nine years. This woman did trace her son - eventually - discovering that he had grown up in an industrial school.

1960s

Ignorance in matters of sex continued into the 1960s, with witnesses stating that girls and women were continuing to become pregnant without realising how or why. It happened to one witness, 15 years old, while she was staying with a relative in the UK. She told the Committee that she did suspect at the time that ‘what I was doing with my boyfriend wasn’t right’.

She split up with this boyfriend and returned home but when she told her mother about her condition, ‘my bag was packed and I was run out of the house’. She went back to the UK but a priest ‘became involved’ and the witness was returned to Ireland. A nun
collected her at a railway station to escort her to a mother and baby home, where, she said, on admission her clothes were removed, her hair was cut, and she was told: ‘You’re here for your sins’.

Then there was the 17-year old who grew up in industrial schools and ‘had never seen a pregnant person. She told the Committee that she had had no idea what sex was, had never had any education about it and didn’t realise she was pregnant (from her boyfriend of that time, two years older than she was) until almost the end of her pregnancy. She was working as a live-in ‘domestic’ at the time and it was this girl’s employer who recognised her condition and who put her into a mother and baby home where she was, she said to the Committee, ‘very frightened and ashamed’.

Many of these witnesses had been moved in and out of the different parts of the Irish care system throughout their younger lives. One who had been in a mother and baby home in 1960 to have her baby, had herself been born 20 years earlier in a mother and baby home and had been raised in foster care.

Now working, she and an older man had become friends; he would give her lifts home from work - and they had gone to the cinema together on occasion. One evening, however, he drove her down a laneway and raped her. She told no-one, she said to the Committee: ‘Nobody would believe me anyway’. She had no idea she was pregnant until she saw a letter her boss’s wife had left open, in which she had written of her suspicions that this was the case and it turned out she was five months ‘gone’.

When she told the birthfather, he initially said he would ‘do the right thing by her’ but then vanished. She sought advice from her parish priest. He initially wanted to go with her to meet the birthfather with the intention of ‘negotiating for the right thing’ but then he himself started acting inappropriately, making a pass at her, telling her ‘he wished it was his baby so he could look after her’. He also said to her that the birthfather had told him she ‘had been with multiple men’.

She threatened suicide and her foster mother called for the help of another local priest. His intervention, however, was to roundly berate her for even thinking of harming herself or her baby and it was he who made arrangements for her admission to a mother and baby home, to which she was taken by ambulance. After her daughter’s birth, she initially tried to keep her, and did for some time but then had to return to the
mother and baby home sometime after the birth as she couldn’t cope without support. Her daughter was eventually adopted to the USA.

Another witness, born in the UK, became pregnant with an Irish boyfriend who was working there. He abandoned her on hearing the news, leaving her a letter saying he was moving back home to Ireland. She followed him and on disembarking the ferry, with no money and nowhere to go, a young man saw her dilemma and his ‘kind’ family took her in. She eventually secured a job and a flat along with another girl - and was put in touch with a professional woman. This woman offered her a live-in job in her house and also said she would help her when her baby was born. There were priests involved now, one brought her to stay in a mother and baby home where she gave birth to her son.

True to her promise, the women who had offered the witness a job came to visit her after the birth and confirmed her offer of a home and a job but the witness told her that the nuns in the mother and baby home would not allow this, insisting that her only option was to send her son for adoption either in Ireland or the USA. She opted for the USA because she felt her son would have a better life there.

One witness came for interview to give voice to her birthmother, now deceased, who had been born in a mother and baby home and raised in foster care. At the age of 19, this birthmother had been training to be a nurse - and in a relationship - when she became pregnant. She and her boyfriend intended to marry, but one night when she was due to meet him, a social worker turned up instead, and brought her directly to a Magdalen laundry.

Her mother, said this witness, went with this social worker because she assumed that because she had been raised in foster care, there was an entitlement by this state official, as she saw it, to move her involuntarily. The next day she was transferred from the laundry to a mother and baby home, where she had her baby and from there, he too, was taken to the USA. He was 20 months old.

This next disclosure was equally difficult to hear. A witness who went into a Home in 1964 at the age of 23, told the Committee that she had been abused by her father for many years after her mother had died. She then met a boy, and thought if she could have a baby with someone, she ‘would have her own life’. However, when her father discovered she was
pregnant, he gave her ‘the hiding of her life’, wrapped cardboard around her stomach and forbade her to be ‘seen outside’. A local priest made arrangements with this father for his daughter to go into the mother and baby home.

These accounts were also given:

• The first witness had been working in a summer job and took a lift in a car with a group of local boys. Two of them raped her.

• A girl spent her first six years in a children’s home before she was fostered. She suffered rape at the hands of her foster father in the early 1960s and at the age of 16, was eight months’ pregnant when a priest arrived at her school and brought her to a mother and baby home. She had had no idea she was pregnant.

• Next is a witness who had been sexually abused by her father. She had been placed in an institution at the age of two - and was also placed in psychiatric care for a short time. As an adult, she came to the Committee to describe how at the age of 16, she went to a dance, became drunk, and having accepted the offer of a lift home, passed out in the car. She woke to find herself in a barn, being raped by the driver; his friend was with him but she managed to run away before he too could attack.

• A 16-year old was raped by a local man who had dragged her into a field. She did not tell anyone about it at the time but her pregnancy was noticed by the woman for whom she was doing domestic work, and the witness did then tell her grandfather what had happened. Her family, however, felt they would be ostracised in their neighbourhood if they reported the rape because the perpetrator was a successful farmer.

For the remainder of her pregnancy, this 16-year old spent most of her time hidden in a bedroom in her home. She was taken away by ambulance when her waters broke - being returned to the mother and baby home in which she had been born 16 years previously - and later, when friends and neighbours missed her in the area and asked where she was, they were told by her family she had been sent away to work.
• When another witness, 19 years old, became pregnant within a relationship, she told her mother and stepfather - the latter having an ‘important’ job. His reaction was that she ‘needed to get rid of the baby as it might ruin his career’. The reaction of the boyfriend, father of the baby, was one of distress - not for his girlfriend but for his own mother as she was a widow and this ‘would break her heart’.

When the witness gave birth to her son, he was taken for adoption and her mother collected her from the mother and baby home, took her to the airport to go to an aunt and uncle in the UK, and warned her, ‘not to come back’.

• Meanwhile, a witness who had been born in a mother and baby home during this decade, came to offer the Committee the story of her birthmother who had been raped by a local boy. Although her mother had been 18 years old when this happened, she had been, according to what she told the witness, yet another who had been ‘very innocent’ about the facts of life, ‘we were green, I suppose’, she had said.

On discovering she was pregnant, she had disclosed it to her grandfather - who had consulted a priest - whose first call had been to strongly urge the grandfather to ‘get her to marry’ the perpetrator. This grandfather said ‘no’ and held to that decision. Sadly, he died shortly afterwards and the grandmother couldn’t cope. The priest came on a Sunday. ‘I had no bag’, her birthmother had said to the witness, ‘just a brown paper parcel tied with twine and that was the way I was brought to the mother and baby home’.

• A witness (24 years old but like so many others of that era, not having much knowledge of sex) went to see her GP to find out what was going on in her body. He phoned the parish priest from his surgery and she was taken straight to the mother and baby home as she would be a ‘dreadful example to her siblings’.

• Another witness told the Committee she had ‘no knowledge of sex or what it might be’. She became pregnant at 19 with a man from her town who was seven years older than she was. The local doctor who had made this discovery, informed the witness’s mother, saying: ‘You’ll have to shift her out of here’, so the parish priest was telephoned and it was he who summoned an ambulance to bring her to the mother and baby home.
Then there was a witness who, at the age of 16, had been in a relationship with the birthfather for a year discovered that she was pregnant only when she was seven months into it. She told her boyfriend, who told his mother, who was friendly with the local priest.

Both sets of parents, with the witness, went together to meet the priest in his house. She told the Committee that he examined her internally, taking 45 minutes about it, saying that he ‘needed to establish whether (she) had been sexually active for a while’ - because if she had, he said, she ‘would not be accepted into a mother and baby home’.

According to this witness, her mother called her ‘a prostitute and a whore’. Three of her uncles were priests and her parents were worried about how her pregnancy would affect them. Both sets of parents were also very concerned, she said, about how ‘an unmarried pregnancy’ would affect the careers of the witness’s brothers: ‘Everyone was being thought of but me’.

As an indication of how desperate some women became in seeking solutions to the problems they faced when finding themselves pregnant in Ireland ‘out of wedlock’ - and how sexually naïve so many were even into their 20s - one 20-year old witness who found out she was expecting twins because she had ‘fallen by the wayside with a casual encounter’ told the Committee that she wrote to the Problem Page of a well-known magazine seeking advice and help from the ‘Agony Aunt’.

Another witness told the Committee that at the age of 22 she became pregnant, having just finished nursing training and having been in a relationship with a married, older man since she was 15 years old. She decided she wanted to keep the child and went to see a doctor, who referred her to a priest, who put her in touch with a second priest who belonged to an adoption society. ‘This’, she said to the Committee, ‘was where the entrapment started’.
With its involvement, it was arranged to send the witness to a home, with an assurance that it was a private nursing home for ‘a better class of girl’; but on arrival and seeing not a private nursing home but a large mother and baby home, she said to herself: ‘Abandon all hope when you enter here!’ She described it as ‘a madhouse’. She outlined the extreme lengths to which she then went to ensure her son would not be adopted, including placing him in a children’s home ‘until she could get back on her feet’. She later discovered, however, that despite her best efforts, he had been ‘taken’ without her knowledge or consent and she is still engaged, she told the Committee, ‘in a lifelong battle’ to discover how this came about and who was responsible.

As seen already, the Committee heard many accounts of women and girls who became pregnant because of deep, sex-related ignorance. One witness was 21 years old when she became pregnant with a doctor of foreign origin. He, however, was not allowed to stay in Ireland and had to go back to his own country. So while the witness’s father threatened to ‘send the IRA after him’ it was her mother who arranged for her reception into a mother and baby home.

Another witness said that she was just 15 years old when she became pregnant for the first time - and again for a second time following numerous rapes she suffered from a family member who, she confessed to the Committee, had been ‘badly’ abusing her from when she was just 13 years old. When she told her family and the local priest of her first pregnancy, she was accused of ‘trying to break up a family’ and that it was ‘her own fault’. Her father, she said, would ‘try to sell me to any auld lad in the pub’. When in the mother and baby home she told the nuns about the abuse, ‘they wouldn’t listen to me’. Following the birth of her first child, she went to stay with an uncle who did inform the Gardaí about the abuse, but again, she said, ‘nothing happened’. When she returned to her own home, she was ‘badly beaten’ and the abuse resumed.

Her second pregnancy - again from being raped by the same relative - resulted in another round of being ‘badly beaten’ by her father ‘who wanted to kill the baby’. This didn’t happen and she was sent to another mother and baby home from where she was sent to a hospital for the birth. (She was so ill and weak from the most recent beating, she said she was kept in this hospital for three weeks after giving birth, before being discharged back to the mother and baby home.)

This witness professed herself as ‘happy’ in both mother and baby homes because she felt ‘safe’ and she was reluctant to leave. Having been released, she did try ‘many
times’ to kill herself. Eventually, this witness emigrated to the United States where she lived for 20 years; back home, her first child was raised by her parents, the second child (she was told by the nuns in the second home) died.

The Committee heard a similar story from another witness, raped twice and becoming pregnant after both; the first was perpetrated by a neighbour, the second by a man with whom she went to a dance. When her father learned of the first pregnancy, ‘he took out the leather’. On hearing of the second pregnancy, the family ‘kicked me out and I was told never to come back’. Her admission to the mother and baby home was organised by the local priest, along with the doctor and her mother and like some others in similar circumstances, she described it as ‘a refuge’ and said she could not fault it at the time. This woman’s children were adopted and she herself moved to the UK.

1970s

A woman, concerned with her birthmother’s history and plight, said that at the time of her conception in the early 1970s, her birthmother was resident in a psychiatric institution. She said she had spent 22 years consulting with solicitors, detectives and journalists, trying to find out how this could have happened.

However, in the midst of all the grief, suffering and loss reported to the Confidential Committee there were reports from some witnesses who said that they did find succour in the mother and baby homes and did go on to have decent, happy lives.

One such witness, 21 years old on finding herself pregnant by her boyfriend in the 1970s, phoned an adoption organisation for help and was given the names of two mother and baby homes. The nun who answered the phone in the first one she telephoned told her to ‘come straight away’.

This witness, like a few others, came to the Committee because she wanted to offer a positive story, using the word ‘refuge’ (a designation along with ‘sanctuary’ and ‘haven’
all employed by witnesses to describe homes which they considered provided solace.)

It became clear that for many of them, this mother and baby home offered escape from terrible conditions at home. The father of this witness’s child had been her boyfriend since she was 15 years of age. They went on to have another child, the witness said to the Committee; they later married, and are still happily so.

A witness, whose parents had both died when she was very young, was living with her aunt and uncle - she became pregnant following abuse by her uncle. One of her colleagues in the bar where she worked noticed her condition and brought her to a doctor - who contacted the sister of the witness and when she returned home that evening, she found her bags packed for her entry to the mother and baby home. She has never spoken to her sister since she found out that it had been her sister who had not only organised the mother and baby home but, she claimed that it was she who had also signed the papers authorising the adoption of her child.

Another witness told the Committee that her difficulties arose when she was 19 years of age and had become ‘enthralled’ by an older man. She became pregnant with him after their ‘first and only’ sexual encounter. This time, the family GP was ‘nice’ to her, referring her to an adoption agency. For six months, she remained ‘terrified’ of disclosing her pregnancy to her parents for fear of stressing them and in the meantime, the birthfather had disappeared from her life but not before revealing to her that he had impregnated other women before her. The plans she was making with an adoption agency to go to a mother and baby home were progressing when her worst fears were realised: the GP telephoned her mother to tell her what was afoot.

A witness met a man at a dance and was with him for a year when she became pregnant. She had been abused by her father and brother on a regular basis and was, she said, ‘looking for an adult figure, and someone to love’ her. She had planned to go to the UK with her boyfriend but on the day they were to travel, he told her there was ‘only one ticket for the boat’. This witness said she was in denial about being pregnant but one day, on coming home from visiting her mother who was sick in hospital, found an ambulance waiting to collect her to go to a mother and baby home. She refused to get into it. At work, a colleague offered to help her but, ‘rigid with terror’ she would not accept and she now thinks that it was her mother who made the arrangements. Eventually, she was taken to a mother and baby home - and to add to her fears, had to field a visit from the Gardaí there; they told her they were ‘making enquiries’ about the birthfather. ‘However,’ she said, ‘nothing came of that’.
It was in the early 1970s that a witness who had been a patient in a psychiatric hospital ‘for about five or six weeks’ discovered when she came out, that she was pregnant. ‘I don’t remember much about the hospital,’ she said, ‘but I have discovered I was found in a male patient’s bed. I had been given electro-shock treatment and the drug, largactil’, and having been found in that other patient’s bed, she told the Committee, hospital staff put her ‘in a straitjacket in a padded room’. This witness gave birth in a mother and baby home but her baby died 11 days later - and much later, she applied for and got her medical records from the psychiatric hospital in which she saw that the psychiatrist who had treated her had described her as a ‘sexual deviant’. ‘I was a 16-year old girl. Who calls a 16-year old girl a sexual deviant?’

Many witnesses did say that when they sought (or accepted) help, they could find it, whether in the mother and baby homes or elsewhere. One, for instance, told the Committee that ‘some religious organisation’ (the Quakers, she thought) had been instrumental in helping her to keep her child.

Some extracts from witness accounts:

- ‘I was treated like a second-class citizen by my family; society had an obsession with hiding everything.’

- ‘Nobody will want you now!’ Said by the mother of a witness, 14-years old when her sister ‘informed’ on her, having noticed she was pregnant. The witness was then kept out of sight upstairs.

- Another witness was also ‘hidden away at home’ until arrangements were made to transfer her to a mother and baby home; a social worker driving her there, early in the morning, took the back roads so as not to be recognised’.

- A 28-year old woman, separated from her husband and living with her four-year old child in her parents’ home, dated a man for one night and became pregnant. Her parents were ‘very ashamed’ when they found out - and called a priest. The priest, she told the Committee, ‘then forced her to swear an affidavit’ that the child was not her husband’s. She was kept at home, hidden away and forbidden to speak, even to her child; she was not allowed to reply if the child spoke to her. Concerned about their reputation
for respectability, her parents were afraid that neighbours might hear her voice and she was kept in hiding until she was eight months’ pregnant, then transferred to a home.

- ‘Get her put away!’ From the father of a 19-year old, who had divulged her pregnancy to her mother.

- The birthfather of another witness’s child was, she told the Committee, from ‘the wrong side of town’ and as soon as he found out [that she was pregnant] he ran. This witness’s mother encouraged her to telephone his parents to tell them that she had lost the baby, while her aunts, who were nuns, became involved in her being sent to a mother and baby home. While in the home, ‘unbeknownst’ to her, she said, arrangements were made for her to be sent from the mother and baby home to the USA where she ‘came under the wing’ of a doctor until the birth and subsequent adoption of her child there.

- This from a further witness, another who was pregnant from rape: ‘I was at a party when a man came in and put his hand over my mouth and raped me. I closed down completely’, she told the Committee. ‘I knew I would never marry. I could never give myself to anyone’.

- This from a witness born in a mother and baby home who was quoting her birthmother: ‘the birthfather tried to abort the baby (the witness) with pills, vodka and a coat-hanger’.

- ‘It was like giving away a packet of crisps’ from a witness who had, at 15 years old, become pregnant while she was involved with a man in his 50s. Having given birth to her son in a mother and baby home, she gave him up for adoption. This girl, homeless and living on the streets a year later, was raped - and finding herself pregnant again, went back to the same mother and baby home. She told the Committee that this time, she had ‘more understanding’ and left the home after six months, and forgoing adoption, took her baby with her.

- A 17-year old, who had grown up in state care, was raped and fell pregnant in the early 1970s while working in the UK. She told her sister with whom
she was living. This sister contacted an adoption agency and a trio, two men and a woman, arrived at their flat to take her - with another woman - back to Ireland. On the ferry, they assigned a number and a new name to her and when the ferry docked, the man waiting for them there drove both women to a mother and baby home.

In the mid 1970s, a 19-year old, who had been in a relationship for two years with the only son of a farmer, told the Committee that they wanted to get married but when it was discovered she was pregnant, ‘the local priest, she said, ‘wouldn’t allow it’, and she was placed in a mother and baby home. This woman became pregnant twice more to the same man and herself made arrangements to go back to the mother and baby home as her boyfriend ‘would never acknowledge the circumstances’. All three of their children having been adopted, she remained in the relationship with this man for nine years, but then married another man, had five children with him and together they raised all five in their family home.

In 1974 a 20-year old woman, having been gang-raped in a park, was found by a man who brought her to the Gardaí. She was placed in a cell overnight and freed the following morning, having not been questioned. Living back on the streets, she was in extreme pain and thought she was going to die. A woman, finding her ‘praying for her sins’ in a church (because she believed the rape had been her fault) recognising her distress and degree of pain, brought her to a hospital where it was confirmed she was pregnant and her transfer to a mother and baby home was arranged. The birth was very traumatic but not just for her, she told the Committee, because the baby was born with the cord around its neck and did not survive.

A year later, 1975, a 20-year woman became pregnant, also as a result of rape, this time by a fellow-resident in the digs where they both lived. She did have a boyfriend at the time but had been afraid to reveal to him how her pregnancy had happened - she hadn’t reported it to authorities because she had felt ‘so ashamed’. Knowing he had never had sex with her and that the baby couldn’t be his, her boyfriend ended the relationship. When her parents discovered her pregnancy, they were so upset by the whole situation, they refused to talk to her. A priest came to the house and then brought her to a mother and baby home.
Serious and serial abuse was described by this next witness. It was the late 1970s when at 17 years old, she became pregnant while in an ‘abusive relationship’ with a local boy - having been sexually abused by her father. She had been put into care - where she was also abused. Her mother had ‘kicked her out’ on discovering that she was pregnant, and she had been sleeping rough when the Gardaí picked her up and recognising her situation, told her she needed to go to a mother and baby home. She hated the home and remains ‘extremely angry ‘about her time there and her treatment by the nuns’.

A girl, whose alcoholic mother died by suicide when she was only 11 years old, was raised by grandparents who were horrified to find that when she was 14 years old (knowing ‘nothing’ she told the Committee, ‘about sex or relationships’) she was seven months pregnant with a local boy. ‘When this was realised,’ she said, they were ‘furiosus with her and ‘deeply ashamed’ and it was a social worker who drove her to a mother and baby home, ‘not speaking a word to her during the entire journey’.

Real terror was felt by young women when they discovered they were pregnant ‘out of wedlock’. For instance this 17-year old who had ‘no knowledge of sex,’ feared that her boyfriend ‘would lose interest in her if she didn’t give him what he wanted’, had sex with him and finding she was pregnant, told the Committee that her first thought was: ‘I’ll have to get rid of it’. To that end, in the hope that she would miscarry, she took hot baths and when that didn’t work, threw herself down the stairs of a department store, which didn’t work either. She confided in her mother, and was told she could no longer stay in the family home and she was sent to a mother and baby home.

There were consequences for a 19-year old, walked home from a staff Christmas party by a colleague ‘to make sure (she) got home safely,’ but who subsequently raped her after another party held in her home. He had been the ‘last to leave’ her party and the rape took place in the context of his claim that she ‘owed him for keeping her safe after the previous party’. Fearing she would be blamed and be ‘looked down on as ‘a tramp’ - she didn’t report the rape. The worst happened and suspecting she might be pregnant, she went to a doctor, who confirmed she was. She did tell him how it had happened. His response: ‘What was wrong with you, you’re a big girl. Could you not have fought him off?’ Her parents were distraught, her sister was angry: ‘Shame on you, look at what you’ve done to Daddy!’ and her
father’s edict was that she could never bring ‘it’ home and that ‘no-one was ever to know about ‘it’. She told the Committee she was ‘locked away’ if visitors came to the house and was not allowed to go outside. She was so upset about all of this, she said, she cut off ‘all her hair’. The witness’s brother drove her to the mother and baby home, after the intervention of a priest.

Brought to hospital after an accident, an 18-year old was discovered to be pregnant. She had been in a relationship with a man, who had left for work abroad. Her mother was informed of this unexpected development and contacted a priest, who from then on, visited the witness regularly in hospital, telling her she had to have the baby adopted to ‘avoid causing embarrassment’ to her family.

She told the Committee she believes it was this priest who arranged, with her mother, for her to be taken by ambulance directly from this hospital where she was being treated for her injuries, to a mother and baby home and when she arrived, she was physically examined by two members of staff ‘to check for diseases: girls like you could have anything’.

In the mid-1970s, a 23 year old woman when she conceived with her boyfriend said ‘but he didn’t want me then’. Her older sister decided it would be best for her ‘and for the family’ if she ‘went away’. Her sister set about organising her admission to the chosen mother and baby home, and she and her husband drove the witness to the Home, instructing her firmly that she ‘would come back home without her baby’. The couple left her at the door of the mother and baby home and drove away. She was then met by two nuns. ‘I began to cry. Sister […] punched me in the back and said: ‘You are here now and you will be here until you get rid of that child. You will be here again next year, you are only a prostitute anyway’.

In the 1970s a girl who was only 15 years old became pregnant with a man ‘10 or 15 years older’ following a ‘casual’ encounter. She came from a very poor family where there were 14 children. She was living-in and working as a domestic in a convent at the time, and had ‘no knowledge of sex or of where babies came from’. 
The nuns, noticing her pregnancy, brought her to a doctor, and then took her home to her family on the understanding that she would be looked after there. However, her family organised that she should go immediately to a mother and baby home (where she was the youngest on the premises). When she arrived she had no clothes with her and the staff in the home did not give her any. The witness wrote to one of the nuns in the convent where she had been employed, asking for ‘clothes and nightdresses’. She said, these kind nuns brought her ‘lovely nightdresses’.

In the same decade, a woman, raped by an older man (she had thought he ‘loved’ her) ‘blanked out’ she said, what he had done to her. At four and a half months pregnant - not knowing this - she fainted. Her grandmother called the GP who confirmed a pregnancy. She said that her grandmother gave her a ‘severe beating’ and a few days later the witness found ‘a packed brown suitcase’ in the hallway and was taken to a mother and baby home, where, on arrival she was brought into an office and was told by nuns that she was there ‘for her sins’ and that she ‘had to repent’. The birthfather said he would take her out of the home but did not.

In 1976, a woman who had become pregnant by a friend of her family, a wealthy farmer, 10 years her senior said her mother had been encouraging the liaison as it would bring ‘status’ to their family. Her mother had been ‘ignoring’ her complaints that ‘this man was abusive and a drinker’. On discovering her daughter was pregnant, her mother brought her to an abortion clinic in the UK, although the witness was under the impression that she was merely seeing a doctor. When she realised the true purpose of the visit, she walked out, realising ‘it was wrong’. For this insubordination, her mother ‘beat her senseless’ telling her: ‘I will get it out of you one way or another’. Two days later, back home and by arrangement with a priest, the witness was driven by her mother and brother to a mother and baby home and she said that her father had never said ‘Goodbye’.

A witness who went into a mother and baby home in the final years of the 1970s at the age of 17 years old, demonstrated how a few kind words can fuel resilience. She said that she had become pregnant by an older man for whom she babysat - and like so many others, did not understand what had happened to her. She spoke with the principal of her school (a nun) who was ‘very supportive’, encouraging her to complete her Leaving Cert before doing anything else, advising that she should remain at home.
This, it turned out, was not to be an option because after the witness told her parents she was pregnant, her mother wanted her ‘out of the house’. The witness steeled herself to telephone one of the crisis pregnancy agencies, seeking advice and help. Even making this phone call took courage because, she told the Committee, she ‘had to make sure’ that no one in her remote town would find out. Help appropriate to her needs came her way, with an adoption society arranging for her to stay with a family far from home - a priest brought her there - and it was agreed that she should go into a mother and baby home to give birth.

At 22 years old, another witness who became pregnant with her boyfriend of six years went into the same mother and baby home. When she had told her parents of her pregnancy, they demanded she ‘get rid of it’ (while a priest ‘roared and shouted’ at her when they brought him to the house.) She took matters into her own hands and arranged to go into a mother and baby home, finding, she said, that ‘they were very good’ to her. The parents of this witness ‘softened’ once the baby was born - and eventually adopted the child as their own.

However, at the end of the decade, this next witness, who became pregnant in 1979 at the age of 22 years, following a one-night stand, encapsulated the position of women and girls within their families - even extended families - with the phrase: ‘In those days you did what you were told’. When her father found out about the pregnancy, he stopped talking to her, despite their previous closeness, while both parents then informed the birthfather’s parents who sent him abroad.

The catalyst for the witness came with a visit to their home by a friend of her sister who had also become pregnant ‘out of wedlock’; the witness was not privy to the discussion but shortly afterwards, ‘my suitcase was packed and put waiting for me in the hallway, and I was told I was going for a trip up the country’, where the mother and baby home was, of course.

When she had her baby, and wanted to keep her, they sent the witness for psychiatric assessment as they could not comprehend why she would want to do that and when she refused to relent, they ‘threw her out’. This story’s end is even sadder because after three months of trying to organise some credible way to keep her daughter, she could not cope and ‘reluctantly’ went ahead with adoption, telling the Committee. ‘You cannot live on love alone’.
1980s

A witness told the Confidential Committee that having had no sex education, she began 'secretly' dating a local boy when she was 16 years old. The relationship broke up but her mother, having noticed 'changes' in her, brought her to a doctor who confirmed she was six months pregnant. Mother and aunts, she said, 'took over' while she herself was 'oblivious' to what was going on in the background: 'I was in a bubble really, still going to school and acting normal. For survival purposes, I blocked out a lot'. She was staying with a friend while 'arrangements' were being made.

For the mother of this witness, history was repeating itself for she too had become pregnant when she was 16 years old. She was particularly anxious that the father of the witness learned nothing about their daughter's situation - he was an alcoholic and she feared his reaction, so he was told that his daughter wanted to become a nun and that the school was liaising with a convent in London for a three to four month exchange so she could figure out if she had a true vocation. The witness was 'dispatched' to the mother and baby home, and having had no discussion in advance about what would happen when she entered it, she went off thinking: 'It would all be sorted. The naivety!'

It was in the early 1980s that a 20-year old woman became pregnant with a man who sang with her in the church choir - it had been the first time she had sex and he had told her that it was his first time too and assured her that his family doctor had said a man 'couldn’t impregnate a girl when it was his first time’. The woman’s father had a high-profile job and he was concerned people would find out about his ‘daughter’s failings’ and he blamed her when he didn’t get a promotion. It was her mother who brought her to the mother and baby home.

This next witness had also become pregnant in the early part of this decade following rape by ‘a group of men’. Although she was 25 year of age when this happened to her she had been she said, ‘very sheltered’ and was now ‘very confused’. When she reported the rape to the Gardai, the reaction was to give advice. ‘We know the people involved’, they said to her, telling her to ‘stay away from them’. Although she told her father about the rape, ‘he didn’t believe me. Nobody believed me’. Her father dropped dead about six weeks later.
The witness told the Committee that her admission to a mother and baby home was organised by a neighbour, while her stepmother paid for it. This stepmother ‘often asked me why I didn’t have an abortion’ and on one occasion when the witness phoned to ask her to come for a visit, ‘she said she was too busy’.

This witness had been sexually abused by her music teacher for about two years when she was just 10 and 11 years old but had remained a virgin, still the case when, at 16 years of age in the early 1980s, she was raped by a 23-year old man after she got drunk at a party. Along with a baby, he gave her a ‘very, very nasty STD’. She told the Committee that in addition to the rape being known in the mother and baby home, two hospitals knew about it too - and had to know that she’d been underage at the time, yet none of the three institutions reported the rape and no-one acknowledged to her that rape was a crime; as a result she felt it was not.

When a 29-year old witness was admitted to the mother and baby home in the mid-1980s, she described it as ‘gorgeous’. Decades later she finally admitted to her 83-year old mother that she had given birth to a baby all those years ago, the mother’s first question was: ‘Who knows?’

A witness, who had been with her boyfriend since the age of 12 years, became pregnant when she was 15 years old. She kept this a secret, ‘in denial and hoping it would work itself out’ but her mother, noticing that she was sleeping a lot and had developed strange eating habits, took her to a GP who confirmed she was seven months pregnant, admonishing her with: ‘Have you been a bold girl?’

On hearing the news, her father’s reaction was: ‘The little bitch kept it to herself for so long so we couldn’t do anything about it’. The reaction of her school principal was that she could not return there because it would bring shame on the school, advising that the girl be sent to a different part of the country. The solution found was that a social worker would drive her to a mother and baby home.

During the 1980s, when a 15-year old schoolgirl discovered she was pregnant she was so terrified her parents would find out - ‘they would have killed me and the baby, dead and buried!’ - she contacted an agency and a social worker arranged for her to go to a mother and baby home ‘for fear of
being seen. She hadn’t told her parents where she was going, they believed she had gone to England - and had filed a Missing Person’s report with the Gardaí.

A witness opened her heart to the Committee, revealing how she felt at finding herself pregnant as a 19-year old ‘and very immature at that’ in the early 1980s: ‘I didn’t want a baby. Babies were for adults. I knew I was pregnant but my mind couldn’t comprehend it. It was like an alien taking over my body’. Her family wanted the whole thing ‘brushed under the carpet’, she said, ‘while her boyfriend’s mother offered to convert their living room into a nursery. Despite the latter, her boyfriend, she said, wanted her to have an abortion as in: ‘You can always have another baby but you can’t have another me’.

When she continued to demur, he broke up with her, and via an agency, ‘arrangements’ were made, with a woman from that agency driving her to the mother and baby home. She has ‘no recollection’ of arriving there.

A student, pregnant from a rape at 20 years of age in the mid-1980s, did not report it (‘where did you go with things like that in those days?’) possibly because she did not realise she was pregnant until some months later when she went to her GP and got ‘the biggest shock of my life’. Her university tutor and her manager, she said, were both ‘completely supportive (and ‘took over the whirlwind’) organising her admission to a mother and baby home, but as an outpatient. ‘It was like going over the edge’.

‘She’s gone on work experience down the country’ was the excuse given by the family of a witness sent to a mother and baby home in 1980 having become pregnant with her boyfriend when she was just 14 years old. When she heard about the pregnancy, her mother was furious, she beat her daughter, brought her to a hospital to confirm the pregnancy and then drove her straight to the mother and baby home where she gave birth and had her child adopted. This witness got pregnant again two years after having her first baby adopted and on receiving this information the birthfather ‘just disappeared’. This time she did not tell her family but contacted an organisation who supported people in situations like hers and it organised a private ‘home stay’ with a family. Her mother heard anyway and arrived to the home where she was staying to take her back to the mother and baby home. Despite this witness’s full intention to keep this baby, after the birth she was left with no option or support but to let her too go for adoption.
A 16-year old, pregnant in the early 1980s with her boyfriend, told a priest, who told her mother. Her mother, father and a friend brought her straight to a mother and baby home. As a witness giving evidence to the Confidential Committee, she said: ‘I was in shock. I had never been away from home’, and then: ‘The big door closed behind me’.

Sex education for an 18-year old in the early 1980s had been: ‘I hope you don’t let boys touch you’. The witness didn’t realise she might be pregnant from her boyfriend until she burst her jeans while laughing. On learning of her condition, her mother forced her go to confession and she told the Committee that: ‘all the priest wanted to know was, did I enjoy the sexual movement of him moving in and out of me’.

Despite all their travails and frequent reports of ‘difficult’ treatment in these mother and baby homes, many residents told the Committee that deep down they were relieved to get away from ‘worse’ situations at home:

‘I had somewhere to go’:

‘I was grateful for some peace. When you’re pregnant there’s nothing on your mind but keeping yourself safe - (from a witness who appreciated getting away from a partner who was ‘a heavy drinker and very violent’.)

‘The mother and baby home was my saviour at a very hard time in my life: it gave me a chance to get used to being a mother. There were, and are, good people out there’.

A witness who went to a mother and baby home on her own initiative as an 18 year old, ‘to save her parents’ shame: I knew it was a home for girls in my situation and my own suggestion was that I would go away to hide the shame. The problem had gone away from my parents’.

From a woman who was 27 years old when she was in a relationship with a foreign national when she became pregnant. She told the Committee that she came from a house with many children and an alcoholic father, whose family received help from the St Vincent de Paul. She and her sister had been taken into care for a while - and when she returned home, she said she (deliberately) started sleeping with foreign nationals ‘because their little bedsits were like hotels compared to my house. I wanted to get pregnant’. Inevitably, she did conceive, went to a social worker to get help and was
brought to meet ‘a woman who helped unmarried mothers’, who in turn brought her to a mother and baby home. ‘It was a roof over my head which I needed. I felt ashamed. I think they took £5 from me when I arrived.

It was to an adoption agency that a 19-year old turned. Pregnant with her boyfriend, she found he had arranged for her to go to England for an abortion but she refused to go. With the help of the organisation, she went into a mother and baby home but like another witness above, has ‘blanked out’ her memories of her stay there because ‘the experience was so painful’. What she does recall, memorably, is ‘a feeling of enveloping darkness’. The adoption agency then organised it so she could leave the mother and baby home and she transferred into a different area to live with a family for the rest of her pregnancy.

In 1983, a 20-year old gave birth to a baby boy in a mother and baby home following a gang-rape. Some two years later she was again raped by one of the original gang and again became pregnant but was fearful to go to the Gardaí because this man had also stabbed her. Following advice from ‘a local lady’ to ‘talk to the nuns’ she sought refuge in a mother and baby home but told the Committee that these nuns neither enquired into her history nor why she was seeking help - but did inform her that she had to agree to adoption before they would accept her. She was admitted, but following the birth of her second son the witness became determined to keep him and despite early difficulties involving foster care placements, she persevered and eventually took her children to live with her in the UK.

A witness described to the Committee her ‘very difficult’ upbringing and said that in 1984, when she was 21 years old, she became pregnant. One of the major problems was that she had been with two men before discovering her situation and therefore wasn’t sure which was the father. Instead of telling her parents, she went to an organisation that placed her with a host family first, and then organised it so she went to a mother and baby home. At 26 years of age, she again became pregnant when she was ‘very messed up’ and in poor health: she had lost her job and her flat at the time. She then went on to have a third child with the father of the second and all told, had resided in a number of mother and baby homes.

In 1985, a girl raised in state care, and now working as a cook in a boarding school, became pregnant after a ‘casual encounter’ with a local man two years older. When she told
him, he ordered her ‘to get rid of the baby’. When she wouldn’t agree, she told the Committee, ‘he pushed me down the stairs in the hope I’d miscarry’. She didn’t. She was sacked from her job, and arrangements were made for her to go to a mother and baby home.

This next witness gave the Committee a precis of how she became pregnant. Having ‘gone with’ a boy since she was 14 years old, she suspected she might be pregnant, but her GP (who did no tests) said she was ‘fine...’. ‘Reality hit’ she said, when she started to get sick. Her mother and aunts took over (as has been seen in similar cases above) and brought her to a maternity hospital where it was confirmed she was five months’ pregnant. The mother spoke with the school principal, who would not, despite pleas, let her remain to do her exams. This principal then addressed the pupils (with the witness present) about ‘girls letting themselves go;’ how they should be ‘respecting their bodies;’ and ‘remaining pure’. Her mother then told her she was ‘going down the country’ with one of the aunts, who took her to a mother and baby home, ‘it was just like going on a day out’.

Another witness who became pregnant in 1989 when she was 17, told how her mother used her ‘contacts’ around the country to ‘sort’ the situation and organise in advance for the baby to be adopted. She took the witness out of college (while still acting with her other children and the witness’s father as though the witness was still a student) and organised her entry into a mother and baby home. Her mother continued the pretence with her father and siblings that she was still away studying.

Having had her child by C-section, the witness told the Committee, she was ‘stiff and very sore’ when she came home, this being explained to everyone by saying she had fallen off a horse. In her view, she said, her maternal instinct had been destroyed on the day she had to give up her son. She decided to be sterilised - and could not pick up a baby for 20 years thereafter. She married, and after her husband told her he wanted children they split up when it became clear there wouldn’t be any.

She met her second husband and had explained to him at the outset that she couldn’t have children. The witness later traced her son and at the time they met she had still not revealed his existence to her husband; when she did tell her husband, he was ‘incredulous’ on hearing about her son, asking how could she have done ‘such a
selfish thing as give up a child?’ She corrected him by saying that giving up her child was ‘the most unselfish thing’ she had ever done.

However, she did say to the Committee she very much regrets giving her son up and still resents her mother because of it - if she had kept her son, she thinks, she probably would have gone on to have more children. She also made the comment to the Committee that it was ‘some kind of Karma’ for her mother that neither she nor any of her siblings have children now, meaning that her mother has no grandchildren.

The parents of a 15-year old died when she was 14 years of age, and despite her relations doing their best to ‘keep an eye’ on her and her siblings, she became ‘quite wayward’. She was impregnated by a man six years her senior, who then moved to the UK. A social worker came to the house and informed the witness she was going to a mother and baby home, admonishing her not to act ‘like butter wouldn’t melt in your mouth. The nuns will know what you’re like’. An uncle drove her there and since she had never been anywhere but home, said ‘it was like going to Spain’. Despite her young age and pressure to have her baby adopted, she persisted in her efforts not to go in that direction and managed to keep her child.

A social worker was involved in this next story too when a woman told the Committee she became pregnant at the age of 19 years with a boy ‘who wanted no involvement’. Her parents, she said, ‘went berserk’ because they were concerned about what people would think and about her father’s social standing with his job in the community. The father brought in the local parish priest to talk to her; he ‘ranted and raved’ at her, told her that she was a sinner and no longer welcome in the church - and she believes it was he who made the arrangements for her to go to a mother and baby home, while it was a social worker who drove her there.

In 1985, when she was 18 years old, a witness became pregnant to an ‘older guy’ in the UK who was a member of the Church of England. Although she was sent to a home (her parents driving her there) they were ‘largely supportive’. Her mother’s initial response was to ‘nearly to fall off her stool’, while her father’s was: ‘Nobody died’. But within half an hour of her arrival, a nun who discovered this was to be a mixed-religion child, ‘was on her knees to say a decade of the Rosary’.
This next witness, whose mother had been born in a mother and baby home in England while she herself had been raised in an industrial school, was 16 years old when she became pregnant by her boyfriend. He had a history of violence towards her and she finally left him because he had attacked her while taking drugs with some of his friends in the bedsit arranged for her by her social worker.

She contacted the social worker, emphasising to him that she wanted to keep her baby and his response was ‘That’s no problem. That’s no problem at all’. He also told her, she said, of a place ‘where she could live independently. They’ll help you get an apartment and they’ll help you with the likes of a carrycot and baby stuff. ‘You’ll be all right!’ He made the arrangements, she travelled by train but when the train pulled into the destination station, standing on the platform was a nun ‘and I knew straight away. I got a pain. I actually felt a weakness coming over me’.

This nun told her that the social worker had called ahead and was aware of her background: ‘Sure you’re one of our girls anyway, you’re well able, you’ll be grand. We’ll get a little routine now, and you’ll be grand’. ‘I was conditioned to yes sister no sister three bags full sister and I was sitting there in the car while the nun drove and we got there and I saw it and I knew that the social worker had fucking lied to me’.

When an 18-year old woman told her boyfriend she was pregnant, his response was an unbelieving: ‘sure you’re on the pill, aren’t you?’ She had no idea what ‘the pill’ was and when they’d been having sex, he’d said to her: ‘Don’t worry, I’m shooting blanks, you can’t get pregnant’, which she didn’t understand either. She went to a mother and baby home with the help of an adoption agency.

1990s

Then there was the witness who was 22 years old when she became pregnant in the early part of the 1990s with an older married man. When she told her adoptive parents, they refused to have her at home any longer; she felt this was a second abandonment and rejection and was ‘hurt and angry’ that they were sending her away.
Asked about the admission to the mother and baby home she said she hated it; her room was above the nursery and the cries of the babies upset her. (This witness told the Committee that two years later she again became pregnant having met another married man.)

It was also the early 1990s when a woman who was then 26 years old, got pregnant while having a relationship with a priest. Because of the pregnancy, she had to leave the town in which she grew up. ‘I feel very stigmatised. There is a lot of pain around the fact that I was wrenched from my home - my emotional connection. When it became known to her family and the church that she was pregnant she went to live with her sister in a city, then made her own arrangements to go to a mother and baby home. The priest-father of her child brought her there. When her father died, she was warned not to come to his funeral.
Conditions in the homes

‘I want people to know what went on in these institutions. The child is punished for what the mother did…’

The opening words of this section, above, were uttered by a woman during her interview with the Confidential Committee. She was born in one of these mother and baby homes during the 1950s, spent the first five years of her life there, and described conditions as ‘horrific’, saying that she had never had shoes, had slept in a bed with five other girls without pillows, sheets or blankets, (their bedding being old coats) and had been slapped by a nun for the crime of spilling milk from its container. She told the Committee that she had been sent to the gate of the institution to fetch it from a milkman but it had been snowing and her clothing was light. She was shivering so hard that some of it had spilled.

A witness recounted that during her time in the mother and baby home as a child she was destroyed from the cleaning products which afflicted her with ‘terrible sores’ on her skin. Witnesses reported that scrubbing of floors, stairs and steps (both as work task and punishment) had been imposed on residents from the 1950s into the 1970s in some mother and baby homes.

Some mothers reported having to do physically exhausting work up to the verge of giving birth, or very soon (as little as two or three days) immediately afterwards; one new mother gave an account of being shouted at and taunted while she was cleaning, post-birth stitches bursting, the cold stone of floor and staircase she had already cleaned now flooding with her blood.

Some referenced scrubbing as an inescapable part of their lives in the homes - saying that, while working, they were frequently and very closely supervised by a nun, some of whom would slap or punch them if they were judged not to be working hard or fast enough. Several witnesses from separate mother and baby homes told the Committee that the nun would deliberately ‘re-dirty’ the cleaned surfaces. One related how she had just finished mopping a long corridor when the nun upended her bucket of dirty water and ordered: ‘now clean it again!’
Some witnesses described that while working on their hands and knees, they were verbally abused about their status as ‘fallen women’. Witnesses reported being called ‘sinners’ ‘dirt’ ‘spawn of Satan’ or worse. They related similar, sometimes identical stories from time spent in institutions where the type of work and living conditions, although based throughout the country in widely spaced geographical locations, seemed to be the same.

As seen above, the abuse described was not just verbal; some witnesses told of being slapped, beaten and punched, with nuns shouting at them that this was their penance for sinful behaviour. One witness came to the Committee to speak of her mid-1980s residency, testifying that she herself had not had a bad time in the mother and baby home, but had come to the Committee ‘fighting for other women’ who, like her, had been ‘in the background, providing a beautiful service for those who couldn’t have children’. During her contribution, she shared her opinion that children born in mother and baby homes had been ‘like commodities’ and that the nuns were ‘like human traffickers’.

**1930s**

A witness born in a mother and baby home in this decade told of spending the first ‘seven or eight’ years of her life there. She came to the Committee with her story of childhood deprivation in this institution - no toys, no visitors, Christmas not celebrated, schoolteachers who ‘didn’t care about children from mother and baby homes and grouped them all together at the back of the class’. This woman was nevertheless accepting of her lot, including her classroom status, ‘because there were so many of us [it meant] there was a type of safety. I didn’t mind’. (Her birthmother, the Committee heard, had had to work in the home for a year after the birth to keep her there, ‘otherwise,’ the witness told the Committee, ‘she would have had to pay a hundred pounds’.)

On the day she was fostered, this witness recalled being dressed in a new coat and also told the Committee that when she arrived at her foster home, she was so unfamiliar with ‘being around men’ she didn’t speak for the first month.
Some years later, when she was ‘14 or 15 years old,’ her foster mother told her she was being sent back to the home because she was ‘becoming fond of boys’. In the end, though, she was sent, not to the mother and baby home but to a hospital run by the nuns; she worked there for the next 12 years, ‘living in’ (for instance having to ‘sign out’ should she wish temporarily to leave the precincts.) She did add that while the work was hard, the nuns were ‘nice’ to her and overall, contrary to what the Committee heard during some of its hearings, she characterised her eight years in the home as ‘happy’; on the other hand, for her, foster-care was ‘lonely’.

A woman, who was born, in the 1930s came to the Confidential Committee to say that she suspects the Birth Certificate she holds may relate to the wrong person and therefore, she has no idea what her exact date of birth is, or how old she is. She knows she was put into the home in 1938 where she remained for two years until transferred to an orphanage for the next eight years before being fostered at the age of 10.

A male witness came to relate his own story, starting when he was born in a mother and baby home at the beginning of this decade, 1931. He told the Confidential Committee that his birthmother had also been born - and raised into adulthood - in an institution from which she eventually ran away; but then, she had told her son, being ‘inexperienced and not knowing where to go,’ she had sought help from a Roman Catholic priest. She said the priest raped her.

The witness said that his mother then wrote to the Archbishop of her diocese to inform him of the assault, but the action that ensued was that she was brought back to the original care institution by Gardaí - and was then punished [by the nuns] for running away; this consisted of having her hair cut off. When it was discovered in that institution that she was pregnant, she was transferred by ambulance to the mother and baby home where the witness was born.

**1940s**

A witness born in a hospital in 1947 and then transferred to a mother and baby home wrote to the Committee, informing it of his memories of the home where he had stayed, without his mother, until he was six years of age. (He also wrote about his experiences
of being boarded out later on in this report.) His memories included repeated attempts to escape from the mother and baby home along with his pal. Here is what he wrote:

My memories are of my attempts to escape with my pal from the abuse we were suffering - every day we got out of the room, we climbed up, using the big iron gate, on to the big stone wall that surrounded the place, but the drop to the outside was too deep and we knew we would break our legs if we jumped down. We would try to get the attention of someone passing outside, but they would ignore us.

The caretaker would come with a ladder to bring us down and the nun would come, grab me by my left ear and drag me inside. I was then locked in to a dark room for a day, or sometimes two.

I was never sent to school.

I used to wet the bed at night, and every morning, the nun would hit me before she grabbed my left ear and dragged me to the wash basins. Sometimes I would trip and fall but she would continue to drag me by the ear. This left ear, he wrote, would regularly produce a discharge (otorrhea) an affliction that has persisted throughout his life: Doctors told me that my ear suffered permanent damage. If I get a cold I lose my hearing in my left ear.

It was almost impossible to get a night’s sleep there as the nun was constantly coming in to the dormitory, shouting and roaring to get me and many other boys out of bed to go to the toilet. If the bed was wet already boys would be beaten there and then - there was near constant noise throughout the night with children crying. The nun would then be roaring at us to shut up and go to sleep.

I still have nightmares about the place and I wonder how they could be so cruel to little children in a religious country. I sometimes wake and think I’m back there.

I was not able to eat most of the food put in front of me and I regularly felt hungry - the food came out on a plate and what I left behind was brought out to me the next day again.

One woman, who had come to the mother and baby home at the age of 20 in 1949, had a generally ‘good, if lonely’, experience there. She described to the Committee
how ‘the girls there were well fed’ and how ‘everything they needed was there’. Her work was in the kitchen, she said, ‘making breakfast and dinner for the men, the farmers and priests working in and around the premises; ‘You just had to work and keep your mouth closed’. She was, she said, very lonely, since she was not allowed to talk to anyone, and so was too afraid ever to do so. Nevertheless, she said, she had ‘made a home’ of her institution: ‘I had nothing else and didn’t know what was going to happen’.

There was another group, who also came to the Committee and whose memories leaned towards the positive: as categorised by one witness, these were the girls whose families could afford to pay for their residencies. Their stays in mother and baby homes (while being far from luxurious or easy) were by all accounts less punishment-prone or humiliating than those whose families could not pay and found themselves in the front line of fire.

This group of women had been ‘put in’ to shield them from society also to buffer their families against the prevailing ‘fallen woman’ and ‘shame’ stigmas. Based on many accounts of conditions in the homes, they received far more latitude than most residents.

What also became evident to the Committee was that while the prevailing culture in mother and baby homes all over the country was harsh, there were exceptions in some, where even in the early years they could be said to run a more forgiving regime than most of the others. (Even here, though, there were drawbacks, one witness’s complaint was that when resident under one of these more benign regimes, she ‘never saw meat, and got a boiled egg at Christmas’.)

The quality of food on offer in mother and baby homes was a recurring source of grievance even amongst the group of mothers who professed themselves grateful for ‘sanctuary’. One member of this group, like the others cataloguing her appreciation of having ‘a roof over my head, a place to sleep and food’, (despite the latter being, in her estimation, ‘Slop!’) adding: ‘You didn’t have to worry about your weight!’ ‘Stew’, offered a second witness, ‘was soup and a few potatoes’. A third told the Committee that an ‘ordinary’ resident’s breakfast consisted usually of ‘lumpy porridge’ taken, under fear of punishment, in strict silence, while the nuns enjoyed, she said, ‘a fried breakfast and eggs’.
A man born in the mid-1940s into a mother and baby home, who could offer few memories of his time there, did remember that a nun ‘had placed his hand into boiling water in the laundry for being bold’. He told the Committee that he spent nearly five years there before being sent to an industrial school.

This next witness came to the Confidential Committee to give evidence of his birthmother’s story. She had told him she had been thrown out of the mother and baby home just weeks after she gave birth to him because she had attacked a nun on discovering a safety pin going through his penis...

A man born into a mother and baby home in 1947 reported that he had remained there until he was five years old, describing the home as ‘a revolving door’. Characterising himself as a ‘loner’, he recalled there being a lot of children with him during his time there but that he never found out what became any of them, telling the Committee they would all ‘disappear’ after six months. He described where he lived during his time as physically ‘very decrepit with an open toilet that wouldn’t flush’. Prone to wetting himself, he spoke of being locked into a room for ‘misbehaving’ and told the Committee that he now continues to suffer from a lifelong fear of enclosed spaces.

During his time, he did make friendships with other children but could never hold them because ‘they would suddenly disappear’. He recalls ‘being put in a glass case while strangers would come and look at me’; this viewing was followed by being ‘sent to the playground’ where he would be ‘observed’. He said he didn’t understand this until much later. He was fostered out ‘at the age of five or six years old’, recalling that he was so upset he had refused to talk ‘for days’ in his new home. This man did meet his mother again when he was 13 years old, subsequently having sporadic but ‘difficult’ contact with her. She was by then ‘with the Magdalens’ in a laundry.

Another witness who had been born in a home in 1948 said to the Committee that his birthmother had told him that, as well as doing odd-jobs and looking after others in the home while she’d been resident there, one of her tasks had been to clean the toilets with a toothbrush.

A man, born in the same year, recalled having been quarantined with other children, all suffering from chicken pox. He needed a drink of water and asked for it; but because ‘they’ told him he would have to wait until dinnertime, he went to the toilet and drank...
from that. Evidence from this man continued to be graphic. It included being ‘let out into a field to play’ and when out there with others, using (little balls of) ‘pig shit’ with which to play marbles; when they got back inside, ‘the smell on your hands would be bad’, he said, but ‘they’ wouldn’t countenance cleaning them before dinner.

There was no sense in the home, he went on, of being ‘wanted’ because ‘you were the product of an evil union and being made suffer for the sins of your parents.’ He recounted the backs of his hands being hit with sticks and that the main sustenance for children was ‘goody’, a blend of hot milk, bread and sugar, which could cause severe diarrhoea. He said that he was ‘always’ hungry and that he suffered very badly on ‘bath night’ (held on one night a week) because ‘they’ would lace the bathwater with Jeyes Fluid, which caused him great pain: ‘My scrotum would be burning’.

Some witnesses spoke of the threat of being sent to a Magdalen Laundry being hung over them. One mother who had taken one of the dirtier jobs, that of sluicing nappies, so she could be nearer to her daughter in the nursery, was thereby close to her for two years until her baby was transferred to a secondary nursery where she was no longer allowed to see her.

She told the Committee that she broke the rule by sneaking in to see her daughter only to be horrified at seeing her ‘in a completely soiled condition’ and took it upon herself to clean and change her. Her transgression was discovered and she was threatened with a transfer to a laundry. She, unlike many others who came to the Committee, had not been intimidated by this or any other threats, explaining that ‘I was able to stand up for myself’. It was possibly because of this resilience that she and her daughter survived many ordeals, not least an outbreak of gastroenteritis amongst the babies, many of whom died.

During this outbreak, she was asked by a doctor to breastfeed babies other than her own to prevent infection spreading through bottles. She did so, while managing to prevail on the Reverend Mother to have her own child ‘taken out and away from others’ and to this day, believes that this saved her daughter’s life.

While relating her experiences during the early 1940s in her mother and baby home, a woman told the Committee that she had been placed there at three months old having been born ‘elsewhere’ and had stayed for eight years.
Understandably, her early memories are not all that clear but she does remember ‘rows and rows’ of very high beds with children in them. She certainly remembers being charged, sometime later, with the ‘minding’ of two small toddlers - and on one occasion, lining them up along with ‘rows of children, big and small’ for a bath which was ‘huge and sunken, with ‘boiling’ water. Of these eight years, one of the ‘good’ memories she retains is of when she was minding the two children and she was standing beside a stove and indulging in the ‘rare treat’ of eating bread and jam.

Other than these two toddlers, she told the Committee she had ‘no pal, no recollection of attending school, no memory of having toys to play with or - sadly, of ever having experienced Christmas or birthdays.’

During this decade some of the witnesses said that they lived with the fear of punishment and they described the culture within which they lived as not just punitive but recriminatory.

Two witnesses came together as sisters to tell of their mother’s experience, also in a home in the mid-1940s. Their mother had stayed with her baby boy until he died at two years of age and had blamed the nuns for his death because the place was wet and she believed that her son got TB from being on wet ground. She also told the witnesses that one of the nuns had ‘knocked the baby out of my arms’.

The Committee heard from many women who were young (some not even in their teens) when they were placed in mother and baby homes because of a pregnancy following rape or incest. In general, these witnesses said to the Committee, that however young, however badly injured physically or psychologically by rape or incest a resident was, how she fell pregnant didn’t matter. The nuns and nurses in the homes showed very little empathy and understanding and the women were there to atone for their sins.

A witness told the Committee that she’d had to knit garments for the babies, mentioning that one of the saddest tasks she
was given was that of ironing the little dresses for the babies
‘to get them ready for when people were coming in to see
them’.

On top of the treatment they received at the hands of their carers, many mothers told
the Committee that their most searing memory of their time in a mother and baby home
was that of the screams of women looking through a window, through which she could
see her child being driven away to a destination unknown; for many, there had not
been a chance to say goodbye.

1950s

Three short stories from the 1950s:

• The first deals with being in a home during that decade and of being beaten
  by the ‘priest chaplain’ when this male witness was four or five years old. He
came to the Committee to tell about his birth and remaining in the mother and
baby home for some years.

• ‘When I was having my baby’, said one mother, ‘the medical professionals
  knew that I had had a previous baby and one of the nurses gave me a clatter’.

• A 25-year old pregnant woman reported that she was ‘forced to climb a ladder
to clean windows’, despite suffering from vertigo.

Then a witness, born in a home during the 1950s, recounted what his birthmother had
told him about an episode during her residency in what she had described to him as
‘an atmosphere of fear and terror the whole time, hardship and humiliation’. One of her
companions, she said, had been punished for some transgression by being locked up
in isolation. Feeling sorry for her, his mother had tried to take her a glass of water but
was caught in the act by one of the nuns, who said: ‘Who’s in charge here?’ slapping
the glass out of her hand and, the witness said, then forced her to pick up the broken
pieces and ordered her to clean and polish the corridor. This story had a good ending
for both the witness and his mother when the witness’s aunt came to visit the pair and,
alarmed by what she saw and heard, arranged for both to be taken out of the home.
A witness told the Committee that when she was born, her birthmother was told by the nuns that her baby would be ‘taken’ and that she herself could ‘work off her sin for the next three years’.

The witness learned that her mother’s response to this information was that if that happened she would ‘go to the top of the building with my child and commit suicide’ the response to this being that she was ‘badly’ beaten by one of the nuns. On hearing of this, the witness’s maternal grandmother took the two of them out of the home.

She told the Committee that she had worked out why the subsequent relationship between herself and her mother did not work out. ‘She had walked into hell, had decided to blame me for her being there, and could not accept me’.

A witness now in his 70s, told of how he started life in a home in the 1950s, was subsequently in a county home, and thereafter in an industrial school. His life had been shaped, he said, in an ‘extraordinary’ way, by ‘the isolation and abandonment’ he felt he had suffered as a child.

A second man, born in the same year, told the Committee that his mother was 33 years old when she gave birth to him. This man had learned that when she was seven months pregnant with him, his mother’s brother and sister had cycled 20 miles, with her on the handlebars, to deliver her to a county home from where she was transferred to a hospital, hence to the mother and baby home where she was to give birth to him. She subsequently spent a year there, unable to leave because, in his words, ‘she didn’t have the money to get out earlier’.

His first memory of meeting her was when he was an adult and she was in a Magdalen Laundry. The second was when she was in her 70s and still living there and it was during that meeting, she confessed to him that she had been unable to bond with him as a baby when they were both in the home, because her time had been taken up with
the requirement to mind other children. She died in that laundry. It was only after she was gone, when he himself was 70 years old, he discovered he’d had a sister born in the same home as himself, but who had died (he was told) at 10 months old. He said to the Committee, that he is ‘not all that sure that she did’ die and his search for further information continues.

One witness, born into a home back in 1942, told the Committee that even as an adult she ‘feels fearful when seeing images of nuns’; another, pregnant at 19 years of age in the late 1950s, said: ‘The very sight of nuns was to be forever frightening’.

1960s

Some witnesses described unkindness in mother and baby homes during all decades under review and not just in the early years. In 1967, for example, a woman who had been made pregnant during a rape went into a home at the age of 16. She recounted to the Committee how her father had taken her to court to force her into having her baby adopted but the judge ordered that she could keep the baby if she agreed for the child to remain in the home while she ‘got back on her feet’. In the home, this girl visited her baby every day to tend to him and do ‘whatever else was asked of me to help with the baby’s keep’. ‘In that home’ she said, she was ‘physically and mentally abused by the nuns’ and was told she ‘was not fit to keep her baby’. When she married two years later, she took her son home.

Another witness from this decade recalled watching a child being beaten up: ‘The child was kicked, and she fell, and the blood was pouring out of her head; the nun was hitting her, swiping her… she was unconscious and was carried off’. The witness does not remember ever seeing that child again.

‘The deaths of babies were covered up’, said some witnesses, with mothers being told, ‘it’s taken care of’. One witness who reported this to the Confidential Committee also said: ‘Mothers were not told where the baby was, or given any records. One young girl whose baby died at two months old wanted to see where her child was buried and was told by the nuns that ‘she shouldn’t know’.
A son came to tell the Committee about what had happened to his mother when he was born (she too had complained about the food: ‘Terrible! Cabbage, bacon and lumpy semolina’ - and had described to him how she was made dig potatoes in the frost while wearing wellingtons without any socks). The son’s own story included his attendance at school from his foster home (where he told the Committee he had been happy), but that it was a different matter at school, where he was taunted as ‘the county home bastard’ which he found very hurtful. Then he was moved to a different foster home, in which he was treated, he said, as a labourer.

The Committee heard a lot about the difficult practices in the homes - one of the most distasteful for one witness was working with what are now called feminine hygiene products. At the time in question, the early 1960s, residents in these homes customarily made their own sanitary towels (‘from rags’ one witness said) while the work of collecting them after use and laundering them, was assigned to a resident or sometimes more than one.

A witness to whom this task was given told the Committee that she also had to wash her hair with laundry soap in the home, and said she found the days ‘long and boring’ especially when the women ‘would sit around the tables sewing and knitting while reciting the rosary’.

No matter what congregation or religious order was in charge, or where its institutions were located, a remarkable similarity of regimes in most homes was described by the stream of individual witnesses of all ages and from all parts of the country who came to the Confidential Committee.

At this point, while outlining conditions for - and treatment of - women and their children in mother and baby homes, it might be illuminating to gather together a short digest of quotes and information given to the Committee. The decades from which the quotes are taken are not in chronological date order.

- ‘The nuns were tuned out of life’.
- ‘They had no connection with people, nothing positive’.
- ‘They would poke at you as you went along, they would push you along if you weren’t walking fast enough’.

52
• ‘There was Confession every week and we were reminded to confess what we had done but told we wouldn’t receive absolution’.

• ‘Any girls who tried to run away were brought back by the Gardai’.

• (My mother) ‘suffered terrible in there. She saw so many babies dying - no crying, no funeral, no parents arriving. She would breastfeed other babies and would steal milk from the kitchen for her own baby.’

• ‘My mother was put back washing sheets two days after giving birth’.

• ‘Local farmers would come to the home looking for a wife…’

• ‘You were given less food after you gave birth, you were starving’.

• ‘I remember seeing trollies with dead people (on them) being wheeled around’.

• ‘As punishment for having a row over a toy on Christmas Day, I was put into a room with a corpse in the corner’. This witness was left in this room, he said, ‘for six hours’.

• ‘I had to care for a nun who had cancer’.

• ‘I was pregnant from rape and I told the nuns I might have syphilis and that there was a danger my baby could be blind, deaf and dumb. I was sent for a test but not given any results’.

• ‘It was clear that we were there to suffer’.

• ‘My mother came in to see the baby and one of the nuns asked her: ‘Why would you want to see something like that?’

• ‘I was told by a nun: ‘God doesn’t want you… ‘You’re dirt’.

For some, the ‘headgear’ (the bonnets worn by members of some orders), was also a source of great fear. Some were huge, they said, their shape not unlike windmills, lending considerable height to their wearers.

For women and girls whose residency in mother and baby homes was paid for by themselves or their families (private patients), one ‘ordinary’ witness after another described how they knew that for this class of client, (‘the posh girls’, as they had been
dubbed by one witness) the diet was of a higher quality and the work less taxing. One witness from this group did concur with this view: ‘There was a class system operating. I think I was treated slightly better than the others because I was from a good family’.

The Committee also heard from others in this category, whose tasks were:

‘I churned the butter which was for the nuns…’

‘We made apple tart for the nuns’.

‘I had experience as a tailoress and I was given a bale of material to make skirts for jumble sales and clothes for the nuns’ nephews and nieces’.

‘My only complaint was that I was put to work for no money, making cards for Knock’.

‘We were ‘sewing lace onto the hems of nuns’ slips’.

Then there was the witness who told the Committee that she had come to the mother and baby home from a very poor family that had included 12 children. She said that in the home, she found the food ‘beautiful’ and the place ‘very warm’, but a week after giving birth, despite coming from a city background and with no knowledge of farming, she was put to work on the farm, milking cows and feeding chickens and was ‘hit’ by the nuns for not doing this work correctly.

It was still in the 1960s when, like many others who came to the Committee, a pregnant 19-year old admitted to a home, ‘was ‘made to feel like a sinner and a fallen woman’ adding, ‘after enough exposure to such criticism, you began to believe it’. Set to work in the kitchen, she remembered ‘making beautiful food for the nuns’, while she and her fellow-residents ate ‘like cattle’.

Not all witnesses were mothers or babies. Several individuals who had worked in the homes or who had had some interactions with them, applied to come before the Confidential Committee to tell of their experiences there and what they had observed.

For example, a psychiatric nurse came to the Committee to tell her story that while on night duty in her hospital ‘in or around 1963-65’ she was approached by a senior staff member who asked her to convey a young, pregnant girl, waiting in the hospital’s
admissions unit, to a mother and baby home; her family had arranged for her reception there as she was close to giving birth.

The transfer was made in an ambulance. When she and her patient got there, she explained to the nun receiving them that for this mission, she had been assigned a ‘red card’. This meant, she told them, that she was not permitted to leave the girl’s side at any time even briefly. However, this nun called another and the nurse was told that from that time on, the home would now look after the patient. This nurse told the Committee that although she continued to protest and to explain her patient’s ‘red card’ status, she was escorted to the canteen by four nuns for ‘something to eat’ before her return journey and having eaten, was directly led to the front door of the home where there was a taxi waiting for her, her final appeal to see her patient refused.

‘The very next day’, again at work in the hospital, this witness found it ‘heart-breaking’ to hear that her patient was already back in the hospital, without her baby. Yet she admitted to the Committee that she experienced a modicum of relief that she hadn’t been fired for abandoning a ‘red card patient’; she had explained what had happened with the nuns to her Matron and she, with one of the hospital doctors, telephoned the home. The nuns refused to talk to them, she said, characterising them as ‘intimidating’ and ‘a law unto themselves’.

1970s

‘You could almost feel the tears in the walls’.

A woman told the Committee that she was 17 years old when she entered the mother and baby home in the early 1970s, finding it to be a ‘mix of hospital, school and jail, full of grief and despair and of disturbing things, including, she said, ‘women screaming, a woman who had lost her mind, and a room with small white coffins’. She also recalled the presence of ‘a nurse known to drink whiskey and a nun who would play with her false teeth’.

An 18 year old when she came to a home characterised the nuns there as ‘verbally abusive’. After giving birth, ‘it was drummed into my head that I couldn’t be a good
mother, that I was not able to keep her’ - one nun hammering at me that ‘It wouldn’t be good to keep her, that I had no experience, was never getting married, and would never get a house’.

‘You were reminded every day that you were a sinner’ - the words of a witness who in the mid-1970s, became pregnant when she was 17 years old. Her job was to clean the parquet floors in the home and: ‘One nun would dirty the floor after I cleaned it. I would have to clean it again’.

On the day of arrival in the home, in the 1970s, at 24 years of age, this next witness had her hair cut off and was allocated the task of handwashing sheets, thick towels and other clothes, under the supervision of a nun who would ‘shout at us to go faster’. She was not allowed to go outside the home or have any visitors or phone calls, telling the Committee that ‘only the posh girls were allowed out’. Each week she received a package from a relative, ‘but the nuns would take things from it before passing them on’.

‘There was one nun who was terrible to the mothers’, she continued: ‘She would shout at them. One Christmas I was going to go home. I had packed my bags. My sister and partner had come to collect me. Five nuns stood in my way and wouldn’t let me leave. They said they would get the Gardaí to come and arrest my sister and partner if they attempted to take me’.

Another mother, pregnant at just 15 years of age, entered the same home a few years later, one of the youngest there at the time. She was put to work in the convent where the nuns lived and told the Committee that sometimes she ‘would feel weak from the work and pass out’. Although a teacher was brought in to help her with her studies, she had ‘little or no contact with anyone else. I was being punished in there for what I had done’.

Some witnesses who came before the Committee did so specifically to relate positive experiences in homes, saying that they wished to add some balance to the stories, or simply to have it noted that while they had to work hard to atone for their sins, it wasn’t all bad.

For instance, an 18-year old who had been resident in the same home as that 15-year old and at around the same time, said that she came to the Confidential Committee.
because ‘with all the negativity, I just wanted to try to balance it out. There were some things done right, there were some nice nuns. We got somewhere to go…’

Another felt somewhat the same. She had grown up in institutional care and described her institution as a ‘home from home’ and said that being there ‘felt like being a child again, being minded’. She had ‘meals and good company, it was sociable, communal and familiar’. This witness gave birth to four children in this home, coming in and out from 1970 until 1977; she gave her first three children up for adoption but told the Committee that on her fourth pregnancy, knew she couldn’t let that happen again as ‘I knew I would have to face my demons’.

_in 1973, a woman, 23 years old at the time, returned to the mother and baby home having already been through two pregnancies (her parents had raised her first child as their own, her second was adopted.) On discovering she was pregnant for the third time, however, her father had wanted her to have an abortion and when she refused, she was thrown out of home, with a priest now involved in organising her re-entry into the mother and baby home. Her work there was ‘washing floors’ and in the laundry, ‘stirring clothes’; but every Saturday morning, she could leave the home for work in her old job._

However, this witness refused to give birth in the home as the midwife there ‘had a bad reputation for leaving girls in labour by themselves without pain relief’. After her third child, a daughter, was born, she was allowed to leave the home to visit the infant, who had been fostered - and then, eventually, adopted. This woman later married and had other children in her marriage.

Among the positive stories were:

- A witness, who was brought up in a number of industrial schools, was 17 years old when she arrived into the mother and baby home in the 1970s and when asked by the Committee to describe conditions there, had no complaints: ‘Sure you were brought up with it’, describing the home as ‘lovely’ her experience as ‘comforting’ and the nuns as ‘nice’, telling the Committee that they helped her to get a job: ‘I needed someone and they were there for me’. She spent her time, she said, ‘cleaning the home - but I
couldn’t say we were slaves or anything’. Arrangements were made for her to have regular pre-natal check-ups at a maternity hospital and overall, she said, the experience was a good one’.

- A similarly positive experience was described by the second woman, 21 years old when she arrived into the same home. She said to the Committee that while other people’s stories were ‘harrowing’, for her the home was a ‘refuge’ (a term commonly used by witnesses who had expressed their experiences as ‘good’, or ‘positive’.)

This witness did explain that since she was older and more experienced than many of the women in the home; with most residents being between 16 to 18 years of age at the time, ‘I would have been among the oldest there and the experience might have been easier for me’.

- The third story in this sequence involves a woman who had resided in the same home as the other two. She became pregnant at the age of 26 and entered it in the late 1970s, coming to the Confidential Committee to tell her story because she was eager to portray the ‘good side’ of the mother and baby home experience: ‘It was not the horrors seen on TV’, adding that: ‘The nuns were not monsters’. She described the Reverend Mother, for example, as ‘very kind’ and - echoing home life difficulties referred to by the 21-year old above -added: ‘my family were worse’, and: ‘Society had an obsession with hiding everything’.

As demonstrated by those three stories, many of the witnesses who testified that their experiences of homes had been comparatively positive, did so because, they told the Committee, on coming into them they had escaped from difficult or chaotic home lives, poverty, poor housing, beatings, alcoholism and incest.

Another witness, revealed she too had had a difficult home life where she had been exposed to conditions which she regarded as ‘more severe’ than at the mother and baby home. For her, the home was ‘warm and comfortable’ but while she found the nuns ‘cold’, this did not bother her. As a resident, this woman said, her tasks every day were ‘cleaning and making religious objects such as scapulars’.
As for the food, she was pleased to be given ‘hot food every day, and on Sundays we got roast chicken, potatoes and mushy peas, with jelly for dessert - and we were given Easter eggs on Easter Sunday’.

Even within the strictest of regimes in these homes acts of kindness were described. During her three and a half years of residence in one of the most regimented of these homes, one witness told the Committee about ‘one kind nun’ who gave her chocolate bars to give to her child; and it was the same nun who ‘secretly’ took a photograph of the woman’s baby, which the witness still has.

‘I had no other option’, said a witness, 18 years old when entering one of these homes. ‘But it was absolutely fine. Maybe I was one of the luckier ones’, she went on, ‘I think I was in the nicer side of the place’.

This woman told the Committee that she received ante-natal care, had a room to herself, and left the home every day to attend a typing course. ‘The nuns’, she added, knew in advance that she was putting her baby up for adoption (so there was no pressure on her as there was for many others.) ‘I don’t blame anyone for what happened’, she said, ‘I felt I had to provide some balance. No-one dragged you in there off the street. People mixed up their own shame with that of others’. Her view was that ‘no one made you give up your baby’.

Even the entry mode into the more relaxed regime of one of these homes was spoken of as ‘easier’ than the norm pertaining elsewhere. It was relatively civilised when a 17-year old was brought to this place by her parents, all three were taken into the ‘parlour’ for the witness to be given the ‘quota’ of jobs she would be required to do. ‘You had a few jobs to do’, she said to the Committee, ‘and then you were free to do what you wanted’.

This woman remembered ‘no antagonism or judgment’ saying: ‘I would say I met some enlightenment in the home’.

On the other hand, a girl, only 14 years of age when she was raped and became pregnant, described the home to which she was sent as: ‘Horrible’; she had to ‘feed babies, morning and evening, clean and scrub floors, we were like slaves’. She told the Committee about ‘a room at the top of the building, ‘without staff present’ but with
’approximately 50 babies in cots. They were not supposed to be known about’, she said. ‘They were all very quiet’.

1980s / 1990s

A witness, 17 years old when she entered a home during the 1980s, described the nuns there as ‘kind’ adding, however: ‘the women were still made to feel that they had fallen from grace and had brought shame on their families’. One whom she described as ‘a jolly character’ would wake the woman and girls for breakfast and after their chores (cleaning still featured prominently) they had ‘a few free hours during which they would knit baby clothes’.

There was a smoking room, and a non-smoking room with a TV, in which one of the nuns would watch TV with them. However, as so many other witnesses did, she too pointed out that the nuns ‘ate differently’ from the residents.

Another woman who entered the same institution in the 1980s, described it as ‘welcoming and warm, a home away from home, of which she had ‘fond memories’. She experienced a ‘deep sense of peace’ on arriving, especially ‘being among other girls in the same situation’ - and divulged that during the Cheltenham Racing Festival, the residents could go into the nearest town to place bets.

This witness had been a university student when she became pregnant and she told the Committee that the nuns bought all the books she needed to help her with exams: ‘it was the making of me; afterwards I was determined to make something of my life.’

It was from this institution, the Committee heard from many witnesses, that a nun would drive their pregnant charges en masse to a hospital for ante-natal checks. ‘We were called the unnuptiates’ said one, ‘and the nun would tell us when we were approaching (the hospital) and we would bend down and throw our coats over our heads’.

This witness came before the Committee to offer a personal perspective on her experience that was not all that much different to that of other witnesses, but wishing
nevertheless to offer context: ‘I would like to think someone is speaking up for the nuns’, she said, ‘I want to be sure they’re getting the kudos for getting it right’.

She told the Committee that she ‘was glad to have found the mother and baby home, to escape the judgment of the public, the way they judged you. You were an absolute slut if it happened to you’.

During her time in a mother and baby home, this woman’s companions included a girl of 14 years of age and the oldest resident, who, she said, ‘suffered from mental difficulties and appeared not to be aware of her surroundings, or what was going on at all’. Within that same home, a separate witness described seeing a pregnant 13-year old ‘clutching a teddy bear and sucking her thumb’.

An undercurrent of the accounts given by many witnesses indicated not just what they had personally suffered during their mother and baby home residencies but also confirmed the prevailing attitude towards ‘fallen’ women and their ‘illegitimate’ children within wider society in Ireland during these decades.

A woman, 17-years old, described living in the mother and baby home as ‘a break’ because she was ‘getting away from a worse situation,’ a sentiment reiterated by another who told the Committee: ‘It was a bit of a relief to get out of the family home’.

Another witness who had been placed in a home following a rape, recalled a girl dying there during childbirth. This witness told the Committee that the girl’s parents ‘would not take her home, even in death…’

In the mind of this next witness, there is no doubt that the attitudes of these nuns mirrored those of the families who banished pregnant girls and women into these homes. She reported that within the home into which she went at 16 years of age: ‘All who were there, were there to hide’. Some of the married women were there because of an extra-marital affair. Some of the girls had been beaten by their parents before being brought in, some had been raped by their fathers. One had been suffering
beatings by her mother - her father was raping and abusing her - and she came to the home with her hair chopped off and with chunks of flesh missing from her scalp.

Another man born in a home came to the Committee - again to bear witness on behalf of his birthmother who had been 17 years old when she became pregnant and went into a mother and baby home. She told him that she had been ‘degraded’ from the moment she went in, being called ‘a dirty woman’, ‘a fallen woman’ and ‘a scarlet woman’ - while having to bear ‘constant verbal abuse about sin and shame’.

Another, born in a home, testified that when eventually she met her birthmother and asked her: ‘was it awful?’ the reply had been: ‘No. It was my penance’. Another mother told the Committee she was so malnourished in the home that all her teeth fell out.

Many witnesses divulged that while resident in these homes, they had no contact with their families or, indeed, the outside world - although some did write letters, closely monitored and censored before being released for posting. Replies, should they come, were dealt with similarly.

**15 years old when she became pregnant by her brother, a witness said to the Committee that when leaving home, she was told by her family she was being sent to boarding school, while other family members were informed she was going away as she had scarlet fever.**

**Her memories of the mother and baby home ‘swing in and out;’ she does not remember the birth of her baby, for instance, but ‘thinks’ she had a baby boy.**

**What she does remember is being sent to a psychiatric hospital to receive shock therapy - and, vividly, the sound of women in the home screaming during the night. ‘They would be gone by the morning so I thought they were being killed. So I was waiting to be killed’.**
This witness returned home after having her baby - and discovered that her brother was now in a seminary - and went back to school.

Another woman, 19-years old when she came to this home, told the Committee that as punishment for complaining about the food in the home in a letter she had written to her granny, she was forced to eat it in front of a nun, who pronounced: ‘You can eat your words’.

The work assigned to a girl who was 17 years old when she fell pregnant in the latter years of the 1980s, included cleaning out the rooms of the girls whose parents were paying for them to be there. ‘I had to dress and change their beds, make sure that their babies were looked after, buy sweets for them in the home’s tuck shop and deliver their letters to the post office.’ She also told the Committee that one woman working in the kitchen had been in the home for a long number of years because she had nowhere else to go - and had been frequently reminded of that; she said that an 11-year old was there for the same reason.

The changing times did mean that a witness who became pregnant at the age of 20 could describe the food routine in her institution, which was small, as positive. For example: ‘After cleaning in the morning’ you had breakfast - orange juice, toast and cereal. Lunch was a bowl of soup or a sandwich. Dinner was standard’.

Nevertheless, for this witness, the conditions were far from utopian. She described living in the home as (still) like being in a ‘concentration camp’. Phone calls, for example, were monitored and every morning she felt ‘like Cinderella; you had to clean your room and the stairs - and all the fires had to be cleaned before breakfast. You couldn’t have any food until you cleaned’. If there was any practice demonstrating how greatly the regime in a home differed from those in the past it’s this: when this witness missed dinner, she ordered takeaways.

A woman who was in one of the homes from where many residents’ stories from earlier years were difficult to hear, was, nevertheless, eager to have her story heard as she felt it was important to say that this home was ‘organised and well run, similar to that of a boarding school’. The women were provided with clean clothes and the home itself was ‘very hygienic’. She did recall some babies dying during her time there.
She confirmed a detail, like that reported by another witness, that for those women who didn’t want their families to know they were pregnant and living in a home, this one, as with others, facilitated letters to be mailed from the UK. Then adding her own positive view of her experience, she added that she had left the home ‘with skills, knowing how to look after babies, knowing how to feed and handle them, knowing about hygiene’. She also told the Committee that the nuns in the home helped mothers get jobs and that they gave references. Speaking of the prevailing societal view at the time, she also told the Committee that while residents could leave the home and ‘head down the town’, no-one wanted to. They were there to conceal their pregnancy.

The downside for her, was that there was no preparation given ‘for the impact of giving up your baby’ but she firmly believed that apart from that detail, ‘without the nuns, many mothers would have been out on the streets’ and in her opinion, ‘it was the families that were hard on the mothers… and men. Men got away with it. Society doesn’t think about all the men that got those girls pregnant’.

This witness’s indignation was palpable. However, she was one of the few witnesses to bring up the subject of birthfathers’ behaviour, attitudes and seeming lack of personal responsibility in this manner, ‘there was always a slur on you. The men just walked away and got on with their lives while you’re left haunted.’

In 1983, a witness of mixed race, pregnant as a result of an assault at the age of 20 (having already given birth to a son following a rape when she was 16 years old) sought refuge, with her first son, in a mother and baby home. When she arrived, she said, the nuns did not ask why she needed help or anything about her history; they simply took her son from her and put him,’ she said, ‘in an annexe of the home’ away from her. This was an area specifically set aside for children who were unlikely to be adopted because of abnormalities or deformities. In her son’s case, she believed that he was placed there because he was of mixed race. She recalled that a nun would call him ‘filthy’ and ‘Little Black Man’.

While giving her evidence, she said the nuns suggested to her that she had prostituted herself, and went on to advise her: ‘to refrain from exchanging sexual favours for money’. The witness said that her son who had been placed in the annexe was badly affected by his stay there. Her second son was placed in the nursery immediately after he was born and she was permitted to see him only for feeding at set times, thus, she believes, severing a bond between mother and son and when making plans to leave,
she was advised that since she had not done such a good job with her first child, she shouldn't keep this new one. This witness’s difficulties continued in the wider community after leaving the home with both sons, but, following some time in foster care for them, she eventually took them away from Ireland to live in the UK.

One woman, who had had a good experience in a mother and baby home, refused to allow her father to take her home, choosing to remain there with her second child as she needed the help of the nuns and ‘could not cope with the shame on the outside’.

In the mid-1980s the changes and improvements that had been happening little by little in mother and baby homes became more apparent and by the 1990s, in one home, previously a source of a stream of complaints from some witnesses, women were being allowed to keep their own names and were offered weekly training courses. One witness took a course in the art of stained glass. A witness, who went in to a home at 21 years of age, was anxious to highlight its ‘good side’, reporting that all the conditions were ‘good’. She had her own bedroom and freedom to go out when she wanted. She too took one of the FAS courses, this one in art and pottery and was paid £50 per week while she learned. She told the Committee, that while adoption of her child was discussed, there was no pressure, and there were no repercussions when she decided to keep her baby.

Another witness said that it was pretty obvious that it was a ‘factory for girls up from another part of the country, having kids and going home as though nothing had happened;’ while a highly positive perspective of her experience in a home was given by a woman who entered it in the 1990s at the age of 26. She described it as ‘a sanctuary, a safe haven, a saving grace - I could be relaxed and carefree; and as a very distressed pregnant person, I never felt I was being judged. I felt I was being cared for as a pregnant woman in crisis’. The home was probably not perfect but was the next best option and was run in the way that mother and baby homes should have been run all along.
The Birth experience

The accounts offered by many witnesses to the Confidential Committee spoke of common experiences during stays in mother and baby homes. Many also said they faced into labour and giving birth without having any information at all about what faced them. Some, not expecting it, were shocked to discover what labour entailed when it arose; these girls and women, some up to late teens and even beyond into their 20s, came to a home in complete ignorance of the facts of life, even of ‘where and how the baby gets out’.

These facts had never been discussed with them by anyone in their own homes, schools or in the institutions. Some of them had only ‘behind the bike shed’ speculation with friends who were equally uninformed so labour and what followed came as a shock. Some of these women told the Committee, it was not just the acute pain, but what was being done to them by their ‘carers’ (sometimes medical professionals), outlining for the Confidential Committee how grossly they had been verbally insulted, degraded and even slapped during the process of giving birth.

Even of those who had known what to expect in terms of the natural process of birth, what was additionally dreadful for them, they said, was the complete absence of pain medication. This, some alleged, had been deliberate since their birth pains were represented by some nuns (and nurses) as ‘punishment’ - retribution by God for becoming pregnant out of wedlock. One interviewee, screaming for relief, said she was told to look at the crucifix on the wall. Pain relief was given in some hospitals and in a few homes.

The overall experience of birth, was described by some as so traumatic that there were lifelong physical repercussions, while others were traumatised psychologically. For instance one witness vividly described how ‘her insides were nearly dragged out of her’ during delivery - with no pain relief - and how nurses, as well as nuns were ‘rough’ - and liberal with the insults they cast on her and the names they called her. Another said that after her birth experience she was left ‘dizzy, anaemic, with post-natal bleeding and a mental state of high anxiety, ending up with a post-traumatic stress disorder,’ adding that ‘you never get off the floor’ after such an experience.
'I never saw a doctor' was a constant refrain, as was another about not being given time properly to recover from the physical and emotional stress of birth, let alone a very difficult one - or the experience of having your baby 'whipped away' without giving you, as a new mother, a chance even to see, touch or hold him or her. Instead, very many said, they were quickly put back to work, some of it exceptionally heavy, as in scrubbing stone floors on hands and knees, or working on the land, and being verbally abused while at it.

Those whose babies had been bound for adoption right from the start told the Committee how frustrating it was to be forbidden to cuddle or even hold their new babies, even when feeding them in a nursery specifically designated for babies going to new mothers and fathers. Others told of nurseries in some mother and baby homes, where damaged, feeble, ill, sometimes those of mixed race - and 'the handicapped' babies (as the terminology of the time had it) were all housed together since the nuns believed they had little prospect of being chosen as adoptees.

Immediately after birth in some homes, 'wet nurse' breastfeeding of other women's babies was in some cases encouraged, while in other homes, the birthmother could bottle feed her own child (along with many others) provided she abided by the rule sequence - *feed, change, put down*. Many told the Committee that bonding was not encouraged.

Some witnesses reported to the Committee that this approach in the homes meant lifelong difficulties in bonding with subsequent children; a few said that their maternal instincts had been destroyed.

**1940s**

A witness told the Confidential Committee that ‘One night in 1942’, she was feeling very sick in the home and feared she might have wet the bed. She was 21 years old at the time and was afraid that the nuns ‘would kill her’. Eventually a nurse came and told her she was in labour. Her stay in the labour ward was for three days and nights, with no pain relief and no-one with her. Then a doctor arrived and ordered the nurses to
‘strap her’ as it was to be a breech birth; she said she was in agony, as they ‘turned’ the baby.

Later in the 1940s, a witness who had become pregnant at the age of 18 and, like many, had received no pre-natal care, was transferred to a hospital for the birth but unfortunately, her baby was stillborn. She told the Committee that the doctor was ‘cold’ and simply said to her: ‘Your baby is dead’.

1950s

In this decade, the situation around pain relief or doctors’ presence did not change very much. A witness came to the Committee on behalf of her mother who had not told her parents she was pregnant until she was eight months ‘gone’. Her mother had told her there was neither doctor nor pain relief available to her during labour and when she was giving birth, her legs were tied to the bed and one of the nuns sat on her chest to get her to push.

The first time another witness ever saw nuns, she said to the Committee, was in the mid-1950s. She was in labour when she was brought to the mother and baby home. The witness was 14 years old when she became pregnant, knew nothing of what was happening to her body or about childbirth and although in serious pain from the onset of labour, was given no pain relief. The nun with her during the process told her: ‘You’ve had your fun, this is payment’. The baby weighed nearly 10 pounds.

It was also during that decade that a 12-year old girl was raped by a family member and when her pregnancy was discovered, sent to a mother and baby home. ‘I was washing the floor. I had pains. I was told I was having a baby. My waters broke. I thought I had spilled something or I had wet myself. I was brought to a room and I was put in a bed. There was clear glass in the door, I was screaming in pain. I got out of the bed because I was in so much pain but I was told to get back into the bed. The baby was born. The nun told me to give the baby a name and I did. My baby died. I was never told what happened. I was told I was going home and that I wasn’t to talk about it anymore. My mother told me my baby was dead. I don’t know anything after that’.
This next witness, 18 years old at the time she gave birth told the Confidential Committee that she had ‘no ante-natal care, no doctor, no pain relief’. It was a breech birth and the nun looking after her had had no experience of dealing with this situation and within the hearing of the witness, went into an adjoining room to ask the mothers there ‘to get down on your knees to pray for her because she’s going to die’. She did not die, but, the Committee heard, she still feels upset about how ‘cruelly and inhumanely’ she was treated.

Also 14 years of age, when the waters of this next witness broke in another mother and baby home, she said she ‘got an awful fright and didn’t know what was happening’. She had a ‘terrible labour experience’, and was not prepared at all, thinking that her baby would come out of her navel. Her ‘delivery room’ was, she said, ‘a mattress on the floor’. She received no pain relief and every time she tried to get up, was pinned back down by the ankles and told to pray. There was another girl going through the same experience beside her, she said; this girl ‘had an epileptic fit’ and on seeing this, the witness thought the same was going to happen to her.

Another witness was equally terrified when her waters broke in the home; the nurse administered an enema - and ‘made her’ sit on a commode. In the interim, she was spoken to ‘derogatorily’, with the nurse telling her… ‘It’s good enough for you; you tasted the sweet, now taste the sour! Christ suffered on the cross for you’. She eventually gave birth to a baby girl and was told how lucky she was. ‘Nobody wants to adopt boys’.

As reported by a witness who also gave birth in the 1950s, ‘there was a building down from the main home known as ‘the mattress room’ where women were sent if they were screaming during labour.

Witnesses said that ‘derogatory’ talk was common in homes during the process of childbirth during these decades. One nun’s comment made to a 16-year old going through the throes of labour and birth was: ‘You didn’t feel it going in, but you’ll feel it coming out!’

This to a woman who was experiencing a prolonged labour, much of it alone in a ‘dark room with bats flying around outside in the courtyard’ without pain relief, without a doctor at any stage and with those who did come to tend to her:
‘completely unsympathetic’. For instance she was told she was now ‘paying’ for her ‘five minutes of pleasure’. In the same harsh spirit, ‘You’re paying for your fun’ was what was thrown at a 16-year old going through a difficult labour.

1960s

A doctor was called to attend the delivery of a baby of a 20-year old in a mother and baby home during the 1960s. The witness said that he had ‘a face like thunder because he was so annoyed he had to come’. She had been going through labour, alone, for two days in a ‘waiting ward’ where she was given nothing to eat. This doctor put her to sleep for a forceps delivery and when she awoke, she told the Committee that he ‘stitched her without giving her any pain relief,’ and that she ‘would never forget the pain’.

Still having been given nothing to eat for a further three days, she was forced to walk, but had suffered nerve damage to one of her legs and could not do so - and was placed ‘on bed rest’ for three weeks, adding that having ‘spent so much time in bed, my legs were like knitting needles’. (This witness later discovered that this doctor had cut ‘right through her rectum’ and that for years afterwards, she was unable properly to defecate.)

Another witness, a woman who had been in a home in 1965 when she was 16 years old and having had no medical care prior to her labour, ‘passed out from the pain’ and told the Committee that ‘a bowl was placed on the floor so that the blood would not splatter’; she described the birth scene as ‘being like the calving of a cow’.

It was also in the early 1960s that the waters of a 16-year old girl broke when she was using the toilet in the home to which she had been admitted. She did not know what was happening, and was ‘made’ get a bucket of water to ‘clean it up’. If she made any noise she was ‘hit with a belt’ she said and she, like many others, was told she was ‘paying for her sins...’
A rape victim, 18 years old when she was admitted to the ‘hospital part’ of a mother and baby home to give birth, describing it as a place where ‘a light shone from the ceiling’. When she went into labour she had been ‘placed on ‘a table’, was given ‘no painkillers or injections’ and, she said, because she had a small frame, ‘they cut her with an ordinary knife’. This woman, referring to the pain and treatment she went through as ‘torture’, said, like many others, that she had had ‘no idea what to expect’ from the time she went into labour.

Another 18-year old gave birth in a mother and baby home and after it, one of the nuns brought in the ‘bloodied sheets’ and told her to clean them. She told the Committee that the nuns in this home referred to the women in their care as ‘unclean’. (During childbirth, this witness was attended by a midwife who ‘slapped her across the face’ when she screamed, said she was an ‘an unclean bitch’ and told her to: ‘Get on with it’.)

In 1967, a witness who was 19 years old went into labour while polishing floors in a home, but was ‘instructed’ by the nun to continue. When the pain got worse she was moved to a small room and, still in labour, was ‘locked in, alone, for the night’. By the time someone came to check on her, she told the Committee, her baby was crowning and she was ‘barely able to walk’. There had been no doctor present for the birth and she was ordered to breastfeed her baby as ‘they couldn’t afford to buy milk’.

_The baby of another witness, 20 years old when she entered a ‘prolonged’ labour, was eventually delivered by forceps in the hospital annexe of the home and both remained there for 10 days following the birth. She said she was ‘looked after well, given salt baths and when better, was returned to the main house, while her daughter was sent to the home’s nursery. This meant, however, that she was allowed to visit the child only to bottle-feed her._

_Her baby unfortunately succumbed to gastroenteritis and was removed to a hospital. She was then, quickly, transferred to a second one, where she died at two months old. The witness, who had been allowed to visit only twice, was told only that her daughter had had ‘an infection’. One of those visits had been at a time just before her baby died and, she reported to_
the Committee, she was ‘grey, just waiting to die. I never got the chance to know her’. Her daughter was buried in an Angels’ Plot in a cemetery.

A baby son was born to the next witness. ‘He was ‘born blue’ and didn’t cry ‘but they didn’t seem bothered about that, put me in a bed and gave me something to eat’. This baby died in a hospital at eight weeks old and the witness later found out that he had been there for the three weeks prior to his death. When she tackled a nun about this, she was dismissed with a curt: ‘Your baby is in heaven’.

The Committee heard many stories about the onset of labour - the breaking of waters - an ‘unknown terror’ for many. At 19 years of age, this witness described waking up during the night in 1965 to find her waters breaking and ‘having drowned the place’, not having any idea what was happening to her. All she knew was that she was ‘in awful pain’. She had been told to ‘call [X]’ that night should ‘something happen’ but had no idea what that meant. When she still hadn’t seen anyone by 1.30 on the afternoon of the next day, she crawled down the stairs to get help, but when, on seeing her, a nun was ‘unpleasant and dismissive’ the witness started to shake uncontrollably. It was recognised she was now in shock, heaters were brought into a room and she eventually gave birth and breastfed her daughter for three weeks, between periods of work in the fields, picking potatoes.

A year before that, 1964, a 16-year old got the ‘fright of her life’ when the same thing happened to her and her waters broke. She was standing beside her bed in the mother and baby home and was so scared of reprisals for wetting the floor, she tried to mop it.

But there were some positive witness accounts of the birth experience interspersed with these stories. A 24-year old in a home in 1962 told the Committee that her experience was ‘good’, that the nuns treated her well, and that they liked her. The consequences, however, had not been so positive because she was another who had, following orders, acted as a wet nurse to many babies and as a result, unfortunately, was unable to breastfeed the children she had had later, as her breasts ‘were destroyed’, so much so that a Master of a maternity hospital she attended warned her ‘never to breastfeed again’.
Given her circumstances, another witness managed to find something positive in her experience. She had spent her childhood in an orphanage and had later worked in a Magdalen laundry, where the nuns discovered she was pregnant and sent her to a home. She was 21 years old. By the time she entered a hospital for the birth, she was suffering from toxaemia and high blood pressure and - contrary to the experiences of others who came to the Committee telling of being admitted to hospitals where staff 'looked down' on 'the unmarried' - this woman said the staff she encountered in her hospital were 'nice' to her 'and didn't treat me any differently to other women'.

A witness who gave birth in the late 1960s in a home had little memory of it but what she did recall, she reported, was that she’d been ‘badly torn, stitched from hole to hole, like they were trying to stitch back your virginity’. She was 16 years old.

Another 16-year old, pregnant from rape, who came in to a home, was in labour for 24 hours, was not allowed out of bed during this time and was told to ‘stop screaming’ as she was ‘frightening the other girls’.

A witness was born in a mother and baby home in the late 1960s and was adopted from there. She came to the Committee on behalf of her birthmother to relate what had happened to her while giving birth to the witness. She told her daughter that her hands and (open) legs had been tied to the bed and she screamed for pain relief while a nun, sitting, knitting, at the end of her bed told her: ‘you have to go through this pain for your sins’.

A very different experience was reported to the Confidential Committee by a witness who, pregnant with twins, was in a home in 1968 and recalled being ‘well treated’. When seen by a doctor there, she was transferred to a hospital where within a couple of days, her waters broke. Both babies, however, were breech and quite large for twins, each weighing more than five pounds. Sadly, her first daughter died during delivery and she was anaesthetised for the delivery of the second. She recalled a nun telling her she was so sorry one of the babies had died as they had ‘taken such good care’ of her, and this witness said she had ‘felt protected by the home’ as she was ‘one of the people who had no one to stand up for them’.
In 1968, a pregnant 18-year old went into labour while working in the mother and baby home, had no idea what was happening and was put into the home’s labour ward while believing that her baby was going to come out of her belly button. She spent ‘hours’ there sitting on the bed ‘with a pan under her’ and with no-one coming when she called. She was getting off the bed when a nurse came in, ‘was very coarse’ with her and ‘slapped her on the cheek for getting up’. The midwife (a named nun) came in and questioned this nurse as to why she had not been called earlier as the witness was ‘so far along’ and, she said, ‘the nurse lied’. (This witness is angry that her son was diagnosed with a serious birth defect only when he was 40 years old.)

This next witness, self-described as ‘clueless about labour’ (she was 21 years old but believed at the time that ‘the baby would come out of her backside’) was cleaning in the mother and baby home when she went into labour and was brought to the labour ward, where the presiding midwife had a reputation for being ‘very stern’. The witness told the Committee that this midwife kept telling her to ‘hurry up’ while continuing to ‘push her onto her side’ - and when she screamed in pain, admonished her to ‘be quiet!’ She was placed in stirrups, her legs were ‘pulled’ and she was being ‘bashed on the bum’. When born, her baby was taken away immediately. However, a doctor came in, and the witness recalls ‘them pushing on her stomach for the afterbirth’.

Apart from being brought her dinner, the witness told the Committee, she was ‘left alone’. She said she was moved to a new section after New Year’s Day and received ‘better treatment’ there. She also told the Committee that throughout the birth process, she felt that the midwife was ‘in a hurry to get away as it was Christmas time’ - and that after dealing with this birth, would be on holiday.

‘Now another little piglet born into the world!’ was the comment of a nun, one of three officiating at the birth of the baby of a witness, when her baby emerged.

It was in this decade of the 1960s that the mother of a pregnant 15-year old colluded with a nun in the mother and baby home that her daughter would be induced early (she was to give birth in a nearby hospital) so she could be home for Christmas and keep up the pretence that she was away in a boarding school.
The witness had not been told what was to happen during labour and was very frightened. Her waters were broken in the hospital two days before labour began but she has no memory of that, of getting any pain relief or of the labour. She told the Committee that hospital staff were very judgmental of her and that having delivered, she had to walk from the delivery suite back to her room and kept passing out - only to be told: ‘Cop yourself on!’ Having given birth, she was finally brought home (where the ‘episode’ was never to be mentioned again) then sent back to school.

Similarly, the family of another witness persuaded the authorities in both a mother and baby home and a hospital to induce their 17-year old daughter a month early; ‘I had an aunt coming home and it had to be done before she came’. The request was facilitated.

Like others, this next witness had been confined to her bedroom at home as soon as her pregnancy became known. In her words, when induced in hospital, her labour and the birth were ‘horrific: I was hooked up to drips, there was blood everywhere, I was screaming and roaring, I think I passed out’. The next morning, an ambulance arrived and I got in with my baby and another girl and her baby, and we went to the mother and baby home. When we arrived, ‘a nun was at the back of the ambulance and she put her hands out for the babies. I thought she was going to help me out of the ambulance but she took my baby and that was the last I saw of him. I was only a few days in the home, the baby was left in the nursery and I was brought home. I had been off the scene for months. People were told I had had a tumour’.

The relative who collected a witness (28 years old when she gave birth) did not recognise her when collecting her from the mother and baby home. After the birth, she had developed a severe toothache with huge swelling on her face; the nuns had placed her in a room in the convent part of the home. The swelling on her face continued to balloon to the extent that she was unable to speak or swallow, while her chin extended into her neck and continuously-running saliva drenched her, ‘so I was wet all the time’. She asked for a doctor but this was refused and when she cried out for help to the nuns, ‘they would either ignore me, tell me to say a prayer or to ‘look at the cross above you’. ‘I was dying and no one was taking a tack of notice of me’. A friend in the home brought her baby up from the nursery so she could say goodbye to him, ‘so I put a medal on him’, she told the Committee, ‘and wrapped a blanket I had bought for him around him’.
Like the relative who had collected this witness, when she was brought home, her family didn’t recognise her and although they didn’t think she would survive overnight, were ashamed to call an ambulance in case it became known that she had been in a mother and baby home. Instead, they called a locum doctor, who on seeing her, assumed she was deformed - and when the family eventually revealed where she’d been, ‘he began to swear and said he was going to report [on this] but the witness’s mother begged him not to; he gave the witness ‘an enormous injection and informed her she had ‘a massive abscess and a massive infection’ and that if he had not been called, ‘you would have died. You would not have lasted the night’.

Again and again, the Confidential Committee was given examples of how, during these decades in Ireland, single mothers were denigrated not just by their families, schools, churches, places of work and fellow citizens in general, but by those given care of them in mother and baby homes and even in maternity hospitals.

One witness, raped when she was 19 years old, was in a mother and baby home from which residents were regularly brought in groups for ante-natal check-ups to a hospital. She reported that when on arrival the group would alight from their vehicle, the married women would laugh and in their hearing, make comments such as ‘Look at the whores!’ The witness told the Committee, that on one occasion, the matron of this hospital said to her: ‘I’ve six married women here giving birth; I’m not wasting my time on you’.

An 18 year old was with her sister in the visitors’ lounge in a home when her waters broke. The witness begged her sister to take her home but the nun told this sister to leave. At 10pm that night a nurse told her to get up on the table, the witness told the Committee that she asked: ‘Where’s the baby coming from?’ and she thought she was going to die that night. The nurses, this witness said, ‘were far worse in their treatment than the nuns, speaking derogatorily to the girls and saying: ‘You’re all the same’.

Another witness was 25 years old when she gave birth in a hospital having gone there from a mother and baby home - and was told her baby was ‘spastic’; when she saw him, he was in an incubator and, she was told, he couldn't now be adopted.
The witness then had to bring him to a clinic for treatment and exercises and was later told that he had progressed so well, ‘it was a miracle’ - and that he could now ‘get the go ahead for adoption’.

1970s

In 1976 at 14 years of age this next witness arrived in a mother and baby home. A nun explained to her what was involved in giving birth, and, she recalled, ‘it was like being called into the headmistress’s office’. In later years, she became very upset to read on her file that one of the nuns had written that she had been ‘sleeping around since the age of 12’ and had ‘planned her pregnancy’. The witness insisted that both allegations were ‘absolutely untrue’.

It was in the 1970s that a witness, in the course of giving her evidence about her own experience, told the Committee that she felt she should report something she saw happening to another woman in her mother and baby ward. She said that she saw this other woman being told that her baby had been stillborn - but then ‘saw a nun take this baby from the ward with a towel over the baby’s face. But, at the end of a corridor’, she said, ‘the nun took the towel from the baby’s face’ and the witness could see that ‘the baby was alive and crying’.

That mother, she said, left the mother and baby home believing that her baby had died. She also described to the Committee how people visiting the home to look at the children designated for adoption, ‘picked babies like you would choose sweets in a candy shop’. As a consequence, the witness told the Committee that she used to hide her own baby in ‘the room for disabled babies’ so that no-one would pick him.

Another 20-year old who was pregnant in this era remembers an old gynaecologist who had arthritis. When the gynaecologist went to examine you, ‘the fingers would stick into you’. This witness was given no pain relief when giving birth, because this gynaecologist said to her that they ‘wanted me to feel every pain’. While a younger colleague of this gynaecologist observed that the witness needed a C-section (‘I was only tiny. I’m skinny now but I was tiny’), the response of the older one was: ‘she’s
from (the named) home, she’s an unmarried mother. She can have it this way, she’ll remember it and she won’t ever do it again’.

‘It was the most horrendous experience’, the witness went on, recalling women in labour, ‘screaming for hours and they (the nuns) wouldn’t come and we’d all be petrified that something was going to happen… We’d all be banging on the doors - and they might come when they decided’.

This next witness was 16 years of age when she was admitted to a home in 1975. She told the Committee that she fell down the stairs in the home, went into labour early as a result, and was sent, alone, on a bus to a hospital to give birth. The witness said that she is very angry about this and recalled an image of herself sitting on the street alone, in labour, weeping, not knowing where to go to get to the hospital. Her baby, she said, was very underweight when born and remained in hospital for nearly a year.

There were a few witnesses who gave ‘happy’ accounts of their birth experiences in mother and baby homes during these decades and this one goes part of the way.

In 1978, a woman who gave birth in a home, told the Committee that she believes now that ‘times had changed’ and that there was ‘evidence of a bit more humanity’. Her labour was ‘difficult and prolonged’, she said, leading to her being brought to hospital by ambulance (with, incidentally, the nuns around her ‘panicking when the paramedics called her by her real name) and when she arrived, ‘the staff were very nice to me’. She did receive pain relief and once her daughter was born, was given a chance to see her.

But the story is not all good. The nuns had warned her not to bond with her baby and the witness had to undergo years of counselling to cope with the effects of that. Her experience in the home ‘defined the person I became and my entire life’. She was in her 60s when interviewed.

Another witness later in this decade again testified, as so many had, that neither she nor the other women in the homes were given pre-natal information about labour, contractions or childbirth. Once a month, a doctor came in, an ‘awful’, ignorant man. ‘He never spoke to you, you just lifted your clothes and he examined you. He made you feel you were
picked off his boots. So the only information you had was Chinese whispers from other girls, which was very frightening: How can a baby come out of there?’

A 19-year old entered a mother and baby home in 1970. She told the Committee that despite having had some ‘classes’, she went into labour not recognising it; ‘I didn’t take on board that I was having a baby’. When she did give birth: ‘I was so happy I could have gone through the roof; I hadn’t realised how maternal I was’. But soon afterwards, she said, her son was ‘whipped away - before he caught my sin’.

Another witness said that in a home during this decade, the residents had not been given any information or ante-natal care other than being ‘lined up every week and weighed like cattle’.

Another witness reported that her labour began at 1.00 am but she was afraid to wake the midwife because ‘she was cantankerous’. In the meantime, however, she began to haemorrhage badly: ‘Pieces of my placenta were falling out of me’. The midwife came at 8.00 am to deliver the baby, in the process hurting the witness, who reacted by screaming - but like the report of the woman earlier, was also told: ‘Be quiet!’  This time, the nurse-midwife added: ‘You’ve had more than that up there!’ When the baby was born, he weighed 4 pounds 15 ounces, he was not breathing and he was immediately transferred to a hospital where he remained for two months.

Still in the 1970s, a 17-year old ‘didn’t know what to do’ when her waters broke. When she started labour, she was told by a nun: ‘This is your punishment. Remember what will happen tonight, never have another baby before marriage’. She was not given any pain relief and was told by the nurse who delivered the baby: ‘That’s the last time you’re going to see him, he’s gone now’.

Another girl who fell pregnant at the age of 15 (and like so many, ‘knew nothing about sex’) was admitted to a mother and baby home during that decade. She told the Committee that when she went into labour, the Reverend Mother said to her: ‘Get up on that bed! You’ve never had a problem getting up on something before’; another nun, she said, then ‘came at me with a fistful of lube and told me to ‘open my legs, that I had had no problem opening them before!’ Like others, this witness said she never saw her baby and no-one told her whether it was a boy or a girl. She was collected by an aunt on the day she had given birth,
which was one day after her 16th birthday, via a side door of the mother and baby home, and was sent back to school the following week.

Then came the witness who’d been pregnant with twins when she had been admitted to a hospital to give birth. She made the familiar remark about staff there ‘judging’ her because ‘I was an unmarried mother’. Both of this woman’s twins were breech, the second died 12 hours after birth. However, she said to the Committee, she still wished to ‘balance out’ the negativity about mother and baby homes, saying that ‘some of the nuns in this home were nice’.

*When moved from her first mother and baby home to another, a 17-year old victim of rape told the Committee that she found the conditions in the second one ‘extremely’ harsh - and that she had been verbally abused by nuns. She found childbirth ‘very painful’ but was given no pain relief while going through it - and overheard this question and answer during a conversation between a nun and the doctor present:*

> ‘What will we do with her, Doctor?’

> ‘Make sure she doesn’t have any more!’

This young 1970s rape victim had no pain relief while being stitched - 16 internal, 16 external - didn’t see her baby after the birth, didn’t know whether it was a boy or a girl. Three days later, she was put back to work in the home. Her mother had arranged work for her in a convent but she was crying all the time and her ‘head was gone’. The mother then signed her into a psychiatric hospital where she remained for 15 months. But: ‘I’ve never been right,’ she said to the Committee, ‘I’m haunted by these memories. I can’t forget it. It destroyed me’.

Like her, this next witness has never forgotten what a nun said to her when she was going through labour in ‘extreme pain’ (again no doctor, no pain relief, very little checking-up on her progress). Engraved on her memory, she told the Committee, is a comment made by a (named) nun while she was going through the birth process: ‘If you felt it going in, you’d feel it coming out’.

When this next witness screamed in pain while in the last stages of a 16-hour labour in the home, she was forbidden to do so again - and the nurse ‘produced a crucifix’. Still
with no pain relief, she told the Committee, she was ‘cut with a scissors’ to facilitate the birth and was then stitched. She bled heavily after the birth and allied procedures however, she said, the nurse ‘pulled her out of the bed’. She had no aftercare, was simply told to take ‘salty baths’ but,’ she said, she was ‘given tea and toast’.

A woman who had been in a home in 1972 at the age of 20 recounted seeing a girl in labour there being told to ‘open your legs like you did nine months ago’. She herself said she had received no medical examinations until the birth process was well underway and there was never any discussion about what to expect. She was scrubbing floors when she realised labour had started, but was told by the nun that until she had completed the job, she could not leave’. This labour lasted, she said, for two days while she was alone for most of the time, clinging to a statue of Our Lady, and with no pain relief. Another woman, 30 years old, told the Committee that she had to attend Mass while in labour.

On first seeing the baby son of a witness who was 19 years old when she gave birth to him in the home, the comment of her mother, the baby’s grandmother was: ‘Saint Damien the Leper!’

In the mid-1970s, another witness (who was three days in labour when giving birth in a home at 14 years of age) was another, she told the Committee, who was ignorant of what was coming: ‘I didn’t know if it was going to come out my ear. The only solace was, if the handicapped girls could do it, I could too’. Still in labour, she was transferred to a hospital where ‘they tried everything to pull it out of me’, describing the use of forceps and suction - ‘and a scissors to cut me. I could feel it opening’. She added that staff in the hospital ‘were not kind’ to her and that after the birth, she was ‘dumped’ on an examination table in the corridor and left alone for 24 hours before the nuns came to collect her. This witness subsequently suffered gynaecological problems and had a hysterectomy when she was 29 years old.

That witness was one of many who reported gynaecological and other medical complications in later life arising from difficult childbirths during their stays in mother and baby homes. One woman, who was 19 years old when admitted to a home, told the Committee that she is ‘having flashbacks to this day’. During her time in there, she said ‘she knew nothing and nothing was explained, she was left alone during almost her entire labour and was examined only on arrival in the labour ward and then once more. She said she was ‘eating the blankets with the pain’.

81
To this day, she said to the Committee, she still ‘suffers from nightmares, wakes up eating her blankets’, and has been left with gynaecological problems and the mental effects of the traumatic experience.

A witness, pregnant from rape at the age of 19 in the mid-1970s, described her memories of the mother and baby home as ‘horrific’, including having to deal with the conviction of one nun that this was not her first pregnancy. She thought I was a ‘repeat offender’. This was because of a scar the witness had from having her appendix out; this nun, however, ‘believed it was there from having had a C-section’.

The witness told the Committee that she ‘felt like a piece of meat. I was bleeding and I think I would have been left to die had I not been from a well-off background. They made that quite clear’.

Eventually she was rushed to hospital and having been given ‘40 stitches’, was given a blood transfusion (and developed hepatitis) and when she was returned to the home, the nuns made her bathe in Dettol. But she bled for two months - was still bleeding when she left the home, and eventually attended a maternity hospital in Dublin where the doctor, on examining her, found that half of the after-birth had been left inside and asked her: ‘what butcher did this to you?’

Amongst the numerous reports and comments to the Confidential Committee about post-birth stitching and the way some of it was executed, one woman, in a home in 1978 at the age of 19 years, included this narrative. She said she had done ‘everything possible’ to make sure she did not give birth in the home and instead went to a large hospital where, she said, she ‘gave birth alone, didn’t utter one sound, and was stitched afterwards’ adding, however, ‘it didn’t feel right’. When she was pregnant with her second child, she said her doctor had been ‘horrified’ at her condition and remarked: ‘maybe someone was trying to prevent you from having sex?’
1980s

Early in the 1980s, the Committee was told by a witness that at 17-years old, having given birth to her baby, she was being stitched by a male nurse, when in her hearing, he made a jocose comment about her to his female colleagues who were also there: ‘She’ll be tighter now than she was before’. They laughed.

In the decade of the 1980s, although the overall ‘unplanned pregnancy’ situation had improved at least a little for some, it was not the case for all. According to one witness, ‘hiding the shame’ was still the scenario for many unmarried mothers and their families; for instance when being brought to a hospital for a check-up, the unmarried were, according to one witness, required to enter through the side or back doors. Another report to the Committee in that context said that one girl found it necessary to wear a wig to hide her identity and shame. With ‘shame’ still endemic, a witness, 15 years old when she was raped and made pregnant in the early 1980s, remembers ‘a lot of shame’ in the atmosphere permeating the mother and baby home. ‘They would put on films and make you watch videos of live abortions. The message was that we were ‘good’ for not having an abortion but we were ‘sinners’ for getting ourselves pregnant.

In the same decade one witness testified that while she was undergoing a check-up, those giving it: ‘weren’t very nice. They weren’t far off putting a bag over your head. One nurse,’ she said ‘was particularly wicked and would verbally abuse [us]: ‘Look at them all, bunch of bitches, trollops! ‘Whore’ was the favourite word down there’.

The positive changes were now becoming evident however. A woman, 29 years old when resident in a home, told the Committee that her experience in the mother and baby home was ‘very positive’. She spoke highly of the home and specifically of two of the nuns who were looking after her.

The Committee heard from a woman who was 26 years old when she was admitted to a mother and baby home in this decade. However, shame and embarrassment had reared their heads again in her case and the witness’s mother would not allow her to have ultra sound examinations during pre-natal check-ups, for fear her identity would be revealed. The witness reported that nevertheless she received ‘good medical care’ during her stay in the home and that that her experience in the home was a positive one.
This next witness was transferred to a hospital from the mother and baby home to give birth; she told the Confidential Committee, that she did so wearing a metal washer on her wedding finger to pretend she was married. The pretence included her fictional husband, 'a truck driver', who was 'out of the area'. Having been collected by a nun in a taxi to return to the home with her child, she was 'afraid' to look at her daughter, but the taxi driver told the nun to 'let the little girl hold her baby' and she did. However, when they arrived back at the home, nun and baby entered through the side door, while the witness entered alone through the main door.

A 16-year old gave birth in a hospital where she was treated well and 'the same as other mothers' whom she described as 'warm, friendly and kind' to her. She said one of the nurses tried explaining to her that the baby would be adopted but in this regard, the witness felt that they were treating her like she 'had a womb but no brain'. She became pregnant again a short time later and as she had on the previous residency in the mother and baby home, went into premature labour and was again sent back to the hospital where she suffered a breech birth; it was too late to give her an epidural anaesthetic but she was given gas and air - and a rosary beads. She went into shock, however, and was given the Last Rites. She and her child both survived - the latter subsequently spending nine weeks in an incubator.

'You had to ring a bell when you went into labour and the taxi would be called', said this next witness and 'the cruellest thing was that you would travel in it alone'. If you couldn’t afford the taxi-fare from this home to the hospital, she recalled you went alone on the bus. In this witness’s case, on arrival at the hospital, she was rushed to theatre as her baby’s heart had stopped. The emergency had been called too late. He had died before being delivered full term. The witness was granted her request to see him, but hadn’t realised he would be discoloured for lack of oxygen and turned away from him, something she has regretted ever since. Her father, the birthfather and her brother assisted in bringing the baby home to be buried. He has a marked grave. But her father put only the surname on his headstone.

Another witness recalled for the Committee three kindnesses shown to her when her baby son died at birth, his shoulders having ‘become stuck’ during his birth. She had remained in
hospital for ‘about a week’ and spent a further five or six weeks recuperating in the home. Her parents collected her and brought her home. They visited the grave with her once, and the witness visits every year, while her time in the mother and baby home is still not spoken about openly, never in the family home.

The first kindness came from one of the nurses who had delivered her baby. She took two photographs of him and they are still in his mother’s possession.

The nuns then gave a grave although she was too ill to attend his funeral, and a local undertaker donated a coffin.
Adoption and Consent

A number of workers who had been assigned to a mother and baby home in a professional capacity for some years during the 1970s and 1980s came to speak with the Confidential Committee about ‘the culture of adoption' prevalent in mother and baby homes.

They voiced the opinion that this culture was ‘systemic' and ‘a belief system', in that adoption was promoted as the ‘better option' and that in any event, by having come into a mother and baby home in the first place, the expectation was thereby that women would see this ‘better option' as the only realistic one and therefore would select it. In addition, these professionals said, this pressure to adopt was strengthened by default because in the mother and baby homes there was ‘no talk around pressure on the women to keep their babies'.

One social worker told the Committee that she found the ‘social work piece' now to be ‘ahead of the institutional piece', the main brief ‘to ensure that women were allowed to take as much time as they needed to be fully informed' of decisions concerning their babies. ‘The nuns were irritated by this', she said ‘but they knew change was coming' and, anxious not to be ‘left with babies that couldn't be adopted', were pushing to get mothers to sign Permission to Place forms.

It was now possible, she told the Committee, ‘if you were strong-minded to keep your baby but culturally it was still hard'. While her job was to explore options and establish trust, she was struck by how ‘emotionally closed down' these women were. There was still some way to go, though - there was as yet no post-adoption counselling, for instance, and the secrecy surrounding most women's stays in a home continued to permeate the attitudes of families and of Irish society in general.

Sometimes, they added, having opted for giving up their babies, mothers could have a change of heart after the child was born; but it was ‘very difficult' to switch choices at that stage, not only because the process was probably already in train, but because it usually meant that the new mother had to plead with her family, who were in most cases expecting adoption to have taken away ‘the problem', to allow her to come home
with her child. She would also have to ask for support, moral and financial, for both of them.

From the time pregnancy was discovered, or was about to ‘show’, many women and girls were banished from view, staying out of it all the way through giving birth and its immediate aftermath. Customarily at the behest of families (or, rarely, on their own initiative if they were more mature) they were sequestered behind the walls of mother and baby homes, coming home - if they were allowed home - with no baby to be seen or even mentioned, the story for neighbours and wider family carefully prepared. As already mentioned, these daughters were ‘going to or returning from boarding school’ or from ‘work experience’ in distant towns; from ‘working in England’ - or from ‘living with an aunt and uncle for a few months in London’ - or elsewhere, remote from her home.

It did happen that a mother could disappear altogether by being banished for good by her family with a one-way ticket to the UK or the USA and a ‘don’t come back’ edict ringing in her ears.

\textit{It is probably worth reiterating a particularly novel scenario invented by one family in cooperation with a daughter’s school: she, they told everyone, was on an exploratory trip to a UK convent. It and the school being run by the same order, she was checking out the terms and conditions involved in ‘entering’ to research her vocation.}

\textit{And of course when again she was to be seen back at school and around the place, there was a very simple and credible explanation: the trip had been worthwhile because she had discovered, before it was too late, she hadn’t a vocation after all.}

Those professionals who came to the Committee insisted that they never saw women having their babies taken without their explicit consent. They added there were some women, conflicted about which choice to make, who abandoned their babies in the home because they were unable to choose, a quandary illustrated by the story of one new mother who had faced it.
This mother had left the mother and baby home without her child who, after a year in the home, was placed with a family. However, she changed her mind: she wanted the baby placed in an orphanage so she could visit. Before that could happen, though, she changed her mind a second time and decided to take the infant back. By this stage, these professionals pointed out, this child had spent a year in the home, six months in an adoption placement, and had then gone to live in a flat with the mother and her boyfriend. Then, following a third change of mind, the child was placed in a nursery to wait for an adoption to go through.

The baby had four different placements within its first two years. When this mother finally signed consent papers, an Adoption Order was made by the courts, which made a fifth placement.

The professionals who came to the Committee indicated that some of those who had rowed back on their original decision to choose adoption and had attempted to keep their children, were the ones who were subject to the greatest pressure. These pressures became intolerable because they were not just from the nuns in the homes, but from what was, in practice, an alliance of authorities, including their families (in many cases assisted by priests) all members of which were angry at the change of heart and adamant that adoption had been the first and was now the only choice.

In some cases, this pressure was couched morally: (‘You’re being selfish; your baby will have a great life with a lovely family and will get a great education. What can someone like you offer?’) Some women reported a baby being ‘snatched’ from their arms before final adoption papers were completed; while other witnesses reported that they had not been told in advance that after birth, their babies had been tagged for adoption in nurseries and were available for ‘viewing’.

There were many stories voiced by women about not being given adequate (or any) warning of an imminent handover, and not being given the opportunity even to say ‘Goodbye’. All these women and girls professed themselves ‘heartbroken’.

Some women who came to the Confidential Committee testified that they willingly gave up their babies for adoption, signed all papers necessary and got on with their lives. This, they told the Committee, had been the definite plan from the time they discovered they were pregnant and residency in a mother and baby home had been merely a necessary stop along the way.
In earlier times, with rare exceptions, most of the men and boys who fathered these children were nowhere to be found after their girlfriends gave them the ‘bleak news’; acknowledging fatherhood of ‘illegitimate’ offspring, even when the sex was consensual, was not common in Ireland during those years, however the pregnancy had occurred, and in the end a large number of these mothers were left alone to suffer and struggle while making their ‘choices’.

1940s - 1950s

A witness born in 1944 in a home - and who grew up in state care - came to the Committee to recount what his birthmother had told him, disclosing that for four years, she had said, in an effort to ensure he would not be adopted, she had paid the nuns in the mother and baby home to care for him as she did not want him to be ‘farmed out’ and believed that by having him in a home where she could visit him, she was ‘doing the right thing’. She also believed, he said, that when he was later sent to an industrial school, that he would receive a good education, (and she ‘had had no idea’ she said, ‘that it was such a terrible place’.)

During all this time, he told the Committee, his birthmother wrote to him, sent him money, and regularly promised to take him out of the school: ‘But this never happened’. No happy ending here, unfortunately: when mother and son finally met in later life, he said, ‘she was a stranger to me’, and that the connection between them subsequently was ‘very tenuous’.

Then there was the witness, who came to the Committee to say that in 1949, she was born in a mother and baby home, and following an unsuccessful fostering placement, also grew up in State care. She recounted how her mother had told her that while they were both in the home, a couple from the USA had travelled from there to ‘view’ her in her nursery but were ‘refused permission to adopt because the nuns didn’t like them’.

She was two and a half years old when she was (again) ‘dressed up’ for another couple visiting who were there looking for a foster child. She said that was the last she and her birthmother saw of each other until they were reunited later in life, this coming as a surprise, she said, because: ‘Throughout my childhood, I had been told that my
mother was dead’. Her fostering broke down and she was then placed, through the courts, in an industrial school at the age of five. This witness lived in that institution until she was 16 years old. In any event, she and her mother eventually met, the latter saying that she had no idea where her daughter had gone or what had happened to her.

The witness filled her in about what had happened - including the news that her foster parents had apparently made an application to adopt her but this had been refused since the child’s birthmother ‘could not be located’. This, the Committee was told by the witness, had been a ‘blatantly untrue’ invention, because, she explained the nuns had ‘sent her mother to work in the UK and had always known where she was’ mainly because she had kept contact, hoping to ‘get her daughter back’ once she was married. This ambition had been blighted because her mother had been told simply that ‘this would not be possible’.

Making the decision on whether or not to choose the adoption ‘option’ caused great distress, even agony, to very many women, a huge number of whom told the Committee that although the ‘giving away’ of their children could not now be undone, they are still highly conflicted about whether the decision they made at the time (or gave in to having it made for them) was the right one.

A parish priest decreed to a woman’s parents that their daughter must not come home after giving birth to her son in a home. Her father collected her and brought her, not to their home, but to her sister’s, and from there she was sent directly to the UK, where she remained with her brother and another sister for more than seven years. She has ‘no idea’ what happened to her son, she told the Committee, and presumes he was adopted, but doesn’t remember signing papers and if she did, insists she had no idea that she was signing him away. She was 21 years old when she had him.

Some birthmothers did fight bravely but, at such a vulnerable juncture of their lives, many, thinking of their families as well as their babies (never mind their own emotional welfare and stability) were unable to stand up to the pressures imposed.

A witness born in 1949 who had been adopted to the USA from the mother and baby home successfully traced her birthmother in later life. She found her mother reluctant to speak in detail of her time in the home - except to say that after giving birth to the witness, she had spent four months with her.
Her birthmother said that her adoption had been organised entirely by correspondence, through ‘Catholic Charities’ - and that the adopters had never been to Ireland. Her parents, she said, had paid $1500 to adopt her, had verified they could ‘provide for her’ and gave assurances that she would be ‘raised as a Catholic’. She told the Committee that they had been required to continue paying ‘donations’ until she was 16 years old. It was ‘by accident’ she discovered she was adopted. She said she had ‘grave concerns’ that her birthmother was not aware what she was signing when completing the paperwork as she was illiterate at the time.

That birthmother was just one of a number who said they were illiterate at the time they had allegedly signed adoption papers. This next witness also told the Committee that she couldn’t read or write. She was raised in state care, was assaulted by a priest and having fallen pregnant, she went into a mother and baby home in 1956, to have her daughter. Like others in this sequence, she insisted that to her knowledge, she ‘hadn’t signed any documents’. In any event, she said, during the 12 months she had spent in the home looking after her baby, ‘there had been no talk of adoption’.

After that 12 months, she had returned to the institution in which she had been living prior to admission to the home - leaving her daughter behind to be cared for. Later, she got a job, moved into a flat and then went back to the home to collect her daughter. She was not there, and no-one would say where she had gone.

The witness then went to the adoption agency she presumed had been involved in taking her child out of the home, but it claimed to have no record of a relevant adoption. (However, when this daughter traced the witness in later life, it emerged that the witness and her adoptive family had been living relatively close to each other.) This mother went on to have another pregnancy, resulting in twins and they too, were born in a home. When she asked for them, she was told that they, like her daughter ‘were gone’. To her this phraseology meant that they had died at birth. Some years later, these twins traced the witness just as her first child had.

Earlier in the 1950s, a 16 year old girl became pregnant, she said, having been raped by a priest. She too went into a home and had her baby there, and then: ‘A nun took my baby away’, she said to the Committee, ‘and that was the last I saw of him. It was terrible the way they took the child away without telling you (this was going to happen).’ As in previous stories, this witness said she later saw an adoption record which appeared to have her signature on it. ‘I couldn’t have signed it’, she told the
Committee ‘because at the time, I didn’t know how to read or write’. She acquired these skills she said, only after leaving the home.

One witness told the Committee that at the time of her birth, her adoptive father was working for an order of nuns, who suggested to him that he adopt a baby girl. He told her that he drove to a chapel yard where he met two nuns who arrived in a taxi and handed me over.

This woman told the Committee she had no idea she had been adopted until she was applying for a passport in 2011, although her husband knew because this had been revealed to him by her adoptive parents. Not only that, but she discovered that ‘for many people in the locality’, her status ‘was well known’, something she continues to find upsetting. ‘Terribly shocked and hurt’, was how she described her reaction to this news. She confronted her adoptive father, who said they didn’t tell her ‘because they considered me to be theirs’.

‘Jesus, Mary and Joseph, who am I?’ she said to the Committee: ‘Everybody knew and I didn’t know a thing. It changed me to tell you the truth’.

An 18-year old who entered a home to give birth, also in the 1950s, had been taken into an orphanage, when she was six years old, together with her five siblings, when their mother died. When, at 18 years of age it was found she was pregnant, she ‘didn’t know what the word meant’; and when the doctor recommended she go into a mother and baby home, she didn’t know what that was either. Having given birth to a baby boy, she remembers being called to the office of the Reverend Mother and being told to sign a 'single-page' document, the contents or meaning of which, she told the Confidential Committee, ‘was not read or explained' to her. All she was told, she said, was: ‘Your son is going to be adopted’. She did what she was told and signed.

Her son was three and a half years old, before one of the nuns said to her ‘it’s happening’; she didn’t have time to say goodbye, but did have time to run upstairs and watch him leave from the window. ‘Being parted from him broke my heart’. She wrote
subsequently to her father and brother asking for help but never heard back from either. This woman said she believed the State should apologise to the women who were coerced into adoption or, like her, were uninformed when they consented to the process as, she said, this had caused “unspeakable damage”.

Another witness came to the Committee to say that the life of her birthmother, who gave birth to the witness in a home in 1950 when she was 23 years old, ‘was made hell’ because she had refused to sign adoption forms for the witness in favour of yet another couple who had travelled from the USA to view her. ‘To put it crudely’, this witness said, ‘the home had lost out on a sale’. For such stubbornness, said the witness, her birthmother ‘was forced to stand in front of a statue to pray for guidance for so long that she passed out’. But this is another of these stories that ends kindly because neighbours of the birthmother’s family told the nuns that they would take in both mother and baby and ‘after payment of a fee’, both were ‘released’ into their care.

One witness said that in the home, she was told that her daughter was ‘going to be leaving’, so, sadly, she wrote her a note expressing her love and attached it to the child’s nappy. Out of the blue she was then told “your money has been stopped from the Government” - and that to get it back, she had to go downtown ‘to sign for it’.

She was brought, she said, to an ‘old shop’ in the town, and told to sign a document ‘partially covered’ by the person who offered it to her so she couldn’t see what she was signing. She now believes these were adoption papers. When she got back to the home, she found that her baby was gone. This mother was persistent, however, and sometime later, after she had left the home, she telephoned it to look for information as to where her baby had gone. The nun, who had sent her downtown to that ‘old shop’, was abrupt, claiming: ‘there are no babies here, never mind adoptions! Now don’t call back!’

Years afterwards, the witness recognised the voice of this nun when she was giving a radio interview. She telephoned again, but was again treated tersely: ‘You are mistaken. This was not a mother and baby home’. Undeterred, however, she went physically to meet this Sister - who initially denied that the witness had ever been in the home. This witness did not give up easily and directly confronting the nun, ordered her to ‘find my daughter’ while informing her that she herself was searching. Her daughter was found.

93
In the mid-1960s, a woman of mixed-race parentage was adopted into a white family and struggled right from the beginning with ‘knowing I was different’. When she was in school, the other children would taunt her, calling her by the names of characters in the popular TV series *Roots* (about the slave trade and the struggles of African slaves sold to America). In later life, from the perspective of this adoptee and many others, the flaws and failings in the adoption system rose to confound her when she became seriously ill. Investigations showed that the illness was related to her racial background, and because she does not know the identity of her birthfather she is unable to investigate it any further.

Having been raised in an orphanage, this next witness was raped, became pregnant, and went into a home. Two supportive sisters living and working in the UK, had finally saved enough to pay her fare to come to the UK, with her baby, to live with them. They came to visit her in the home to give her the good news. ‘But the nuns overheard this conversation’, the witness told the Committee, and one morning, shortly afterwards, she was ordered to dress her baby and was brought, with the baby, to an adoption agency. The baby was separated from her and she was locked into a room, from where she could hear her child was being given to a couple - she could hear the child crying and in distress but she couldn’t get out of the room to go to him. She told the Committee that she ‘hadn’t consented in any way’ to her child being taken away from her.

One witness, having resisted all pressures and brought her baby home recounted that while walking along a street with the child, both had been ordered into the car of a priest - he had drawn up alongside her, ordered her to get in, and when she did, drove straight to a home. On arrival, she and the baby were separated and the pressure immediately began for her to sign adoption papers. The witness was locked into a room and told she would stay there until she signed the adoption papers for her baby.

She told the Committee she ‘kicked and kicked’ that door and ‘wouldn’t stop kicking and yelling,’ demanding release, to see
her baby, and that her father should be called. She kept it up until eventually the priest arrived back and tried again, through the locked door, to get her to sign papers, even shoving the papers under it, enticing her with a promise she could leave as soon as she signed, then changing tack and calling her a ‘selfish whip! But she continued to yell, protest and clamour for release.

Eventually her father was summoned and he took her home with her baby. A short time later, she left her child with her mother and father while she went back to work in the UK. Not long afterwards, however, she got a panicked phone call from her parents: this priest had been calling to the house, threatening guardianship proceedings against her. She came home to collect her daughter.

Another witness told the Committee that she gave birth in a mother and baby home in the late 1960s and described the following. Having said to a nun in the home that her plan was to go to England with her baby to stay with her sister, the response to the witness was: ‘That doesn’t happen here. You’ll do what we tell you and that’s it. You’re not keeping that baby. You’re going nowhere with that baby. You’re going home and the baby is going somewhere else’. The witness told the Committee that after that conversation, the nun contacted the sister of the witness to tell her that the witness had decided to have her baby adopted. ‘This’, the interviewee said, ‘was not true’.

She was then, she said, ‘brought to a room with a chair and a desk where I was told to sign the piece of paper put in front of me’ and when she refused to comply, she said, she was ‘dragged down the corridor by the nun to an office where I was made to sign the paper’. After this, she and another mother from the home were brought to what she thinks was a solicitor’s office where she ‘swore an oath and signed another document and paid the solicitor half a crown’.

Later again, along with her baby, she was brought to ‘another place’. Where the nun said to her: ‘You’ll be off now in a minute, so put that child down in the basket’. The witness would not do this and again insisted: ‘I’m keeping my baby’. However, this nun took the infant from her, placed her in the basket, ordering: ‘Off you go now!’
This story has a sequel. Many years later, this witness received documents related to her child’s adoption and read letters in her name which stated she was putting her child up for adoption. ‘I did not write those letters’, she told the Confidential Committee, ‘and did not get anyone else to write them for me’.

This next witness claims she was blackmailed. One day, in the early 1960s when she was 16 years old and having given birth to a baby in a mother and baby home, she was told by the nuns that her grandmother was dying and that she should go and visit her. When she arrived home, she found that her grandmother was not dying. She also found that it had been her mother, in concert with the nuns in the home, who had arranged for her to be absent so that her baby could be taken quietly. ‘I think of my baby as having been kidnapped’, she said to the Confidential Committee.

Later, her parents wrote to her in the UK, where she and her boyfriend, her child’s birthfather, were ‘trying to get things together’ so they could get the baby back and set up home. In that letter, her parents wrote that she had ‘one week’ to sign adoption papers or the baby will end up in an orphanage. ‘That’, she said, ‘was blackmail’.

This next witness, who gave birth to a baby boy in 1965, was told from the start that her baby would be going to the USA and was never allowed to touch him or speak about him. Like many others, she has no memory of ever signing anything, nor was anything explained and as the years passed, she ‘sometimes questioned whether she had even had a child’. However, her son traced her and it transpired that he had not gone to the USA as she had been told, but had been adopted locally.

*Then there was the witness who discovered that her daughter’s name on her Baptismal Certificate was her adoptive name, despite the adoption not having taken place until months after the sacrament was held.*

*But here is a witness who had a ‘happy upbringing with very caring (adoptive) parents’ who nevertheless told the Committee: ‘You had to accept that at one stage you weren’t wanted’.*

The birthmother of another witness became pregnant while being treated in a psychiatric hospital. This witness was told by a nurse who had taken care of her
mother in the unit, that she had been ‘too ill to understand what was happening around her, or to sign papers;’ the witness is convinced that none had been signed. She added, ‘the Adoption Board didn’t inform me that my mother had been a psychiatric patient’.

Another witness said that before her daughter was taken away, she had a photograph of her daughter taken and took a lock of her hair, and when she got home, she hid both in ‘her mother’s cupboard’. A few weeks later, however, she realised that they were gone and told the Committee that ‘a sibling had taken them. It was the cruellest thing done to me. That was all I had’.

On a more positive note, a witness, adopted locally in the 1960s, told the Committee that he had had a ‘happy upbringing’ with parents who had always said to him that he was special, because they had picked him. ‘You were loved twice’, they said, explaining that his birthmother had loved him enough to make the sacrifice of giving him up.

This birthmother, when he did meet her later, disclosed to him that she had also given birth to his ‘two natural half-siblings’ whom she had also placed for adoption. She hadn’t been able to face them, she had said, because they had been conceived as a result of rape. He told the Committee that his natural father ‘didn’t want a relationship with his mother’ and so she was sent by her family to the mother and baby home. But then, adding to a mystery inherent in this man’s story, was the ‘strong feeling’ he said he had always had, that he had been a twin: ‘But I have a letter that says my mother wasn’t carrying twins and there is no record of twins being delivered’.

However, during their meeting, his birthmother told him that ‘the remains of the stillborn baby’ had been placed ‘in the graveyard with the nuns’. ‘I looked for a death certificate’, he told the Committee, ‘but I understand it wasn’t the practice to issue a death cert for a stillborn child’. This witness told the Committee that he had come for interview because he was convinced that ‘somewhere there is a record of my stillborn sibling’.

_A witness was 24 years old when she had her baby in a home._
_She had hoped, she told the Committee that the birthfather would ‘come up with a plan’ for them to keep the baby but this did not happen._
The nun in charge told her she ‘knew of a farmer looking for a good wife’ but the witness insisted she would marry only the birthfather, so the nun began the adoption process telling her that the adoptive couple were ‘two doctors’, so the witness signed the consent forms.

She then discovered that her baby had not been adopted by doctors but by her own neighbours - assisted by the local priest. For some time afterwards, the witness, said to the Committee, when at Mass, she would see her little girl with the neighbours, her child’s adoptive parents, when they attended at church. She had to watch her grow little by little, until they moved away sometime later.

A witness, 17 years old when she gave birth in a mother and baby home in the early 1960s, told the Confidential Committee that she was ‘mentally tortured’ and ‘horrified’ that she had given her child up for adoption - and equally tortured with worry that her husband and children might find out that she had given birth to this baby or had even been in a home. She had attended counselling, she said, but had never indicated the core reason for her distress to the counsellor. Having been in a home and giving birth was never mentioned during the sessions.

In fact, before coming to the Confidential Committee, she said that she had not told a single person about her baby and now felt that ‘her whole life was a lie’, that she had been ‘keeping secrets from the people she was supposed to love and care about’. ‘I feel like a fake, she said, ‘it’s a terrible thing I’ve done. It never goes away’.

Having given birth in a home, an 18-year old was afraid to tell her parents she wanted to keep her daughter. An adoption was organised and one day with no prior notice, she was ordered to dress the baby for the handover. ‘It was all organised by this adoption agency; I had to hand her in like a parcel’. Six months later, her parents brought her to a solicitor’s office and: ‘My father put a pen in my hand and made me sign my signature’.

One witness was 19 years old when she gave birth in 1967 in a home. She had had no idea her child would be taken - and certainly not in the way he was. Three weeks after he was born, a nun came into the nursery and ‘snatched’ him from her. Another
nun came to talk to her because she was ‘totally distraught’ but the witness ‘punched her and tried to yank her veil off’. Her mother collected her from the home two weeks after that, took her to the airport to send her to an aunt and uncle in the UK and told her ‘not to come back’. The witness insists she never signed an adoption consent form.

A witness had to ask for assistance, when she was unable to spell the Christian name, when she was ‘told’ to write it on the document she was given to sign. Having become pregnant at the age of 15, she told the Committee that her baby was registered for adoption under false names, both Christian and surname, her name also inserted incorrectly, none having any connection to the real names. These ‘made-up names’ were used, she was told at the time, so that she could not be traceable as having had a child, a subterfuge, she said, that had been at the behest of her mother and aunt. She returned to the home in 2004 in search of information, to be told that ‘no baby boy’ had been born in the home on that date. When she mentioned to the two nuns who were talking to her about having had to sign the false names on the documents to facilitate her son’s adoption, the response was that ‘they didn’t know what she was talking about,’ and ‘bundled her out the door’. This witness concluded this section of her evidence by saying to the Committee: ‘there was a crime committed by the nuns because they registered me and my baby in another name’ adding that she had also reported the matter to the Gardaí.

The Committee noted that during the interview given by another witness, the word ‘shame’ was used nearly 20 times. She was 22-years old when she gave birth to her child. At the time she became pregnant she said that her overwhelming feelings were of shame - and consciousness of her parents’ fears that the neighbours might find out - these feelings have permanently endured. They have prevented her from telling her subsequent marital children, grandchildren, or even friends, about her having had a baby in a mother and baby home and choosing adoption.

This next witness traced his birthmother who had been 17 years old in 1969 when she gave birth to him in a home. When this happened, she told him, her parents had brought her to a solicitor’s office in a town and had ordered her to sign adoption papers, but she had refused and they left the office. The witness said that his adoptive mother told him that there had been ‘some uncertainty and delay’ in his adoption procedure in comparison to what she had experienced with the witness’s previously adopted two siblings. Her husband had been told that this time they were getting a girl
and they were also told that when they came to the home to pick her up, they were to have the number plates on their car covered up. They complied with this, but when they arrived, ‘were brought into a room and handed a boy’.

His adoptive mother had photographs taken of her new son, and asked that they be sent to the witness’s birthmother. They weren’t. The witness said that his adoptive mother had also offered to meet his birthmother but this offer was not allowed by the priest who was organising the process.

*A possible explanation as to why these adoptive parents had been asked to cover their car’s registration number was expressed by a mother who, at another time had been watching through a window in the home as a car took her baby. As she watched, she said to the Confidential Committee, she was told ‘that wasn’t the car of the adoptive parents’.*

*That mother said that in her opinion, she had been told that to prevent any attempts she might make in the future to trace her baby.*

But here is a woman who was 26 years old in 1969 when she went into a mother and baby home to have her daughter. She told the Committee that she had had ‘a very positive experience;’ that going into the home and having her child adopted was the best and only option she had at the time. The birthfather had promised marriage but had let her down and her mother had threatened that if she returned home with a baby, she would be thrown out.

Although she had a good job, she admitted that she had gone into ‘a very dark place’ when she discovered she was pregnant and felt she had ‘nowhere to turn’. In desperation she had sought the help of the priest who had been due to conduct her marriage. He had made contacts with relevant agencies and she was ‘very grateful’. In the home, she told the Committee, they too were, ‘very understanding of my situation’.

She did acknowledge that she had ‘grieved bitterly’ when leaving her child after giving birth to her and had been unprepared for the fact that it was going to be so emotionally
difficult. She did accept, she said, that at the time, adoption had been the best option for her daughter because she had not wanted her to be ‘in the limbo of fostering’, so even though it ‘felt like a death’ to her, she agreed to sign the final consent forms.

She also commented that ‘families were hard on birthmothers and that ‘society doesn’t think about all the men who got those girls pregnant!’ Although she did express a negative view of the nuns’ ‘lack of understanding about how difficult adoption was emotionally for birthmothers’, she was less concerned about that - (‘the nuns were trying to save the child from bad circumstances’) - than she was about the ‘villainising’ of adoptive parents, of ‘portraying them as snatching children away from their mothers’.

Another witness, a 21-year old mother, resisted all pressures to sign adoption papers and, defying all odds, while lugging a buggy went to ‘the place where my baby was being minded’ took the child, brought her to the UK and married the birthfather.

1970s

This next witness was extremely distressed during her meeting with the Confidential Committee when relating her experience of having her baby in a home in the mid-1970s at the age of 19, explaining that she had had no other option. She has had no further children because, she said, she was ‘too scared to go through again what she had gone through’ and she had a lot of regrets about the adoption. ‘Reeling’ is how she described the feelings she had about the entire experience and especially about the way the institution in which she gave birth, dealt with the adoption. Firstly, she was told to dress the baby and did so in clothes her family had crocheted. She was then instructed to go to the bathroom and get herself dressed. When she returned, her baby was gone. She contacted the adoption agency asking if she could take her baby back, and was told it was too late.

‘No-one ever spoke about my child at home’. This next witness, who was 18 years old when she gave birth in the mid-1970s, had given up her child ‘because I knew I was unable to mind a child and I was conscious of not ruining my boyfriend’s career’. On
one occasion, she burst into tears at the family dinner table because of her sadness, ‘but everyone carried on as though nothing was happening’.

A witness, 19 years old in the mid-1970s, had made a similar plan to escape with her baby from the home but when putting it into action, a nun tried to stop her. ‘I said: ‘You’ll have to kill me to stop me. She sneered at me and said: ‘we’ll see how far you’ll go’. But then to her astonishment this nun gave her £4 and the witness left with her baby.

This next witness gave birth to her son in 1970 when she was 21 years old. When she was back in the family home, the parish priest put pressure on her to give the baby up for adoption, warning her that ‘no bastard child will enter my school’. Subsequently, ‘one day, some women carrying documents’ arrived at her home - she had no idea who they were. ‘They gave her no choice’ she said but forced her to sign the documents. This witness told the Committee that she had no idea where her child is and ‘no one would tell her’.

Then there was the witness, 15 years old in 1972, when she gave birth to her child; ‘one day’, she said, ‘one of the nuns sat me down for lunch’ and by the time she got back to the nursery her baby was gone. When she left the home, ‘a priest visited her, put papers in front of her and told her to ‘shut her mouth and sign’. He never asked her if she understood what she was doing and she had no one to support her.

In 1974 a witness, who had a son in a home when she was 20 years old, said she had signed adoption papers before leaving as she ‘knew it was the only way she could get out’. But when she got home, she telephoned to inform the nuns she had no intention of signing the final papers as she intended to keep her baby - and was met, she said to the Committee, with ‘a litany of abuse’.

This nun then arrived at her house and tried to convince her that her son had ‘gone to a good home’ and even offered to give her the £10,000 that the adoptive family had put together to keep the baby. However, the witness stuck to her guns and refused to sign - and two days later, she was told her baby was ‘ready for collection’ but that she had to collect him at the back door of the home.
In 1976, a 16-year old who, a year earlier, had given birth to a child in a home and had given him up for adoption at three weeks of age, was back again. She had been living on the streets, had been raped and was now pregnant with her second son. This time, she wanted to keep her child and told the Committee that she had convinced a taxi driver to pretend he was her uncle so she could take her baby out. This worked and six months later she and her son left the home.

With the exception of one of her sisters, the family of this next witness, who took home the baby to whom she had given birth in the mid-1970s, were ‘charmed’ with her. She said, ‘the neighbours loved her too’. While in the mother and baby home awaiting birth and having signed the first two adoption forms, she had refused to sign the third, final one. ‘I said I will bring up my own child’, and from then on ‘it became a battle for me to hold on to my child’. The nuns, a social worker and a priest all met with her ‘to force me to sign her away’. This was before her baby was born - and she said, the pressure to sign the papers continued after the birth. This witness has remained single all her life and speaking about her daughter, she said ‘I live for her. She is my rock’.

A witness spoke to the Committee about being 19 years of age and pregnant in a home in the late 1970s and seeing nuns ‘getting physical’ with residents, wrestling babies from them in the nursery while the mothers were ‘roaring that they wanted to keep their babies’.

However, one of the jobs given to this witness in this home was to look after the children who would never be adopted because they had physical or intellectual issues. ‘It was like Chernobyl. They were in a room on their own. I was traumatised by it. I will remember them until I go to my grave’.

1980s

In the 1970s and 1980s, professional workers who were studying and working in mother and baby homes did sense that attitudes to unmarried mothers had begun to shift a little, especially as social workers continued to promote options other than adoptions.
However, the pace of change could be glacial. In 1985, for instance, a birthmother overheard this from the woman who was feeding the baby to whom she had just given birth in the home: (‘You were discouraged from feeding your own baby’, she said), but she heard this surrogate feeder say to her baby: ‘Your mammy doesn’t love you and she’s leaving you…’

Immediately after giving birth in 1980 in a hospital, the infant daughter of an 18-year old woman was taken straight from this hospital to adoption while the witness went back to the home. The witness told the Committee that in her view there was no acknowledgment of the bond between a mother and her child that ‘begins even before birth’. ‘I grew up on a farm’, she explained, ‘I watched cows having calves and I know the bond that exists even in the animal world’. When she returned home shortly after giving birth, even though they had never discussed it, her mother, she said, ‘could have kissed the ground that I had dealt with it and that was that’.

This witness was told that her baby’s adoptive parents wanted to meet her but her own parents would not allow this - and she was given half an hour to write a letter to her son before she left the home without him. Up to the last minute before she left, she said, she ‘held out hope’ that when her parents came to collect her they would take her and the baby home with them, but this did not happen.

The witness said that when she finally signed the papers she felt like ‘someone had carved her up the middle’. She went back to her studies in college, outwardly behaving ‘as if nothing had happened’ but she wanted to emphasise to the Committee that ‘she needed a template to survive the experience and move on with her life’.

1990s

Progress in the loosening of attitudes continued to be slow and as the 1990s dawned, a witness who had her baby in a home at the age of 17 told the Committee that she
wanted it to be known that ‘the same things were still happening.’ Her parents wanted ‘the whole thing’ kept secret, they had ‘a friend who worked in social services who was making the arrangements, and there were no choices offered, nor were any discussed’.

She had hoped that when her mother saw the baby it would be different, but that didn’t happen and the witness said that the ‘friend from social services’ did tell her she had the choice to opt out of the proposed adoption, but her parents had made it clear that this was not possible. For instance, none of her siblings had been told about the pregnancy so all believed the lie that when she went into the mother and baby home, the witness had ‘gone away to study’. Up to the day of her appearance before the Committee, the witness said, only one of her siblings knew that she had given birth to a baby.

So her job from the time she had given away her baby, she deduced, was simply ‘to return to her life after the birth, to act as though nothing had happened - and to carry the secret to this day’.
Fostering and Boarding out

This section describes the experiences of children who were boarded out or fostered from mother and baby homes or county homes from the 1920 to the 1950s. Boarding out and fostering are fully dealt in the Commission's main report.

Female Experience

1930s / 1940s

*This witness was not just resilient and optimistic, she was observant. She knew how, in a few words, to paint a picture for the Committee of what that era felt like: 'there was no joy, no happiness, it was a time of war, it was tough in Ireland, no-one playing outside, it was gloomy. ‘There were no coloured doors’.*

A woman born in a home in 1942 was sent to a foster mother ('a lovely woman' was how the witness described her) staying with her from the age of four until she was nine years old. But this foster mother became ill so the witness was taken back to the home for about a month and then sent to live with nuns. This experience could not have been more different from her previous one, particularly as 'one nun there would light into me every day. She was evil incarnate'.

‘Fostering for money’ was an issue for another witness. She had suffered ‘significant physical and psychological abuse in her foster home, which had ‘a lifelong effect on her’. Her foster parents, she said, believed that foster children ‘were the lowest form of life’, and were ‘caring’ only to make money. This woman told the Committee that she was an alcoholic by the time she was 16 years old, when she was taken out from this fosterage and sent to an institution, describing the move as ‘like going to heaven in comparison to where I had been’.

The following witness told the Committee that she still has scars on her legs from being beaten with ‘sticks’ by members of both families with whom, one after the other, she
had been boarded out in the mid-1940s. Having been born into a home, her childhood, she said, ‘was terribly unhappy’. When the nurse came to do inspections, she ‘never asked me what was going on - and my foster families made me wear wellies to hide the blistering on my legs’.

There were other types of oppression too, insults, taunting - the lies - that for years afterwards left mental and emotional scarring, not immediately visible, on many children.

_Born in the early 1940s this witness described for the Committee a childhood where physical and mental abuse were regular features of life with her ‘boarded out’ family, by whom she was ‘beaten with a leather strap and a sally switch’. If she was ‘bold’ she said, she would also be told that she was being sent back to the home and was ordered to ‘go and pack your case’; then, with it beside her, she would be left waiting, ‘standing at the fireplace all day’._

_At Christmas time, she would hang her stocking on the fireplace but on Christmas morning would find in it ‘only a lump of coal’. She never received a Christmas present, and like another witness in this report, was not permitted to sit at the table with the family, or in her case to use their cups and plates. She was given a tin mug. When having her period, she was given only old rags to use and had to wash and reuse them._

_Unexpectedly, this story ends kindly. When she was 16 years old, this witness left the family and got a job working in an orphanage, where, she told the Committee, ‘the nuns were lovely to me’._

The next witness told how her new foster parents, a teacher and his wife who was 53 years old at the time, took her from the home in 1944. The fostering, she told the Committee was arranged by a solicitor. When thinking about it in later life, she suspected it was organised because her foster mother ‘was anxious to have someone to look after her in her old age, and felt the need for ‘a servant girl’. She remembers
the foster mother saying to her that ‘no nice boy would want you’, and when she got to see her notes from the home, there is ‘no mention’ of her being either adopted or fostered: ‘I just slipped off the radar’.

In her foster home, she said, she had to share a bedroom with her parents until she was 13 years old and that ‘they would often have sex while I was in the room’.

To judge by the stream of similar accounts of beatings and abuse of all kinds heard from witnesses in the care of the state in the 1940s, it represented a cruel decade for foster children. This next witness stayed in the mother and baby home in which she was born in 1944 until she was eight years old and was then brought to stay with an ‘older couple who were nice to me’.

Tragically, her ‘nice’ foster parents died and she was moved to her second foster family, ‘missing a lot of school from then on’ because she was ‘working out in the fields’. She would ‘cut the turf and mind the children and be beaten’, while two brothers of this family ‘tried to assault me sexually’.

The next witness told how there were six ‘natural’ children in the family where she was placed at the age of three. She was there for ten years, she told the Committee, working as a skivvy - while being raped and sexually abused. This abuse, she said, was started by one of the sons from the time she arrived and she told the Committee that she was also ‘taken’ by neighbourhood men in cars.

Her ‘skivvy’ work entailed ‘unloading turf, all the housework, and working on the family farm. The inspector, she said, would call ‘very occasionally’ and she was ‘dressed up’ for him when he did call. Once, a neighbour gave her money for ‘helping out’ - but her ‘boarded out’ mother took it from her. She had a teddy bear, the only present she had ever been given and it had been from her birthmother. Her ‘boarded out’ mother took it from her.

Allied to the ‘early life’ experience of the previous witness, was the broadly similar one lived by the woman who was boarded out in 1948 from a home at the age of five months and who stayed with her boarded out family until she was 12 years old. One of her comments to the Committee was that ‘the older you get, the angrier you get’. Her story is that her foster parents were ‘totally inappropriate’ to foster her - the woman was 70 and her husband was 80 years old. They would keep her at home from school.
to ‘mind’ them - and along with a 12-year old boy (who was also ‘boarded out’ with them) all three ‘sexually and physically abused’ her. In addition, she said, this couple ‘would allow other men to come to the house and pay ten bob to rape me’. She was moved from this home to a children’s home when she was 12 years old. When the nuns there realised how far behind she was educationally, she was ‘put to work, morning and night and had to ‘hand over her earnings' to them’.

When this witness married and went on to have her own family, she had ‘serious difficulties in bearing children because of the ‘internal trauma and abuse’ she had suffered and has now ‘only one living child’. Bearing witness to the resilience of the human spirit, she left Ireland to train as a nurse in the UK and her fury with this family is equalled only by her anger towards the state, telling the Committee that this family ‘had never been vetted’ and that during her time with them, there were no checks made on her. She said, if there had been, it might have been discovered how she was ‘being used as a child prostitute’.

At the age of eight in 1945, this witness did not want to leave the home as she had been ‘very happy’ there, but abruptly found herself boarded out with a family and immediately, from that age, being subjected to ‘extreme sexual abuse’ from ‘various members’ of it. She told the woman who would come to inspect the house, ‘but she never listened’. She also told her ‘boarding out’ mother, but she ‘didn't listen' either. Later she tried to bring one of the ‘natural children’ in the house to court for his part in the abuse, but ‘the Gardaí wouldn’t touch him’.

She was ‘rarely' allowed to attend school and never did any exams. ‘My young life was ruined’, she said to the Committee, ‘and that’s all I can remember of the past’. She does remember, however, that on his deathbed’, her boarding-out father said to her: ‘We should apologise for what we did’.

This former foster child reported to the Committee about being ‘whipped’ by her foster brother until ‘blood was running down my legs’. She told the Committee that in addition to these ‘regular beatings,’ she had also been ‘regularly’ abused sexually by another of her foster brothers in their home - and on one occasion, as a result ended up in hospital. She suspects now that she might have been having a miscarriage.
but is unsure about that because at the time ‘I hadn’t a clue about periods or anything’. ‘There’s no words there for me to tell you how bad it was,’ said this next witness to the Confidential Committee - one of several who testified that she had never before spoken about the sexual and physical abuse she suffered in her childhood: ‘Telling people would hurt too many, this is the first opportunity I’ve had to say how it was for me without affecting anyone’.

In the mid-1950s she had been ‘taken in’ from the home in which she’d been born by her maternal aunt and the aunt’s husband - although she was never formally adopted. From the ages of 3 to 13 years, this uncle sexually abused her; From then on, he switched to abuse ‘of a physical nature’. ‘There were so many times I wanted to die. As a young child I prayed that he would be killed, because of the terror I would have’. When she was making her first holy communion, this child thought she was dying ‘because she was ‘sinful’. She fainted after receiving. ‘Developmentally’, she concluded, ‘that was my life, not much room in it for anything else’.

This next witness was fostered from a home when she was two years old in the late 1950s. She told the Committee that her foster parents had a ‘dysfunctional relationship and that there was ‘violence and mental abuse’ in the home. She is angry that children were ‘farmed out’ to such unsuitable parents, despite weekly visits from an official. On one occasion she asked her foster mother why she was fostered, this woman replied: ‘Well I couldn’t get a dog so I got you’.

This evidence was in stark contrast to that of the witness who came to the Committee to say that she was fostered and later adopted by ‘a good, ordinary, decent family’ and had a ‘happy, normal childhood’.

This next witness was five or six years old when fostered out from a home in the early 1950s ‘from one hell hole into another’. Her foster family were farmers ‘and they turned me into a work horse and a wild animal. My father would rape me every chance he got, and my mother would beat me; she would lock me in a room and cycle off, and my father would take me out of the room and into his room’. This witness does not remember eating any dinner in that house, ‘only porridge and jam’ - they turned me
into a wild savage and with two others on that farm who had suffered similarly, at the age of 9 or 10 she was sent to a convent: ‘We were all crazy’.

The witness was transferred into a psychiatric hospital at the age of 13, because she had hit back when one of the nuns in the convent hit her. Poignantly, this witness told the Committee that ‘the only place I ever felt loved as a child, was in that mental hospital’, where the nurses ‘were nice to me and gave me cigarettes’.

**Male experience**

**1920s / 1930s**

A man, born in the late 1930s, spoke about the general ethos for children in Ireland in the decades under review and not just for those in care: ‘You grew up in fear all the time. You were afraid of school. I served mass - I was afraid of the priest. You had fear all the time’. (Not just of ‘the priest’ but of the Master, the Nun and the Christian Brother).

Another coming from a man born in 1947 who was called ‘a bastard child’ in school, always ‘felt like an outcast’ and whenever asked questions about his family: ‘I was all the time telling lies’.

A third quote taken from the testimony of a witness who had also been born in that decade: ‘The psychology of being a bastard is deep in the Irish psyche and has stayed with me throughout my life’.

Given how many witnesses were heard, and at such length, as already implied this report cannot be exhaustive or give full details of all disclosures to the Confidential Committee.

Inevitably, though, there were major similarities in the disclosures as witnesses reported how they were treated while in care. The Committee heard that it was not just the cruelty, mental and physical or the sexual abuse and brutality that caused the deepest wounds - horrific as they were - but what cut even deeper was ignorance and indifference to individual suffering and needs.
A ninety year old man came to speak to the Confidential Committee of having been in state care during much of his childhood. It was unusual but not unknown that while he had been born in a mother and baby home in Ireland in the late 1920s, much of this care was in the UK where he was sent when he was four years old, having been moved around between institutions somewhat those first four years.

This witness was just a year old when sent to be ‘boarded out’ from the home, to live in the community with a woman who would, under inspection and supervision, look after him as her own and when the time came, send him to school. He had few memories of that period because three years later, when he was four years old, he was sent to an orphanage in the UK (and continues to attend its reunions.) From there he was again ‘boarded out’ this time for five years and from there, was finally sent to a ‘training farm’, where everything changed for him and, he told the Committee, his life became ‘extremely rough’.

He suffered the physical assaults common to these reports, but what was most upsetting was that he was treated and ‘thought of’ as a ‘lesser human being’ by the family who ran this farm; they made their attitude to him clear by leaving him, for example, to eat his Christmas dinner alone in the kitchen, while they celebrated theirs in the dining-room of the house they ‘shared’ with him. Although having developed ‘identity issues’ throughout this peripatetic existence of being shuffled around with no say in any of it (‘what am I doing? I’m no-one. I’m no-where’) this man found structure in his life by joining the British army; he trained as a nurse, and then ‘ran a hostel for alcoholics’.

Another witness discovered he was ‘illegitimate’ only when his daughter, on his behalf in the mid-1990s, began a tracing search for his mother and found his birth certificate and he also discovered he had had three sisters and two brothers with his birthmother - who had died, unfortunately, five years before this revelation. While he told the Committee that he was ‘sad he had never met his mother’ he believes that it is good not to dwell on the ‘terrible things of the past’, far better to ‘live in the day’. To do otherwise, he said, ‘is a cancer of the brain’.

A man born in the Ireland of the 1930s, told the Committee he was fostered through a number of foster homes from the age of 14 months. He was placed as a ‘farm labourer’ at the age of 16, where he was compelled to live in a shed on the land for a number of years before he joined the army.
1940s

Witnesses described how as children in abusive settings they were left to cope alone without any help from their families or the state bodies. Some men, who had been boarded out as children joined the army in either Ireland or the UK. Many went on to marry but could not cope with the intimacy of that institution, or had trust issues: ‘The marriage broke down’; ‘the marriage didn’t last’; ‘there were difficulties in the marriage’ were common refrains in the interview room. In later life, some sank into alcoholism or drug use in an effort to blot out the recurring nightmares of their early experiences.

This next piece of evidence given to the Confidential Committee came from a man whose mother was 18 years old when she gave birth to him in a home in the late 1930s. He learned much later that for some time she sent money to cover his upkeep. From his birth home, he was transferred to a second one and then was sent to a foster home.

Growing up there, he said he never got Christmas or birthday presents and ‘I didn’t know what Santa Claus was’. But his life changed when he met his wife. ‘I didn’t know what true love was until I met my wife’. He was not only very happy with her, but by getting to know her family, ‘learned about how family operated. His wife’s family ‘embraced’ him he said, and ‘when that door opened, the love oozed out. I’d never seen this before. Had never got hugged, never got kissed’.

This wholehearted, generous outpouring of love served also to illuminate the barrenness of his earlier life. Referring sadly to it with what might also have been even a small tinge of bitterness, he said to the Committee: ‘We were fostered out for money’.

This next witness was traced by a sibling but he wanted to have a relationship with her only ‘if she is kept secret’. She hasn’t contacted their birthmother, fearful that it would be ‘too much of a shock for her’.

Meanwhile, a snippet of how one small adventure paid off for a witness who had tried to run away from his troubles but was caught by the Gardaí and returned. He subsequently managed to stow away on a boat and ended up in Wales. He went on to work in manufacturing and learned a trade through the Open University.

This next boy, however, born in a home in 1940 was placed ‘inappropriately’ he said, with a foster mother and father, aged, respectively, 67 and 72 years old. Their home had neither electricity nor water, and his main job, he said, was to ferry buckets of
water into the house. He remained at this posting until he was 16 years old and ‘all
tings considered, he said, ‘did quite well’.

When he was leaving (National) school, his headmaster asked him what he was going
do about his education, encouraging him ‘to keep learning’. Unfortunately, before he
could get the results of the Civil Service exams he sat, his foster mother fell and broke
her hip so he gave up the notion of a (white-collar) career and took a job with a local
butcher.

This next witness verbalised a portrait of profound sadness and loneliness. He was
born in 1940 and when he was two and a half years old, he was sent from the home ‘to
fill the gap’ for parents whose son had been tragically killed. Then he was sent to an
orphanage when he was four years old, remaining there for years, ‘with occasional
visits back to the couple’ with whom he had been living.

He would be ‘overjoyed’ when sent to see them but was then ‘totally confused’ when
he had to go back to the orphanage, as he had thought he was their son and couldn’t
understand ‘why I didn’t remain with them. I thought there was something wrong with
me. I was forsaken’. (That word, he told the Committee, was the only one that could
illustrate that feeling of ‘loss and loneliness’.) In the 1970s and 1980s when he
discovered the true details of his past, this man suffered a breakdown. He had
married, he said, but his wife ‘knew nothing of it’.

This next witness was fostered by an older couple. Their son was ‘threatening’ to the
witness. On one occasion when they were cutting turf together he told the witness he
‘was going to put him in a bag and throw him into the bog’. He told the Committee that
his foster mother was ‘nicer’ to him, citing as evidence that while he was being
whipped by the son, the belt leaving welts and marks all over his legs and bottom, she
would urge her son ‘to leave him alone’. This son, he said, was also ‘cruel’ to the
animals on the farm, for instance kicking them, and he was also aware that he was
‘molesting children’.

Despite the fact that the family received an allowance for him he had very few
possessions - shoes to wear only for going to Mass and at all other times he wore
wellingtons. No-one knew what he was going through as he was not allowed to visit
the neighbours and forbidden to talk to anyone; he ‘fared poorly’ in school where the
teachers were ‘horrible’ to him, regularly ‘hitting’ him - and in any case, he was frequently taken out of class by the foster family to work on the farm.

This witness stayed on that farm until he was 31 years old. Although he was ‘always tempted to leave’ he said, he had become ‘institutionalised’ and ‘fearful of the unknown’. He did marry and have his own children (and would never allow his foster brother into his own home.) He discovered when he scrutinised documents relating to his birth, that after his birthmother left the home where she had given birth to him, she had spent most of her life in a Magdalen laundry.

In the matter of being ‘a bastard’ and being judged in Ireland by where you were born rather than the person you are, the man born into a home in the 1940s won't easily forget a taunt he suffered in a pub. He was with friends celebrating his imminent wedding when a man sidled up to him, leering: ‘You’d better invite me to the wedding. I’m your father!’

In 1945, a baby was ‘boarded out’ from the home when he was ‘seven or eight’ years old to ‘very bad, very hard’ people, who were ‘very wealthy and Catholic’ and who had four natural children, all older than he was, ‘doing no work on the farm’. He told the Committee that the work he had to do on this farm ‘would nowadays be considered as slavery and if you opened your mouth, you would get a whip across the face’.

He would be given only ‘leftovers’ to eat - and would often subsist on the ‘potato skins thrown out for the pigs’; he was not allowed to use the toilet in the house, and would he kept out of school to work on the farm, his foster family writing ‘sick notes’ to the master. Sometimes he did manage to get away to visit his foster sister’s home and she was ‘good’ to him. Eventually, he escaped to the UK, where he trained in a trade and went on to ‘make a good life’ for himself.

There were two major escape hatches for distressed men and boys during this era and it is striking how many of them told the Confidential Committee how they stepped through the first one to ‘join the army’ both here and in Britain, speaking warmly of the experience. These witnesses contrasted their old lives with this new one, where they now had food, warm clothing, a bed, and structure added to their lives, that up to then in many cases had been chaotic, full of all kinds of physical suffering and with fear and hopelessness in equal measure dominating thoughts about the future.
The other hatch opened onto the mail boat on the Dublin docks, or its equivalent elsewhere in the country, taking escapees across the Irish Sea and into the UK. It was availed of by many, including girls, especially if they had relatives settled there who were willing to offer transitional help.

Britain offered not just bigger territory, but a far larger population within which to hide and gain anonymity even during the war and post-war periods where frugality and food rationing ruled. So the way of life during those years wasn't easy. On balance, however, when set against institutional suffering in the Irish state care system, even living under the Blitz and the lean years afterwards was preferable - with the prospect of personal freedom and independence beckoning those who had never experienced either. Some fell by the wayside, of course, but many, for the first time in their lives, were at least cognisant of the opportunities, big and small, that came their way. Some grasped them, some didn't (or couldn't.) Even if only on the surface, they now enjoyed the privilege of being able to make personal choices.

This next witness, who was born in the late 1940s, had 6 siblings in his foster family, the progeny of his foster parents. This new child was expected to fetch water from the well in the middle of the night if his foster father felt like a cup of tea - and had to supply tea for him and his friends who would come to play cards. He would be fed the potatoes that were given to the pigs. In the mornings before school, he would take the hens’ eggs, place them in the fire and take them with him to school. His teacher noticed this and would give him sandwiches and milk - but if he was late home from school, the father would whip him.

In 1963, he was moved to another foster family and suspects this was because it was noticed that he was being maltreated in the first one. This new family were wealthy dairy farmers, with two sons already in University. He was paid £1 a week, and ‘put sleeping in a shed, working from six in the morning [before school] and until midnight (after school) pulling turnips, bringing in the cows, washing, milking and feeding them, delivering the milk door-to-door. On one occasion, he was told to go into town on a bike to fetch groceries; a Garda noticed there was no light on the bike and summoned him to court. The foster father ‘fined’ him, taking his weekly £1 from him to ‘teach him a lesson’.

This witness was another who escaped all this by joining the army and didn’t know himself: 17 pounds a week, 3 meals a day, a bed, a uniform, and work finished every
day at 4.30 in the afternoon’. In 1998, he eventually did meet his mother, forging ‘a good relationship’ with her until she died.

Another witness eventually moved to UK but not before his life beforehand, as related to the Committee, had encompassed almost all of the worst elements of state care. This man said he had come forward ‘quite reluctantly’ to tell his story and ‘nearly didn’t’. He was born into a home in 1945. At the age of ‘about three’ he was fostered out but then returned to the home when the couple had their own child. This couple, he said, ‘didn’t feed me but didn’t harm me’. At the age of eight and a half years old, he was sent to his second foster home, where there were sons and a mother but no father.

One of the sons, ‘about 45 years of age’, regularly ‘came into the bed’ of the witness. A second was a ‘bit of a fiddler too’, and a third was ‘an alcoholic’. At school, the witness was ‘treated like a piece of shit and was caned every day’. ‘Even the other children would line up after school to beat me.

In this second foster home, he was again ‘not fed properly’ and would ‘eat anything I could get my hands on, even the pigs swill’. ‘Everyone in the village knew I was malnourished but didn’t care as I was seen as the devil’s child’. This was the witness, who was only once during his fostering given new clothes - for his confirmation - ‘and they were taken back off me as soon as the ceremony was over and returned to the shop’. Nothing was ever explained to him about what was dangerous about working on the farm ‘and I was put in many dangerous situations, with live cables and the like’; he had ‘a number’ of accidents.

There were eyes and ears everywhere in this Ireland of the Forties: ‘I would go to confession in the village and the next day the policeman would know everything I said and would punish me. ‘I would be blamed for anything that went wrong in the village - the policeman would kick me in the hip’. He has ‘no memory’ of any inspections of the foster home. Perhaps the unkindest cut of all came courtesy of his foster mother: over the years, she had regularly promised him: ‘if you are good and do all our chores, your mother will come and visit you’. This witness told the Committee that every Sunday, he would wait in anticipation of his birthmother coming to visit him, but ‘this never happened’.

By doing odd jobs ‘on the side’ he eventually managed to save enough money to ‘get on a cattle boat and start a new life in England’. By the time he traced his birthmother,
she was dead. He told the Confidential Committee that he had never wanted to know anything about his birthfather as ‘the men of Ireland used to get away with murder. They were never to blame'.

In the 1950s, a male witness was placed with a couple who were under the age of 30. They emigrated and raised him abroad - never going the legal route of adopting him. As a child he was also exceptionally lonely because both parents were ‘golf fanatics’ and so he spent ‘all’ his time alone.

This witness is ‘very angry and distressed’ because of his childhood and past, saying that his ‘adoptive’ father was an alcoholic and a ‘very violent man’ and because he believes these people should not have been allowed to ‘remove him from the country of his birth and his cultural heritage’.

Born in a home in 1946, this witness’s only memory of his mother and baby home, he told the Confidential Committee is of his being ‘walked out of it’ by a nun when he was nearly five years of age and bound for ‘boarding out’. In his new home, this little boy was, from the beginning, ‘beaten every single day’, thrashed for not doing things the right way - ‘but I had never been shown the right way’. The father in the family was a ‘chronic alcoholic’ and the worst beatings were inflicted on this child when his father had been drinking on a Friday night. The family had a farm and from a young age, the child was made work ‘very hard’. For a period he had ‘no shoes, and ‘I would have to walk for hours to get to school’.

This regime lasted until he was 12 years old - when he was moved to a second ‘boarding out’ family. But he was similarly beaten there and ended up running away. Then his luck seemed to change when, while ‘on the road’, he was picked up by a man, a member of a film crew, who paid for his first night in a hotel and gave him the fare to get to London (via the ferry). He was free of the day-to-day horrors of boarding out, but the long-term effects of the constant beatings and the other aspects of his life up to that time, proved to be profound; he became an alcoholic, and although he did marry twice, both wives left him because of the drinking and he has little contact with his children. He has now been sober for 10 years, he told the Committee, and has worked as a labourer and in the security industry, but overall, he said, he has led ‘a very nomadic life’, even moving from the UK to the USA ‘on a whim’. This man never
managed to meet his birthmother but the saddest sentence in his narrative was: ‘I miss her every day’.

Stories of serious physical abuse by foster families resulted not just in psychological scarring but in life-altering physical injuries and they continued with this next account from the witness who was fostered, also at five years old. His new “parents” were three unmarried siblings who lived on a farm and who ‘severely’ beat him and, he told the Committee, threw him down the stairs. This series of assaults resulted in a ‘fused’ ankle which has left him with a bad limp, a frozen shoulder, and arms that cannot properly bear weight.

When the severity of the abuse was discovered, he was moved to another foster home where he was ‘very well taken care of’, too late. While looking for work after his second foster mother died when he was 18 years old, he found it difficult to find any as he was now seen as ‘a cripple’ with employers telling him: ‘You’ll be no good to us’. He is angry with the state for not protecting him from the abuse he suffered. He is also upset about the fact that ‘the circumstances of my birth came up throughout my life - having to tell people I was illegitimate has been very hurtful’.

The spectre of land inheritance rose for a time in the case of this next witness, who had been fostered with an elderly couple with no children of their own, and whose farm was let to their nephew, who resented the witness, fearing that he would ‘get in the way’ of inheriting the place. Although life was not easy, he did manage to get on very well at school and ‘was never singled out for being a foster child’.

Some years later, however, he was moved into another farming family where there were fleas in the room where he slept, and ‘mice crawling along the roof; there was no heating or running water and he had to drink from a stream and use the fields as a toilet. Sometimes the food he was given was infested with maggots. He couldn’t study properly, because there was no electricity, his books were ‘filthy with soot’ and his school work deteriorated significantly.

This witness never received a penny for his ‘labours’ on this farm. He is emotionally scarred as he feels he has never ‘belonged’. He also feels the loss of ‘proper education’ and it makes him angry. In addition, he told the Committee, that he believes that it is because he had to drink dirty water that he now suffers from hepatitis B.
This next witness said that he remained in the home until he was six and a half years old, and was fostered out to a couple who could not have children of their own and wanted ‘someone to take over the farm’. They had responded to an ad in a local newspaper seeking foster parents ‘and when they came to the home, I smiled at my foster mother and she knew she wanted me’. When first he arrived at his new home, however, he was ‘frightened’ by it, never having seen a dog before, or farm animals (even pictures of them) but cheered up and from then on he had a ‘happy upbringing’ and enjoyed ‘the freedom of being outside on the farm. ‘I was born a second time’.

His difficulties arose, not on the farm, but everywhere else; when still at school, although some of the teachers were ‘very supportive’, he said, he was ‘not allowed to mix with other children in the playground and had to take his lunchtime at a time different from that of other children. Later, at work, he experienced ‘verbal abuse’ and ‘being called a bastard’. The discrimination spread later to dancehalls, where, because of his family status being well known (and obviously well-discussed) in the area, he ‘would struggle to meet girls’.

He did marry and have his own children, but always worried how they might be affected by his past as to this day, he still gets ‘a certain number of digs’. Unfortunately, throughout, his birthmother refused to sign adoption papers, so while his parents had wanted to adopt him - his foster mother praying ceaselessly to Padre Pio for both him and his birthmother - the witness himself was conflicted about the situation. On the one hand, he would have liked her to sign the papers because ‘it would have made his life easier’, not least because he ‘would have inherited more land’.

On the other, it did make him aware that his birthmother ‘wanted him’ and he intuited her fear that he ‘wouldn’t look for her if she had signed’. His foster parents were very supportive of his quest to find her, accompanying him to the UK when he eventually tracked her down and went to meet her. Just in time, because she died not long afterwards. He has erected a headstone in her memory where she lived.

Another foster child’s farm placement was also a source of gossip in the parish. It also involved land. The farming couple were elderly and before leaving for school, the witness had chores to do, milking and feeding the cows, (seasonal) sowing of potatoes and cabbages, filling barrels with water for cement. While his foster mother tried to
have him adopted, his foster father refused as he wanted his nephew to inherit the land.

However, the witness went to work for his foster mother's brother, and while he received no payment for his work there, that man left him his farm in 1972. His foster mother bought him a car to enable travel between both tracts of land. So all in all, unlike others who had suffered by being placed with farm families, things worked out for this witness, although he said 'stigma, complete with ugly comments' still applied, and not just to him. One day he overheard a neighbour chatting to his parents and then, casually, mid-chat: 'Sure you’re only raising a bastard!'

This next man came to the Confidential Committee ‘because I wanted to get it off my mind’. He spent two years in the home and then was sent to another, then juggled into and out of ‘different foster homes, in one of which he was forced to ‘sleep where the pigs slept because I was wetting the bed’. ‘There was no light’, he went on, telling the Confidential Committee that on one occasion while in the pigsty, ‘a rusty nail went through my forehead’. The foster parents he said merely ‘washed the wound and put a plaster on it’. No mention of a doctor. Nor did he ever see a doctor in his next port of call, an industrial school to which he was sent at the age of 11 years, by a judge. ‘The teachers were fine, some of the staff were great, but some would hit you for no reason and some would call me ‘an imbecile’. I wasn’t an imbecile, I was depressed. I had a pain in my mind. I think that’s worse than any pain, I felt like a lesser boy. It’s lonely growing up without a family’.

He met his mother once, when he was still five years old. ‘She brought me to her parents and they didn’t say a word’. He never saw her - or them - after that. As an adult, having worked part-time for 30 years, he continues to suffer from depression, anxiety - and to add to his difficulties now, agoraphobia.

A positive fostering experience was described by the next witness to the Committee. The mother of the witness, having remained in the home with him for a year, then emigrated to the US. He was fostered out to a farming couple in their late fifties and always knew his true position, but said he had a ‘happy upbringing’ and that they regarded him as ‘their son’ and for company, he also had a foster brother.

This witness believes, he said, that in later life, his ‘heavy’ involvement with the local GAA, both as a player and an administrator, helped him within the community in that
he was ‘accepted’. He believed that ‘the media’ was ‘forgetting about the good that was done’ and that ‘the nuns were being criticised unjustly’. This man said that he had no sense of being let down. He believes he had lived in ‘the Ireland of the times’ and that being fostered had never impacted on his life. He did help his foster parents on the farm but never considered they were ‘taking advantage’ of him, never felt stigmatised and has always been very open about his origins and the fostering. ‘I wouldn’t swap it’.

A man who was born in a home in 1952 was brought into a room ‘to be tested’ when he was seven years old. Two weeks later he was put into the back of an ambulance ‘and taken to a special school’ for children with learning disabilities. The witness was then ‘boarded out’ from this school with a family to serve as ‘companion and minder’ for their intellectually disabled son - his bed during this posting was ‘two kitchen chairs’ put together. At 12 years of age, he moved to another home, and at the age of 13 years, he was taken out and given the job of cleaning ‘a disused hospital, wherein he was ‘handling dirty used medical equipment with no gloves or protection. He would start work at 5.00 am and go on to school at 8.30 am. Then, he would work every evening. He had to give his money to ‘the priests’. Every summer he was sent to work for a farmer where there were no toilets or running water.

This witness told the Committee he ‘was beaten in every placement he was in’. Insulted too - in one, for instance on asking for help in preparing his ‘family tree’, the response was: ‘That’s easy, your mother was a whore and you’re a bastard’. ‘To this day, this man said, ‘I suffer the effects, often waking at night, screaming and shouting’.

A witness with a disability came to the Confidential Committee to say that ‘he doesn’t know what it is like to be treated well’, ‘you are nothing because you come from one of the homes’; explaining that all his life he was mimicked by others for being disabled for instance, being called ‘Christy Brown’.

Another witness told the Committee that his cousins would mock him, saying ‘you’re not entitled to anything, you’re adopted, you should be grateful someone took you in’.

A man who was boarded out in 1953 wrote to the Commission about his experiences of being boarded out, including the day he left the mother and baby home. (His experiences in the mother and baby home is recounted in the section on the conditions in the home)
I was put into an ambulance - nobody said anything to me about what was happening. I am a farmer - I was loaded like a beast and brought off. I cried a lot and was especially distressed at leaving my pal, whom I depended on totally. I looked out the window of the ambulance for the whole journey and I remember arriving at a long road with two big piers and a big gate with spikes. I thought I was going to another prison.

(The person we are calling Missus) met me at the gate - I didn’t know who she was and she took me in. She was a nice woman. I had a room but (Mister) was an alcoholic who went to the pub every day.

The day after I arrived he had me out working in the fields and that was most of my life from then on. I was only allowed to go to school on days when it was impossible to work on the farm, he would leave out the work I had to do every morning before he went to the pub and he would come home drunk. He was always cross and giving out, even if I had done the work. He would lash out if I was near him and Missus would try to intervene to save me.

I often worked through the night so that the work would get done and I would not be punished - I would get no sleep at all. I often got soaked but had to keep working without getting to change into dry clothes or footwear.

The few times I was allowed to go to school I was not able to keep up or I would not have by homework done so the Master would've put me outside the door as punishment. The children would come at me and ask me why I had [his name] but was living in a home with a (different name) but I couldn't answer because I did not know why.

When the teachers were gone home, some lads would attack me and even though I tried to fight them, I often went home with a black eye. Missus would complain to the school but they only beat me worse afterwards. They would follow me and force me to fight again so, as result I would be late home from school and would be abused for this by Mister. Even when I was playing hurling I was singled out to get belts more than the other children. I was never protected from this by the trainers.

I continued to wet the bed for nearly ten years after I went to Mister and Missus’s. Missus never gave out to me as she knew it was because of the abuse I suffered in the
mother and baby home. She would often ask me in the morning who I was talking about when she heard my nightmares.

I was well into my twenties before Missus explained my background to me. I got my birth certificate then and eventually met my mother. I was shy all my life and never had any close friends. I never married and always stayed on my own.
The Adoption experience

Legal adoption is the process by which a parent/child relationship is established between persons unrelated by birth whereby the child and the adoptive parents assume the same rights and duties as children and parents in ‘birth families’ and the birth mother relinquishes her rights over the child. Adoption in Ireland was introduced by the Adoption Act 1952 which came into effect on 1 January 1953. It quickly became the most likely outcome for ‘illegitimate’ children and the most significant exit pathway for children in the institutions being investigated by the Commission. The vast majority of foreign adoptions took place in the period 1945-1969.

Adopted to the United States

Some of the babies adopted from homes were sent to the United States and had happy childhoods with caring families. However, the ‘adoption experiences’ of these following witnesses have varied tales to tell. They range from the mid-1940s until the 1960s.

This first adoptee categorised her childhood as ‘extremely unhappy’, was sent to the USA with a boy from the home in which both were born, ‘he was to become my adoptive brother’. She told the Committee, their adoptive father ‘never wanted her and made his feelings about that known’.

There was a third adoptee in the household, an older girl who had been adopted from within the States before the other two arrived and she, the witness said, was ‘favoured’, while their father always referred to the witness as ‘homely’ and ‘stupid’, and her mother had always introduced her to others as ‘my adopted daughter’ which made her feel ‘different from other children’. Her parents, she said, never told her that they loved her.

When she was in her early teens, her adopted brother ‘attempted to molest me’, she said, adding that ‘this sexual assault was the biggest thing that happened to me’. She thought he was going to kill her, she said, and thinks that this was the cause of her
being ‘afraid of boys’ for most of her life, that all through school, she wanted to be
‘invisible’ and that at the age of 14, she ‘began to have suicidal thoughts’. In addition,
she said she ‘could not bear to be around people’ and so a series of retail jobs couldn’t
work out for her and she left each of them in very short order. Her adoptive
grandparents were the only ones ‘who ever showed me love’ and when they died, she
spiralled further downhill, abusing alcohol and prescription medicine, suffering acute
attacks of psychosis, and being treated with electric shock treatment.

She now suffers from agoraphobia and wishes she could come to Ireland ‘but how can
I when I can’t go out the front door?’ She did marry in the US, she told the Committee,
and had two sons, one of whom, tragically, died only in recent years. The other, who is
divorced, now lives with her to help her cope with her agoraphobia along with the
‘health issues’ of her husband. This woman ‘doesn’t remember ever being happy’
amending that a little: ‘Perhaps when I married and had my children? But I’m not sure
even then’. She concluded her evidence with this: ‘I wish I was not taken away from
my country. I wish I could be in Ireland. I wish my mother could have kept me and
raised me in a loving family’, adding: ‘I love my Irish heritage’. She celebrates this, she
said, ‘every Saint Patrick’s Day’.

The second adoptee-witness had remained in the mother and baby home for five years
in the mid-1940s before being adopted to the United States and although there was a
huge difference between the tone of his interview and that of the woman above, his
had its own poignancies.

His adoptive parents, he said, had paid ‘between £750 and £1000 to adopt him’, and
his adoptive father had used his ‘connections’ with the American Embassy in Ireland to
assist with the visa application. The witness was then brought to Dublin to obtain that
and to have a medical check. Then, along with a nun, he was driven to Belfast airport
‘because’, he said, ‘there would be ‘fewer questions asked’ in that ‘getting illegitimate
children out of Ireland was difficult at the time’.

This man’s adoptive family was ‘Irish Catholic’, lived in California and already had a
natural son who was older than the witness. On arrival in the United States, the
witness had his tonsils extracted, was circumcised, had warts removed - and was
enrolled in a Catholic school.
As a sidebar to this story the man told the Committee that the nun, who had accompanied him to Belfast, ‘held his hand all the way’ because he was ‘scared of being on a plane for the first time’. His fear was ‘that the toilet would suck him down’. The conclusion of his evidence to the Committee was: ‘I was never without want’, he said, adding: ‘from a materialistic point of view’.

The experience of this third witness is that she never felt that ‘being adopted was a bad thing: it was sort of cool being adopted in another country!’ She was giving evidence, she said, primarily to ensure that what had happened to her birthmother around the issue of her adoption ‘was never going to happen again to other women and children. ‘My mother was put out on the street with a broken heart, left to pick up her life. She never recovered’. She said: ‘My parents told me they had sent the nuns a lot of money. There is no piece of paper saying that my mother relinquished her rights. I definitely believe that I was sold’.

A witness was adopted from a home to the USA in 1961 (having been born in 1958) and spoke in great detail to the Committee about the extreme abuse he suffered at the hands of both his adoptive father and a close family relative for many years. His adoptive father physically abused him and he was sexually abused by the family relative. This relative, he said, was instrumental in organising his adoption and he exerted huge influence and control on all aspects of the witness’s early life. The witness’s experience is now the subject of litigation.

1940s / 1950s

A witness who was born in a home in the 1940s was adopted to the USA. She had been told that her birthmother had died in childbirth, but she had discovered that this had been a lie and when her own child was born, curiosity to trace her birthmother was born too, so she came to Ireland to search. Having arrived in Ireland she met two nuns from the home where she had been born; one read ‘snippets’ from a file ‘but refused to hand them over’ and she felt she was being treated as though she was 10 years old.
With the help of a genealogy website, she found a match with someone who proved to be her cousin and in this way, also found her mother. She went back to the USA and wrote from there, received no reply, and came back again to Ireland where she left ‘notes’ at her mother’s house - but her birthmother telephoned her at her hotel, asking her to stop contact as her husband and children didn’t know of her existence. However, the witness did persist and they did eventually meet, her mother taking her out to dinner and giving her a birthday present. In 2016, the witness brought her own husband and children to Ireland to meet her birthmother and this ‘was very positive’.

Nothing is simple in this world, however, and the witness told the Committee that her adoptive mother is resentful about this reunion.

Another witness, adopted into a family in the USA, and treated ‘well’ by her adoptive family, nevertheless faced constant jibes from classmates that ‘her mother had died because she was bad’. When she told her adoptive mother about this, it was explained to her that she had been adopted by her new family because her mother had died in childbirth. She feels, she told the Confidential Committee, that this information had been couched in a way to prevent further questions and expressed concern that her parents had received no counselling or advice as to ‘how to handle an adoption’. In consequence of the way she had been told, however well-intentioned this had been, ‘every scrap of confidence I had, went’.

Later, because of ‘anxiety and nervousness’, she dropped out of college, and by the time she gave her evidence to the Committee, she had been treated for depression and self-harming and had spent time in a psychiatric hospital where she had been placed on heavy medication. It was only when she was in her mid-twenties when she discovered that her birth mother was not dead.

Years later she set about trying to find this mother. ‘Anything I found out has been in spite of the system’ she told the Committee, saying that in 1993, she had sought information from a nun and, she says, was given ‘false’ information that her mother had been from the (wrong) county: ‘She was as cold as ice, it made me feel ten times worse, it was her whole demeanour - I was the offspring of a fallen woman’. But with the help of her husband, she narrowed down the search, coming up with nine women of the same name and with the approval of a dedicated agency, wrote a letter to each of the nine in turn until, one day, her mobile phone rang when she was in a grocery store carpark.
Her birthmother, she said, ‘was nervous, blunt and direct’ during that phone call telling the witness, ‘I didn’t bond with you, I moved on’. The witness’s shock at having made contact after such a long search, she told the Committee, was such that she ‘stayed in bed for two days’. She now phones her mother every month ‘and the relationship is improving’ but she had to ‘build up’ that trust: ‘Her DNA is running through me and my children but we don’t know each other.’

One witness had been slated for adoption to America but her birthmother had refused to sign adoption papers. Later, the witness’s mother said to her daughter that she regretted not signing the adoption papers, because the witness ‘may have had a better life’ if she had, ‘times’ being hard at home and the witness’s stepfather being ‘fond of the drink’. This witness said, however, that while she always knew, growing up, that she was different and ‘felt that stigma’, and while she did have her ups and downs ‘I had my Mammy’.

‘Things were very good’ for a woman who was adopted into her family in 1957 until her adoptive mother died when she was 11 years old. After the death of her adoptive mother, she saw her adoptive father abusing his niece - while also discovering that he had been in prison because of ‘inappropriate issues with young men’ while in the army.

In the garden shed where he ran ‘workshops’ for young boys, she saw him abusing them too. Obviously having realised that she knew what was going on, he threatened her that she would be ‘taken away’ if she ever spoke of these things. She told the Committee, that when she was 15 or 16 years old, men who ‘worked with her father’, began calling to the house with the message: ‘Your daddy sent me to see you’. Her additional issue with this man, her adoptive father, was that he had told her that her birth mother had died in childbirth, but that was a lie. The witness has since traced her birth mother.

When a witness was two months old in 1955, she was adopted into a family with two natural children. Being mixed race, with her new family being ‘fair and pale-skinned’, she always ‘felt different’, especially as she and her family faced ‘open racism’ in their neighbourhood, with neighbours coming to the house, asking her mother ‘why she had brought a black child home?’ and arguing that ‘she should be taken back to the orphanage’. After a while, her parents were unable to take the sustained pressure and did take her back, but after a couple of days, came and took her home again.
Disputes with the neighbours continued, however, with her adoptive mother constantly 'getting into fights' about her. She told the Committee that her family had been given 'absolutely no guidance or support' as to how to deal with this situation and fully acknowledged that despite all these difficulties and pressures, they did their best for her and gave her a 'good upbringing'. However, she said, she 'still feels like an alien'.

This witness, born in 1959 in a home, found out she was adopted at the age of 'seven or eight' and 'thought it was a disease'. She finally met her birthmother in 1992, to find that she had always been unwell, was suffering from depression and has always had difficulty acknowledging the witness: 'You'd love to hug her and hit her at the same time'.

Then there was the witness, who in the mid-1950s had a 'very difficult childhood' with a 'very strict adoptive mother' who would not let her associate with any other children and who beat her. Her adoptive father was blind. When the witness met her birthmother in later life, her birthmother told her that her birthfather had been a priest who had raped her. The two lost contact ‘for a while’ and during that period, a half-brother contacted the witness, with the news of who he was, and not only that, but that he had a twin - both born of the witness's birthmother. The birthmother had told the witness that she was the only child. When the witness confronted her about this falsehood, the birthmother said she had thought the twins 'were dead'.

This next witness, adopted six months after she was born in a home in the mid-Fifties, does not believe that any vetting of her adoptive parents or their home was done to ensure that they were suitable to adopt herself and the other five children who were in the house. Her adoptive mother, she said, was a witch. She was critical about the 'lack of accountability' of adoption agencies and adoption placements and when she arrived at her new home, there was no space for her and she had to sleep in a drawer. When this witness was 17 years old, she married the first person who told her he loved her. ‘It was a terrible marriage’.

The ‘morass of lies and deceit is very unsettling,’ another witness told the Committee. She said that her adoptive parents were given ‘incorrect information' about her; although they knew about her background, ‘they were lied to, to stem further investigation’. On the other hand, this witness’s situation was complex: she believes,
she said, that had her birthmother (a widow with 10 children) kept her, she, the witness, ‘would have had a very difficult life’.

While her own children ‘struggle’ to understand how their grandmother could have given up her baby, the witness regards herself as being ‘one of the lucky ones’ in that she had a mother (in her adoptive mother) while her sister, also adopted, did not.

For many years, this birthmother had not revealed the existence of these two adopted children to the 10 of her ‘natural’ brood, but eventually, contact was made and all 12 of the birthchildren met together, which ‘went very well, except for one sibling’. While she now has an ongoing relationship with her birthmother, her adopted sister, the witness told the Committee, had been looking for a ‘mother figure’ but ‘they just didn’t gel’.

When she was seven months old, this next witness said, her birthmother’s father (her widowed grandfather) adopted her, being permitted to do so only after a ‘hard fight’ with the authorities. With him she had, she said, ‘an excellent life’ and while growing up, referred to him as ‘Dad’. He died, however, when she was 12 years old and she then moved to a life less happy with her mother and stepfather, the latter, she said, being ‘very abusive’ towards her mother and ‘hating’ her. She felt ‘totally lost’ while her mother had gone on to have a further 11 children with this man. This witness left school, in effect, after her Inter Cert, attending for only one day a week after that. She got a job in a textile firm and worked there for 26 years.

1960s

At the beginning of the 1960s, a woman at two years of age was adopted by a farming couple into a ‘beautiful home’. Things were not straightforward for these parents, however, because the neighbours would make ‘cruel’ comments about their new arrival. ‘They didn’t know how to handle this and received no support for their situation’.

At school, the witness was sad and lonely, even suicidal, because she felt different from her peers - who would tease her. She also suffered from ‘rage’ towards her adoptive mother, blaming her for ‘taking me away from my birthmother’. This witness
started drinking at the age of 12, and 'trying to fill the hole', became an alcoholic. 'Wanting to be loved', she also, in her own words, 'was promiscuous and was taken advantage of a lot'.

She married ‘an abusive man’ at the age of 17, but ran away from him and the marriage after having her third child. She has had therapy and counselling for her problems and has been sober for more than 20 years now, but continues to ask: ‘What’s wrong with me? ‘I think I died the day I left my mother’.

A witness ‘felt compelled’ to come to the Confidential Committee to ‘break down the wall of secrecy’. He was adopted when he was three years of age and explained that even as a child, he suffered ‘feelings of loss, low self-esteem and abandonment, huge lows, feelings of annihilation, and anxiety’ - and confessed that as an adult, even going for a job interview hadn’t caused the level of anxiety he felt coming to the Commission to speak about his childhood.

He put all this sadness and negative feelings down to ‘the lack of nurturing at the start’. He also told the Committee that he broke down in tears when he went back to visit the home in which he was born and saw all the little headstones. ‘I kept thinking they’re dead and I’m not’.

A witness born in the late 1960’s said she discovered she was adopted on the day she was with her mother and brother at a school and overheard a nun asking incredulously: ‘So what you’re telling me is they’re not really brother and sister?’

This is a story about a girl and her brother who were adopted into a family, involved in a schismatic Catholic group with headquarters in another country but with premises in Ireland. ‘They seemed to have adopted me’, the witness said, ‘to purify me from the perspective of their religious ethos’. ‘I was bad blood, and I wasn’t to be like my mother’. This ‘purification’ could be classed as torture and makes for difficult reading as the witness was subjected to severe physical beatings, was starved and then intermittently force-fed: ‘If I vomited I was made eat the vomit. I remember my brother being made eat poo because we were hungry’.

She was tied up, put under the stairs, made ‘kneel on the stairs for a long time seeking forgiveness’ - and her head was scalded ‘with water from a hot kettle’. Although her
brother was hospitalised ‘because of abuse’ and she had been hospitalised for ‘a head injury’ (but not from that scalding, ‘I had all blisters. I have scars on my hands from defending my face. All the abuse was carried out by my mother’.) She remembers ‘eating the pages of books because of anxiety’, she told the Committee, and this was followed by her mouth being ‘washed out with soap’.

Adding to all this, she was sexually abused by her adoptive grandfather - when she was ‘three, four and five years old: ‘I remember the feathered quilt and the smell in the room. I remember pain. I remember not wanting to go up there’. This man, she said, also abused his own daughters ‘and other cousins. My understanding was that we were sent up to him by aunts’.

It is extraordinary, certainly by present day standards, to understand that by this witness’s account, since ‘social workers were involved’ with this family, why she and her brother were not rescued and taken away by them. ‘The government or somebody should have checked if we were alright’, this witness said to the Confidential Committee. This witness attempted suicide when she was 13 or 14 years old - and then, as she grew older, in an attempt to avoid the abuse: ‘I ran away several times. I often slept out in the open, in sheds or behind buildings. When I was 15 or 16 years old, I left one night and never went back’.

The next witness raised the socio-economics of child placements. She was adopted at three months old into ‘an educated professional family’. She questions the motive for transferring children between socio-economic groups and ‘whether there were agendas’ operating here. Speaking of herself, she told the Committee that her life has been ‘profoundly affected’ by ‘her background and start in life’ and ‘all the unanswered questions and uncertainty’ she had to deal with during her early experience.

She has ‘very strong views’ on the obstacles faced by adoptees in attempting to access their own records, emphasising ‘the seriousness of not knowing one’s own story’ and of ‘being treated like a commodity and as different to other people’. She also has a singular perspective on adoption itself: ‘splitting your identity in two, life before adoption and life after, is entirely deceptive and undermines your sense of self. The very idea that you became something better after your adoption is offensive to your birth family’.
Unfortunately, in 1965, the mother of a witness died shortly after giving birth to her in a mother and baby home, having haemorrhaged. The witness was adopted at the age of three months, but didn't know this until she was 11 years old, like other witnesses who came to the Committee. She discovered this 'through talk at school'. She then created a fantasy about her birthmother - that she had been a 'princess'.

Her adoptive mother, she told the Committee was far from the vision of mothers she had created in her head, 'people thought she was my grandmother' and this witness felt very isolated as she had no siblings, cousins or friends, although she loved her adoptive father: 'he was a wonderful man', it is her mother who was 'the disciplinarian'. Nevertheless she does believe she was 'given a good life' and was 'well provided for'. When she had her own children, the effect on her was 'profound' they 'being the first (living) blood relatives I had'.

A small number of witnesses of colour came to the Committee. All spoke of their difficulties while growing up within what was until recently a monocultural population.

This witness was adopted at nine months old. The other daughter in her family would refer to her, using the N-word, she was 'stared at constantly and always felt nobody liked her. She couldn't wait to get away - and did - to the UK, at 17 years of age, where she went to college. She then went on to the USA where she still lives.

But this witness feels rootless: 'I always wanted to be somewhere else, lied about my identity my whole life and still do. I've never been able to say I'm Irish - I don't believe I'm from there'.

Another witness of mixed race said she was adopted from a home at eight months old, to a couple who were 'extremely old, poor, and struggled to put food on the table. The house was in 'poor condition, with water running down the walls'. Her adoptive mother was ill and would regularly spend time in hospital - and in any event, the witness 'did not get on' with her. She believes that she was adopted into such 'an unsuitable' family because 'it was presumed that nobody else would want me'.
This next woman’s adoptive parents were, she told the Committee, ‘substantially’ wealthy, but the mother was ‘emotionally’ and ‘sometimes physically’ abusive. She regards the situation into which she was placed to have been ‘a nightmare scenario’ and cannot understand how anyone could give a child to someone like that - ‘you’d have to be psychologically assessed now. I feel I was sold like a piece of meat’ or ‘bought in a supermarket,’ especially when her mother would make comments such as: ‘You weren’t worth it!

Another witnesses told the Commission about her ‘wonderful’ adoption. Born in a home in the early 1960s, she became the only child of a couple in their late 30s. She was sent to a private school, given dance and piano lessons and ‘could not speak more highly’ of her adoptive parents.

She had ‘one concern’. She had, she said, spent her ‘summer months’ in the town of which both her natural mother and adoptive parents were natives. Her concern was, she told the Committee that ‘I could have ended up marrying my own brother!’

1970s

Social workers featured in a lot accounts from witnesses, some by their absence or lack of action when, according to disillusioned witnesses, action was warranted.

This next story pertains to the 1970s and the witness who came to the Committee saying that her adoptive parents split up when she was two or three years old. Years later, she discovered that her adoptive father had been in a relationship with the social worker who had arranged her adoption and they continued to be together for years after he left her adoptive mother, before marrying another woman. She believes that this affair may have started before she was adopted, and feels that her adoption had been a (vain) attempt to shore up the marriage of her parents. This witness is ‘very angry’ that in her professional capacity, this social worker put her into a family where she had to know personally how ‘unstable’ it was.
About adoption itself, the witness told the Committee (echoing what other adoptees expressed in essence) that ‘you belong to two families but you don’t belong’. She added, ‘it’s only now I’m able to say: ‘I’m adopted’ without my face going blood red’.

The group of professionals who had come to speak to the Committee about the ‘culture of adoption’ in mother and baby homes (see section on adoption and consent) did not confine themselves to that topic but went on to discuss the somewhat depressing situation pertaining to children who were not adopted - and who would never find homes for all kinds of reasons.

They explained to the Committee that as part of a ‘community social work team’ in the late 1970s and early 1980s, in the home they selected for study, there were three separate nurseries, one for new-borns, one for children aged three to six months, and the nursery in the ‘special care building’ where the toddlers were kept. There was also a special room for older toddlers who were considered to have some form of birth defect. They were kept in cots, in their pyjamas, and fed pureed food, despite their ages. (One witness reported to the Committee that she had been in the vicinity of that room on one occasion and had been struck by ‘how quiet’ it had been.)

There was a belief that adopters wanted only perfect children and this group was told in the course of their study, that what was wanted was ‘a child of good progeny’ and that a psychiatrist would come to the special care building ‘to do a report’ if there was ‘a history’ in the child’s family: a ‘report had to be done for the adoptive family before the child could leave’. These workers told the Committee that children were ‘held up’ for a long time for unnecessary reasons, one witness describing it as an ‘archaic practice’ and an ‘unhealthy caring situation, cocooning them in institutions’.

Other observations by these witnesses included:

- one boy with an intellectual disability had his situation ‘worsened’ by the way he was treated in the home.

- The adoption agency would consider ‘the smallest thing’ as making children unfit for adoption, something like a cough or a chest infection. They said they had also noted that the adoption agency doctor would extend their times for ‘absurd’ reasons.

- If they, these workers in social care, did not intervene to have a child adopted, they didn’t know, they said, ‘where the children would have ended up - but were ‘met with resistance’ when they did try to intervene.
Those children of whom they spoke, many of them languishing in that ‘quiet room’ in the mother and baby home, were those who probably never made it through to be able to come to the Committee to tell of their fostering or adoption experience.

This next witness said: ‘I’ve no horror stories, thankfully!’ He had been born, later again than the previous witnesses, in a home and had been adopted at seven months old. He had always known he was an adoptee but apart from experiencing ‘a small level of detachment’, he told the Committee, he was fine with his new situation, although, ‘if you are not with your original family, being adopted affects you to some degree’.

His parents told him in later life, that as an infant when he arrived at his new home, he had a habit of banging his head against his cot, leading them to believe that this had arisen from him having been left alone in the mother and baby home cots (he had been born in one and transferred to another) too long by himself. Overall, though, this witness testified that he had enjoyed a ‘good upbringing in a happy home’.

*When growing up in the USA, into which he had been adopted by a ‘Catholic family’, a young boy fantasised greatly about his birthmother, creating wonderful images in his mind of who she might have been.*

*However, he was completely disillusioned when he discovered a letter from her to his adoptive parents demanding ‘more money’ in exchange for her consent to adopt. Even sadder was that up to then he had been under the impression that he was an orphan. From then on, the witness, said, he felt like he had been ‘sold for silver’.*

*In later life, this witness started to search for his mother, going so far as to appear on a radio station, local to what he believed was her home place. In doing so, he upset the status quo in the locality, with some people professing disquiet about him ‘going public’ with his search, leading him to conclude that ‘there was still a stigma’. Then in going through the files and archives of County Council records and those of Social Services offices, he found himself described*
as ‘illegitimate’ and an ‘inmate’. His mother had died before he found her.

Finally, ending this section with two positive experiences of adoption brought to the Confidential Committee.

In the 1970s, this first witness was adopted by a family where there were five natural siblings. She said she had a ‘very happy’ upbringing and was made aware at an early age that she was adopted. She believes, she told the Committee, that in her home, the fact that she was one of the middle children in terms of age helped to make her feel ‘wanted’.

This second woman, born in a home in the mid-1980s, said she had had an ‘excellent’ experience with a family who fostered her after the three years she had spent in the home, and later adopted her when she was 17 years old. Her birth parents, she told the Committee, were mixed race, from Ireland and Africa. When she was young, she had health issues and she believes that this explains her parents’ delay in changing her status in their home from ‘fostered’ to ‘adopted’ ‘as they wanted to keep her in the health care system for as long as possible’. ‘They always explained about my colour’, she said. ‘I didn’t really have any bad experiences, just the odd comment’.

There was a natural daughter in the family, and the witness became close to her - as she was to her adoptive parents. She has some information about her birthparents but has never traced them: ‘My mum and dad always said they were happy to help if I ever wanted to and I put my name on the Adopted Person’s Register, but I’ve heard nothing. You hear a lot of bad stories so I’m cautious about tracing my mother. I am also curious. I don’t think you can totally prepare for it’ (meeting birth parents). She now has her own apartment and lives close to her adoptive parents and her sister.
Exit and Aftermath

‘Part of me died the day my son was taken. I became a sad, empty shell of a girl’.

‘It was the end of my prison sentence when my Mum took me home’.

1950s

This witness was 13 years old when she was removed from her foster family. Her experiences of boarding out are described earlier in the report.

She was 13 years old when her stepfather, married to her ‘real’ mother in the UK, brought her over there, for the sole purpose, she believes, of abusing her. She became pregnant twice. With the first, she had an abortion, her second child was adopted. (Her birth mother had a further five children with her stepfather and the witness believes she ‘knew what was happening’ to her but ‘did nothing’.)

She spent time in a remand home because, she said, she was regarded as ‘a bad girl’. She told the Committee that her social worker had said to her that ‘if you were a nicer girl I would have got you a job in Marks and Spencer’. This social worker, she said, ‘never asked her who was abusing her’.

She had a second abortion when she was 17 years old - and then she got married so she could get away from her stepfather. That marriage was short-lived. The witness married again and had two children, but this husband was ‘extremely violent’ and she was scared of him. He died at the age of 44. She said that the two children she had with him knew nothing of her early life, for instance about the baby she had put up for adoption, who would have been their half-sibling. Then she met and married a ‘lovely man’. He died of cancer.

‘It’s lovely to talk to you’, she said to the Confidential Committee before leaving the Commission’s premises, ‘because you bury it’.
A woman who had been adopted to the USA came to the Confidential Committee to speak of her search for her roots in Ireland. She was born in a home in 1957, and was adopted to the USA when she was three years of age. She later discovered that after she was born her birth mother went to the USA and was working as a nurse there when 'she met another man', and became pregnant for the second time. She went into labour one night when she was alone and had no phone and no-one to call for help and sadly, that baby died soon after birth. The witness’s mother then developed pneumonia and a short time later, died tragically.

The witness came to Ireland in 1983 to research her history, not knowing that her birthmother was dead. However, her research did bear fruit in the late 1990s when she managed to connect with newly discovered Irish relations, her birthmother’s family; they gave her the information she had wanted, and she is now 'on good terms' with this new family. This witness also discovered during her search that she was a twin - her twin brother having died at birth in the home.

In 1959, a 15 year old became pregnant following a sexual assault by a friend of her father’s. The parents of the witness adopted their granddaughter and brought her up as the witness’s sister, a ruse families frequently employed to head off stigma and parish condemnation. It required adherence to utter secrecy by the parties who knew the full story, including the birthmother. This witness had ‘a nervous breakdown’ when she came back home after giving birth.

Another witness who had also given birth in 1959, when she was 21 years old, did not wish to give her baby up for adoption. She agreed with the nuns that she would temporarily place her daughter in foster care until she could marry the birthfather when their child could then be classified as ‘legitimate’. That marriage took place in 1960. When their daughter was returned to her, this man didn’t want her and consequently, 'ill-treated' both his wife and the baby, so badly that the witness felt she had to give the child back to the foster carers. Despite this, the witness went on to have six more children with this man before he left her to marry again, thereby ‘committing bigamy’. She told the Committee that at the time, she ‘would have married anyone’ to get her child back.

The mother of this next witness had died just before the witness gave birth to her son in a home at the age of 16. She was ‘very unwell’ after the birth. She was in recovery for six weeks, stayed in the home for four years and spent the next nine years in a
laundry, by this time having become ‘so completely institutionalised’ that when she left there, she couldn’t cope with the nursing home job that had been arranged for her and had to return to this laundry. She spent more time there before finally moving to a city.

Soon afterwards, she married and had seven children with her husband; but, she told the Committee, it is not a ‘happy marriage’ because her husband is an alcoholic. They remain together ‘because you have no choice’. She has since traced and met her first son, to find that he had a ‘difficult’ upbringing in state care, and suffers from alcoholism and other health problems. However, she said, ‘he has become close with his half siblings’.

It was also in the 1950s that a 19-year old, due to be married to her boyfriend, discovered she was pregnant when she went to the family doctor for a check-up. Like so many witnesses around that age (and younger but even into their 20s), she too told the Confidential Committee that she’d had no knowledge of the ‘facts of life’.

This doctor called an ambulance right away, which took her to a mother and baby home - her parents were unaware of this and she herself believed she was being taken to hospital. When her fiancé tried to visit her he was not allowed on the premises; it was customary in that home, she said, that ‘when workmen came to the home, the women were locked away’.

The nuns she said, pressured her to have her baby adopted but this woman’s parents stepped up and ‘fought to get me out of the home’ so she could keep her baby and go home. She told the Committee she ‘doesn’t know how they did it’. Despite everything ending well from her perspective, the witness said the home had left ‘an imprint’ on her, and that the whole experience had been ‘very distressing’. She did marry the birthfather and went on to have a further 11 children with him.

A witness, who gave birth to a daughter in 1956, left her child in the home ‘while she got herself set up to look after her in the outside world’ she said. She subsequently had twins, but all three of her children were adopted, without she said, her permission or involvement. (This happened before she met and married her husband. She told him she’d had an accident and could not have children with him.)
She and her husband ended up running a very successful business in the UK and in later years, all three of her children have traced her, and reunited with her first daughter with whom she is ‘in constant touch’.

This next witness had ‘deliberately’ stayed on in the home with her daughter after the child was born, long enough so that her daughter would have learned to walk and be toilet trained, and so in the witness’s view, would be independent and thereby ‘safer’ from ill treatment when the witness had to leave her behind in the home. The plan was that the witness would go out to work ‘so she could make a plan to keep her’.

She put the plan into action while continuing to visit the child in the home but time moved on, and came the day when she was told by the nuns that they could no longer keep her daughter. The subject of adoption came up again at that point but the witness maintained her stance and refused to contemplate it. She ensured she made enough money to pay the home for her daughter’s keep there. She met a man, they married and he went with her to the home to collect her daughter, and then he ‘raised her as his own’.

This couple went on to have seven more children, but as the nuns had always warned her that ‘the sins of the mother will be passed on’, she told the Committee that she had been ‘very strict’ in rearing that first daughter. As a small addendum, she told the Committee that when she and her fiancé told her father they were getting married, his response to her future husband was: ‘You’re a better man than me for wanting to marry her!’

Another witness had thought she would be leaving the home with her baby, but was simply told: ‘You’re leaving today’ and was immediately sent, without him, to a solicitor’s house to be a live-in housemaid. She spent five years there, receiving ‘only a few bob here and there’ to mind the children and do the housework: ‘When I left, I left in the same clothes I arrived in’. She was in such despair about losing her child and her own position in life, she went to the banks of a river and was contemplating throwing herself in, when a man who was fishing nearby saw what was happening and, ‘stopped me’. She ‘ended up’ marrying him, she told the Committee. They had more children, but she had never told him, or them, about her son before, sadly, her husband died.
Her first son traced her and after their first meeting, she opened up about everything to her daughters, and all her children now enjoy a ‘great relationship and ‘it’s all a great relief’. The witness said that when she was attending her own mother’s funeral, she felt there was still a stigma: ‘The priest passed me by, refusing to shake my hand’.

This next witness had her son in 1955 when she was 15 years old. Her father collected her from the home after her son had been ‘taken’ for adoption. He brought the witness straight to her sister’s house where she was ‘hidden away’ until they could organise ‘what should happen next’. Her (married) sister had just had a baby and being near this child gave the witness, she said to the Committee, ‘some comfort’ at the time.

Her father then organised a job for her as an ‘au pair’ for the next year and a half. He then arranged for her to go to the UK to study nursing on a one-way ticket. The memory of that ‘secret son’ went with her into her nursing training and her subsequent marriage. He was in her thoughts when her two other children were born, through her divorce and remarriage. Then in recent years, he traced her. She had to tell her second husband about him. She had always worried about this husband’s reaction should he find out about her first son’s existence - but, to her huge relief, he was ‘very understanding’.

However, she told the Committee, ‘the trauma of leaving home at the age of 15 years and never returning, will never leave me’. She also said that she regrets many things, not least that she kept that secret for so long - especially since her daughter died without knowing that she had a half-brother. Had her son not traced her, she said to the Committee, she would have taken the secret with her ‘to the grave’. Having met him, though, it wasn’t plain sailing for her - she now felt, she said, ‘exposed to the world, my secret was out’. In addition, some of her siblings, never having known of this nephew’s existence, had, in her words, ‘difficulty processing it’. But a ‘strong relationship’ between witness and first son was established and continues.
1960s

A witness who gave birth in a home in the 1960s told the Committee that when she and her daughter left the institution, she went to her family home, while the baby went to live with the witness’s uncle and his wife. But the baby became very ill and was hospitalised. When she recovered, and was discharged: ‘Myself and my mother brought her home on the bus’.

A witness then told the Committee that although she ‘lives a Christian life’ she cannot not go along with the Roman Catholic Church because of her ‘experiences’ of being in a home in 1964. She had eventually traced her daughter but she found that her child, who had been adopted into the USA, had died at the age of 37. The witness has suffered from ‘memory blanks’ and puts this down to ‘forgetting what you can’t handle’.

In 1965 a witness gave birth to a daughter in a home following a ‘very traumatic’ upbringing during which her mother suffered from psychiatric issues and her father was an alcoholic who abused her. On turning 18 years in 1983, this daughter successfully traced the witness and telephoned her. Her daughter had become pregnant and, with her adoptive parents both dead, she was seeking advice from her birthmother. However, they then had no further contact until 20 years later.

Another witness married and had two more children after her exit from a mother and baby home. However, issues developed with her husband because of her continuing unhappiness about the adoption of her baby son and after 20 years, her marriage ended because her husband could (no longer) support her ongoing efforts ‘to challenge the authorities about what had happened to’ her, ‘a battle’, she said, ‘that changed and defined my life’. She remained adamant, she told the Confidential Committee, that she had ‘signed nothing’ and yet her son was taken in 1968. Since then, she said: ‘I have spent my life fighting to expose the wrongs that were done’. She also lost all connections with her family. As for her first son, she did trace him but described their relationship as ‘acrimonious’.

In 1967, when an 18-year old left the mother and baby home, her boyfriend collected her and drove her straight to the institution where the child had been sent to await adoption. The nuns, however, called the Gardaí and they were not allowed to take their child. The witness’s relationship with her mother (who had refused consent to a
marriage with this boyfriend) had broken down so she cut ties there and followed him to the UK, where they did marry and have further children together.

This witness went for counselling after her (estranged) mother died in the early 2000s, but found herself still unable to forgive the lack of family support. She then set about tracing her daughter, with a successful outcome and they corresponded for a year before arranging to meet. However, when that time came, the daughter’s birthfather, ‘shocked’ at this prospect because he had been kept in the dark about the process (he accused the witness of being ‘sly’ she told the Committee) nevertheless went along to this first encounter with his daughter, but while his wife wanted to shout from the rooftops with joy, he remained, she said, ‘very uncomfortable about the situation’. This witness and her daughter, now married with her own children have an ‘ongoing close relationship’ and this daughter has now met her new siblings and they have met her children.

This next witness gave birth to a son in a home in 1968. Her son was adopted. Having left the home, the witness married ‘within a year’, and over the next 20 years, gave birth to six more children. She did tell her husband of her mother and baby home experience, revealing the existence of another child, but at the time, did not tell her children or anyone else, as she was ‘too ashamed’. This marriage ‘broke down’ after those 20 years, but when her son turned 21 years, she and a daughter (who by then knew about her half-brother), made enquiries about finding him, but ‘got nowhere’. The witness renewed the search having attended a lecture about adoption, and it was at about this time she was told that her son was also searching. Their reunion ‘went very well and her son told her that his experience of adoption had been ‘very positive’.

Another witness told the Committee she believed that her son’s adoption papers had been forged. She married some time later and had five more children never telling them about their half-brother - until a work colleague asked one of them: ‘Did your mother ever trace her baby?’ ‘The burden had been lifted’, she said. Her husband was very supportive and the whole family then assisted with the tracing. ‘It worked out’, she said, ‘and they’ve all since met and have a ‘strong relationship’.

Still in the 1960s, an 18-year old gave birth, her baby was adopted, and four years later, she decided to tell everything to the man she was to marry. He was supportive, the marriage went ahead and they had four children. They had
both kept the secret from everyone, including the children they had together.

Her husband died in the 1980s. Years later, just two years before coming to the Confidential Committee, the witness decided that it would have been unfair to keep the secret from her children any longer, and certainly didn’t want them to find out after her own death. She wrote each of the four a letter, having to call on all her courage to do so because she feared they would ostracise her. However, that didn’t happen and, she said, ‘there hasn’t been much discussion about it since’.

A witness, who had had a ‘casual’ encounter with a local in the mid-1960s - she was 19 years old, he was of a similar age - became pregnant. She disclosed this to her parents. They ‘dropped her off’ at the gates of the home, ‘no kiss, no goodbye’.

After giving birth, she told her parents she would not return home if she was forced to put her child up for adoption. Like some other parents in similar circumstances, they agreed that they themselves would adopt her daughter, but with a very serious stipulation - this would happen only if the witness signed her over and never, ever disclosed that she had given birth to her. When speaking to the Committee, the witness was upset because, she said, her daughter had only recently discovered the true story of her birth.

Her own story was that after yielding her daughter to her parents, she had gone to the UK and had met and married a man of foreign origin, who, when she revealed her history, ‘threw her into a puddle’, then ‘abandoned’ her. However, he returned after six months and they had two children together - but the marriage did break up and the witness went on to have a further two children with a new partner, whom she described as ‘a diamond’. ‘God will never forgive me for what I’ve done’, this witness said.

This witness, aged 21 years in the early 1960s, had been with her baby son in a mother and baby home for ‘approximately a year and a half’ when a nun approached her with her son in her arms. ‘He’s being taken’, she said, and was gone. The witness now lives outside Ireland. Her ‘natural’ daughter has traced her half-sibling. He is living in Ireland, is mentally ill and addicted to alcohol.
Another mother said, ‘it was cruel to have had him in the home with you for fifteen months, and then have him taken away’. She realised she had no choice but to give up her son for adoption. Having done so, she was transferred to a laundry directly from the home. ‘Just told this was happening and being given a false name. It was a live-in, unpaid job’. Her son, she said, ‘could not walk properly because he had been kept in a playpen for too long’, and her main memories of the home were: ‘Fear of the nuns, the control they had over you, depression, loneliness, sadness’. In later life she traced her son and discovered that his adoptive parents had sent money to the home for many years after he had been given to them. ‘You feel your baby was sold and you were there working for nothing’. ‘I still get the creeps when I see a nun in uniform’.

It was 1964 when the next witness, 23 years old, gave birth to a son in a home. She was very soon sent ‘with her baby and three nuns’ to an agency to hand him over for adoption. Immediately after she came home, she met her boyfriend, the birthfather, who apologised to her ‘for the way he had acted’ and asked her to marry him. She said she would if they could get their baby back - and contacted the priest who had organised the adoption. However, this priest she said, told her that her son was already gone (failing to tell her she had more time to consider her options before she signed the final papers.) She signed her consent.

The pair did marry and had four more children together. However, the husband died and it was then that the witness began the process of tracing her son - discovering that when he was a teenager, he had emigrated, with his adoptive family to Australia. Birthmother and son corresponded via ‘letter and phone over a period of five or six years’ until, she told the Committee that tragically, her son had died.

When this next witness’s husband died, she discovered she had been living in a ‘bigamous’ marriage. She had had four children with him. As for her own backstory, her mother had died when she was just 16 years old, her father, who had died more than 20 years before she came to the Committee, had abused her sexually and had been ‘brutally violent’. When her father found out she was pregnant, he gave her what she termed ‘the hiding of her life’ and forbade her to be seen outside before going on to sign adoption papers on her behalf. She has since traced the son she had had in a mother and baby home but as things stood when she was speaking to the Committee, he had not wished to meet her.
A witness came to give evidence to the Confidential Committee detailing her ‘very traumatic upbringing’, including sexual abuse by her father. With her siblings, she had been taken into state care for a period. She gave birth to her baby, a daughter, who went for adoption from the home in 1965.

Having left the home she began a new relationship and had a son who also went for adoption. In 1975, she told the Committee, she married again and had four more children.

Her first and second children, half-siblings, contacted each other and then contacted her and, both aware of the history of abuse within their mother’s family, needed jointly to ask her if she would take a DNA test because they were anxious, they said, to confirm whether they are the children of their grandfather, or not.

While still in the home, this next witness had been threatened by her family that she would be ‘put out on the road’ if she didn’t sign adoption papers for her son; she did sign and was then told that her child was going to the USA. She married a year later and went on to have seven children with her husband within the next nine years. Then her husband died and six of her children were placed in institutional care in the 1980s.

In later years, a social worker worked on her behalf to trace her first son but came back to her with the news that not only had he not been adopted to the USA but that he had been adopted to a family living near where she herself had lived; unfortunately, he had died in an accident seven years before the search had started. The witness told the Committee that she has ‘blanked out’ a lot of what has happened to her, but sometimes, she said, ‘the memories come flooding back’. What’s more, she has had the opportunity to read a medico-legal report on herself. It diagnosed her, she said, as ‘suffering from suicidal tendencies and nightmares’.

In 1990, 25 years after leaving the home, a witness told how she received an astonishing telephone call from the nuns there to come back, as there was ‘news’ for her. On getting there, she was ‘utterly shocked’. Her daughter, equally
shocked, was there too. Neither had been told in advance of the other’s presence.

‘Things initially went well despite the shock’ the witness told the Committee, but the relationship did break down and during the 15 years prior to the witness’s interview mother and daughter had not been in contact. On her part, the witness said, she ‘doesn’t feel she has the right to interfere in her daughter’s life’.

The next witness was 16 years of age when she fell pregnant, and late at night was brought to a home by her father in a taxi. While there, she was told by the nuns that her grandfather had died and one of them gave her £1 ‘to get the bus home’. When she got to the house, it was in darkness and there was no-one there (her father was in the UK) but she locked herself in, afraid to turn on the lights in case ‘people’ figured out that she had returned home. She now fully intended to stay there and never to go back to the home.

When her father arrived home, he agreed to let her stay and later, when it became clear that birth was imminent, drove her to a hospital. (He wanted to adopt the baby but the witness refused to give her up.) She married a local man but did not tell him about her daughter, allowing him to believe that the baby was her sister. The couple went on to have four children, with the witness working locally, and relying on the St Vincent de Paul for help. The daughter of this witness was 15 years old when she discovered that the man she thought of as her father, was not her father.

This next witness moved to the UK having giving birth to a son in a home. The birthfather of this woman’s child was a man from another country with whom she had been in a relationship. She left, she told the Committee, because she ‘couldn’t cope with life in Ireland’.

In the UK, she had ‘a shotgun wedding’, as she described it, with another man and gave birth to their child, another son. This man, she discovered, was violent, and fearing he would murder her, she left the marriage. She then married again and had a third son, but in later years, her husband, who had come to the UK from abroad, returned to his country of origin. She didn’t go with him, she told the Committee, because by then she had grandchildren and wanted to remain ‘close’ to them.
In the meantime, the son who had been born in the home (and still lived in Ireland) traced her and she came across to meet him here. However, she said: ‘Too much, too soon’ he moved to the UK and went to live with another of her sons. He was drinking heavily at the time and, she told the Committee, ‘he had a lot of issues’ although ‘while he was very angry, I was very happy’. This son has now married in the UK (his wife telephoned the witness to apologise for his past behaviour) and he has spent time with the witness. ‘He is now’ she said, ‘a different person’.

It was the late 1960s when this next witness had her baby in a home, where, she said, her treatment was ‘fine, overall’. She always knew her child would be adopted because neither she nor her family had the means to raise her. She married 15 years later and had two further children; her husband, she told the Committee, knew about this first daughter. Reflecting on her experience in a mother and baby home, she said that ‘the hardest part was ‘not knowing where her daughter was and if she was safe’. Because of this, throughout her marriage and motherhood, she ‘has found it difficult to be emotionally close to them’, fearing all the time that ‘someone would come and take them’.

At the time she got pregnant, she said, she had ‘no option’ but to go into the home: ‘No-one else would look after you’. Her first daughter traced her and they met for the first time just a year before the witness came for interview; her main reaction to the reunion, she said to the Committee, was ‘relief’ - on two counts: firstly, that her daughter was safe, and secondly that she had ‘got on well in her adoptive home’.

Next is a witness who had been fostered and who told the Committee that in 1961, she had been raped by ‘an older man’ and became pregnant. She had been ‘delighted’ she said, when her foster mother came to the home to take both her and her child back home. Within days, however, she was being ‘completely ostracised’ by this foster mother who was ‘increasingly unhappy’ with the situation. The nuns called her back into the home together with her daughter, telling the witness she was ‘being selfish’ - asking her what kind of life she could offer her daughter?’, and after some months of resistance, the witness agreed to her child’s adoption.

Afterwards, she went to the UK to stay with an aunt, married soon after, and had two more children, but said ‘there was no love in it’. (Her husband had told her, she said, that if she had kept her baby, he ‘would have had nothing to do with her’.) That
marriage broke down and she married again, this time with a ‘supportive’ husband and at the time of her interview, they had been together for more than 40 years.

1970s

In the mid-1970s a witness suffered from such severe depression, after her experiences in a mother and baby home from which her son was adopted, that she had been unable to leave her house for many years. The burden grew heavier when she learned that for those years, her son’s adoptive parents had sent photographs of him to her via the mother and baby home’s address. They were never forwarded.

It was also in the mid-1970s when a woman who was 26 years old and pregnant having suffered a rape, gave birth to a daughter in a home. The two met in later life and while they had ‘difficulties’ over the years, are on good terms now, the witness told the Committee. Part of the problem between them was that for many years, her daughter believed that the witness had given her up for adoption because she was of mixed race.

It took a long time to complete this birthmother’s tracing of this daughter because ‘the adoption agency was not helpful, and put ‘a barrier between her and her daughter’ while also advising her that the process ‘would take a long time’. She discovered, however, that both she and her daughter had been trying simultaneously to trace each other and, she told the Committee, ‘are now on good terms’.

Another mother who gave birth in the early 1970s had no option but to allow her child to be adopted. Almost immediately after leaving the home, she told the Committee, she became addicted to alcohol. She began the search for her child in the year 2000, but discovered he had taken his own life in 1994.

As for herself, having married an ‘abusive and violent’ man, she divorced him - and while she subsequently had a long-term relationship, is now single and living with ‘her dogs and
cats’. She came to the Committee to tell her story, she said, because: ‘Not everything has a happy ending’.

‘Two or three’ days after giving birth, also in the mid-1970s, this next witness signed a consent to have her baby adopted: ‘It was dictated to me what to write. I didn’t have a clue what I was signing’. She never married or wanted to, ‘for someone to have control over me; I could never give myself to anyone’. ‘They made sure that one way or another, you would be punished’.

Meanwhile, a group running a homeless shelter arranged with a mother and baby home to take in a 17-year old woman who became pregnant in the mid-1970s. She and her siblings had spent most of their childhoods in care. This witness kept her son despite ‘constant’ pressure from the nuns to go the adoption route. She took him to live with her for 18 months in a squat, married the birthfather and had five more boys with him. But, she told the Committee, she had developed an eating disorder because of the small amounts of food she received when in care and during her stay in the home, and now struggles to control her weight being fearful she will ‘run out of food’.

During her pregnancies, she was ‘afraid to let the public nurse into the house’, worried that her children would be ‘taken’. She has lost contact with the first son she fought so hard to keep, because he was taking drugs and has become, she told the Committee, a dealer.

In the late 1970s, having given birth in a home another witness said that, without knowing what she was signing, at 17 years of age, she consigned her baby son into the care system. She had two later children with the birthfather, ‘a very violent man’ who during one attack broke both her eye sockets, her nose, jaw and elbow.

She left him after that attack, living for a year in ‘safe houses’, then went on to have two further children with a second partner but that relationship did not last. Because of ‘severe depression and anxiety’ she told the Committee, she ‘cannot work’; and revealed to it that she has ‘attempted suicide in the past’.
This next witness and her sisters were all sexually abused by their father over a period of years. The witness reported her father to the Gardaí, but then had to leave home before his release from prison as she ‘knew he would kill her’.

She went to live in a Laundry, never reintegrated with her family, but became pregnant in the 1970s when she was 18 years old and living with a married man who spent half the week with her and half with his wife. She eventually had six children with him and was in a mother and baby home on three occasions, her first baby dying shortly after birth. She never saw this infant, but did see the ‘orange-coloured onion box’ in which her child was buried.

Of those six children, one had died, her twins (who suffered from intellectual disabilities) had been adopted, and the witness was rearing the remaining three. (They, however, she told the Committee are also lost to her in a way: ‘They now live in a city and are on drugs’). The adoptive father of the twins ‘died young’ and their adoptive mother remarried. When the witness went to meet this mother and her new husband, she said that the husband ‘sexually assaulted her and asked her to take the twins for a month’. She ‘could not cope with this’, she said, and ‘hasn’t seen anyone in that family since’.

_Prison features in the account of this next witness’s journey through her life. In the 1960s, she was 15 years old when she suffered a sexual assault and became pregnant. Her parents went to the Gardaí but the perpetrator spent only one night in prison and then her family, who had adopted their grandchild and were raising her as their own daughter, took this man to court, suing for maintenance. Years later, the witness sought ‘justice’ for her daughter by trying to have her included in her birthfather’s will; but she was advised that her daughter had no rights since she had been legally adopted - but a financial settlement was, however, reached._

This witness had her first child in a mother and baby home in 1970, but acquiesced to the demands that she should consent to adoption and gave up her child. She married in 1979 and had three more children with her husband, who, she said, was ‘physically abusive’ (he ended up going to jail at one stage, she said, because ‘he had to go out robbing to support his family’, but he left the marriage, and has since been with a new
partner.) The witness also told the Committee that one of her daughters has ‘health issues’ and she believes that this represents ‘some kind of retribution’ for her having given up her first baby.

Another witness said that at the onset of labour, she took a bus to a maternity hospital as she was afraid that should she give birth in the mother and baby home, ‘my baby would be taken away from me’. After giving birth, she and the baby went to live with her boyfriend’s mother. They later married and he was violent to her. She said that she had sex again with her husband ‘only because she wanted a companion for her first child and didn’t want her to grow up alone;’ she had not had sex since then, finding the thought of it ‘repulsive’.

She got a ‘decent job’, additionally working weekends in bars and restaurants to save for a mortgage; and with those savings and some help from her family, managed to buy her house. However, she became an alcoholic and suffered from mental health issues, at one point spending a year and a half in a psychiatric hospital. Her daughter became a single mother when she was 18 years old. Her son began taking drugs when he was 13 years old. He is now a heroin addict and has served two ‘lengthy terms of imprisonment,’ incarcerated for the first time when he was 18 years old.

‘If I had a dream’, she said to the Committee, ‘it would be just me, my daughter and my granddaughter living together. I hate men. I am always waiting for something bad to happen. All my life I never had help from anyone, anytime I would go looking for help it wouldn’t be there’.

After giving birth to their child in a home in the middle of the 1970s, this mother initially made every effort to avoid contact with the birthfather ‘because he was violent and aggressive’, but did go on to marry him and they had three more children together. When he died five years later, she confided to the Committee that ‘it was a release and everything calmed down’. She got a job in a local factory, spent time at home rearing her children, and now minds her grandchildren.

Another witness, who gave birth in a home during the 1970s, told the Committee that a priest, ‘in his 30s’ sexually abused her ‘regularly - multiple times’, there, saying to her: ‘it doesn’t matter because you’re already pregnant. You do this and I’ll pray for your soul’. She exonerated ‘an older chaplain, who was not abusive’, but when she left the home this younger one traced her. He called to the house, then drove the witness and
a friend of hers to a bar. She told the Committee that ‘he tried to get rid of’ her friend:
‘But we went to the bathroom and escaped’.

‘I’m angry’, she told the Committee, ‘I’m angry at how the people that wore the cross of
Jesus described us when they’re supposed to have love in their hearts for everything
and everybody. I’m angry at what they done to other girls, took away their babies, how
they made you feel. I’m angry at the Catholic church’.

• ‘My boyfriend moved away with his entire family’ (when this witness’s
pregnancy was discovered.)
• ‘My mother said if she found any photos of the baby she would burn them’.
• ‘To this day I can’t pick up a baby. I might contaminate them. I was a
leper’.

This next mother, who became pregnant, at the age of 17 in the early 1970s, was told
that her baby son had gone for adoption. Having left the home, she re-connected with
the birthfather, figuring that this was the only way to have her child returned to her.
She had two more children with him.

She herself had been fostered from the age of seven years old and had been abused
and raped by her foster father. Maltreatment continued within her marriage with her
husband ‘severely’ beating her and all three children (including a one-year old) in its
course. Her two eldest children, she told the Committee, do not speak to her now
because of the physical abuse they suffered, because they continue to believe she
allowed it to happen. Her search for her first child concluded when she discovered ‘he
had been in the home the whole time’.

Another witness from this decade married the father of her ‘home baby’ (without
revealing to him that he was the father) - she told the Committee that she had gone on
to have five more children with him and because of what had happened to her during
her first birth, she had ‘dreaded’ each labour. She said she then noticed how much
better she had been treated in general during these later births and that there had also
been an improvement in the levels of medical care provided.

Another woman told the Committee that she finds it too upsetting ‘even to think back to
that time in the home; she had bonded with her baby for three months before she had
to ‘hand him over’. She did marry and have other children - but both birthmother and
adopted son had begun searching for each other for many years, until (not long before the witness came for interview) they were reunited. Their relationship, said the witness, ‘has gone from strength to strength’, the only drawback being her husband’s ‘reluctance to engage, so ‘I have to hide when meeting my son’.

A 16-year old girl gave birth in a home in the mid-1970s and after she left, married a man who beat her, broke her nose and caused her to have two stillborn babies. He was violent with his children, attacked the witness on the street outside their house and during the marriage, raped her repeatedly. She then went with another man who also treated her badly. But when she came to the Committee, she said she had been with a ‘nice’ partner for four years.

With her baby set for adoption in the early 1980s, a 17-year old girl was made to feel she had ‘blackened’ the family name. ‘My sister tortured me, was pure nasty’ and as an escape, she began to drink heavily: ‘People don’t act in a self-destructive manner for no reason’. She suffered from PTSD and depression for 10 years and had ‘a number of breakdowns - everything I had ever repressed just exploded’.

Also in the early 1980s, a 17-year old girl who had her baby in a home was forced by her mother to have the baby adopted. This witness and her boyfriend had been together since they were 10 years old, ‘really loved each other’ and had wanted to keep their baby. But a short time after the baby was given away, the witness’s mother began ‘attempting suicide in different ways.’ The witness found her ‘with her head in the oven, with slit wrists, having taking overdoses’.

Her mother did die by suicide two years after the baby was adopted and it was only then that the witness discovered that her mother had been in a Magdalen laundry when she was younger and believes this may have been the cause of all this distress, especially why her mother had reacted so badly to the witness’s pregnancy.

Some quotes taken from the testimonies of witnesses:

• ‘I had a panic attack when I decided to sleep with my partner for the first time; it brought back memories of a previous rape’. ‘At that time they didn’t call it ‘rape’.
• ‘The adoption process knocked my confidence; I lived on anti-depressants’.

• ‘The people I knew fell away’.

• ‘I had a back-street abortion because I couldn't face going through it again. I wanted to ask the Pope for forgiveness’.

• ‘You will get over losing a man but you won’t get over losing a child’.

• ‘The social worker said I had the choice of running away with my child ‘or else we’ll take the child off you’. (From a witness who was living with her child’s violent birthfather.)

• ‘I’ve grieved the loss of my family, even though they’re not dead’.

• ‘I was given away by my mother so I wasn’t going to give my baby away’.

The next witness, who was engaged to be married, had her baby at home in 1970 and they were both taken to a mother and baby home. However, she suffered a post-partum haemorrhage, and had to go to hospital for transfusions and was then taken to a nursing home. All she was told about her son was that he had been ‘taken’ - she had no idea where. Her father did not speak to her for a year after she had her baby because she had ‘let down the family’, her boyfriend/ fiancé would not resile from his position that he was not the birthfather, so clearly she was not bound for marriage. However, she did marry in 1974 ‘to take away the stigma’ and went on to have children. She is now divorced.

‘Looking for her son’ she told the Committee, ‘took over her life’. She found herself for instance, buying newspapers to check if any child had died so she could try and figure out if it could be him. She traced him eventually, met him in 2002 and although her ex-boyfriend ‘to this day’ does not accept his paternity, ‘meeting her son has given her peace of mind. She has a good ongoing relationship with him and is glad to know he’s had a good upbringing and a good life’.

In a home with her baby in 1970, this next witness was told that her son ‘was the devil’s child and would die’ - and then ‘they took him away’. Having left the home, she decided to go to England to look for him (someone had told her that was where he had been sent) but during a medical examination it was discovered she was again pregnant. She went back to the home and gave birth to another son. She did meet
the first son but many, many years later. He had 'problems with alcohol' and they do not have much contact now. Her second son does not want to see her.

A witness told the Committee that she is still in contact with a nun who was 'very kind' to her when she was 'kicked out' of home and sent to a laundry. She married and divorced and said that her 'past was used against her' during the proceedings.

The next witness had a daughter in a home in 1973 who was adopted to the USA. The witness later took a nursing job abroad where she met her husband; she told him straight away about her backstory and how she could never have more children because of her deep fear of them being taken away from her. He was very understanding and they adopted a son.

Back home, the mother of the witness spotted an ad in the local paper; it had been taken out by the daughter she had given up and who was now searching for her. They met together with the daughter’s adoptive family but the witness commented to the Committee that ‘once the tie is severed, there’s no going back’ and in any case, she said, ‘the relationship with her daughter is strained - in relation to her adopted son’.

Another witness told the Committee that she wanted to keep her baby but whose parents would not allow it ‘because of the neighbours’. She too went on to be a nurse for 35 years. She had another child in 1990, this one she kept and reared. Her adopted daughter traced her in 2015 and they have remained ‘close’ ever since.

A witness who had been 15 years old when having her child, said that she had just simply ‘handed him over’ to be adopted, without any real understanding of what she was doing. Her parents had placed her in a laundry when she was 12 years old, because she had been ‘wild and unmanageable’ at home. A year after she had left the home, she was raped while living on the streets and, falling pregnant again, returned to the home, determined this time to keep her child.

She and her six-month old son went to live with an uncle for a time but he sexually abused her and would ‘lock her into her room’. She escaped from him and within ‘another couple of years’ had met another (older) man and had two more children with him. But he too, it turned out, was abusive and the relationship ended. The witness began to suffer from mental health difficulties and then fell into alcoholism - but at the time she spoke to the Confidential Committee had been sober for several years. She
has not sought to trace her first son as she feels it is for him to find her. She has a strained relationship with her second one, while continuing to ‘feel worthless’ and to ‘struggle with day to day life’.

To reward her daughter (in advance, before her new baby was adopted) the mother of this next witness gave her the gift of a bracelet ‘for being a good girl’ when all she wanted ‘was her baby back’. Her sister, meanwhile, revealed to her that she too had had a baby ‘secretly’ in the UK but had had the child adopted there, advising the witness that she should ‘just move on and forget about it’. Her father did make enquiries about keeping the child but was told ‘she was settled with a new family’.

Her mother increased the pressure on the witness to send her child for adoption but the witness was adamant this would not happen. She told the Committee, when the nuns in the home saw she was not for turning, they accepted her decision and were ‘helpful’, supplying her with what she might need for the baby. The accommodation she had secured for herself and her daughter didn’t work out and she ended up in a squat before eventually moving back home. Her mother would not let her stay, however, as yet another sister had now had a baby and this mother would not deal with more than one child in her house.

A witness who fell pregnant at 22 when she had been ‘seeing’ an older man since she was 16 years old, said that when she broke the news to her mother and father their initial response was wanting her to ‘get rid of the baby’. When she returned home after the birth, a nun from the home where her son had been born sent her a picture of him.

The witness told the Committee that when her mother saw this picture, she was ‘over the moon’; when her father saw it, he said he ‘wanted the child home’. These parents ended up adopting her son and while the witness said that ‘at the start’ she was affected by ‘the whole experience’ she got to the stage where she would ‘always tell people about her son and never made a secret of it’.

From that same year of 1978, a witness, who at 20 years old gave birth in a home, had to face into ‘years of counselling’ because ‘I had done what I was told by allowing the
decision to have my child adopted made for me by others, including my family. It was taken out of my hands even before I entered the home. It was done and there was no discussion about it. After her daughter was born, she went back to work ‘as though nothing had happened’ and for 20 years never spoke about it, refusing to discuss it even with her brother on the one occasion he tried to. She also ‘disengaged’, she told the Committee, even from ‘friends she had made while in the home as they were just a reminder of that time’.

Unfortunately, she became an alcoholic, although managing to function, but at one stage, was ‘called aside’ at work, joined a support organisation and in sobriety began to consider tracing her daughter. They have now met but the witness commented that she feels ‘very much on the edge’ of her daughter’s life. This witness never went on to marry, and believes that her experience ‘impacted on relationships I’ve had since’. She does accept that while adoption was the only option at the time, she continues to ‘feel strongly’ about the decision being made without her involvement.

As an interesting aside to this story, the witness had been working in a state body when she became pregnant and on confiding in her supervisor, the latter (who, she said was ‘very supportive’) arranged for her to be certified as absent from work ‘on sick leave’ so she would not have ‘unmarried mother’ entered on her personnel file.

This next witness struggled with addictions to alcohol and other substances. Her first child was adopted immediately after she gave birth to him in 1979, at 16 years old. In 1981 she had a son with the same birthfather, and it was he who also fathered her third child, this one, a daughter, after the couple married in 1984. Tragically this third child died after ‘a misdiagnosis and receiving the incorrect medication’ and the witness commented to the Committee that having giving birth to three children, she now had only one. She said looking back, that leaving her first son in the hospital, was in many ways worse than the death of her daughter, as ‘there was no closure in it’.

Yet another witness told the Committee that she too has ‘struggled with alcoholism to block things out’. The daughter she gave up for adoption - now divorced - has refused to let the witness see her grandchildren, informing her that she has to ‘earn the right to see them’. This witness has also ‘lost some friends ‘because my parents had warned them to stay away’ - but she does acknowledge that her parents have been ‘very good to her daughter and treated her very well’.
After this next witness gave birth at 16 years of age, her baby daughter was put up for adoption by the witness's family - who were, she said to the Committee, ‘dysfunctional, acrimonious and violent’. Back at home, without her baby, she said, she was ‘a total mess and suffering from post-natal depression’. Her mother did send her to the doctor, but was terrified she would reveal ‘the secret’. From the doctor’s surgery, the girl was referred on to a psychiatric hospital and she confided what had happened to her to the doctors there, but on learning this, her mother took her out of the place and she was beaten.

About a year later she met someone else, became pregnant again, the birthfather vanished again, and again her mother brought her to the home, where she was admitted as ‘a second offender’. She gave birth and yielded to pressure to give up this baby too. She married at 21 years of age and went on to have nine miscarriages - which led to ‘severe’ problems in the marriage, she told the Committee, ‘and a separation from her husband’. She attributes her gynaecological problems to (mis)management of her second birth.

Meanwhile, in later years having been ‘given the run-around’ when trying to trace her two adopted daughters, she hired a private investigator who found both within ‘a couple of weeks’. Sadly, one has died since, following ‘an overdose’, but she has ‘a good relationship’ with the other one.

1980s

_The stigma attached to being a single mother, ‘when it is said that no-one would want you, a seed of doubt is sown and it stays with you’. This is from a witness who gave birth in a home in 1981, kept her daughter, brought her to the UK with her and worked there, before moving back to Ireland._

_Thinking back to her time in the home, she now accepts that while she wanted to get out of there as soon as she entered it, ‘there were some women there who did not have any choice and were ‘relieved’ that someone was taking the baby_.
This next witness ‘fought and fought and fought’ to keep her baby to whom she gave birth in 1982 at 17 years old. Then with the help of her father who had visited her one day, she achieved her goal. ‘Only for him’, she believes - ‘the baby would have been taken’. Her father continued to support her in keeping her child, but, she told the Committee, once home, ‘the attention I got from people wasn’t good - at Mass the priest wouldn’t give me Communion’.

‘You’d think it was someway enlightened in the 1980s, but it wasn’t’ - this from a witness who nonetheless accepted that while there was a (slightly discernible) change in society’s view of ‘fallen’ women, it was hit and miss.

Having given birth in 1981 when she was 20 years old, this woman had come under pressure to have her daughter adopted but had insisted that this was not to happen, although she had been worrying about how she would manage, not least financially. When she did get home, however, she found that her ‘welfare cheques’ had been sent there in error and had mounted to £450: ‘This was a lifeline and meant I could keep my daughter’.

When she moved to a city with her daughter, a neighbour gave her details of part-time work and ‘a friend would watch the child’ while she was out. As for family, however, she told the Committee that when she and the baby went to visit the family home from time to time, her father would come to collect them from the train station but would throw his coat over the baby’s head to hide her.

Despite going on to have a rewarding professional career in the UK, the next witness confessed to the Committee that she still ‘feels bad’ about having her baby adopted, and having given in to the ‘secrecy’ insisted on by her family - who, when she was leaving for her new life, told her not to come back. ‘I hadn’t robbed, stolen or murdered, I just made a stupid mistake’, but, she said, I still battle with ‘shame’ and ‘guilt’ and ‘proving that I wasn’t just some stupid young girl who got pregnant’.

She has made ongoing attempts to reunite with her daughter but the response to date has been painful because up to the time she spoke to the Committee, her daughter had not wanted to meet her.

‘Running all the time and cannot settle’ is how this woman, who at the age of 18, gave birth to a boy, whom she had named and had baptised, before he was ‘taken’, described her life. Four months later, she, her sister and her sister’s husband went to
take him back to the family home, but the witness then had ‘rows and arguments’ with her parents who were trying to force her to marry the birthfather. In the end, they adopted the little boy, raising him as the brother of the witness and it wasn’t until later years that he discovered the truth.

This witness had three more children by three different men, but none of these relationships worked out and she is single now. Her relationship with her three children is ‘difficult’ and she feels she has ‘struggled all her life’ on her own.

‘I lost my mother 30 years ago’, said this witness who became pregnant when she was 15 years old. Her mother was very concerned about ‘what the neighbours would think’, she said but eventually, influenced by the witness’s father, gave in and allowed mother and baby to come home. The relationship between them has ‘remained difficult’.

With both parents deceased, another 15-year old went to stay with an aunt having given birth to a son in 1986 - but this aunt had five children already so she moved back to the family home, living with her baby in a mobile home in its back garden. Despite her age and lack of family support, she said to the Committee, she had no official visitors checking up on her.

She went on to have another child by another man and he too, like the birthfather of her son, vanished on hearing the pregnancy news. She has since married and is happy, worked when her two children were young, went back to education when she was 35 years old, got a diploma, and continues to work. ‘Everything is in the past now but I think how easily things could have turned out differently and I would not have my son’.

‘It was the outside world that made things difficult’ said a witness who at 17 years of age, became pregnant and had a daughter in a home. On learning she was in a home, her father was supportive, came to fetch her and bring her home.

But the witness herself wanted to stay a bit longer as she needed the help of the nuns, being unable to face the ‘shame’ on the outside. Her father tried to console her, telling her she was ‘to keep the baby and not to worry about it’. Contrary to what the Committee heard from some witnesses, she said
that ‘the nuns in the home were ‘very nice’ about her wanting to keep her baby and even gave her ‘some items’ to take with her.

On the contrary, though, she reported that on discovering that she was keeping her daughter, her social worker ‘didn’t want anything more to do with her’.

This next witness became pregnant while in university, never told her boyfriend - and in any case, the relationship had no future; he was of a different religion and her family would not have tolerated a union. The decision about the adoption of her child (a son, born in 1983) was taken out of her hands. She told the Committee she had been ‘profoundly affected’ by the whole experience, did not have sex for 16 years and went on to suffer multiple problems - with alcohol, with severe depression, and not least with anorexia.

Seeking help, she did contact the home where she had been confined but the nuns referred her to the priest who had attended her there; they spoke at length about her distress and when she was leaving him, he embraced her, told her she was ‘beautiful’ and attempted to kiss her.

‘Everything kicked off’ when this next witness had her second child, having given birth to the first in a mother and baby home in 1985. This second child, she said, was ‘gorgeous’ but she could not cope and had to seek counselling. She eventually traced and met her son in 2014, but saw herself as ‘a kind of aunt figure’ in his life. She is ‘very appreciative and thankful’ to anyone who has loved and cared for him over the years, in particular his adoptive family.

On the advice of social workers, a birthmother placed her baby son (born in 1987) in foster care while she ‘got her head straight’. She continued to visit her son, ‘but he didn’t know who I was. It broke my heart’. Recognising that he was bonding with his foster family, she took him back, went into a home with him, remaining there for two years while she attended college. (During this period she would make occasional visits back home to her family but ‘had to hide upstairs’.)

She and her son were given council housing but ‘it was in a very rough area - where it was made clear I wasn’t wanted’. They left and stayed with various friends for a while until she got housed again when her son was three years old. She did ‘odd jobs’ while
being back in college to complete a degree; she later secured a ‘good’ job and moved to the UK.

She told the Committee that social workers had exerted considerable pressure on her to have her son adopted, telling her ‘she had nothing to offer him’; her father, too, insisted she give him up, saying he would pay for her education if she did, but would ‘cut her off financially’ if she didn’t. He kept his promise, she kept her son. She has never married or had other children and believes this is as a result of what she has been through. She still feels she has been stigmatised, not helped by her son having been diagnosed with ADHD, undetected while he was in school, and his teachers attributing his behaviour to her ‘being a single mother and unable to cope’.

This next witness was raped by a friend of her boyfriend and became pregnant when she was 24 years old and living abroad. Her boyfriend was not supportive - and neither was her family ‘who put a lot of shame and stigma’ on her and gave her the message repeatedly that she was ‘not fit to be a mother’. Her relationship with them, ‘forever fractured’, she went into a home where she gave birth to a son in 1989.

Having been led to believe that she could still get her baby back despite signing papers, she agreed to have him fostered. While initially she visited him in his foster home, she ‘hardly recognised him’, and ‘began to feel that she was intruding on the foster family’. She went back to University, married in 2000 and had other children but told the Committee she could never enjoy her pregnancies because of her earlier experience.

Contact has been made with her son, she told the Committee, but their reunion ‘has turned her life upside down;' her siblings are unhappy with her for bringing ‘it’ all back up, believing she was putting their mother ‘in a bad light', and as for her son, he has struggled with his mental health, blames the witness, and is resentful of her other children. She now believes, she said, that ‘adoption is as irrevocable as death’.

When she was 16 years old, a witness’s desire to keep her baby was thwarted, she said. She went into a home to have her baby. This was in 1989 when, as other witnesses noted during this decade, circumstances and attitudes did seem (slowly) to be changing, yet, she told the Committee she was given ‘no option to keep my baby, or offered any choices’ in
the matter. Her experience, she said, had ‘impacted and affected every aspect’ of her life and has left ‘an indelible mark’.

Despite returning to school and having been a very good student, she became ‘of no use. I couldn’t concentrate’. She dropped out of college and married at the age of 22, because she said, she was looking for security and ‘someone to love me’. Her husband has been a huge support to her, but in her view, she has never ‘fulfilled her potential in her career’. To enable later tracing, she remained in constant contact with social workers throughout; she and her daughter have since met and have a ‘strong relationship’. She remains ‘very aggrieved’ she said, that she was not offered any counselling at the time she was pregnant and giving birth at such a young age. ‘Everything was in the best interests of the child but they forgot that I was a child too’. ‘At that time I would have to justify why I would want to keep my child, now you would have to explain why you would give your child away’.

1990s

A mother told the Committee about what happened to her in the early part of the 1990s. She had been in two homes and spoke about the aftermath of her birth to twins, and her relationship with the children’s father, who was of foreign origin. She was 26 years old and the birthfather was living abroad. When she discovered she was pregnant, went to visit him to discuss the matter. He wanted her to have an abortion and although reluctant to do that, she did agree to attend a gynaecologist. When making the appointment, however, she discovered that he had already made it. He was a priest, a member of a religious order and not long ordained. She said he had spoken to her about ‘possibly’ leaving the priesthood but she told the Committee that she will never forgive herself for getting involved with him: ‘I have lived with the shame and guilt about doing such a naïve and stupid thing. I knew this was controversial’.
Back in Ireland after that visit to him, she moved into a mother and baby home to wait out her pregnancy and contrary to the descriptions given by so many women and girls of the conditions they suffered in earlier decades, she described this home as ‘a haven and a sanctuary’ where she ‘never felt she was being judged’, but was ‘cared for as a pregnant woman in crisis’. ‘I’m glad I managed to find it, I had to do the footwork myself’.

She gave birth to twins and afterwards, their birthfather regularly came to visit her and their children while she remained in the home. However, she told the Committee, ‘he raped me’. She said, ‘he also threatened to circumcise the children with a breadknife’. She stopped him from having access to the children, but he went to court and got an Order for Supervised Access and she moved with the babies to a different home, one offering her an individual flatlet.

However, pressure to have her children adopted was again coming from her family, who had always wanted her to take the adoption route because of the stigma not just the witness herself but them too. When her pregnancy became known, she had to leave her home town. She ‘might’, she said to the Committee, ‘get a visit from family members once a year. ‘I was on my own’. She worked part-time for several years but found - and still finds, she said - that it is ‘very difficult’ to make ends meet. Initially, she had had enough money to buy ‘cots and clothes’ for her children, funded by her weekly Unmarried Mothers’ Allowance, along with the extra £50 a week she had been granted by the birthfather’s Order. When she came to give evidence to the Committee, she told it she was now ‘on the dole’.

This next witness, at 21 years of age, had a daughter in 1994. She came from ‘a very middle class area’ but one where the neighbours ‘staunchly disapproved’ of her pregnancy. Her mother had died after a long illness, her boyfriend had disappeared and when she told her father he was gone and she would not be marrying him, he would not allow her to stay in the family home.

He, she told the Confidential Committee, then told her younger siblings to ‘toughen up and forget about’ her, which, she said, ‘they did’. She also told the Committee that during the following six years, when she and her daughter were living in ‘charitable’ housing, her siblings were ‘bought houses and given credit cards’ by her father. She told the Committee that this is something about which she is ‘extremely bitter to this day’. She realised that she could not raise her daughter in that environment so her
father gave her enough money to buy a house in a very remote part of a rural county, where they lived a ‘very isolated existence’ and where the little girl experienced ‘difficulties and bullying’ in school because of her background.

They stuck it out for a further six years, then the witness sold the house and moved back to a city, where she again took up work (she had always worked but it was always ‘low-income’ employment, so she had found it very difficult to get off social welfare.) At the time of her interview with the Confidential Committee, she and her daughter were living in ‘a garden flat’ in her father’s house and she said that her daughter now ‘feels the stigma of having been born to a single mother’. As for her father, she believes he now feels guilty.

In 1996, an 18 year old woman had ‘just started college when she became pregnant. She thought at the time that she would be supported by her parents, but such support was not forthcoming - their expectation was that this baby, when it was born, was for immediate adoption - but that, the witness said, ‘was not going to happen’. She secured help from a social worker, went her own way and stuck it out with her son.

There was a breakthrough, however, when eventually her family invited her to come home for Christmas. Some contact resumed although she still had to support herself and her son. She secured accommodation for nine years, returned to college and then got a job. Her relationship with her mother was ‘adversely effected’ but her mother now has a relationship with the witness’s son and the witness sees this as ‘an indication of her mother’s ‘regret’ about the way she treated her.

A quote from yet another witness of this period: ‘The priest asked (the witness’s future husband) ‘are you sure you know her? Do you know she had a baby and gave her up?’

Or this one: ‘I remember having this chubby little guy, I used to call him Jumbo, and he was mine and I used to feed him, change him and then one day he was done up like a Christmas tree and he disappeared’.

‘Thank God for the UK’, said a witness, one of those who had left Ireland for ‘across the water’ shortly after leaving the mother and baby home, having given birth there at the age of 17. She has had two 15-year marriages, and yet felt she should tell the Confidential Committee that her experience in a mother and baby home still causes
her ‘grief and despair. Everything that happened in Ireland I've been surviving’, she said, ‘the pain lasted for years and I've been left with emotional scars for which there is no relief’. ‘I still carry the 17-year old with me’.

In describing their lives after leaving the mother and baby home many women who came to the committee spoke of difficulties in later life. Even those who had married and had other children disclosed that they had suffered from deep feelings of isolation, lack of self-worth and loneliness as well as shame and anger.
Tracing

Witnesses came to the Committee to tell of their experiences in mother and baby homes and afterwards - but also felt it necessary to round off their narratives with the story of how they got on with tracing. For a good proportion of these seekers, unfortunately, even when the search was successful, it was too late. For others, a birthmother, when found, was still suffering from feelings of ‘shame and blame’ and had not revealed their secret to their husbands or natural children and were fearful of doing so. As for the birthmothers, some deeply yearned to contact their lost children but some had worked so hard to move on from what had been deep trauma, when a son or daughter came calling, they simply did not want to know.

‘A social worker was assigned to me and I got a phone call saying that my parents had been found, but my father was dead, then I was told he was alive, then I was told he was dead again’.

‘Every place I tried to look for information, I got no response - Irish Government, nuns, adoption agency…’ this was a statement from a witness adopted into America in the early 1960s and who began to trace her birthmother when she was 18 years old.

The Committee did encounter a few who, having successfully traced birth families, subsequently rued not paying attention to the adage: ‘be careful what you wish for’.

Take this witness, born in the late 1960s into a home and then, with her six siblings, was raised in care. When her tracing of these siblings was successful: ‘They were not at all what I had been expecting, and I wish now I’d never found them’ she said to the Confidential Committee, adding that she had been ‘horrified by the appearance of some of my brothers’ and now has ‘no real relationship’ with any of them.

On the other side of the equation, some of the children born in mother and baby homes and subsequently fostered or adopted, searched for their birthmothers, only to be, in their view, hindered, not just by the officialdom of those early years, but by the lingering sense of stigma felt by these mothers who did not want to be traced. Some mothers, having ‘moved on’, simply did not want to be discovered. Some children never discovered the identities of their birth parents at all.
‘I was the skeleton in the cupboard’, one witness said to the Committee who had found documents in his foster parents’ home, some of which contained his birthmother’s name, enabling him to start the search. He did make contact with some of his extended family ‘but they were not forthcoming with information’. He also discovered that his grandfather had ‘provided for him’ in his will, but he had never been told of this...

A woman, born in 1942 and later transferred to a home with her mother, was later brought up in state care, but also worked in a Magdalen laundry. She began trying to trace her mother when she was getting married, as she wanted to source any medical records available for when she had children. She began her tracing by going back to the home, but with no tangible success, although she was told by one of the nuns: ‘You look like your mother!’

At one stage, this witness had been told there that her mother had been a prostitute and ‘was now deceased’. She didn’t believe this but continued her search by using a specialist agency and eventually, was told that her mother was living in a certain suburb; but she had spotted the actual address on her birthmother’s file. She went there ‘without prior notice’ discovering that while her mother had lived at that address for 61 years, she had just recently died. When she did get the records, she told the Committee that they were in ‘an appalling state, with a lot of information either scribbled out or incorrect’.

A man, born in a home and later boarded out to foster care, told the Committee that he began to search for his files in 1963, but was ‘denied them’ until he finally got them in 2014 through his solicitor; they contained all the information he needed. A year later in 2015, he discovered that he had had a sister born in the same home, who had died when she was 10 months old. (The totality of what those files revealed about her is that she died of ‘convulsions’.) He has not been able to source information about where she might be buried; and he continues to harbour the suspicion that she had been adopted and may even be still alive.

This next witness, another male, came to the Confidential Committee to tell it that he had grown up in state and foster care until he ran away at 16 years of age. He ‘always wanted to know about (his) mother’, and he did manage to get her birth certificate and using the details on it, did get to trace her ‘30 years ago’. They met and she told him she had married his birthfather - but had never told him about the witness. During that
meeting, she made the witness ‘swear not to tell any other relatives’ while she was still living. Before this meeting took place, the witness’s birthfather had died, unaware of his son’s existence. When his mother died, the witness did not get to attend her funeral as he only heard that she had died when the funeral was already over.

A witness born in a home in the late 1950s began to trace his mother in 1995 but when he contacted the agency that had handled his adoption, was told ‘you’re in a queue’. This agency finally handed over his birthmother’s address in 1997, but also told him that she had died. He became very angry, stating for the benefit of the Confidential Committee that his mother ‘had never moved house’ and that he believes this agency ‘waited until she was dead’ before telling him that they knew where she was. He described the Catholic Church and the Irish system as an ‘abusive, sinister mafia’.

Similarly, another male witness whose search for his birthmother had been successful (‘I brought her flowers and photos. We went for dinner’) was told by her that she had had another baby with the witness’s birthfather five years earlier, and in the same home. That baby, he was told, had died. He had obtained certificates of birth and death for this child ‘but I don’t believe it’. He told the Committee that ‘he has lived with the hope of finding his sibling but his biggest fear is that ‘he was one of the babies buried without any proper records. I don’t believe that certificate we got. I think the child was taken and sold by the church. I’m convinced there was something’.

A witness born in a mother and baby home, (like her mother before her), told the Committee, she was constantly asking: ‘Where’s my mummy?’ and as soon as she finished school, went to the home where she had been born, knocked on the door and asked to speak ‘to the head nun’. ‘They slammed the door in my face’. She went to the home again, ‘four or five times’ seeking information, ‘but they were very rude to me’.

Then a social worker found someone who was also searching for the witness’s mother - he turned out to be the witness’s half-brother and together, they traced their mother to an address in the UK. When the witness asked her birthmother: ‘Would you like me to stay in touch with you?’ The ‘very cold’ answer was: ‘I’d rather not’.

_A witness told the Committee that she ‘occasionally’ looks at photographs on Facebook of her half-brothers and sisters ‘who do not know of my existence’. As a child, she had been_
told that her parents had been killed in a car accident and it 'came as a total shock to her to discover she had been born in a mother and baby home'. Her adoptive mother, she found out, had gone to the home seeking information on her behalf but was reminded by a nun that (during the adoption process) she had taken a vow never to trace the child's natural mother.

The witness did manage to get her file from the home 'but it was heavily redacted'. However, by going through records and phone books she did trace both of her parents, their addresses and families. She and her birthmother had three phone conversations, she said, during which she learned that the pregnancy had resulted from a rape by the witness's father. During all three calls, she added, her mother had been 'courteous' but finally told the witness that she was not interested in a face-to-face meeting or in establishing a relationship.

A birthmother, who had given birth to a son in a home in the early 1950s, decided to trace him when she was 70 years of age - starting with agencies and Government departments where she found 'reluctance' to help her. On contacting the home in 2004 in search of information about him, she was 'abruptly' informed that he had died.

She had kept her home informed of her current address in case he had wished to contact her. She (later) found out:

- that her son had travelled from America to find her and had been told by these nuns that ‘they couldn't help him’, with one nun telling him that his mother had ‘abandoned’ him when he was two weeks old and that ‘her whereabouts were unknown’.

- that he had paid these nuns ‘a large sum of money’ to have his ashes buried in the grounds of this home in case his mother came looking for him; the witness was not told this by the nuns on either occasion she had been in the home seeking information.

- that his adoptive parents had also paid a sum of money to the home in connection with his adoption and ‘made annual donations’.
When this next witness, born in a home and then adopted in the mid-1960s, began to trace her mother, she encountered the kind of delays and barriers frequently mentioned by other witnesses bound on the same mission. In addition, she was critical of a social worker ‘who behaved as though the witness was causing her mother ‘great distress’ because of this search, and told the Confidential Committee that this social worker had failed to pass on letters she had written to her mother - which she felt was ‘cruel’ - as was the fact that she wasn’t told ‘for two months’ that her mother ‘had responded’. However, this one ended well. The witness was reunited with her mother and said she gets on ‘wonderfully’ with her, and with her half-siblings.

Another witness described how her mother was ‘very angry’ at being found. She complained to the witness that ‘she had been guaranteed secrecy and didn’t want to go back to revisit the past’.

Sometime later, however, the witness told the Committee, her mother did make contact and they had a couple of ‘pleasant’ meetings - but these have now ceased because her mother was moving in with (another) daughter and said ‘she would find it very hard to keep the secret’.

Having been raped and made pregnant by her foster father and put into a home to give birth in the early 1960s, this next witness relayed another story relating to a social worker, who, she said served as social worker for both herself and the son to whom she gave birth - ‘assigned’ to both throughout their lives. ‘She never connected us’, the witness told the Committee.

As an adult, this witness, trying to trace his birthmother, approached the mother and baby home in which he had been born also in the early 1960s, but, he told the Committee. ‘They showed me only a copy book that showed she had paid in full while she was in the home’.

In 2002, another witness (born in a home in the mid-1960s) began the process of tracing her birthmother and was given the relevant telephone number to call by an agency. Having left messages on an answering machine for several months, she was then contacted by a nun ‘who was extremely rude and unhelpful’. As a result, she
‘stopped tracing efforts for a year’ then resumed, contacting the original agency and explaining what had previously happened with that nun.

From then on, with agency personnel making the contacts on her behalf, she told the Committee that she was ‘bombarded with information and family involvement’, discovering, for instance, that nine years before she discovered her birthmother’s identity, she had died from contracting Hepatitis C from contaminated blood products. But she did meet her mother’s sister before she too died.

_This next witness was advised by the same agency as the one above, and ‘made sure’ that the file they had on her included her wish that should her son approach it while he was trying to find her, he should be given ‘full assistance’. _

_But later, she learned from her son himself that when he did come to Ireland from the US to trace her, he had gone to the home where he was born and was told by a priest who lived nearby that she had died. _

_On returning to the US and in conversation with an Irish couple he knew, he mentioned what had happened. They advised him not to believe this priest but to contact the agency directly. He took the advice and from both his own and his birthmother’s points of view, got terrific results, which meant that they were put in touch with each other and the witness flew to the US to meet him. He collected her from the airport and they went for a walk on the beach together and later on, she spent a six-week holiday there with him. She told the Committee that this agency had been of ‘great assistance’ in helping with this successful reunion. _

To get her birth certificate, a witness had to go to a solicitor to ‘swear an affidavit’ that she would not contact her birthmother unless it was through a named agency. Personnel there, however, informed her that this agency’s responsibility was towards the mother. ‘It failed to recognise’, the witness said to the Committee, ‘that they also had a responsibility towards the child’.
This agency did, she said, 'send a letter' to the witness's mother on her behalf. (She herself was simultaneously tracing, she said ‘for the sake of her own children’ in order that ‘they can know their lineage’.) But in contrast to the successful tracing outcome for the last witness, this witness’s mother phoned the agency to say she didn’t want any further contact.

‘Files are there one day and not the next. The agency through which I was adopted no longer existed. I got documents and details in a piecemeal fashion’, - this witness faced many barriers in trying to locate her birthmother. One of the nuns mentioned in her file had ‘no memory’ of the witness when the witness contacted her. Of mixed race and born in the 1960s, she had been adopted and came to the Committee to talk about her experiences, particularly about her belief that while she could agree with the right of a birthmother to privacy, her own right to information about herself should be in balance with that; ‘at the very least I should have a right to access medical information so I can pass it on to my children’.

The trace was ultimately successful, but, sadly, the meeting with her mother was not: ‘she was hostile and had not wanted to be found;’ and she described her mother to the Committee as ‘cagey’ and ‘wanting to know what I wanted…’ Sometime later her birthmother’s other daughter contacted her to tell her to ‘cease associations as it was too upsetting’. The witness complied.

This man’s adoptive parents ‘had pretended’ they were his adoptive sister’s birth parents and had written their names on her birth certificate ‘to try and camouflage the whole thing’. The tracing process took between five and six years and, the witness told the Committee, ‘there was no paper trail’, but his birthmother was found; what helped, he said was that ‘the social worker had disclosed information. He wrote his mother ‘a very straightforward letter’. I said things had happened in the past and things were different now… ‘She wrote back’, he told the Committee, with ‘a very sorrowful letter’. However, he wrote again, telling her that her letter was the best Christmas present I ever got!

When they did meet, in a hotel in 2011, he discovered his birth parents had married and that he had three sisters - information that his adoptive mother had never passed on to him. His mother also told him she’d had to have him adopted because of ‘social shame’ but had been unable to talk about her time in the mother and baby home because ‘she is totally traumatised by it. Whatever the wall of secrecy - she can’t deal
with it’. He now meets with her on a regular basis and they talk on the phone every week or two. They go to the theatre together and he has visited her at Christmas.

This next woman was born into a home in the early 1970s, was adopted and had ‘always’ wanted to meet her birthmother. Fate took a hand in the process when, unexpectedly, she got a letter from one of the nuns in the home where her mother gave birth to her. The letter said, as follows:

Your mother wants to meet you but it wouldn't be a good idea as she is profoundly retarded. She lives in sheltered accommodation and a carer lives with her.

This nun continued by telling the witness that her birthmother had also given birth to a baby boy and had drowned him in a bath. Don’t give her your address, the letter concluded, she'll be pestering you for the rest of your life and you'll have to look after her and she never looked after you.

The witness ignored the advice and wrote to her mother. They ‘exchanged letters for about a year’, then they met, whereupon the witness found: Her mother was not retarded. She was not living in sheltered accommodation with a carer. She was living with her partner. The baby boy had not been drowned in a bath but had died of a kidney disease. The witness’s mother died a year and a half after they met.

A witness, trying to find his mother, commenced formal tracing in 2006 and discovered, through the Adopted Persons Register that he had a brother. He said to the Committee that he has issues about how this register works: ‘If I hadn’t contacted them to see if there were any hits, I wouldn’t have been told about my brother. I am very grateful to the person that pieced it together. I was told that the register is not designed for siblings to meet. People should know that’.

When she turned 18 years, this adoptee, born in a home in the mid-1970s discovered during her efforts at tracing that her birthmother had herself been born ‘out of wedlock’ and placed in state care until she was 17 years old. This witness found her attempts to access her files and her own birth certificate to be ‘a very negative experience’. She was told by a relevant authority that it would take three years before she would be
allocated a social worker, but was given ‘non-identifying details’ on the proviso that she ‘would not undertake any private investigations’. Then she was given ‘a blank A4 sheet out of a printer’ to this effect and signed it.

In continuing her efforts, she met a nun who had known her mother; this nun told her that her mother had ‘gone to live in Germany and had a happy life’. However, when she did obtain the files she found that this account was at odds with what was written in them. In addition, she became angry about the way these notes about her mother had been written - citing, for example, ‘the suggestion that as a teenager, her mother had been ‘man mad’.

To continue her quest, this witness had to ‘go before a board of people’ which she found ‘traumatising, it was numerous social workers versus me’, during which she was told that her own file was ‘very traumatic’. Plus, she said to the Committee, she was told she would be ‘allowed’ to have her original birth certificate only if they could ‘ensure that she was sound of mind’. This witness never met her birthmother. She discovered that two of her siblings had died when they were babies but no-one can tell her where they are buried. She has been met with ‘a wall of silence’ she said, and ‘there are no hospital records’.

This next witness, whose child was adopted in the mid-1980s, spent time in a home before giving birth to a daughter. She began the tracing of her child quite early on but at the time of coming to speak to the Confidential Committee, has yet to meet her. At the outset, a social worker told her that she had: ‘no entitlement’ to meet her daughter; that ‘her daughter would not like her’, that ‘making contact could take years’, and that she had ‘no rights’. Despite all this, however, to the witness’s delight, a meeting was eventually arranged - but her daughter ‘cancelled at the last minute’, writing to the witness that she was ‘not ready’. They kept in contact by letter for a while, but that ‘petered away’.

The witness then discovered that her letters to her daughter were being ‘scanned for appropriateness’ before being passed on by the adoption agency. ‘We had to vet them’, was the word used when she found out that the letters not deemed to be ‘appropriate’, had not been sent on. She was told she was ‘heaping’ too much on her daughter. She was ‘distraught’, about all of this, she told the Committee, because her letters had ‘explained everything’. ‘I had been obsessed for almost 30 years’, she said, ‘but in the past year I’ve let it go. For myself, I had to get over it, what will be will be’.
Coming immediately after the last story, this one is a counterbalance. Just as the experience of the woman above illustrated the wish of a mother who had been separated from her child to re-connect, this man’s story also illustrates the wish of a child to know his mother, not just that but the desire to know who he is: ‘You couldn’t know where you were going if you didn’t know where you came from’. Walking down the street, he said to the Committee, ‘he would think: Any one of these people could be related to me’.

Born in the early 1980s and then adopted, this witness began to trace his mother when he was in his 20s, acknowledging that his adoptive parents were ‘very supportive’ of the endeavour. He, unlike some others, also said that he had found the agency he went to ‘very helpful’, although he did add: ‘I can imagine, if I couldn’t get information, how frustrating that would be! The not knowing’.

The process, he said, had been explained to him, along with the possibility of a time delay: ‘It’s not a simple process where you can just open records’. He was lucky, his mother had registered soon after he had turned 18 years of age and a match was soon found. But after this success, he said to the Committee that he ‘had been hoping for a deal that would include time to settle and register what was happening’ and that happened, with letters and photographs exchanged until, finally, he and his mother started to phone each other.

They met at the agency premises. He found this first meeting ‘very natural’ and described his mother as ‘warm’ but said he still struggles with the notion of her being only 16 years old when she became pregnant with him: ‘I can’t get it out of my head that she was so young’.

He had worried, initially, that by conducting the search for his birthmother, his actions could be perceived as him ‘not considering myself as part of my adoptive family, but I’m not looking for another mother’. He said, speaking about his own sense of relief: ‘I never felt I had a bloodline, that was a hurdle I had to cross. Meeting my mother helped, otherwise I had felt I was floating’, adding the experience meant he could call the place where he lived, ‘home’.

His birth and adoptive mothers have met each other and he greatly appreciates that the former ‘doesn’t have a sense of entitlement to meet me. She handed me over in
good faith that my adoptive mother is now my mother. ‘It was a healing process for her, I think, she would die a sad woman if she’d never met me’.

Laden on top of this very positive experience, though, was the meeting he had later with his birthfather, facilitated by his birthmother. They met in 2012, when the witness discovered, sadly, that his father suffers from depression and addiction. He also went on to meet his half-brother, ‘also difficult’, he said, because up to then, this half-brother had had no idea about the witness’s existence. He keeps contact, however, with this newly discovered birth family, feeling that he has a ‘moral duty’ to those who had given birth to him.

Having given birth to her in a home, a witness gave her daughter for adoption in the late 1980s and later made contact with her through the adoption agency. The contact began as was customary, with an exchange of letters and photographs. When they met, they discovered that the witness’s daughter had been in the same class in school as her cousins; and that the gift brought by the witness to give to her daughter to mark their first meeting, had been purchased in the shop where her child’s adoptive mother worked.

In some cases, having successfully traced each other, a mother and the child she had given for adoption did not, or could not, maintain their relationship. At nine years old, this witness’s daughter wrote to her through a social worker, leading to an exchange of cards and gifts. They met in 2008 and kept contact for a while - but then her daughter moved abroad and following a visit home in 2016, cut all ties on a don’t call me, I’ll call you basis. ‘I have loved this child for 35 years’, said the witness to the Confidential Committee: ‘It was like getting your heart broken all over again’.

‘He sat in my kitchen so many times and lied to me’, a witness said of a priest who had told her that the family who had adopted her daughter had emigrated to the US. They hadn’t, and having successfully traced this daughter, they haven’t yet met. The witness told the Committee that quite separately, her daughter’s adoptive brother, having also been traced, had held ‘an unsuccessful meeting’ with his birthmother and she believes that this has engendered wariness in her daughter about meeting her. At
the time of telling her story to the Committee, this mother and daughter were ‘exchanging Christmas and birthday cards’.

This next mother, bent on tracing her adopted son, told the Committee that the nuns she approached looking for information, wanted to ‘interview’ her first. ‘I had to play a game and be a good girl’ to get information on my child. It took everything in me not to slam the nun against the wall!’

Before a birth mother traced her child she said that: ‘the only life I could give her was a life undisturbed…’ The witness said that her attempts to trace her daughter had been frustrated by letters not being passed on and she had gave up. But later, this daughter (who had waited, until after her adoptive mother had died) reversed the process and traced her. Mother and daughter found each other and are now ‘strongly bonded’ and meeting regularly: ‘I was very aware when she came to meet me, she didn’t know me from Adam, and I’d loved her all my life’.

This next witness featured in an earlier section when she came to the Committee to tell of her fostering with an elderly couple during which she endured a life of ‘extreme’ abuse. When she was 35 years old she met her mother once again, her siblings too and went on to write a book about her childhood and experiences. ‘But’, she told the Committee, her siblings were not happy about this book. Her parents, she also discovered, had married after the witness’s birth (and had gone on to have nine more children.)

This next witness was adopted to the USA in 1951 and ever since her early 20s has been trying to trace her records, as her adoptive parents had destroyed any records they held. In 2013, the witness undertook tracing research when on a visit to Ireland and went to the home in which her birthmother had been born and was given access to her birth records by the nuns there. However, when she returned to Ireland in 2015 and again went to the home, she found that the files they had been holding were now missing a ‘significant number of documents’ and when she enquired as to where they were, she told the Committee that ‘the nun avoided answering her questions’.

This next witness overcame all the obstacles thrown in his tracing path using determination, persistence, and the odd white lie. He was taken to a home, with his mother, having been born in 1949 and was later fostered at four and a half, having also spent a year and a half in another home. This witness told the Committee that he
‘always had had concerns about his identity’. As soon as his own son was born, he felt ‘compelled’ to begin the process of tracing his birthmother. He managed to get his ‘long form’ birth certificate in 2001, but it took a further year to find his baptismal cert. He then decided he would ‘put things off due to the stigma attached to it all’.

He took up the search again in 2011 and following fruitless enquiries with various organisations, was eventually allocated a social worker, who began the process of liaising with the relevant bodies. During this process, he said to the Committee, he was ‘asked a lot of questions that would discourage you from trying to trace’ but was determined to keep going, and did - and in time, arrangements were made for him to meet his seven half-siblings, none of whom had known anything at all about him, nor he about them. He also discovered that the documents he was getting ‘contained specific inaccuracies’ which, he believes, were deliberate attempts ‘to frustrate tracing, and’ he said, ‘he had had to lie’ to access his own records. In 2012, his social worker organised a meeting with his birthmother, who, up to then, had continued to protest that she was not his mother. ‘However’, he said, ‘the minute they met, she admitted to everything’, which was a ‘huge relief’ to him - and now they have an ‘ongoing close relationship’.

When this next witness, born in a home in 1956, turned 21 years of age, her adoptive parents passed on to her all the information they had been given about her background when they adopted her. This triggered a desire to trace her birth parents and her husband said he would help her; he had heard a radio programme about a specialist agency in this field and had noted its details. It transpired, though, when they started the process, that her adoptive parents had been ‘lied to’ about her background, with the nuns giving them ‘incorrect information’, so when the witness got her birth cert, she was shocked to discover she had been searching in the wrong geographical area.

By the early 1990s, she had been assigned a new social worker who was successful in tracing a niece of the witness. This niece revealed the whereabouts of the witness’s mother and in due time, this mother contacted the agency. When they met, the witness discovered that the information about her birthfather had also been incorrect, this, she figured, was because of his ethnicity, reasoning that his background could have (in the opinion of the nuns at the time), hindered her prospects of adoption. As the years passed, the witness eventually met everyone in her extended family and continues to have a ‘strong’ relationship with her mother.
The Committee heard from a witness who went to a social worker and was given one of two files held, while informing her that despite previously having been told that her mother had died in childbirth, she was alive. This social worker then left the other file open so that the witness could read a letter that her mother had written to her, telling her ‘how heartbroken she had been to leave her’ and how ‘she hoped that she (the witness) was happy’. In 1991/92 this witness wrote to her birthmother via the social worker but in her reply, her mother said ‘she would rather die’ than have her husband find out about the witness’s existence.

Time can work in your favour and this happened for this witness. Later, she discovered that her birthmother’s husband had died and initiated contact by phoning her to sympathise. She also managed to contact her half-siblings through internet searches. In consequence of all this, ‘a family gathering’ was organised for ‘all to meet stateside’ her mother and family live in the USA. The witness has now been ‘welcomed into this family’.

‘Maybe you make decisions at significant moments in your life’, said a woman who had been born in a home in 1957 - and who had decided to start her tracing journey just after her 40th birthday. The tracing worked but the relationship stuttered after a few ‘pleasant’ meetings’ because of the witness’s birthmother’s ‘obsession with secrecy’.

The tracing experience was equally fraught for this next witness, born in a home in 1959 and whose upbringing with her adoptive parents was ‘very traumatic’, to the extent that she ended up in a Magdalen laundry at the age of 14. Her initial attempts to trace her birth family via contacts with the nuns in the home, went nowhere, and it was a priest who ended up arranging for her to meet her birthmother. This mother had divulged that she and the birthfather of the witness had married; they had had six more children together, none knowing of the witness’s existence.

The news did break within the birth family and the witness told the Committee that she ‘had been blamed for the breach of secrecy’, despite her insistence that she had not been the one to perpetrate this; in any case, the entire family rejected her. She was now, she said, in ‘complete estrangement’ from her family. To rub salt into the wound, she went on to discover that she had, unknowingly, grown up living very close to this birth family. She said that (other than from that priest who had made the first contact)
she had had ‘total lack of support’ around it and feels that ‘some form of counselling’ might have helped the situation, because, ‘the difficulties persist’, she said.

They persist too in the situation involving a witness who, born in a home in 1961, ‘had always wanted to trace and meet’ her birthmother and to that end, contacted the nun who had been involved in arranging her adoption. This nun had remained in ‘good’ contact with her adoptive family. It was she who, like the witness above, along with a priest who was a friend of the birthmother’s family, organised the first meeting between the witness and her birthmother.

However, the birthmother did not show up, explaining later that since she had not told her family about the witness, due to ‘other family commitments’ at the time of the meeting, she had been ‘unable to get away’. The witness told the Committee that she had been ‘extremely upset’ by this no-show as it had made her feel that she was being ‘rejected all over again’.

A further meeting was arranged, this time in the birthmother’s family home, but it was less than satisfactory. The witness was disappointed to find her birthmother asking her to pose as her cousin, ‘should any of the family return home’. It was a short meeting’, she said, adding that while her birthmother, ‘did seem eager to keep in touch’, the witness herself soon became ‘heavily involved’ in caring for her adoptive mother and thereby lost contact, although she did speak with her half-brother over the phone. They had not yet met as of the time of her interview with the Committee. As for her birthmother: ‘We just weren’t meant to be, in this life’.

Secrecy is a feature of this next story too. This witness (born in a home in 1962) was 45 years old when he first met his birthmother after a ‘couple of attempts’ to trace her, rendered ‘difficult’ because he had no birth certificate. After that first meeting, he told the Confidential Committee, they met again but ‘only three or four times’, and there hasn’t been any contact ‘in many years’.

The authorities cannot be blamed in this case because it is the witness himself who has broken contact. His own children, he said, were unaware he had been adopted, and he wanted to keep that from them, feeling it is still ‘a taboo subject’ and he doesn’t want to burden them with any stress, such as that he experienced, growing up. ‘I’ll take this to the grave with me’, he said to the Committee, ‘not to shatter their lives’.
Born in 1963 in state care, the witness gave birth to a son in a home. When she made contact with him for the first time many years later, she discovered that he had had a difficult life with an adoptive mother who was an alcoholic, and had received only a ‘poor’ education. Her son was suspicious of her motives in contacting him, she told the Committee, believing she could be looking for organ donation.

This witness was born in the UK in 1959, but later spent time with his mother in a mother and baby home in Ireland in 1965, from where he was taken to be raised in state and foster care. He told the Committee that she had wanted to keep him with his two younger brothers, but alleges that all three were ‘wrongly removed’ from her through a Court petition claiming she was ‘an addict’. (He said she did suffer from alcoholism but only after her children had been removed from her and she had moved back to the UK.) When he was eight years old, he was told she had died. His birthfather was from a distant country.

This witness said that he has ‘always’ been seeking to find information about his background. When he sought records from the home in 1980, he was told that all records had been ‘lost or destroyed’. However, he told the Committee, when a TV company became interested in covering his search, its researchers had managed, in a short space of time, to access more information than he had in 30 years. Contact was eventually made with his stepfather’s family in the UK, and he learned that this stepfather had attempted to have him and his two brothers brought back to the UK, but that the application had been ‘denied by the authorities’.

A witness, born in a home in 1965, told the Committee that he ‘lost 23 years’ when his birthmother could have been in (his) life’, but she wasn’t. To find her, he had gone back to the home seeking records and information but was told they ‘had nothing’. It wasn’t until he became ‘very ill,’ that a social worker was able to trace his mother and they finally met in 1999. She has since died. However, he said to the Committee, he was ‘hidden even in death, not acknowledged at her funeral’.

This next woman had a son in a home in 1966. She told the Confidential Committee that she had ‘always’ wanted to find him but felt for many years that ‘because (she) had signed a piece of paper saying (she) would never look for him, was
bound by that’. Notwithstanding, she had ‘left messages for him’ all over adoption boards. When she knew he had turned 18 years of age, she registered with an adoption agency saying she wanted to meet him. This adoption agency turned out to be the same agency he registered with when in his 30s, saying he wanted to meet her. They were not matched.

The son then found his mother on Facebook and sent her a message - but the witness didn’t notice the message for over a year. She then replied to his message but for some reason, he couldn’t receive it. They were eventually matched through this adoption agency, had their first meeting there, and thereafter, continued to meet privately, their relationship going ‘from strength to strength’. ‘The only drawback’, she said to the Committee, was that her husband ‘refuses to discuss the matter’ so ‘I have to hide our meetings from him’.

Another witness who had her son in a home in 1967 began to trace him in the year 2000. When, as so many others had found, she was thwarted in her searches and requests for files and information, she went to an Irish minister and also to ‘some other politicians’. In 2013, she rang the relevant state agency, again requested her files, and was told ‘it would take eight years’. She then went to the European Parliament to speak about her experience.

Along the way, she had been told by a social worker that ‘all the files were in a shed’ (in a named village) and that ‘there could be vermin eating through the boxes’ and that in any case, ‘they didn’t have the resources to go through the files’.

For the next six months, the witness told the Committee, she phoned this social worker’s office ‘every Tuesday and Thursday’ looking for her records - and kept calling until a match was found. It was only then she discovered that in parallel, her son had been battling for nine years with another, bigger, state entity to get his files. ‘They have an incredible knack of keeping you apart for as long as possible’, this mother said. Files found on all sides, the witness and her son then wrote to each other for about six weeks, ‘exchanging information’ before finally meeting later that year of 2013. They have an ongoing relationship.
A witness who was born in a home in 1968 and who had ‘a very happy adoption’, came
to the Committee outlining a very different experience. Having contacted a register in
the pursuit of her medical information because one of her children was having ‘health
issues’, she was ‘overwhelmed’ with the amount of information she was given by a
nun, who had asked her to come and talk to her because she would be ‘closing all the
files’.

When they met, the witness discovered that her birthmother had died very recently.
This nun then proceeding to relay all the background information in the files, (despite
the witness having requested only what was relevant medically to help her child.) The
witness, who clearly hadn’t known very much about her mother’s background, found
the depth and detail of what she was being told ‘overwhelming and inappropriate’ with
everything she had been told previously about her own identity ‘changed within
minutes’.

The social worker, contacting her afterwards to find out how she had got on, was
‘shocked’ to hear about the way she had been given all this information. This social
worker then instantly assigned a (dedicated) social worker to help her. She told the
Committee that she has been ‘deeply affected’ by the whole process, and ‘the more
she delves into the past, the uglier it gets’.

Once she started tracing her son (she gave birth to him in a home in 1970) this next
mother didn’t have too much difficulty with the tracing process itself, but once she and
her son met, she found it tricky to negotiate those waters; ‘there are boundaries that
need to be respected around adoption and there is little guidance or expertise in this
area’. She had held off on the tracing process until her own birthmother had died: ‘My
parents carried grief about what they did to me, having me give my son away…’

She and her son finally met in 2006, and following that meeting, she did a course with
a specialist agency, telling the Committee that she had met ‘some lovely women there
who helped me to open up’. She continues to meet her son ‘a few times a year’ but
said: ‘It’s very hard for a birthmother to get it right. You’re trying to make up for lost
years but you don’t want to overwhelm them. I don’t know if adoptees can fully trust
their birthmothers, there is a whole area of sensitivity’. For instance, when she tried to
explain to her son that she hadn’t wanted to give him up, ‘he totally withdrew and was
unable to cope with that information’. ‘It’s much more complex than I thought it would
be’.
A woman who had a son in a home in 1971 told the Committee that she began tracing in 2011 with the help of a social worker. However, it transpired that her son did not want to meet her at that time. Then, about five years later, she received a call from him and they now meet up ‘about once a year’. She said that his adoptive family is ‘secretive’ about the fact that he is an adoptee and she struggles with this, and also with the fact that her son calls them ‘Mum’ and ‘Dad’. She does recognise, though, that ‘they are lovely people’.

Like many other witnesses who spoke to the Committee about the frustration involved in searching for records and files, this witness, who gave birth to her daughter in 1973, said when she travelled back to the home to request the paperwork, ‘it was like somebody had come along with a black marker and erased everything’.

She told the Committee that her daughter had been adopted to the USA, but as far as the witness knew, there hadn’t been any attempt on that side to start a trace. As for her, while not opposed to the tracing process itself, she had already got ‘so much grief’ from her family due to her pregnancy, she hasn’t done it.

Another witness who did begin the process of tracing had had a daughter in 1976. Her husband had encouraged her to search for her daughter and she went along to a counselling session run by a specialist group. However, she told the Committee, she had been unable to stay for the full group session as she ‘didn’t want to hear their stories, it was too sad and it did me no good’.

Only a few months after putting her name on the register in 2006, the witness received a phone call from an agency to say that contact had been made with her daughter. The witness wrote to her and then told her other two daughters (from her marriage) that they had a half-sister. ‘They were very shocked’.

Birthmother and daughter exchanged photos; and she told the Committee that when writing a letter, she would ‘check the dictionary to make sure everything was correct’. She didn’t want to ‘rush’ her daughter, she said, for fear of ‘losing her again’. They met in the agency offices. The agency personnel had instructed her: ‘not to cry, not to hug, not to bring gifts’. But her daughter had brought a gift for her. They hugged. They were ‘immediately comfortable’ with one another and chatted for a few hours. They now continue to meet regularly, although the witness told the Committee that she ‘never puts pressure on her daughter to meet’.

188
This next witness said that from the beginning, she said, she had been open to her son tracing her, and would regularly update her contact details held by the relevant adoption agency. The agency rang her one day to tell her that her son, now aged 22 years, had been in touch and wanted to meet her. The witness immediately travelled to meet him. Neither she nor her son had had any counselling prior to this meeting, she told the Committee, and during that first encounter she was careful, keeping in mind that while she was ‘hoping for a relationship with him, his adoptive mother was now his mother’.

They met again sometime later, but this time she worried about him, feeling he might be suffering ‘some kind of a breakdown’. Afterwards, she phoned the adoption agency, expressing her concerns and asking the nun there to ‘look into it’. This nun, she said, ‘went directly to the adoptive parents, telling them that the witness ‘had concerns that their son was on drugs’. Naturally, the parents told him and after this, he sent her an email saying he ‘wanted nothing more to do with me’. Since then, the only contact she has had with him, is to send ‘the odd card at Christmas or on birthdays’.
Acknowledgment

As seen above, some witnesses did acknowledge to the Committee that over the years, improvements had been made to the conditions pregnant women had to face in the homes but up to the latter decades of the 20th century, the lifting of cultural disdain for ‘fallen’ women and their ‘bastard’ offspring - and acceptance of them as full members of society - was slow to gain widespread currency.

There were mothers who told the Committee that over the years they had managed to bury the experience of their younger lives by strength of will, many within the UK to which they had re-located. They reported how they had made a success of their lives, post-mother and baby home, having put their earlier experiences to one side.

For all kinds of personal and public reasons, some witnesses still felt it was necessary to tell their stories, sometimes against their own families who, petrified by shame, mortification, fear of parish scandal and neighbours’ blame, had jettisoned them at a time when help and solidarity were most needed.

However, in all groups, the depth and honesty of what witnesses revealed to the Committee about what had happened to them having left the mother and baby homes, was startling. To tell these stories and have them noted by the Irish state, took courage, and of that there was plenty.

The Committee is very grateful to all those who came forward to tell of their experience in the mother and baby homes. For some it was the first time they had revealed their feelings and thoughts of their time there. The Committee wishes to acknowledge how difficult that was for them.

Thank you.
Part V: Archives

Introduction

The Commission’s Terms of Reference include a clause which states

> In order to assist public understanding the Commission should provide in its reports an outline of the archival and other sources of most relevance to these issues and the nature and extent of the records therein, together with the challenges and opportunities in exploiting these sources for the purpose of further historical research or examination.

This part lists the sources used by the Commission to compile this report. The Commission has created a digital database from the registers of institutions, which is the key source for institutional chapters, and the data that is provided in the Executive Summary. It was also used at various points in writing the Social History. This database is being transferred to the Child and Family Agency (Tusla) under the Commission of Investigation (Mother and Baby Homes and certain related Matters) Records and another Related Matter Act 2020.

The other major sources are not the property of the Commission - they remain under the control of government departments, local authorities, religious organisations and other bodies. The Commission does not hold original documents from any of these repositories. Access is determined by legislation - in the case of government departments or local authorities - or it is at the discretion of the organisation.

In Part 1: Social History, detailed footnotes are provided. Many of the sources used in that part were also used for the institutional and specific issues parts. Some sources were used exclusively for the Social History part. These are mainly from published sources but some are from individual archives and they are not repeated in the lists given here.

The main sources for Part 2: Individual Institutions are the institutional records of the institutions investigated by the Commission and the files provided by the Department of Health. The Department of Health files frequently cover a number of institutions or a range of issues. In the institutional chapters, the main Department of Health files used are listed.

The other significant sources are the local authority records and records held in diocesan archives. The reference codes for these files are given where they are available but the Commission is aware that changes may be made to these codes. For example, the Commission is aware that some material consulted in the Cork City and County Archives
has been assigned new reference codes since the Commission examined the material. It is possible that this has occurred in other archives as well.

Department of Health files

The Introduction to the Report contains a description of how the Department of Health provided files to the Commission. This is a complete list of all the files provided. These files are already departmental files for the purposes of access by researchers. The original files are all held by the department or its successor, the Department of Children. The department scanned the files and provided scanned copies to the Commission.

A small number of files were not relevant to the Commission’s work. For example, some files were received which were titled ‘St Patrick’s’ which actually dealt with industrial schools. The names of the files are as given by the department. In some cases, the file name includes the name of a person or persons: this has been indicated by […]

Institutional records

In each institutional chapter, a description is given of the sources used including the main Department of Health files used. In the case of a number of the institutions, for example, Regina Coeli, The Castle and Miss Carr’s Flatlets, all the sources are mentioned in the chapter. Here there is a more detailed description of the sources used for the larger institutions.

Dublin Union/Pelletstown

The records of the Dublin Union and the Dublin Board of Guardians-Assistance are held in the NAI. The 30 volumes, designated BG79-G-158 - BG79-G-186, Indoor Relief (Admission) Register of the Dublin Union which cover all admissions into the Dublin Union from November 1921 until August 1938 were used to identify unmarried mothers and their children entering the Dublin Union. The names and other available information were typed into the Commission’s database. Notes and photocopies were made of the relevant parts of the minutes of the Board of Guardians/Board of Assistance.

The originals of the Pelletstown institutional records are held by the Child and Family Agency (TUSLA). They were on an electronic records management system to which the Commission was given on line access. The relevant information was then typed into the Commission’s database. These records (itemised) consist of:

- 11,453 mothers’ cards;
- 7,548 mothers' medical charts;
- 14,573 children’s cards;
- 5,985 children’s medical charts;
- 1,941 miscellaneous records (social workers reports);
- 18 Indoor Admission and Discharge Books covering the period April 1942 - March 1985;
- 5 Records and Particulars Books of Maternity Home Books which cover the period June 1935 - November 1980;
- 1 Register of Girls Admitted to St Patrick’s covering the period 1939-1957;
- 3 Death Registers covering the period 1938-1976;
- 1 Maintenance Book covering the period 1953-1967;
- 1 Cash Receipts Book covering August 1950 - March 1956;

**Documents provided by the Daughters of Charity**

The Daughters of Charity retained paper copies of some of the original Pelletstown records and made hard copies of these available to the Commission. These were used to assist in the compilation of the Commission's database.

The Daughters of Charity also provided the Commission with a range of documents including personnel files on the Sisters who worked in Pelletstown; documents relating to administration; and documents dealing with vaccine trials which had originally been prepared for CICA. Documentation about transfers of children to other institutions, particularly St Philomena’s, was also provided. The Daughters of Charity also provided correspondence between themselves and the board of assistance. The discovery provided by the Daughters of Charity included some of the EHB visiting committee (which visited and reported on the various hospitals and institutions in its area, including Pelletstown) reports. These are all in hard copy.

**Tuam**

The Tuam institutional records are held by the Child and Family Agency (Tusla) in Galway. The Commission made digital copies of all these records, listed (comprehensively) below. These are uncatalogued.

- Galway County Homes and Home Assistance Committee Minute Books
- Children's Home, Tuam, Co. Galway: Children
- Galway County Council: Register of Nursed Out Children

- Western Health Board: List of Adoptions, 1981-1986
- Western Health Board: Index of Adoptive Parents
- Western Health Board: Register of Adopters and Children Placed for Adoption
In addition, the Commission was given a copy of a database which a health board/HSE social worker constructed from the documentation contained in a small box of records relating to American adoptions which took place between 1951-1958.

The Admission Registers record the admission of every new resident to Tuam. Each new resident was assigned a unique register number. Those whose maintenance was paid by Galway County Council were recorded in blue or black pen. Those whose maintenance was paid by Mayo County Council were recorded in red pen. The date of admission (or date of birth in the institution), name, age, sex, marital status—child’s ‘legitimacy’, occupation (if any), religious denomination, disability (if any), place of birth (children’s Glenamaddy admissions only), date of birth (children’s admission only), address prior to admission, name and address of nearest relative, date of discharge or death, cause of death (Glenamaddy only) and place of discharge (Glenamaddy register only) are all recorded in the register. The admission register also records a resident’s previous register number in the case of their re-admission (for example, from hospital or unsuccessful boarding out). There is a column for the name of the resident’s spouse if not in the institution; however in the case of Tuam, this column was never used for that purpose. Instead, it was used to record the name of the parish priest of the resident. Another column not used is one titled ‘No. of children if not in Institution’. Another column is named ‘Observations on condition of Inmates when admitted’. There is a page missing from the Admissions Register covering the period August to November 1933. The Commission has been able to use other institutional records to establish the names of those on the missing page.

When born in the institution, a new admission record for the child was created in the register. The mother’s register number was recorded in the column for the child’s nearest relative. It
was also recorded if the child was ‘illegitimate’ or ‘legitimate’. In the case of a mother entering Tuam with a child or multiple children, their details were recorded directly below that of the mother and their register number was the next sequential figure to the mother’s. As with children who were born in Tuam, their status as ‘legitimate’ or ‘illegitimate’ was recorded. Children found abandoned or deserted who were admitted to Tuam were described as foundlings and were recorded as such. Sometimes, the location at which the child was found was recorded in the admission register.

The maternity registers recorded a pregnant woman’s admission to the maternity wing of Tuam, the mother’s register number, as previously assigned in the Admissions Register, her name, address, age, date of reception to the maternity wing, her condition on reception (that is, pregnancy, advanced pregnancy, recently delivered), number of previous pregnancies, name of her husband, occupation of her husband and the name and address of the medical attendant (if any) of the mother while in Tuam. It goes on to record information on the labour and birth of the child; date and hour of delivery, whether the delivery was normal or abnormal (that is, forceps delivery, breech labour, delayed second stage), whether sepsis or other complication developed and their particulars (for example, ante-partum haemorrhage, vaginal fistula or if they were sent to hospital for delivery), sex of infant, weight of infant at birth, whether full term or premature and the degree of prematurity and whether the child was born alive or stillborn. The register also records any information on a miscarriage of a woman in Tuam, information on a death of either mother or infant (solely within the maternity wing) and the discharge date of both mother and child and their condition from the maternity wing.

There are two types of children’s registers - both are titled ‘Half Yearly Return Children’. The first type, of which there are three volumes, records the presence of a child in Tuam at the end of a month on a bi-annual basis. These volumes cover the period from April 1931 to September 1959. There are separate records of children maintained by Mayo and Galway County Councils. Again, as in the Admissions Register, the Mayo children are recorded in red pen and the Galway children are recorded in blue or black pen. This register records the child’s register number (as in the Admission Register), their name, age on admission, date of admission, whether ‘legitimate’ or ‘illegitimate’, age on the date this was being recorded, sex, state of health (for example, normal, delicate), whereabouts of parents (for example, mother went to Magdalen, unknown, near Tuam, mother dead, working in Galway). Two columns are assigned for observations by the matron and the medical officer. The matron’s column is not used; the medical officer’s column records, for example, ‘mentally deficient’, ‘normal’, ‘anaemic’, ‘abscess near ear’. A final column is headed ‘Orders by the Board or Committee’ but this was not used. On occasion, this register also records admissions to Clifden District
Hospital and the Central Hospital, Galway. These children are not included in the Tuam Admissions Register, so there is no evidence that these children were ever in the Tuam Children’s Home.

The second type of children’s register, of which there are three volumes, recorded the admissions and discharges of the children on a month to month basis. These volumes begin in January 1930 and end in December 1959. As in other registers, the children maintained by Galway county council were recorded in either blue or black pen and those maintained by Mayo county council were recorded in red pen. The page is divided into two sections. The top section relates to children admitted in the given month and the bottom relates to the children discharged in the same month. Both sections record the children’s registration numbers (as in the Admission Register), their name, date of birth, their status as ‘legitimate’ or ‘illegitimate’, age, sex, and their date of admission-discharge. In the admissions section it records the reason for the child’s admission (for example, destitute), the whereabouts of their parents, the Matron’s observations (for example, ‘clean and well cared’, ‘healthy and well’, ‘suffering from inflammation of eye’), the medical officer’s observations (column not used) and the orders of the board, also not used. The discharge section records the reasons for discharge (for example, ‘sent home to parents’, ‘sent to Galway Hospital for surgical treatment’, ‘taken by mother’ or ‘died’). It records the details of the person to whom they were discharged, their address and if, and by whom, they were accompanied on discharge.

The Mother Returns record the mother’s name, age, date of admission to Tuam, occupation, her means (for example, ‘destitute’, ‘means’), proposed contribution (to child’s maintenance) by mother, if any, name and address of nearest relative and name and address of putative father. It includes a section for proceedings against the putative father; ‘Is mother willing to swear information against putative father and state means if known’. This was usually answered with ‘signed statement enclosed’ or ‘signed statement sent’ or ‘made no statement’. These registers also record whether the child died and the date of the mother’s discharge, plus the name of the child and information on proceedings on the same line (for example, ‘proceedings withdrawn 13/09/1944’, ‘no further actions’, ‘put[ative] father gone to England. Proceedings to be taken on return’). The final column records any further observations such as ‘referred to solicitor’, ‘Await report of H.A.O’; [Home Assistance Officer] ‘Try to get address of putative father’.

There are two types of Billing Registers; the Indoor Assistance List (March 1939 - March 1962) and the Indoor Admission and Discharge Book. Both registers were used to track the numbers of women and children in Tuam and to send bills for their maintenance to the
appropriate County Council. The Indoor Assistance List records the entries by register number, name, age, the number of days they were in Tuam in each month (for example, 15 days in March, 30 days in April and 5 days in May). It records the Galway county council maintenance cases in blue/black pen and the Mayo county council maintenance cases in red pen. It also records the date of discharge or date of death of the individual if it occurred during these months. The second type of Billing Register, the Indoor Admission and Discharge Book of which there are six volumes, covers the period from October 1923 to August 1961. This register records the admission and discharges of both mothers and children on a monthly basis; the date of their admission or discharge, their name, age and register number; whether they were married or unmarried and in the case of a child, whether they were ‘legitimate’ or ‘illegitimate’. A death in Tuam was recorded in the final column of the discharges. It differs from other registers in that, in the earlier years, all the residents were recorded in the same colour pen, with a note indicating if they were maintained by Mayo county council, but in later years they adopted the practice of using blue/black for Galway and red for Mayo.

All of this material was used in compiling the Commission’s database.

**Sisters of Bon Secours**

The Sisters of Bon Secours told the Commission that their archive contained 281 boxes and there were only two boxes that related to Tuam. Some of these were created in the years subsequent to the closure of the home. The Sisters supplied the Commission with historical accounts and personal letters that make reference to the Tuam home including statements to CICA. These are in hard copy.

**Galway County Council**

The extant minutes of the Galway Board of Health are held by Galway county council. There is almost a complete set for the period 1922-1941 but there are some gaps and there are no surviving minutes for the year 1937. The Commission has examined the managers’ orders for the period 1942-1961. The comprehensive list is listed here:

- GC-CSO2: Galway County Council, County Secretary's Office: Manager's Orders
- GC-F: Galway County Council: Finance
- GC-1-03: Galway County Council: Minute Book, 1917-1925
- GC-1-05: Galway County Council: Minute Book, 1932-1942
- GC-1-06: Galway County Council: Minute Book, 1943-1952
- GC-1-07: Galway County Council: Minute Book, 1951-1956
- GC-1-08: Galway County Council: Minute Book, 1956-1959
• GC-1-09: Galway County Council: Minute Book, 1959-1962
• GC-2-1: Galway County Council: Attendance Book, Council Members, 1945-1950
• GC-3: Galway County Council: Finance Committee Minutes, 1899-1950
• GC-WS-CS-12: Galway County Council: Water Services, Capital Sewerage Schemes, Maps, Plans Drawings e.g. as constructed drawings
• GC-WS-WS: Galway County Council, Water Services: Water Supplies and Extensions
• GC5: County Galway Board of Health and Public Assistance, Archives Collection 1922-1949
• GC6: Galway County Board of Health and Public Assistance: County Galway Hospital and Dispensaries Committee, 1922-1942
• TTC-1: Tuam Town Commissioners: Minutes
• CC-CC-13-2-0001: Bishop's Palace Grounds, Tuam
• CC-2-6-0054: Hospital Charges
• RT-COE-3-0337: Tuam Water Improvement 1947
• Uncatalogued: Files relating to water, drainage and sewerage for county Galway
• Uncatalogued: Registers of Insurance

Notes and photocopies were made of the relevant material. These are held electronically.

**Kilrush**
The Commission has not found any extant institutional records for the Kilrush nursery. They do not seem to have survived.

**Clare County Council Archives**
• Minutes of Kilrush Rural District Council.
• Minutes of Clare County Board of Health.
• Minutes of Clare County Council.
• Minutes of Kilrush Board of Guardians.
• Minutes of County Nursery and District Hospital Committee.

**St Senan’s Church, Kilrush**
The baptismal records of the parish church of Kilrush, St Senan's, from 1922-1932 were made available to the Commission’s researcher. The Commission did not copy these records.
Bessborough
The Bessborough institutional records are held by the Child and Family Agency (TUSLA) in Glanmire, Cork. The Commission made digital copies of these records. The institutional records include:

- **Bessborough home Admission Books**: The admission books cover the period July 1922 to January 1998 and recorded admissions of women and children to the Bessborough home. This collection has survived relatively intact. Omissions are infrequent and relate to short periods in the earlier admission books. The earliest admission books were compiled by county; this was presumably done for billing and accounting purposes. In the 1930s, the admissions began to be recorded chronologically. All admission books were hand-written and recorded details such as a woman’s name, age, address, occupation, house name, date of admission and discharge and discharge pathway. Additional information relating to the name and date of birth of the child, the reputed father, the woman’s parents and siblings, her education and work experience were also recorded. The admission books also recorded maternal and infant deaths which occurred in Bessborough.

- **Bessborough maternity hospital Admission Books and Maternity Books**: The maternity and hospital admission books cover the period from May 1934 to August 1987. This collection is incomplete. The surviving records are for the periods May 1934 - April 1937; May 1944 - March 1957; October 1961 - September 1964 and July 1980 - August 1987. The earliest Maternity/Hospital admission books recorded a woman’s name, address and house name as well as her date of admission and discharge. The name, date of birth and date of discharge of her baby were also recorded. Short notes such as ‘came in labour’, ‘obstruction from birth’ and ‘slow and difficult labour’ were also included. The later maternity admission books recorded details relating to a woman’s parents (and if they knew she was pregnant) along with details of a woman’s occupation and referral. Some hospital admission books recorded babies’ birth weight and the dates on which the PKU test and BCG anti-tuberculosis vaccination were administered. The admission books also recorded maternal and infant deaths which occurred in Bessborough.

- **Registration of Births, Bessborough maternity hospital**: The Registration of Births Book relating to the Sacred Heart Hospital Bessborough covers the period December 1930 - May 1986. This collection is complete. The register books were supplied to the institution by the Registrar General and recorded the name, sex and date of birth of children born in the hospital along with the name, address and occupation of the mother. The date of the registration of births was recorded along
with the initials of the registrar for South Cork. It appears that births were registered in bulk at intervals of around two months in the 1930s and fortnightly from the 1940s.

- **Records and Particulars Book, Bessborough Maternity Hospital**: The *Registration of Maternity Homes Act* 1934 required the keeping of various records. The Records and Particular Books relating to the maternity hospital cover the period September 1935-July 1987. This collection is complete. These books recorded the details of women admitted to the maternity hospital including her name, age, address, date of admission, condition on admission and the number of previous pregnancies. Additional information recorded the name and sex of the woman’s baby, date and hour of birth, details relating to the delivery, birth weight, whether born full term or premature and whether a child was born alive or stillborn. The name of the medical attendant, generally the institutional medical officer, was also recorded. Further information recorded the person into whose care the child was removed from the hospital.

- **Private Patients Admission Book**: A Private Patients Admission book recorded the admission of private fee-paying patients to the maternity hospital in the period February 1951-January 1971. This book also recorded financial details relating to these patients. Private patients were billed for their hospital stay and medical treatment as well as costs relating to laundry services, baptism, certificates and clothes. In cases where private patients did not pay their Bessborough bill in full, their accounts were transferred to the relevant local public assistance-health authority. It is clear from other admission books and registers that private patients were being admitted to Bessborough since the 1930s. Although no other Private Patients Admission Books appear to have survived it was possible to identify private patients in the general admission books and associated records as they were designated the letter ‘P’ and were not associated with a public assistance/health authority account. Baptismal registers relating to Bessborough assisted the Commission in establishing the number of private patients admitted to the Bessborough hospital from 1930 to the late 1940s.

- **Maternity Hospital ante-natal records**: Records relating to the ante natal care of women and children in the maternity hospital are available for the period 1946-1999. The collection is relatively intact. However, ante natal records for the years 1948-53; 1959-63; 1985-86 and1995 are missing. The earlier records recorded a woman’s name, age, date of birth, date of admission and condition on admission. Other information included medical test results, a summary of labour, observations on labour and a list and dosage of drugs given where applicable. Additional information
recorded details relating to the baby including the name, sex, date of birth, condition at birth, date of discharge, weight at birth and on discharge, diet on discharge and the dates of any medical tests undertaken and vaccinations received. The records contain comprehensive weekly observations on the baby’s health and development. By the 1970s the range of information recorded was expanded to include information on the type of delivery, head circumference, date of baptism, feeding schedule and bacteriological reports. The ante-natal records also recorded maternal and infant deaths which occurred in Bessborough.

- **Death Register:** The Registration of Maternity Homes Act 1934 required that all registered maternity homes compile a register of deaths. There is only one surviving death register for Bessborough; it covers the period February 1934-January 1953. This register recorded most but not all maternal and infant deaths which occurred in Bessborough in the period. Recorded details included the name, age, address and date of death of the deceased along with the cause of death and duration of illness. Deaths were notified to the registrar for South Cork at regular intervals. The Commission has found that the number of deaths recorded in the surviving death register falls short of the number of deaths notified by the Bessborough authorities to the General Register Office. The age at death of most children and infants recorded suggests that the register related, in the main, to deaths in the Bessborough home. The wording ‘Bessboro Home’ is written in the header section of most pages in the death register. However, a section of the register covering the years 1938-39 recorded some deaths which occurred in infants who were just days old. The heading on these pages state that the deaths were recorded in the ‘Bessboro Home and Hospital’. The Commission is of the opinion that these were neo-natal deaths that occurred in the maternity hospital and not in the Bessborough home. The section covering the years 1938-39 related to infant deaths which occurred both in the Bessborough Home and the maternity hospital. From 1940 the register does not record the deaths of new-born infants. The Commission considers it plausible to assert that at that juncture the Bessborough authorities began to record deaths which occurred in the Sacred Heart Maternity Hospital in a death register reserved solely for that section of the institution. This would explain the discrepancy in the number of deaths recorded in the death register in the years 1934-53 and the number of deaths notified by the Bessborough authorities in the same period. In the absence of a complete set of death registers, the Admission Books, Maternity/Hospital Admission Books, Records and Particulars Books, Ante-natal Records and Baptismal Registers proved invaluable to the Commission in establishing the extent of infant mortality in Bessborough. The Commission recorded every note, handwritten or otherwise, that
suggested that a woman or child had died in the institution. The Commission crosschecked every suspected death against records held by the General Register Office.

**Other records held by the Child and Family Agency (Tusla):**

- **Records of the Sacred Heart Adoption Society:** Records relating to the Sacred Heart Adoption Society comprise adoption application files; Adoption placement files; Adoption orders files; Minutes of the Adoption Society; Foreign applications files and Foreign adoption files. The combined records span the years 1953-98. The records facilitated the Commission in identifying domestic and foreign adoption of Bessborough infants and children which were facilitated by the Sacred Heart Adoption Society.

- **Records of the Catholic Women’s Aid Society:** They comprise: Record of payments to foster parents books for the years 1920-45; Index of babies placed for fostering and adoption for the years 1937-71; and a small number of miscellaneous documents relating to the society. Prior to the introduction of legal adoption in Ireland in 1953, the lay run CWAS played a significant role in finding nurse mothers for ‘illegitimate’ children in Cork. Over half of all infants who were fostered through CWAS were born in Bessborough. The birth mother paid a fee of £60 to CWAS who in turn paid the money to nurse mothers in 12 quarterly instalments. The records of payments to foster parents books take the form of basic double entry accountancy. Money received from the birth mother was recorded on the right and monies paid out to nurse mothers was recorded on the left. The CWAS records assisted the Commission in identifying infants born in Bessborough and their exit pathway from the institution into the nursed out system via CWAS.

- **Records of St Anne’s Adoption Society:** Registers relating to St Anne’s Adoption Society were available for the years 1954-99. The registers recorded details of women who were repatriated from the UK to have their babies adopted in Ireland. The registers facilitated the Commission in identifying women who were admitted to Bessborough under the auspices of St Anne’s Adoption Society and to capture the exit pathways of their babies from Bessborough, which generally took the form of legal adoption.

**Cork Diocesan Archives:** St Anne’s Adoption Society: correspondence files
**Cathedral of St Mary and St Anne, Cork**

- Bessborough Baptismal Registers, 1930-2010: The Commission located a complete set of baptismal registers relating to Bessborough for the period December 1930 to January 2010. As the registers are church records, they are not kept with the Bessborough records held by Tusla. The baptismal registers are kept at the Cathedral of St Mary and St Anne (North Cathedral), Cork. The registers recorded a wealth of information including a child’s name, date of birth, date of baptism, mothers name and address, name of the priest and godparent (usually one of the other mothers in Bessborough), date of discharge and discharge pathway and details of any subsequent marriage. The registers also noted if a child had died and the date of death. Interestingly, the registers also recorded the Board of Assistance responsible for the child’s maintenance in Bessborough and private patients were designated the letter ‘P’. This information facilitated the Commission’s efforts to establish the number of private patients admitted to Bessborough from 1930 to the late 1940s.

**Cork City and County Archives**

The relevant records (catalogued) of the Cork local authorities (the Boards of Guardians, South Cork Board of Health and Public Assistance/Cork Health Authority/Southern Health Board) are:

- Registers of boarded out children 1925-73;
- Cork Board of Assistance payment records for boarded out children 1959-72;
- Registers of children at nurse 1912-65;
- Health authority adoption registers 1935-99;
- Minutes of meetings
- Managers orders

These local authority records facilitated the Commission in identifying the exit pathways of children from Bessborough through the boarding out system and through informal adoption (pre 1953) and legal adoption (from 1953). The registers of children at nurse allowed the Commission to identify children who were placed in the nursed out system from Bessborough by their mothers who did not engage the services of the CWAS.

Cork City and County Archive also held 150 boxes of uncatalogued public health records. A perusal of one box revealed correspondence relating to infant mortality in Bessborough. The Commission sent an archivist to the Cork archives for several months to catalogue this collection for analysis.
Below is a detailed list of material consulted:

**South Cork Board of Public Assistance Records:**
Creation dates: 1924-1963: 96 volumes and 512 files.
- CBPA-SO-M: South Cork Board of Assistance Minute Books, 1924-57. 28 volumes
- CBPA-SO-GF: South Cork Board of Public Assistance Files, 1925-63. 157 boxes
- CC-PA-MO: Cork County Council Public Assistance Manager’s Orders, 1942-60. 70 volumes
- CC-CO-M-11-26 Cork County Council Minutes, 1922-60. 16 volumes
- CC-MO Cork County Council Manager’s Orders, 1942-60. 16 volumes
- CC-NO-M Cork County Council North Cork Minutes, 1942-60. 13 volumes
- CC-NO-MO Cork County Council North Cork Asst Co Manager’s Orders, 1942-60. 35 volumes
- CC-SO-MO Cork County Council South Cork Asst Co Manager’s Orders, 1942-60. 18 volumes
- CC-CS-Files County Secretary’s Office Files, c1900-1968 [mainly 1913-47]. 39 files
- CC-CS-LB County Secretary’s Office Letter Books 1922-28. 12 volumes
- NCBPH-NCBPA North Cork Boards of Public Health and Public Assistance, 1927-42. 20 volumes
- LG II (SCBPA) South Cork Board of Public Assistance Files, 1923-63. 159 files
- BG Board of Guardian Records, 1922-25. 30 volumes
- CP-CY-SJ-3: St Joseph’s Cemetery Collection; Register Book of Burial Plots and Burial Rights Therein.

Cork City and County Archive also held 150 boxes of uncatalogued public health records. A perusal of one box revealed correspondence relating to infant mortality in Bessborough. The Commission sent an archivist to the Cork archives for several months to catalogue this collection for analysis.

Files held by Cork City and County Archives which were of direct relevance to the chapter on the Bessborough Mother and Baby Home are as follows:
CC&CA, CA-PA-MO-SO-6: South Cork Manager’s Order No. 813-47; 23 June 1947.
CC&CA, CA-PA-MO-SO-7: South Cork Manager’s Order No. 598-48; 10 June 1948.
CC&CA, CBPA-LGII, Box 15: Secretary, South Cork Board of Public Assistance to Mother Martina, Bessborough, 20 July 1928.
CC&CA, CBPA-Orders-SC-Box 6: Cork South Manager’s Order No. 507, 30 March 1943.
CC&CA, CBPA-SO-F- Files, LGII-91-2, Dr Robert Condy to J.F. Wrenne, 5 January 1944.
CC&CA, CBPA-SO-8-M- 26 March 1930.
CC&CA, CBPA-SO-8-M- 31 December 1930.
CC&CA, CBPA-SO-8-M- 26 November 1930.
CC&CA, CBPA-SO-8-M- 9 April 1930.
CC&CA, CBPA-SO-LGII, Box 15: Flora Burton, Department of Public Welfare, Boston, to Miss M.J. Cruise, [This is the spelling used in the original] Middle Abbey Street, Dublin, 24 May 1926.
CC&CA, CBPA-SO-LGII, Box 15: Welfare Department, Liverpool, to the Sacred Hearts Home, Bessborough, 19 January 1927.
CC&CA, CBPA-SO-M-10- 12 September 1934.
CC&CA, CBPA-SO-M-10- 14 September 1932.
CC&CA, CBPA-SO-M-10- 27 June 1934.
CC&CA, CBPA-SO-M-10- 5 December 1934.
CC&CA, CBPA-SO-M-17- 22 August 1938.
CC&CA, CBPA-SO-M-18- 12 September 1938.
CC&CA, CBPA-SO-M-20- July- December 1939.
CC&CA, CBPA-SO-M-5- 1 June 1927.
CC&CA, CBPA-SO-M-5- 1 June 1927.
CC&CA, CBPA-SO-M-5- 4 May 1927.
• CC&CA, CBPA-SO-M-9- 22 April 1931.
• CC&CA, CBPA-SO-M-9- 25 March 1931.
• CC&CA, CBPA-SO-RB-01: South Cork Board of Public Assistance, Records of Business, October-December 1942.
• CC&CA, CC-CBPA-Orders-N.C. Box 1: January to December 1944. North Cork Board of Assistance Manager’s Orders, Order No. 759, 26 September 1944.
• CC&CA, CC-PA-MO-SO-10: South Cork Manager’s Order No. 1,219-51; 3 August 1951, and Order No. 1,436-51; 29 August 1951.
• CC&CA, CC-PA-MO-SO-11: South Cork Manager’s Order No. 933-52; 7 July 1952.
• CC&CA, CC-PA-MO-SO-4-Box 6: Cork South Manager’s Order No. 42-45, 30 Jan 1945.
• CC&CA, CC-PA-MO-SO-9: South Cork Manager’s Order No. 138-50; 4 February 1950.
• CC&CA, Orders-NC-Box1, January-December 1944: North Cork Manager’s Orders No. 570, 26 July 1944.
• CC&CA, South Cork Board of Public Assistance Files, LGII, Box 41, June 1934.
• CC&CA, South Cork Board of Public Assistance, LGII, Box41: Miss Butt, Secretary, St Joseph’s Home for Mothers & Babies, Clapham Road, London to Mrs Crofts, Department of Local Government and Public Health, June 1934.

**Congregation of the Sacred Hearts of Jesus and Mary, Chigwell Convent, UK.**
The Congregation of the Sacred Hearts of Jesus and Mary facilitated the Commission in accessing the congregational archive in Chigwell, London (see Chapter 17). The Commission was given access to the collections:

• Sisters of the Sacred Hearts of Jesus and Mary Council Minutes, 1904-37.
• Annals of the Order (Diaries of the Mother General), 1919-99.
• Council minutes.
• General Chapter 1933: Report of the Superior General.
• Correspondence: J. A Shaw and Co Solicitors, Mullingar, to Mother General, Chigwell, regarding Castlepolland, 14 Feb. 1952.
• Roscrea annals, 1969-85

**Irish Defence Forces, Military Archives,**
The Commission was given access to historical aerial photography taken by the Irish Air Corps in the mid to late twentieth century. The earliest collection included a high resolution photograph of the Bessborough Estate and hinterland from February 1951.

**Society of African Missions, Provincial Archive, Blackrock, Cork**

The Commission was given access to the Society of African Missions, provincial archive, to examine documentation relating to St Joseph’s Cemetery, Cork. The Society of African Missions owned and operated St Joseph’s Cemetery before being handed over to Cork Corporation in 1947.

**Sean Ross**

The Sean Ross institutional records are held by the Child and Family Agency (TUSLA) in Waterford. The Commission made digital copies of these records. There are over 14,000 records, all uncatalogued. The institutional records include:

- **Indoor Registers** Admission Books by county, covering the years 1931-1969. These appear to have been used for the purpose of billing.
- **Admission Books**: These recorded admissions to Sean Ross from June 1931 to May 1968. They record details relating to a woman’s name, age, address, occupation and date of admission along with her child’s name, date of birth and discharge details for both mother and child. The later volumes include a woman’s ‘house name’ along with information regarding her family, the putative father and the family doctor. These are handwritten records. They recorded whether a baby was born alive or stillborn, if an infant subsequently died and the date of death.
- **Private Patients Book**: This covers the years 1959-69. Details recorded were a woman’s name, address, date of admission, date of discharge and a record of payments received. Record of payments included a charge for a woman’s stay at a weekly rate, charge for her baby’s stay at a weekly rate as well as charges relating to blood tests and birth and baptismal certificates. The later entries include details relating to infant discharge pathways.
- **Nursery Admission Book**: This is for the period September 1957 to November 1966. It recorded details such as the name and address of the mother as well as the name, date of birth, weight and some discharge details relating to her child.
- **Maternity Register**: This recorded admissions to the Sean Ross maternity hospital (which was called St Gerard’s) for the period October 1933-March 1939. It contains an index of all admissions in this period along with details relating to a woman’s
name, address, age, date of admission. Entries recorded in the later years include handwritten medical observations on the expectant woman.

- **Records and Particulars Books**: There are 12 volumes covering the period April 1935 to November 1969. There are two gaps in this record: November, December 1962, and March 1966. The books recorded admissions to the maternity hospital and contain details relating to the name, age and address of women along with a note on their discharge pathway. The early volumes are handwritten notebooks. The later volumes are registers with column headings such as name, address, age and date of admission of a woman along with observations on her ‘condition on reception’. The books also recorded details of the birth including the date and hour of birth, the sex and weight of the baby, the name of the attending doctor and whether the baby was premature, full-term, born alive or still-born.

- **Birth Registers**: there are ten volumes covering the period December 1933 to May 1964.

- **Death Register**: This covers deaths in the maternity hospital in the period March 1934 to November 1967. It recorded the name, date of death, home county, sex, cause of death and age of death of infants who died. The recorded age on death strongly suggests that the deaths recorded in this register related to deaths that occurred in the maternity hospital only and do not relate to deaths that occurred in the Sean Ross home. Maternal deaths which occurred (all appear to relate to deaths associated with complications of childbirth) in this period are recorded in this register also. In the absence of a complete set of death registers, the other records mentioned and the baptismal register facilitated the Commission in establishing the extent of infant mortality in Sean Ross. The Commission recorded every note, handwritten or otherwise, that suggested that a woman or child had died in the institution. The Commission crosschecked every suspected death against records held by the General Register Office.

- **Miscellaneous Registers**: These include a Baby Weight Book, 1966-71; Birth Certificates Received, 1966-69, Discharge Details, 1963-66, Children admitted and Boarded Out, 1936; 1943; 1944-45: Contains a list of children from County Clare who were admitted to and boarded out from Sean Ross in this period. The register also includes medical reports relating to children prior to boarding out.

- **Adoption Ledgers/Adoption Orders/Adoption Placements/American Adoption Files**

  There are four volumes arranged as follows:
Volume 2: A register of adopted children, 1952-66. This register recorded a child’s name, date of birth and date of adoption along with the name and address of the ‘adopters’ and the child’s adoptive name.

Volume 3: A register of children placed for adoption in the US from Sean Ross, Bessborough and Castlepollard in the years 1951-60. This register contains an index listing names of children who were placed for adoption in the US. The register recorded a child’s name and date of birth along with the name and address of the adoptive parents in the US.

Volume 4: A register of children placed for adoption in Ireland from Sean Ross, Bessborough and Castlepollard in the 1950s and 1960s. This register recorded a child’s name and date of birth along with the name and address of the mother. Details relating to the child’s adoption such as the name and address of the adoptive parents, date of adoption, adoption order number, and the name and address of a referee were also recorded.

The Adoption Orders comprise 12 volumes and contain applications for adoption orders as well as copies of Adoption Orders issued by An Bord Uchtála. Each Adoption Order has a unique reference number and recorded details relating to the name and address of the adopters the child’s date of birth and name prior to adoption, the child’s name on adoption and the date on which the Adoption Order was approved.

The Adoption Placement files comprise five volumes and recorded the name, ‘house name’ and address of the birth mother along with her child’s name and date of birth, the name and address of the adopters and the date of placement.

The American Adoption Files contain documentation relating to children adopted in the US such as consent to adoption forms, signed by birth mothers and witnessed by a Notary Public, along with signed and witnessed release forms giving custody of a child to adoptive parents in the US. This collection also contains medical and financial information relating to adoptive parents in the US, correspondence between adoptive parents and the authorities at Sean Ross, affidavits in support of adoptive parents, assessment of prospective adopters and their homes undertaken by US agencies such as the Catholic Home Bureau, correspondence between the authorities at Sean Ross, the Department of External Affairs and the American Embassy, Dublin, along with documentation produced by the United States Department of Justice Immigration and Naturalization Service.
**Congregation of the Sacred Hearts of Jesus and Mary, Chigwell Convent, UK.**
See Bessborough above

**Killaloe Diocesan Archives**
- Fogarty Collection, Box 35 1-9-B-6: Fogarty Correspondence
- Sacred Hearts of Jesus and Mary, Box 31 1-8-A-2: Correspondence regarding adoptions

**Tipperary County Council, Civic Offices, Nenagh**
The Commission examined archived local authority records of North and South Tipperary in the Civic Offices, Nenagh, Thurles Library and Tipperary County Archives, Clonmel. Three collections which were of interest to the Commission were identified, listed below. These, however, did not have much information of relevance.
- North Tipperary County Council Minutes, Volumes 1-47
- North Tipperary County Council Manager’s Orders, Volumes 1-117

**Thurles Library, The Source, Cathedral Street, Thurles Townparks**
- TL-LG-22: Tipperary North Riding Board of Public Assistance Minutes

**Tipperary County Archives**
- Tipperary South Riding County Board of Public Assistance Minutes, 1924-1942
- South Tipperary County Council Manager’s Orders, 1942-2012.

**Castlepollard**
The Castlepollard institutional records are held by the Child and Family Agency (Tusla) in Letterkenny. The Commission made electronic copies of these records. The Records and Particulars Books/Birth Registers for St Kevin’s Maternity Hospital, Castlepollard record information relating to babies born in Castlepollard including: child’s date of birth; Christian name; sex; name of father (all blank); mother’s name; father’s occupation (all blank); mother’s date of birth; mother’s address prior to admission; year of marriage (all blank); number of previous children (generally blank) and initials of the recording officer.

They consist of:
**Admission Books:** There are three volumes covering the years 1935-49; 1943-57 and 1955-70. The Books recorded admissions to the Castlepollard Home and were arranged by county of origin. They recorded a woman’s date of admission, register number, name, age, address and date and place of discharge. They also recorded the name, date of birth and
date of baptism of her child along with the child's date of discharge. Infant deaths and date of death were also noted.

**Records and Particulars Books/Maternity Registers of St Peter's Maternity Hospital:**
The Records and Particular Books comprise six volumes covering the years 1943-71. Records for the years 1948-50 inclusive are missing. They recorded admissions to St Peter’s Maternity Hospital, Castlepollard, and details relating to a woman's name, age, address, date of admission and condition on admission (pregnant, in labour). Dr B Cullen, Westmeath, is named as the attending physician in all cases. Details relating to infants included date and hour of birth, sex, the type of delivery (normal, breech, forceps), details of any complications during the birth, weight at birth, whether full-term or premature, and whether the child was born alive or stillborn. Some instances of whose care the child was discharged to were also noted.

**Ante-Natal Records:** There are nine volumes covering the years 1939-66. The records are handwritten notebooks and captured details of a woman’s age and house name, dates of admission and discharge along with notes on her medical history, medical condition on admission to St Peter’s Maternity Hospital and test results (blood, urine Rh). They also contain notes on the woman’s labour and medical examination of her new-born infant. Details of maternal and infant deaths were also recorded.

**Private Patients Register:** There is one Private Patients Register which is for the period July 1961 to March 1970. This is a handwritten notebook which recorded details of a woman’s name, address and date of admission along with the name, dates of birth and discharge of her baby. The register also recorded financial details relating to costs associated with the maintenance of the woman and her child in Castlepollard including amounts paid, method of payment (cash or cheque) and the outstanding balance. Some women recorded in the Private Patients Register were transferred to a local authority health board account after admission.

**Babies Register:** A Babies Register recorded births in St Peter's Maternity Hospital, Castlepollard, in the period March 1942 to January 1954. The register takes the form of a handwritten notebook. It recorded details such as a woman’s name, address and date of admission along with the name and date of birth of her infant. Still-born infants were also recorded.
Indoor Register; County Leitrim: An Indoor Register relating to Leitrim County Council was included with the Castlereagh records and relates to the years 1936-76. Most admissions recorded here relate to the years 1936-70 and contain details such as a woman’s name, age, occupation, religion and previous address along with the name, sex and date of birth of her child. Some details relating to the date of discharge and discharge pathway were also recorded.

Baptismal Register: A typed copy of a Baptismal Register recorded baptisms at St Michael’s Church, Castlepollard, in the period 1 January 1935 to 12 November 1994. Details recorded include a child’s name, date of birth and date of baptism.

Adoption Orders: The Adoption Orders comprise five volumes and were composed alphabetically. This collection contains scanned copies of Adoption Orders, which recorded details of a child’s adoption such as name prior to adoption and name on adoption along with details of the birth mother and the adoptive parents. Files relate to adoptions from the late 1950s to the 1970s.

Death Register: This is a typed spreadsheet recording deaths in Castlepollard, (infant, maternal, congregational) in the period 17 April 1935 to 16 October 1970. The age on death of infants and children range from a few hours to two years old. This suggests that infant and child deaths recorded here were deaths which occurred in both the Castlepollard Mother and Baby Home and St Peter’s Maternity Hospital. This record appears to record details from an original death register and includes the name, cause of death, date of death and age on death of the deceased along with the place of death, who notified the death and the name of the Registrar for the Castlepollard district.

Congregation of the Sacred Hearts of Jesus and Mary, Chigwell Convent, UK.

Bethany
The institutional records (uncatalogued) of Bethany are held by PACT (Here2Help). They were digitally copied by the Commission. There are four registers:

The Admission-Discharge Register from 29 March 1922 to 3 May 1946: This register is the continuation of the admissions register of the Dublin Midnight Mission (which is not relevant to this inquiry). It lists the woman’s name; age, religion, birth-place; her most recent address; how long she had been in Dublin - though this is generally blank; her occupation; dates of admission and discharge, and her destination when discharged.

The Bethany Baby Records covers the period 7 May 1922 to 25 August 1970; This lists babies’ names; date of birth; whether they were born in the home or admitted after the birth; date of christening, vaccination details; date of leaving the home; where they went and if they were readmitted to Bethany.

Records and Particulars Book of Maternity Home (or Hospital) known as Bethany Home 1936-1956 and Records and Particulars Book of Maternity Home (or Hospital) known as
Bethany Home 1956-1971: This was the standard official register that all maternity homes and hospitals were required to keep under the *Registration of Maternity Homes Act 1934*. It gives the woman’s name, age, date of admission, condition (not always completed), date of discharge, state of health, removal of child, particulars of the person removing a child and particulars of person to whose care a child was removed, plus a general column for observations. It appears that Bethany completed this official record and also continued to maintain its individual admission book until 1946, when it began to rely solely on the official register and the Bethany Baby Book.

**Representative Church Body Library**

The minutes of monthly meetings of the management committee of the Bethany Home from 8 January 1924 to 8 January 1937, and from 12 May 1944 to 14 January 1966, are held in the Representative Church Body (RCB) Library in Braemor Park. The library also holds copies of some annual reports of the Bethany Home; these give some details about the mothers and babies, records of donations, subscriptions and an annual financial statement. The RCB Library also holds a register from Zion Church of Ireland Parish, which includes separate pages with entries for the baptisms of babies born in Bethany Home, c.1935-1949. These give the dates of baptism, the child’s Christian name, parent’s (mother’s) name; they give no entry under ‘abode’, or ‘quality, trade or profession’.

- MS 264.1: Bethany Home Minute Books
- MS 264.2: Bethany Home File
- P.288.2.1: Zion Church of Ireland Register of Baptisms

**Irish Church Missions**

The Commission has also consulted the records of the Irish Church Missions (ICM) to the Roman Catholics held by the ICM. They include:

- ICM-CF-0001-0793: Children’s Fold: Correspondence
- Uncatalogued: The Banner of Truth/The Banner of the Truth/Irish Church Missions News Seasonal Reports

**Wicklow County Archives**

- WLAA-BOH-M: Minutes of the Wicklow County Board of Health, 1924-1942
Denny House

Most of the institutional records relating to the Magdalen Asylum/Denny House are held by PACT (Here2Help). The institutional records (uncatalogued) were digitally copied by the Commission. They include:

- Magdalen Home: Monthly Meeting Committee Minute Books
- Magdalen Home: Case Committee Books
- Magdalen Home Annual Reports
- Magdalen Home Report Books
- Magdalen Asylum Mother and Child Case Books
- Magdalen Home: Baby Books
- Magdalen Asylum/Denny House: Case files
- Denny House Discharges
- Denny House Synopsis of admissions and discharges
- Records and Particulars Book of Maternity Home or Hospital known as Magdalen Home, 1961-1982
- Magdalen Home: Case Committee Notes, 1952-1973
- Church of Ireland Register of Baptisms solemnized in Magdalen Asylum Church, 1869-1983

The Nursery Rescue Society Archives

PACT also holds the records of the Nursery Rescue Society which was affiliated with Denny House. These records (uncatalogued) include:

- Nursery Rescue and Protestant Children's Aid Society: Annual Reports, 1914-1978
- Nursery Rescue and Protestant Children's Aid Society: Case files
- Nursery Rescue and Protestant Children's Aid Society: Entered Institutions
- Nursery Rescue and Protestant Children's Aid Society: Surrender Forms
- Nursery Rescue and Protestant Children's Aid Society: Children's Ledger, 1945-1972
- Nursery Rescue Society: Agenda Book, July 1938-December 1943
- Notebook on children under the care of the Nursery Rescue and Protestant Children's Aid Society, 1965-1975
- Nursery Rescue Society: Little Fortfield Journal, September 1915-October 1921
- Nursery Rescue Society/Protestant Adoption Society: Pre-1952 Adoption Agreements, 1943-1952
Nursery Rescue Society/Protestant Adoption Society: Adoptions case files
• Nursery Rescue Society/Protestant Adoption Society: Adoptions Northern Ireland, UK, USA, Canada, and Australia
• Nursery Rescue Society/Protestant Adoption Society: Adoptions and administrative records, 1944-1990.

Dunboyne
The Dunboyne institutional records are held by the Child and Family Agency (Tusla) in Drogheda. The records received by the Commission take two forms, Registers and Files.

The Registers have no uniform pattern of information; they are a series of handwritten notes filed by date of admission. However, they typically include:

For the mother: name, address, date of birth, date of admission, date of discharge, by whom she was referred, next of kin, exit pathway, previous pregnancies, whether or not there was a living infant;

For the child: first name, date of admission, date of birth, date of discharge, place of birth, exit pathway, child death, date and place of baptism.

A short social history is sometimes included, along with notes regarding adoptions, visits to the hospital, letters and photos received from the women admitted. Some of the admissions are recorded in multiple locations. For example, there is a large overlap between those recorded in the Registers for the years 1989/1990 and the Files.

The Files consist of typed standardised forms that were used from 1966 onwards. The information contained in the files is much the same as that contained in the registers, however there is a stronger emphasis on the mother and putative father’s social history. The files often contain a series of miscellaneous records from adoption societies, health boards, doctors, social welfare, maternity hospitals, etc. These include referral letters, letters relating to the mother’s decision regarding the child, social work reports, ante-natal records and medical certificates for the child. There is also, on occasion, letters and photos from the women admitted and their families.

They consist of:
• 7 registers: Admission Register 1955-1966 (includes some correspondence); Admission Register Girls 1989-90 Ard Mhuire; Admission Register 1955-1962 Ard Mhuire; Admission Register 1966-1969; Private Patients 1965; List of stillborn and deceased infants 1981-1984;
PART 5 ARCHIVES

- Girls Admission to Dunboyne Register 1981-1990;
- 4 Admission cards and case files, containing correspondence;
- “Adoption” files;
- “Tracer” files;

**Discovery from the Good Shepherd Sisters**

The Good Shepherd Sisters provided extensive documentation (2,001 scanned pages) to the Commission, including various internal Good Shepherd Sisters documentation such as:

- Annals of the Convent.
- Chapter Books, which were required to be kept in all of the Good Shepherd Sisters’ locations: The Dunboyne Chapter Book provided to the Commission has entries from 1972.
- The ‘Book of Benefactors’ records donations received from 1969;
- The reports from council meetings are from 1986 onwards;
- Various accounts of the history of the institution: some accounts are contemporaneous and some were written after the institution was closed.

The documentation also included audited financial accounts for virtually every year of its operation.

**Tusla**

Fr Regan Archive, relating to adoptions, many of the babies came from Dunboyne, others from Stamullen.

**Cork County Home**

The following records which are held in the Cork City and County Archives were analysed by the Commission.

- Cork Union workhouse indoor relief registers 1840-1925.
- The combined indoor relief registers for Cork county home and district hospital cover the years 1925-57 (CCH-GD).
- The indoor relief register relating to 1959-60 is part of a 2009 accession from St Finbarr’s Hospital (formerly Cork county home).
Other records from Cork City and County Archives

Cork City and County Archives also hold a substantial collection relating to the Cork Union Workhouse/Cork County Home/St Finbarr’s Hospital. The collection comprises over 600 individual bound volumes. Files which were of most relevance to the Commission are as follows:

- Cork County Home, Matrons’ Journals, 1927 - 1945
- South Cork Board of Public Assistance Minutes, 1924 - 1942 (28 vols).
- Cork Board of Public Assistance Managers’ Orders, 1942 - 1969 (16 vols - Boxes six to twelve (files 19-36) relate to the South Cork district).
- South Cork Board of Public Assistance files, 1922 - 1960 (158 boxes)
- Records of deaths Cork County Home and Hospital, 1931 - 1940

Health Service Executive Library, Cork University Maternity Hospital

The main sources used from this repository are:

- Folder of Burial Records and Burial Index Card Box, 1968-85 (These records comprise physical Burial Index Cards and a Folder detailing the information recorded on the cards).

St Finbarr’s Hospital, Cork.

- Register of admissions to St Finbarr’s Hospital neonatal unit
- Register of boarded out children
- Admission and discharge index cards

Stranorlar

The HSE is the current owner of what was the Stranorlar county home and gave the Commission access to digital copies of the Indoor Registers of the home. This collection comprised six PDF documents, each a scanned copy of a register, covering the periods:

- 30 January 1921 - 31 March 1932 (179 pages, 4,581 entries)
- 1 April 1932 - 31 Dec 1942 (192 pages, 4,918 entries)
- 1 May 1943 - 30 April 1948 (118 pages, 2,520 entries)
- 1 May 1948 - 31 August 1957 (135 pages, 2,960 entries)
- 1 September 1957 - 31 January 1974 (140 pages, 3,000 entries)
- 1 February 1974 - 31 March 1994 (132 pages, 2,920 entries)
Donegal County Archives

The Donegal county archives have a range of relevant material including:

- Ire-Don-BH-1-19, Minutes of the Board of Health and Public Assistance, 1922-42
- Ire-Don-CC-2: Donegal County Council: Manager's Orders
- CC-17-17: County Home Donegal 1946-53 (Paying orders and building plans)
- CC-30-58: Burial ground correspondence
- CC-30-59: Number of burials 1944-45
- CC-15-4-6: County Council correspondence with Board of Health.
- CC-17-3-11: County Medical Officer Annual Reports
- BH-2-1-23: Board of Health Reports and Correspondence 1933-35

Thomastown County Home

St Columba's Hospital, Thomastown, Kilkenny:

- Combined Indoor Relief Registers 1919-72 (26 volumes).
  The collection of Combined Indoor Relief Registers for Kilkenny County Home, Thomastown, comprises 26 volumes. The collection is largely intact apart from two missing volumes covering the periods October 1930-April 1932 and March 1938-December 1939. The registers were manufactured by Dollard Printing House Dublin Ltd, and each cover a period of 18 months, i.e. April 1941 to September 1942. Each register has 75 pages and capacity to record admission details of 30 individuals per page.
- Record of Maternity Hospital 1959-65 (1 volume).
- Record of Births 1919-65 (1 volume).
- Record of Deaths 1919-62 (1 volume).
- Return of Unmarried Mothers admitted to the County Home 1939-61 (1 volume).
- Half yearly Return of Children in the County Home 1938-61 (1 volume).

Kilkenny Health Records, HSE Library, St Like’s Hospital, Kilkenny:

- Kilkenny Board of Health & Public Assistance November 1921-July 1925.
- Kilkenny Board of Health and Public Assistance July 1925-June 1927.

Kilkenny County Board of Health & Public Assistance Records, Kilkenny County Library.

- Kilkenny Board of Health & Public Assistance Letter Books.
PART 5 ARCHIVES

- Letter Book: Containing correspondence of Miss Fitzgerald-Kenny, L.G.D. inspector regarding Superintendent Assistance Officer, Assistance Officers and Relieving Officers 1929-1934.
- Kilkenny County Council Manager’s Orders—Public Assistance Section.
- MO/PA/2: 1 September 1942-31 March 1944, Orders No.1-1089.
- MO/PA/3: 1 April 1944-31 March 1946, Order No. 1,090-3,144.
- MO/PA/5/ 2 April 1947-31 March 1948. Order No. 4355-5642.
- MO/PA/6/ 1 April 1948-30th March 1949. Order No. 5643-6873.
- MO/PA/7/ 1 April 1949-31 March 1950. Order No. 6874-8166.
- MO/PA/10/ 1 April 1952-31 March 1953. Order No.1-1931.

Vaccine trials

**GlaxoSmithKline**

GlaxoSmithKline provided the Commission with extensive documentation about vaccine trials and clinical trials conducted in children’s residential institutions in Ireland in the period 1930 to 1973.

• GSK, A.H Griffith, ‘Minutes of the Seventh Meeting of the Department of Clinical Immunology, Wellcome Research Laboratories, Beckenham’, 7 September 1971.
• GSK, A.H. Griffith to A.D. Munro-Faure, 3 October 1972.
• GSK, A.H. Griffith to A.D. Munro-Faure, 3 October 1972.
• GSK, A.H. Griffith to H.V Furness, 16 November 1973.
• GSK, Aileen Scott, Medical Director, National Drugs Advisory Board (Ireland) to A. H. Griffith, Wellcome Research Laboratories, April 1973.
• GSK, Alan Goffe to Patrick Meenan, 2 March 1965.
• GSK, B.M. Walker, Glaxo Laboratories, to Dr Eithne Conlon, 29 January 1968.

Where the Commission’s archives will go

As is described in the Introduction to the report, the institutional files of the main institutions were scanned by the Commission and a database of individuals compiled from the scanned copies; the files from Pelletstown were transcribed into that database from an existing electronic records management system. The database of individuals is being provided to the Child and Family Agency (Tusla) in order to assist with tracing. It is also being provided to the Department of Children, Equality, Disability and Youth as part of the overall archive of the Commission.

The notes and photocopies of material which were from a range of archives, including the archives listed above, and national and local newspapers and magazines, are on the Commission’s researchers’ database. This database also includes reports on various archival collections compiled as part of the process of identifying relevant sources. This digital database will be transferred to the Department of Children, Equality, Disability and Youth by February 2021.

The Commission holds transcripts of hearings where witnesses gave evidence under oath (or affirmation) and were questioned by members of the Commission. The witnesses included women who gave birth in mother and baby homes, and children who were born in these homes, members of religious congregations, public servants and social workers. The transcripts record the names and status of all the witnesses, and the date of the hearings. These will be transferred to the Department of Children, Equality, Disability and Youth by February 2021.

The Commission also holds files relating to the Confidential Inquiry, including notes taken during the testimony and personal details relating to the witnesses. Individuals who testified to the Confidential Inquiry are being contacted to determine whether they wish their names and personal details to be redacted before the Commission’s records are transferred to the Department of Children, Equality, Disability and Youth by February 2021.
Recommendations about archives

The Commission has identified a number of ‘challenges and opportunities’ provided by these sources to enhance public understanding.

Department of Health records

Apart from the institutional records of the individual institutions, the largest collection of files examined by the Commission was provided under discovery by the Department of Health in the form of digital copies (see Introduction). The originals are held by the Department of Health or its successor, the Department of Children. The overwhelming majority of these files are over 30 years old. Under the terms of the National Archives Act 1986 they should be publicly available in the National Archives of Ireland (NAI). These files have been listed by the Commission’s archivist. The Commission recommends that digital copies, together with a descriptive list, be made available within six months to readers in the NAI.

Section 8 (c) of the 1986 Act provides for the withholding of files that:

- would or might cause distress or danger to living persons on the ground that they contain information about individuals, or would or might be likely to lead to an action for damages for defamation.

Some files would need to be withheld or partly redacted in accordance with this section. However this process should not be used to delay public access; files should be made available as they are cleared, and the work should be completed within 12 months.

Most of the files that would be withheld/redacted relate to inspections of boarded out children and children at nurse, and the files relating to women who contacted the DLGPH seeking assistance, including many files relating to women who had returned from England from the 1940s until 1961. The files on boarded out children contain important information about the children’s health, physical descriptions, comments about their personality, education, and their foster homes. The files relating to the women contain details about their family and about the circumstances of the pregnancy. The Commission considers that these files should be used to create two databases, by name, one relating to the foster children and one relating to the women. They could be linked with the Commission’s electronic database of individuals where possible (many of the boarded out children were never in mother and baby homes so there would be no connection with the Commission’s database). This information could be made available to the individuals or their immediate family under the normal Freedom of Information and data protection rules.
Industrial school and adoption records
The Commission’s electronic database of individuals could also be expanded by incorporating information collected by the Ryan Commission about the children in industrial schools, records held by the Department of Education about industrial schools and records held by the Adoption Authority of Ireland. This would provide a more comprehensive picture of the longer-term outcomes for children born in mother and baby homes.

Death registers
Consideration should also be given to examining death registration records of the children who were born in mother and baby homes in the 1920s and the 1930s with a view to establishing their age at death and causes of death. In order to achieve a comprehensive picture it would be necessary to also check UK death registers. The purpose of this exercise would be to try to establish some of the long-term consequences of birth in mother and baby homes and being raised apart from one’s mother.

Local authority records
Access to the records of local authorities, which includes the records of county homes, is governed by Section 80 of the *Local Government Act 2001*, which states:

Subject to the other provisions of this section, it is a function of a local authority to make arrangements for the proper management, custody, care and conservation of local records and local archives and for inspection by the public of local archives.

The 30-year rule applies, similar to national government archives, as do provisions for withholding access of files containing information about individuals. Virtually all of the local authority records used by the Commission are over 30 years old. We recommend that local authorities should examine their archives, with a view to identifying all material that is relevant to the issues investigated by this Commission, and they should make these files available to the public, subject to the requirement to withhold or redact some records.

HSE Records
There are no regulations governing the preservation of, and access to, the HSE records or the records of its predecessors in title. The HSE was unable to find many of the records which would have assisted the Commission in finding out more about the institutions under investigation. This should be addressed by legislation requiring the HSE and other State bodies (including, for example, the Child and Family Agency) to records in broadly the same way as local authorities.
Diocesan and religious order records
Diocesan records and the records of the religious orders involved in the institutions are the property of the holders and they have the right to determine who gets access. The Commission was given voluntary access to every diocesan archive which was asked. Two of the religious orders provided extensive documentation under orders for discovery while others provided the limited documentation which they had available. The Commission would encourage relevant religious orders to make more documentation publicly available.

General
The Commission recommends that the Department of Children, Equality, Disability, Integration and Youth appoint a qualified archivist to draft a guide to the records that are of interest to those who have either a personal or academic interest in the history of women and children in residential institutions.
Bibliography

Wherever possible a link to a freely available digital copy has been included. Links were working as of 29 October 2020.
Checking some references for this bibliography has been impeded by the current pandemic as access to libraries was difficult, hence missing details such as page ranges on difficult to access publications.

Summary
The cultural record of the lives of Irish single mothers and their children is surprisingly rich, though there is little direct reference to the Mother and Baby Homes. Literary sources actively contest the official denial of the existence of pregnancy outside marriage in Ireland and frequently criticise dominant social attitudes. Folkloric sources tend to exhibit a greater degree of ambivalence than the official version of Irish culture.

- The most complex and detailed depictions of the dilemmas facing single mothers and their children in Irish society are found in fiction. There is a sustained effort by women writers beginning in the early 1940s to change social attitudes, employing popular genres, gothic, satire, pathos and humour. Despite avoidance of direct criticism of church institutions in most cases, the majority were censored and unavailable in the Republic of Ireland. Key writers for this period are Maura Laverty, Mary Lavin, Mary Beckett and Una Troy.

- There are direct references to pregnant women being sent to 'the Home' in fiction from the 1940s and 1950s, but the writers do not appear to have had any direct information about the experience of Mother and Baby Homes or Magdalene Laundries for the women and children themselves.

- There appears to have been a degree of self censorship in relation to this topic in Irish drama, exemplified by the history of TC Murray's *The Briery Path*.

- Fiction and drama in general promoted the acceptance of single mothers and their children into their own extended families and communities. The references to the banishment of this group to 'homes' and 'convents' by their families or communities in fiction and drama from the 1940s onwards are overwhelmingly negative. The texts indicate that the long term effects of these institutions, especially on children, were beginning to be understood from at least the early 1940s. Mary Beckett is particularly significant in this regard.

- In general the folk song tradition retained a focus on the unjust plight of young women who found themselves pregnant by men who had seduced and abandoned them. Ballads which dealt with this topic remained popular throughout the twentieth century.
Chapter 1
Contexts: Religion, Censorship and the Cult of Purity

The last fifty years has seen enormous change in attitudes in Ireland, to the extent that the views expressed even two generations ago can seem profoundly alien to us in the twenty first century. This is not just the case in relation to attitudes to single mothers or sexuality, but also in relation to the rights of children, the way in which childhood itself was understood, and the very different value put on the bonding process between mothers and babies if they were not part of a legally sanctioned family. Central to understanding these very different attitudes is an analysis of the framing of all official discourse around sexuality, childbirth and child rearing within a rigid religious context on the one hand and the intensity with which the state sought to control almost all forms of cultural expression on the other.

Purity, Piety and Patriotism

It is not possible to disentangle religion and politics as cultural determinants of the ideology of sexual purity in the post-independence Irish state. At the zenith of Catholic influence in the southern Irish state, Pope Pius XI's address to the Eucharistic Congress of 1932 spoke of the 'The Virgin Mary, Queen of Ireland.' The reference would have been immediately recognisable to devout Irish Catholics as an acknowledgement of the ascendency of Catholic doctrine and idolisation of ‘purity' in Irish social and sexual mores. Single mothers and their children were not represented in the official discourse of Irish Catholic nationalism: that ideology insisted that they simply could not exist.

While the prevailing attitudes of the period 1922-1960 seem alien and sometimes comical now, this was a system of belief which had very real and tragic consequences for young unmarried women who became pregnant and for their children. The existence of Irish children outside the institution of marriage was treated as simply unthinkable. Parallel to the national investment in sexual abstinence and the institution of marriage, respectability became a closely guarded commodity at local and familial level. The economic status and viability of a family could be seriously undermined by loss of this commodity. In an example from Northern Ireland, Sara in Sam Hanna Bell's 1951 novel, *December Bride*, eventually marries because her daughter ‘must have a name' in order to marry and form her own family (the novel was inevitably banned in the Republic). While the religious context is different...
(Bell's characters come from the Presbyterian community), the connection between land, family and respectability in a community of small farmers is not. There is a very pronounced class aspect to this, as is also apparent in MacNamara, Lavin, Beckett and Laverty's fiction discussed below. Civil suits taken for redress in cases of 'seduction' and reported in local newspapers specifically sought to put an economic value on this loss of reputation as well as the loss of earnings where the 'seduced' women had worked or assisted in the work of the family farm and business. As historian Maria Luddy has chronicled, the newspaper reports of these cases were paradoxically the most widely circulated representation of the experiences of single mothers and their children, a singular breach in the wall of silence. The level of payments made were too small to serve as a proxy for child support. Instead an eighteenth century legal definition of seduction as a form of theft from the family of the young woman who became pregnant enabled compensation to be sought by her family. This included loss of earnings for the family if pregnancy meant that their daughter could not work, either in paid employment, at home or on the family farm, for the duration of the pregnancy. This did not apply to the more prosperous families, however, and the reparation sought was one for loss of reputation. It seems likely that some cases were taken as a counter to the stories being told about the woman by the father of her child to justify his refusal to marry her.

Censorship and Silencing
The deliberations of the first Irish film censor give a fascinating insight into the evolution of a bureaucracy to impose a culture of silence around childbirth and sexuality in general and 'illegitimacy' in particular. As early as 1923, D.W. Griffith's The White Rose was rejected by the film censor, James Montgomery, on the basis that it was 'a story of seduction wrapped up in unhealthy sentimental twaddle' (31/07/1924). References to illegitimacy and birth control feature prominently in Montgomery's notes justifying cuts and rejections of films. Blossoms in the Dust, a biopic of Edna Gladney, the American campaigner for the removal of the word 'illegitimate' from Texas birth certificates, lost much of its force for Irish audiences when Montgomery insisted on cutting out her passionate, if not exactly liberal declaration: 'there are no illegitimate children. There are only illegitimate parents' (14/11/1941).
While the views of the Official Film Censor's office must be understood as an extremely narrow version of Irish cultural attitudes, it is important to note that it was the official version of those attitudes and perceived itself to have public as well as clerical support. As such it was a powerful indicator of a state which considered it both distasteful and un-Irish to discuss sexuality or even childbirth. Montgomery considered even a scene in 'a taxi on [the] way to lying-in hospital' as is 'too intimate for general exhibition' in Ireland (30/9/1936).

Parallel to the development of state control over cinema, the Censorship of Publications Act (1929) created a censorship board which sought to control the sale and distribution of literature via a notoriously broad definition of obscenity. This censorship was routinely evaded by those with the resources to do so, but it impacted heavily on those depending on library borrowing. Censorship of publications was closely linked to the control of population, especially the suppression of individual control over reproduction.

Any representation of the reality of sexual and reproductive life was understood as a foreign assault on pure, devout Ireland and the Register of Prohibited Books became, as one wit put it, the Everyman's Guide to the Modern Classics. The Department of Justice admitted in a memo in 1966 that the board was particularly prone to ban Irish writers and the next chapter demonstrates how fiction that dealt directly with the experience of single women and their children fared under this regime.

Chapter 2
Cultural Representation of Single Mothers and Their Children
Fiction: Seduction, Cruelty and Survival

New Women, Naturalism and Modernism, 1894-1922
The 'New Woman' fiction of the late nineteenth century, while often focussed on questions of education, employment and equality in marriage, also began to open up discussion of women's sexuality and pregnancy outside marriage. George Egerton (Mary Chavelita Dunne), disowned by her own family for her affair with an older married man, forged an international literary career in the spaces between the emergence of the 'New Woman' and the development of modernism. Her stories deal with domestic abuse, abortion and prostitution as well as the active
choice of single motherhood. The fiction of this period can seem much more contemporary in its attitude to gender and sexuality than material from the mid-twentieth century. Unusually among the Irish writers who wrote on the subject, Egerton was herself a single mother.

The best known Irish nineteenth century novel about the travails of a single mother and her child is George Moore's *Esther Waters*. Moore wrote in a self consciously naturalistic style about the life of a young servant girl, seduced by a fellow servant, who abandoned her when he had a chance to elope with a wealthier woman. The novel is scrupulous in its attention to the economic dimension to Esther's plight and the cruel dilemmas presented to an unmarried working woman who chooses to keep her child. Dismissed from her position when she can no longer hide her pregnancy, the only work Esther can get is as a wet nurse to a wealthy woman's child. To feed this child, she has to commit her own baby to the tender mercies of a local baby farm. It seems unthinkable to us now, but the insistence of Esther's employer that she cannot keep and feed her own baby due to a fear of infection was not uncommon in the period. Realising quite quickly that her baby has little chance of surviving this arrangement, Esther has no option but to seek admission to the local workhouse. This being a novel, despite Moore's intense realism, she finds alternative childminding and employment prospects at the last minute. Thereafter she moves from job to job, frequently almost worked to death or dismissed from her post when the existence of her son becomes known to her employers. Disastrously, Esther eventually marries her initial seducer, giving up the alternative marriage she had desired in an attempt to rescue her son from the stigma of 'illegitimacy' and to secure his future.

The novel which would become a by-word for the attitudes of small town twentieth century Ireland was published before the establishment of the Irish state. Brinsley Macnamara's 1918 novel, *The Valley of the Squinting Windows*, tells the sorry tale of the destruction of two generations by the stigma of illegitimacy, situating the problem very much within an analysis of the class micro-distinctions of small town Ireland. Macnamara's bleak novel tells the story of Nan Brennan, who having aspired to marriage with a comparatively wealthy farmer falls pregnant by him and is then subject to a quite deliberate effort on his part to ruin her reputation: ‘Nan thought of how Henry Shanahan had failed to marry her after he had ruined her; of how the disgrace had done no harm at all to him with his money and his fine farm.
Then there was the burning thought of how he had married Grace Gogarty, the proudest and grandest girl in the whole parish.' Nan has assumed that their child died, but it transpires that he has been secretly adopted by his father to replace the 'legitimate' stillborn baby he has had with his new wife: 'It seemed less of a crime that the little innocent babe should have been murdered in this house and buried in the garden than that her old, dead mother should have sold it to Henry Shannon. And how was she to know?'

Nan initially emigrates in the novel, returning to inherit her parents' house and land with a new husband and son in tow. Unlike her first lover, however, she is never allowed to forget her past and her marriage is destroyed by gossip as soon as she returns home. A bitter woman, Nan is as judgemental of others as they have been of her. Her one consolation is her son's aspiration to be a priest, a possibility which makes her the source of much local jealousy and the target of threats to reveal her past to her son. The rural community portrayed by Macnamara is vicious in the extreme. The priest effectively acts as an enforcer of a moral code which protects the interests of the more prosperous members of his flock and enables sexual exploitation. Nan's second son, John, forgets his clerical ambitions when he falls in love with the local schoolteacher, Rebecca, who is in her turn seduced and abandoned by his half-brother. The tragic inevitability of the denouement is very much influenced by the ideas of Ibsen, but with sharp, detailed local elements. Rebecca is pressured by the priest who forces her to leave the town (and her job) to hire a car (which she can't afford) to the station. For this she is charged the extortionate sum of £1 from the meagre £5 that is all she possesses, a gift from the local schoolteacher, the only sympathetic character in the novel. It is not coincidental that Macnamara's father was himself a teacher in an Irish village, the inhabitants of which recognised too much of their locale in *The Valley of the Squinting Windows*. Vindicating Macnarma's pessimism, they retaliated by throwing stones through the windows of his father's schoolhouse and burning copies of his novel. Quite apart from the power of its naturalist prose, the novel is striking for several reasons. It represents pregnancy outside marriage as a recurrent feature of Irish village life, a high degree of ambivalence if not acceptance of infanticide as a way of dealing with the problem, the connivance of the church in secret adoptions and the crucial role of class in determining how both mothers and babies were treated in these circumstances.
The exposure of the economic injustice which compounded the sexual double standard in Moore and Macnamara’s representations of single mothers remains a key concern of later twentieth century realist approaches to the same subject. Mary Lavin’s story, ‘Sarah’, which appeared in *Tales from Bective Bridge* in 1943, is very much in this tradition. It is brutally clear about the factors which propel Sarah from relative social acceptance as a mother of three sons outside wedlock to death in a ditch giving birth to her fourth child. When the story opens, she ‘has a bit of a bad name’, but is regarded as ‘unfortunate, that’s all’. A ‘great worker, strong and tireless’, Sarah works as a cleaner for many of the local women while also keeping house for her two ‘rough’ brothers and three children. Her brothers’ habitual tolerance of their sister’s situation is motivated by self interest: “The priest said a Home was the only place for the likes of her. I said we would have no part in putting her away - God Almighty, what would we do without her? There must be a woman in the house.” The spectre of clerical interference and incarceration hovers over Sarah as her brothers contemplate her fourth pregnancy, taking into account the possibility that her existing sons can soon be ‘put out to service’. The rural Ireland portrayed in this story is a place with no glimmer of affection or hope. Despite their pity for the ‘unfortunate’ Sarah, married local women are careful to keep her away from their husbands and warn newcomer Kathleen Kedrigan to avoid her. As a demonstration of her superior faith in her own husband, ‘goaded on by her legitimate power over her man’, Kathleen hires Sarah to keep house when she has to attend a clinic in Dublin. The story is characteristic of Lavin’s externalisation technique, but also enigmatic to avoid censorship. We never know what motivates Sarah or how willing a partner she is in the sexual encounter which leaves her pregnant with Oliver Kedrigan’s child. This time Sarah does not submit in silence as she has previously done. She writes to Kathleen, identifying Oliver as the father of her child, with disastrous consequences. Kathleen informs Sarah’s brothers, who react violently, throwing the heavily pregnant Sarah out of the house on a terrible night. The eldest brother, Pat, comments that he wasn’t going to stand for her: ‘Carrying on with a married man! No one is going to say I put up with that kind of thing. It was different the other times when it was probably old Molloy or his like that would have been prepared to pay for his mistakes if the need arose.’ Pat’s diatribe indicates that social standing and economic advantage, not kinship, are his overwhelming concerns and the key motives underpinning this society. Sarah is left to give birth alone in a ditch and to die
in appalling conditions with her newborn child.

In contrast to the bleak picture of Irish society presented by Macnamara and Lavin, Maura Laverty's 1942 novel *Never No More* is a warm, nostalgic portrait of a young girl, Delia, growing up in the nineteen twenties in the home of her beloved Gran in the little village of Ballyderrig. While the novel is full of lyrical affection for the place, the villagers and their way of life, it includes several stories of the difficulties facing single women and their children. Pregnancy outside marriage is not presented as a rare or tragic occurrence, but part of the normal life of the people, with which families and individuals come to terms and from which they move on to ordinary lives. Ballyderrig is home to another unfortunate Sarah, a young woman who supplements her income from doing 'heavy washing' and casual labour by 'one of the oldest professions in the world'. The narrator notes that 'Ballyderrig's attitude to Sarah was surprising', but the women of the village stop and chat when they meet her and regularly employ her: 'Even those who turned with horrified loathing from any young girl who anticipated her marriage by a few months, never shunned Sarah'. Sarah's eldest child does die in the course of the novel, but the emphasis is on the kindness and support of the community, led by Gran, for both mother and daughter. In an enthusiastic and very shrewd introduction to the 1984 Virago edition of *Never No More*, Maeve Binchy noted the element of wish fulfilment fantasy in the novel, which differed significantly from Laverty's own childhood experience, though she presented it as autobiographical fiction.

The story of another single mother, Bids Smullen, gives a fascinating insight into the social role of the IRA's district tribunals during the War of Independence. These tribunals, unlike the formal courts that came later, actively pursued the fathers of children conceived outside wedlock, though their solution, according to the novel, was the imposition of forced marriages, not maintenance payments. In Bids case a member of the tribunal which has already forced her errant lover to flee the country for theft eventually marries the girl himself. Interestingly, in this case the fate of the child is not explicit, though an adoption by her married sister is implied: 'Bids Smullen went to stay with her married sister in Portarlington. She returned to us six months later, shyer and quieter in her manner, but otherwise unchanged'.

A positive resolution is even offered to one of the most startling and disturbing
episodes in the novel, which deals with child abuse: ‘all Ballyderrig was horrified to hear that fourteen year old Nellie Mack, of the plaits and white pinafore, was going to have a baby. The horror was changed to fury when it was learned that the father was old Mr Graham. And all that terrified Nellie could sob when questioned was, ‘He promised me a bicycle. He promised me a bicycle!’ Her rapist escapes the lynching threatened by the men of Ballyderrig by collapsing into insanity and ending his days in the asylum in Carlow. The novel is scathing about the ‘diabolical cruelty’ of her aunt who blames Nellie and it is implied that the beating she gives the girl contributes to the baby being stillborn. 'Soon after that, Nellie Mack was sent away to some convent for fallen women in Dublin'. This is one of very view direct references to Magdalene laundries in Irish literature prior to the nineteen nineties and it is significant that this is the outcome for the youngest, most powerless and abused single mother in the novel.

Mary Beckett' short story, 'Theresa', appeared in the liberal modernising magazine, *The Bell*, in 1951. ‘Theresa’ tells the story of a young woman who enjoys a wartime romance with an American soldier stationed in Northern Ireland. Beckett wrote primarily of Catholic nationalist Belfast life, so there are significant areas of overlap with Lavin, Laverty and Troy, but the historical and political contexts of her characters are different. When Theresa discovers she is pregnant, she is exasperated with her mother’s reaction: ‘Oh, don’t go on like that. I'll have the baby in the hospital and then I'll leave it in the home and then I'll be back at work the same as I always was’. We later find out that work is a key concern here. Theresa's mother has worked cleaning houses and struggled to raise her family while her husband was long term unemployed before the war. Theresa finds that when the baby is born her feelings towards her child are very different, though they are complicated. She is puzzled to find that her daughter is black: she has not perceived her soldier lover to be black at all. The story presents Theresa as very naive, well intentioned and frightened. The protectiveness she feels towards her baby is exacerbated by anxiety about how the little girl will be treated: ‘how could she keep the child safe from people who would jeer at her for being a n____?’ She calls the baby Deirdre after the nurse who delivered her, but the name invokes the legendary Deirdre, the most beautiful and most sorrowful of women in Irish legend. Trying to make plans to combine work with looking after the baby, Theresa thinks: 'she would have to be watching her all the time for fear anyone would harm the child.' When Theresa's own mother initially recoils and tells her she can't bring Deirdre home, Theresa tries to persuade her that the nuns won't take a black baby.
The grandmother quickly relents, but Theresa is so frightened by the initial hatred and rejection of Deirdre that she decides her baby 'would be safer in the Home'.

A puzzling episode brings this anguish to an end. The new parish priest makes an appeal from the altar for the 'girls from this parish' who had babies during the war to retrieve these children from the local orphanage where, no matter how well the nuns are caring for them, they lack a mother's love. There is nothing like this represented anywhere else in the literature. Beckett may be trying, like Laverty and Troy, to conjure up a more compassionate form of Catholicism in her fiction and assert that religion and single parenting are not incompatible. This kind of reforming project in fiction is very much in keeping with the ethos of The Bell. The story, like Maura Laverty's Never No More, represents single motherhood as a relatively common occurrence. Theresa's difficulties derive primarily from her fear of racism rather than her fear of scandal and gossip, though the economic challenges of raising a child on her own push her into a marriage for which she has little enthusiasm.

Mary Beckett's stories from the nineteen forties and fifties anticipate issues which were to later become key topics of public debate. 'Ruth' was published in the first issue of the highly influential Belfast journal, Threshold, in 1957. Once again, Beckett sets the story of pregnancy outside marriage within an intergenerational and communal context, tracking the consequences through the generations and across family relationships. The twenty year old Ruth has already run away from her grandmother's house when the story begins and the tale is told from the perspective of two gossiping neighbours and Ruth's grandmother, Mrs McGreevy, who pours out her grief and guilt to them. Ruth is the daughter of a young intellectually disabled girl who became pregnant, died in childbirth and whose family put the baby in an orphanage and denied her existence for eleven years. Mrs McGreevy eventually has a change of heart and brings Ruth to live with them, but the family does not recover from the double shame in their society of having a daughter who is intellectually disabled and a granddaughter who is illegitimate. 'Wee cold Ruth' has never recovered from the time in the orphanage, unable to do more than stiffly shake her grandmother's hand when she arrives: 'she's poor ... and empty and how is she to know what is love or friendship'. Mrs McGreevy laments her own lack of demonstrative affection for the child, who 'gave no trouble ... but she gave no happiness either and I don't think she got any herself from us'. It is tempting to regard the story as a precursor to the
nineteen sixties and a reflection on the consequences and legacies of Irish attitudes which continued to have repercussions but which were beginning to be challenged.

Una Troy (who also wrote as Elizabeth Connor) published *We Are Seven* in 1955 with William Heinemann Ltd (proudly boasting its operations in London, Melbourne and Toronto on the novel’s title page). The blurb neatly and humorously sets out its challenge to any preconceptions of Irish rural life. ‘In the townland of Doon in County Waterford live the Monaghans, a source of delight to themselves, but a blot in the eyes of the sterner inhabitants of the parish. Bridget Monaghan is the proud mother of seven, but the various men who should be filling the role of proud fathers are instead skulking nervously in the background, and even join forces in a plan to resettle the Monaghans. But they reckon without Mary, Tommy, Willie and Sissy (the twins), Pansy, Toughy and Pius - seven characters in search of a father!’ This humorous tone is maintained throughout, though the novel hints at darker realities. The daughter Mary knows, however, that ‘they were despised for what in others might have been admired, but in the Monaghans was adding insult to injury’ in the view of their neighbours. When the twins sit a scholarship exam to attend secondary school it left: 'even the best-intentioned neighbours bereft of Christian charity ... There was a universal, but faint, hope that they might fail'. When they succeed: ‘The injustice of the world was recognised anew. Better children than these - children whose right to exist was indisputable - must be content with the schooling the State gave them up to fourteen’. Similarly ‘when it became known that Tommy Monaghan was dying from peritonitis after an operation, everyone was very sorry ... But it was considered quite time for God to have visited Bridget Monaghan with some trouble that wasn't of her own making’. Tommy survives, partly due to his previously miserly father paying for an expensive nursing home. There is a fairytale quality to the eventual good fortune of all the children, but the novel mentions that Mary, the eldest of Bridget's children, did not even sit the scholarship exam as she was too involved in bringing up her younger siblings. Bridget is a good provider for her household, but not necessarily a good mother to her children in the traditional sense.

Under the pretext of concern for 'the poor children', the deplorable Mrs Bates involves the local sergeant, pointing out that, 'Children that aren't properly cared for
are taken and sent to Industrial Schools. Children under fourteen. Bridget Monaghan mightn't wish to stay here if her children were taken from her. This is one of a series of events in the novel which raise the possibility that the Monaghans could fall victim to one of the tragic fates which nineteen fifties Ireland in reality so often visited upon single mothers and their children. In each case this fate is averted and the story transforms tragedy to comedy: 'It was unfortunate for those most deeply interested in the Monaghan case that their District Justice should be a man whose sense of humour approximated to the authentic and rather broad type of Gaelic culture so much deplored and condemned by the decent, modern Gael'. The Justice, justifying his title, and the Sergeant, representing the State, reflect on the case which concludes with the former sending the children home. The judge is quite clear that Bridget has been unjustly treated. He 'objected to the attempt to make him a tool to eradicate the consequences of erring respectability. "They're nice children," he said. "They're all right," said the Sergeant. "The only thing anyone has against them is that they shouldn't be there at all."

The story of Bridget Monaghan and her children is based on the real life case of Mary McCarthy, a single mother of seven who lived in Marlhill, County Tipperary. She was subjected to an arson attack in an attempt to get her to leave the area in 1926 and eventually murdered in 1940, possibly to avoid her naming the father of her seventh child, who died in infancy. Troy's father, Sean, was the local district justice who rejected applications to send Mary's children into institutions on two separate occasions. Mary McCarthy's story is now most often remembered for the miscarriage of justice which saw an innocent local man, Harry Gleeson, hanged for her murder.

Both Laverty and Troy had significant success outside Ireland which might have exacerbated the censor's antipathy to their work. Both portrayed single mothers and their children as part of rural Irish society, vulnerable and subjected to prejudice, but surviving and in most cases capable of making decent lives for themselves against the odds. This seemed to be much more offensive to the sensibility embodied in the censorship process than the representations of pregnancy outside marriage as a catastrophic exception leading inevitably to misery, ruin and death which is evident in Lavin. A key factor in slipping stories of single motherhood through the censor's net appears to have been conformity to the
paradigm of death and destruction as the inevitable outcome of pregnancy outside marriage. This factor may explain why *Never No More*, full of affection and nostalgia for the rural Ireland which the state purported to cherish, was banned, while 'Sarah', a bleak portrayal of a rural Ireland populated by the vindictive and miserly, was not censored. Representing single mothers and their children as simply part of Irish life, with aspirations and the possibility of viable lives outside the strictures of secrecy and separation in adoption or institutionalisation, was intrinsically subversive.

**Drama**

Irish theatres enjoyed an anomalous position, which is illuminating in relation to the class bias of censorship. The theatre was not subject to official censorship, though it did periodically attract expressions of disapproval from church, state and public that included subtle pressure, bad reviews, letters to the paper, riots and demonstrations. In January 1914, TC Murray read excerpts from his tragic drama, *The Briery Path*, to the National Literary Society in Dublin. The play dealt with the subject of a young, unmarried, pregnant woman, driven to suicide by denunciation from the altar and abandonment by her lover. Murray was a school teacher in a rural community at the time, a married man with five children, and his terror of his clerical manager was such that he pretended he was reading someone else's play. The play finally reached the Abbey in 1948, when it was staged by Ria Mooney's Experimental Theatre Initiative. The review in the *Irish Times* failed to mention the subject matter of the play. The strange history of *The Briery Path*, which would be re-invented as an attack on the prohibition on contraception in another 'experimental' initiative in 1973, indicates how much self-censorship and self-protection was involved in the choice of topics in the apparently unregulated theatres and explains why so few plays dealt with the topic prior to 1960. *The Briery Path* is only a moderately well written play, but the Abbey's experimental wing kept returning to it when it sought to break the taboos on single motherhood.

During the 1950s, a battle was going on for control of Irish culture, with Archbishop McQuaid initially gaining control of the Censorship of Publications Board via the Knights of Columbanus. It was still a long time before the existence of single mothers and their children was fully acknowledged by the Irish state and an uncontroversial topic in Irish culture. Drama would be a significant factor in that process. Mairead Ni Ghrada's *An Trial* (1964) was revolutionary in its attempt to
deal directly with the experience of a 'Home', the 'House of Refuge', which is obviously based on a Magdalene Laundry. Like some of the earlier writers discussed here, Ni Ghrada was careful to avoid a direct attack on the role of the Catholic Church, though those on trial in the play for their part in the tragedy of Maire and her child's deaths represent almost every other aspect of Irish society. Premiered in the Dublin Theatre Festival in 1964, it was a mature work from a writer, broadcaster and language activist who was a veteran of Cumann na mBan and was imprisoned for her activities during the War of Independence. Ni Ghrada was very close to the heart of the Irish state and a significant contributor to RTE. She was also, by 1964, extremely disillusioned with the treatment of single mothers and with the sexual double standard that applied in rural Ireland. Ni Ghrada begins and ends the original Irish language version of the play with the song Siuil a Ghra, a folk song featuring the seduction and betrayal of a young woman. In doing so she situates Maire's story firmly within Irish tradition. Writing in the Irish language, she had resources within the folk tradition to draw upon, but also a degree of protection from the accusation of being anti-Irish in depicting a situation which was so regularly denounced as intrinsically un-Irish. Maire's exploitation by a married teacher, her family's rejection, her incarceration in the House of Refuge, her inability to find work are all chronicled and Irish society is held responsible when she kills her child and herself. Even in death Maire and her child are ostracised:

Nach uaigneach an tsochraid a bhí aici.
An Bheirt acu in aon chónra!
Ba bhrónach an radharc é!
Go bhfóire Dia ar an gcréatúr.
Trócaire go raibh ar a hanam.

The English language version reads:
‘Tis a lonely life she had, a lonely funeral after she was dead
‘Twas a sad funeral, the two of them in the one coffin.
The two of them going out of life together without plume or a hearse or anything.

In many respects, An Trial! expands the story told over 20 years earlier in Mary Lavin's 'Sarah'. Both draw on the folkloric tradition of songs and stories of doomed single mothers and their children.
The Folk Tradition: Song, Tale and Memoir

Songs dealing with the tragic fate of single mothers were highlights of the repertoire of two of the most influential women folk singers of the twentieth century, Elizabeth (Bess) Cronin and Sarah Makem. Cronin's revered rendition of 'Lord Gregory' (a version of 'The Lass of Aughrim') creates a link back to the use of the song in the "Dead", a short story by James Joyce, which indicates that the experience of single pregnant women was a central part of the folk culture which Joyce and Irish modernism so ambivalently drew on. Cronin's repertoire and rendition of folk songs had a substantial influence on the folk revival of the 1960s and 1970s. Folk songs and folklore function on one level to re-enforce social norms, on another level to vent frustration at those norms. Cronin's version of 'Lord Gregory' has a complex moral framework. On the one hand, the 'lass' who sings of her troubles has no prospect other than a lonely death along with her child after her seduction and abandonment. The cause of her 'downfall' is identified with the gentry class and by extension the English invaders. In an interesting reversal of the usual gender roles, dangerous sexuality is identified with both masculinity and foreignness. The class disparity between the protagonists is also a very significant part of the tragedy.

In contrast, the protagonists of 'The Butcher Boy', from Sarah Makem's repertoire, are both young people of humble origin. The song was hugely popular into the late twentieth century and appropriated as the title of Patrick MacCabe's 1992 novel and Neil Jordan's renowned film adaptation of that novel in 1997. The transmission of Sarah's repertoire through her son, Tommy Makem, a key figure in the folk revival, undoubtedly contributed to its prevalence in the folk song and ballad repertoire of the late twentieth century. The song's repetition of the key cultural trope of pregnancy outside marriage as a catastrophe which can only be remedied by death undoubtedly contributed also. The young woman in the song wishes 'in vain' that she was a maid again. This being impossible, she moves on to 'wish my baby it was born/ And smiling on its daddy's knee/ And me poor girl to be dead and gone/with the long green grass growing over me'. The song shifts into the third person when she is found hanging with a note pleading:

    Oh, make my grave large, wide and deep
    Put a marble stone at my head and feet
    And in the middle, a turtle dove
    That the world may know, that I died for love.
Sean O'Cuíomhthainn's account of the lives and culture of the former Blasket Islanders who moved to the mainland adopts a tolerant and even comic tone about pregnancy outside marriage. Lá Dár Saol presents rural, Irish speaking society as much more tolerant than the mainstream of Irish society in 1969. The memoir tells the story of the successful efforts of a local mother to overcome the objections of his mother to the father of her daughter's child marrying the girl. The dominant forces in the story are the two mothers. It is the mother of the girl who eventually prevails:

“Féach ní héinne atá marbh. Nach teaspach an cúram go léir, agus aon tigh go bhfuil bean óg agus clann óg tagtha isteach ann, dar ndóigh, ní fhéadfadh san a bheith amhlaidh gan rath Dé a bheith ar an dtígh sin.”

The English language version,

"Look, it isn't dead anyone is. Wasn't it only heat of the blood was the cause of all, and if a young woman and her child move into any house sure it couldn't happen unless God's blessing was on that house?"

The upshot of all the commotion is that the priest is sent for: 'They made a great wedding day of it in Buailtin'. This perception of the young woman and her child as a sign of God's blessing is very much at odds with the dominant representations of Irish traditional beliefs around this issue, but it is worth remembering that Sean O'Criomhthainn was much closer to that tradition than many of those who wrote about it. He was also writing at the end of the 1960s, when cultural change was very much in the air and his account was unlikely to be considered scandalous.

There is further evidence that a greater degree of ambivalence is evident in the Irish folk tradition than in the attitudes of Church and State. Anne O'Connor notes the very different inflections of the moral status of the single mother in the dark legend of 'Petticoat Loose', with its intimations of monstrous sexuality, on the one hand and the folktale referred to as the Mary Magdalene story on the other. The latter, collected by Sean O'Dughda in 1958, condemns the judgemental attitude of a priest who refuses the last rites to a single mother and is forced to do penance for his severity. It is worth noting that the central role of the 'Schools' Project in collecting Irish folklore in the 1930s intrinsically limited the types of material collected to that which parents and grandparents
considered suitable for children's ears. Consequently and not accidentally, the folklore record for beliefs in relations to pregnancy, childbirth and sexuality are scarce. There are references which give credence to Macnamara's description of communal complicity in or ambiguity around the infanticide of newborn infants of unmarried women. ‘They say that Moll Garvaun used to sleep with her eyes opened. That only happens to women who kill their child, a garlach [illegitimate child], you know,’ recounted a school child in Croom in the nineteen thirties. Daithi O'Ceanntabhail, the teacher who collected the Croom reports, seems to have been open to recording lore around ‘illegitimate’ children. A longer story points towards a high degree of communal ambivalence towards infanticide in such cases, complicated by a desire to avoid any entanglements with the law:

I'm telling you nothing but what's the truth, I have it from old Paddy. He said there did a woman live at Boherabassy and she did away with her (illegitimate) child. She buried the child under a shallow sod on Ardthreeevesa.

Old Paddy was going to work to Croker's (In Fort Elizabeth, properly Garrane, Manister Parish) and he found the fresh red sod. He turned it with his spade and found the dead child under it. He covered it up and left it so, for he didn't want to have to be giving evidence, and he said let somebody else do that.

He knew who owned the child (i.e. who was its mother) and he didn't want to get her into any more trouble than she was in, and so he held his tongue. I often heard him say that he saw that woman afterwards doing public penance in a big white sheet, behind here in Croom”.

These stories may explain the association of 'illegitimate' children with the uncanny and supernatural in some of the piseogs and stories, such as the Hungry Sod/Fod Ghorta, the spot where an illegitimate unbaptised child was buried secretly: ‘If a person happens to stand on this sod he is seized with hunger and weakness.’

**Conclusion: Legacies**

There is a considerable difference between the cultural representation of single mothers and their children and the historical realities of their experience in the twentieth century. This is not a uniquely Irish difference, but it was compounded in the Irish case by a particularly rigid regime of censorship in relation to fiction and film. This regime of silence entrenched attitudes, making single motherhood
appear much more aberrant and unusual than was the case.

Culture is profoundly shaped by what is unsayable within it. There were brave voices who challenged the regime of silence around single mothers and their children. There were far more examples of covert engagement with these issues, through displacement onto other places and times, from folk songs to ghost stories. Above all though, the mainstream of Irish culture was deformed by its refusal to talk about what happened to its most vulnerable citizens. The refusal to accept that Ireland was just an ordinary country of ordinary human beings, neither especially pure nor especially sinful, contributed to punishing regimes around sexuality and fertility. Understanding the ways in which single mothers and their children were rendered outcast and invisible by official culture in Ireland is crucial to coming to terms with the legacy of that culture.

Many people helped in the compilation of this report. The following made a major contribution.

The witnesses
The Commission is particularly grateful to all the witnesses who gave evidence and especially to the former residents whose contributions are an essential part of this report. Thanks are also due to the local people who assisted in relation to the sites being investigated.

Direct contributors
The Commission wishes to acknowledge the direct contributions to this report of:
Dr Patricia Crowley FRCOG, FRCPI (maternal deaths, Chapter 33)
Dr Colm Costigan MRCPI [Edin] paediatrics, FRCP[C] paediatrics (infant deaths Chapter 33)
Liam Delaney and Mark McGovern (Death statistics – Chapter 33 A)
Rita McCarthy (Kilrush – Chapter 16)
Róisín Lacey SC (vaccine trials – Chapter 34)
Petronella Bakker (the Netherlands – Chapter 37 A)
Janet Greenlees (Scotland – Chapter 37 B)
Niamh McCullagh and her team (Chapter 38 A)
Geraldine Meaney (Cultural representation of single mothers)
Julitta Clancy (Index)

People who helped the Commission to find information
Many people helped the Commission to find information notably:
Archivists in the National Archives of Ireland, in the local authority archives and diocesan archives mentioned throughout the report. All the archivists involved were exceptionally helpful and enthusiastic.
Staff in the National Library
Staff of the General Register Office (GRO)
Staff of the Child and Family Agency (Tusla)
One Family (formerly Cherish)
Denis K. Bergin FSCSI FRICS Reg.Val. for bringing the existence of Air Corps aerial photography to the Commission’s attention.
Church of Ireland Representative Church Body Library
The Gardaí in Tuam and Roscrea were essential for the Commission's investigations into the burial sites.

**A number of lawyers:** The Commission had no full-time lawyers. Donal McGuinness BL was involved in many aspects of the Commission’s investigation particularly the investigation into the Tuam site. Other lawyers who provide services: Ellen Gleeson BL, Conor Feeney BL, John Healy SC.

**The Department of Children of Youth Affairs**
Commission staff

The Commission is very grateful to all its staff who, in spite of having to work with difficult material, managed to be enthusiastic and good-humoured throughout.

The following is a list of the staff who were with the Commission for a substantial period.

**Commission members**
Judge Yvonne Murphy
Professor Mary E Daly
Dr William Duncan

**Director:** Ita Mangan
**Solicitor:** Maeve Doherty

**Senior historical researchers:** Dr Brian Casey, Dr Michael Dwyer, Dr Marie Léoutre, Dr Richard McElligott, Dr Conor Reidy (2015-2016)

**Principal Legal Researcher:** Dolores Sullivan BL
**Junior Counsel researchers:** Sarah Lea BL, Meg McMahon BL
**Documentary Junior Counsel:** Jeffrey Horahan BL, Victoria Kilfeather BL, Kim McDonald BL, Charles Murray BL, Mark Ryan BL.

**Other researchers:** Sarah Brennan, Darragh Buckley, Lisa Capelli, Emma Courtney, Maeve DeSay, Ann Devlin, Dara Dooge, Catriona Fyfe, Deirdre Lawless, Niamh Malone, Jeffrey O'Connell, Conor Rock, Michael Tyndall.

**Archivists:** Claire O'Flaherty, Hanne Sheeran

**IT Consultant:** Paul Boland

**Confidential Committee**
**Members:** Kevin Healy and Lucy Scaife
**Senior researcher:** Dr Roni Buckley
**Witness Support Officer:** Nora Ni Dhomhnaill
Administrative staff
Office Manager: Vera McGrath (2015-2016)
Corporate Services Manager and Finance Office: Fergal Somerville
IT Manager: Liam Preston

Other administrative staff: Mary Ann Earls, Damien Griffin, Ciara Murray, Laurence Ogle, May O'Reilly, Martina Regan–McMyler, Ciara Hughes.
