Through the institutional records, the Commission identified 43 deaths among women admitted to Pelletstown: representing a mortality rate of 0.29%. The majority of deaths occurred in Pelletstown/Dublin Union/St Kevin’s Hospital. Thirty deaths were not associated with pregnancy or childbirth - they were, in the main, due to tuberculosis, dysentery, pneumonia and cardiac failure. Five deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy and generally resulted in cardiac failure. Eight deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were mainly due to nephritis, pulmonary embolism, postpartum haemorrhage, septicaemia and peritonitis. Adhering to WHO guidelines the maternal mortality rate in Pelletstown was 0.08%.  

Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. [https://www.who.int/healthinfo/statistics/indmaternalmortality/en/](https://www.who.int/healthinfo/statistics/indmaternalmortality/en/)
The Commission identified 18,829 children who were admitted to Pelletstown. Information relating to date of birth/admission was available for 18,338 children (97.39% of births/admissions) in the years 1920-1999. The available records show that 83% of children born in or admitted to Pelletstown were ‘illegitimate’ and almost 9% were ‘legitimate’; it was not possible to establish the status at birth in the remaining cases.

In the 1920s, 259 children on average were born in or admitted to Pelletstown annually; this increased to an average of 290 per year in the 1930s. Although 365 children were born or admitted in 1941, numbers declined steadily until 1956 when 106 children were recorded. Births and child admissions began to increase again from 1957 and peaked in 1973 when 420 children were recorded. Numbers decreased steadily for the remainder of the 1970s and
more rapidly from the early 1980s. By 1986, just 66 children were born or admitted to the home and this number decreased to 39 in 1998.

Analysis by decade shows that more children (19.7%) were born in or admitted to Pelletstown in the 1970s than any other decade followed by the 1960s (19%); 1930s (15.8%); 1920s (14.1%); 1940s (12%); 1950s (8.2%); 1980s (8.2%) and the 1990s (3%).

The available information shows that 68.1% of children were admitted to Pelletstown accompanied by their mothers; 31.3% were admitted unaccompanied and 0.6% were accompanied siblings admitted with their expectant mothers.
Of the 5,888 children admitted to Pelletstown unaccompanied 3,203 were recorded as ‘illegitimate’ and 1,441 were recorded as legitimate. The status of the remaining 1,244 unaccompanied children was not recorded.

The 5,888 children admitted to Pelletstown unaccompanied by a parent account for 31.3% of all child admissions. Some of these children were recorded as ‘foundlings’ or ‘abandoned’. Others were brought to Pelletstown by nurse mothers when their fostering fee ran out or were brought by local authority health visitors. From 1920 to 1941, the proportion of unaccompanied children admitted to Pelletstown fluctuated between a high of 54.7% in 1920 to a low of 27.3% in 1939. From 1942 to 1957 the proportion of unaccompanied children was significantly lower and stood at just 4.7% in 1952. Numbers increased significantly in 1958 and accounted for 50.3% of admissions that year. Unaccompanied child admissions peaked in 1960 (57.2% of admissions) and remained broadly on par with accompanied child admissions until 1964. This increase coincided with the Department of Health’s decision to discontinue the practice of housing children with physical or congenital disabilities in county homes for extended periods. The leading cause of death in Pelletstown in the 1960s was spina bifida, which suggests that a significant number of unaccompanied children admitted in that period were children born with congenital debilities. Although general child admissions to Pelletstown increased significantly from 1965, the proportion of unaccompanied children began a staggered decrease until the late 1980s. Although representing 14.1% of admissions in 1985, by 1988 unaccompanied children accounted for 77% of admissions. From the mid-1990s unaccompanied children accounted for around 1 in 4 child admissions.
Analysis by decade shows that more unaccompanied children (41.5% of admissions) were admitted to Pelletstown in the 1960s than any other decade followed by the 1920s (41.3% of admissions); 1930s (33.9% of admissions); 1970s (19.6% of admissions); 1940s (24.6% of admissions); 1980s (29.7% of admissions); 1950s (23.8% of admissions) and the 1990s (39.2% of admissions).
Children born in or admitted to Pelletstown in the 1920s spent 301 days on average in the home. By the 1930s, however, the length of stay for a child had increased significantly to 476 days on average. This increased even further in the 1940s. In the years 1943-56 the length of stay for a child admitted to Pelletstown was 737 days on average. Children born in or admitted to Pelletstown in 1943 could expect to spend 890 days on average in the home. Although some children admitted that year were discharged after just nine days, others remained in the home for five and a half years. Child length of stay decreased significantly in the late 1950s falling from 638 days on average for children admitted in 1956 to 197 days on average for those admitted in 1959. This downward trend continued and by 1970
children admitted that year spent 134 days on average in the home, 87 days by 1980 and 41 days by 1990.

Analysis by decade shows that child length of stay in Pelletstown was longest in the 1940s when 669 days was the average stay. This had decreased dramatically by the 1960s when children spent 188 days on average in the home - one fifth that of their 1940s counterparts.

Information relating to children's discharge in relation to their mother's discharge was available for 10,895 children (57.9% of admissions). The institutional records show that 50.4% were discharged from Pelletstown after their mothers' discharge; 36.3% were discharged on the same date as their mothers and 13.3% were discharged while their mothers remained in the institution.
Information relating to occupancy was available for 17,313 children (91.9% of admissions). The institutional records show that child occupancy in Pelletstown increased incrementally from 67 children on average in 1920 to peak occupancy of 454 children on average in 1937. Child occupancy rates remained high in the years 1938-53 when it averaged 384 children annually. Although child occupancy had reduced to 162 on average by 1960 it increased again to 230 in 1964. From 1965, child occupancy declined steadily and by 1986 had fallen to just five children on average.
Analysis by decade shows that child occupancy rates were highest in the 1940s; a child born in or admitted in that decade could expect to be living in the home with another 385 children. In contrast, a child born in or admitted in the 1970s could expect to be living with another 106 children.
The Commission compared occupancy rates derived from institutional records relating to Pelletstown and returns furnished by Pelletstown to the Department of Health for the years 1950-67 inclusive and 1970. Temporary absences, such as children who were in hospital or absent from the institution for short periods before returning, are not recorded in the Commission’s calculations. This may inflate the Commission’s numbers slightly. Notwithstanding this, the Commission found that occupancy rates forwarded to the Department of Health in this period were broadly in line with those which the Commission established from the institutional records.
Comparison of mother and child average occupancy

A comparison of average occupancy between mothers and children in Pelletstown highlights a great disparity between the two which is discernible from 1923. From 1923 to 1981 there were considerably more children in the home than women. Even allowing for the fact that 31.3% of children were admitted to Pelletstown unaccompanied, the difference in occupancy rates suggests that during this period significant numbers of children remained in the institution after their mother had been discharged. The disparity was most apparent in 1937 when 454 children on average were living in Pelletstown at any given time that year compared with 176 women. The high discrepancy between the average number of women and children in the home continued until 1953; 346 children on average were in the home that year as compared with 120 women. By 1960, the disparity between the numbers of women and children in Pelletstown had decreased (162 children and 86 women). Although the disparity increased again in the early 1960s - 230 children and 92 women in 1964 - a steady decrease can be identified from 1965. The number of women and children in Pelletstown did not approach parity until 1982 - 49 children and 52 women on average were living in the home that year.
Information on exit pathways from Pelletstown was available for 13,566 children (72% of admissions). The most frequent exit pathway was through legal adoption (from 1952); 41.7% of children left the institution via this route. Almost 27% of children left the institution with their mother or returned to the family home; 24.2% transferred to another institution; 5% were boarded out; 1.6% were nursed out and 0.5% were informally adopted (pre 1953).
Comparison of exit pathways accompanied/unaccompanied children.

Comparative analysis of exit pathways from Pelletstown for accompanied and unaccompanied children show that accompanied children were far more likely to be discharged for adoption (47%) than unaccompanied children (27.5%). Of the 1,012 unaccompanied children adopted from Pelletstown, at least 90% were ‘illegitimate’ children. Conversely, the records suggest that unaccompanied children were more likely to return to the family home or to be transferred to another institution than accompanied children. That 36.2% of unaccompanied children were discharged to the family home suggests that they had been admitted to the institution for medical treatment rather than institutional care - it is difficult to establish this with any degree of accuracy from the institutional records. Of the 1,329 unaccompanied children discharged to the family home, 62% were recorded as ‘legitimate’ children. Of the 1,059 unaccompanied children transferred to other institutions, 31% were recorded as ‘legitimate’ children. The majority of unaccompanied children transferred to other institutions went to hospitals, specialist homes, industrial schools and orphanages. Of the 238 unaccompanied children boarded out from Pelletstown all but nine were ‘illegitimate’ children.
Foreign adoptions

The institutional records and records held by the passport office combined show that 367 children were sent for foreign adoption from Pelletstown. Most (90.46%) were adopted in the USA. Just over 7% were adopted in Great Britain and 1.3% in Northern Ireland. Two children were adopted in Egypt and one child was adopted in Germany and Serbia respectively. Fourteen children sent for foreign adoption had been admitted to Pelletstown unaccompanied - 13 were adopted in the USA and one in Northern Ireland.
Child deaths

The Commission identified 3,615 deaths among infants and children associated with Pelletstown. This includes children who died in the institution, children who were admitted to the institution but died elsewhere and children who were never admitted to the institution but whose mothers were resident there prior to their birth. A date of death was available for 3,605 children (99.7% of deaths).

The available records show that 88% of deaths occurred among ‘illegitimate’ children and 7.2% occurred among ‘legitimate’ children - it was not possible to establish the status at birth in the remaining cases.

The Commission identified a GRO death record for 3,511 children (97.12% of deaths). Infant and child mortality in Pelletstown was particularly high in the years 1920-42, 78% of all infant and child deaths in the home occurred in this period. Mortality was highest in 1920, when 200 deaths were recorded and peaked again in 1936, 188 deaths were recorded that year. Mortality in Pelletstown declined substantially in the mid-1940s. For much of the
1950s annual mortality in Pelletstown was in single figures, but began to increase slightly from 1958. From 1960 to 1980 Pelletstown recorded 16 infant and child deaths on average annually, fluctuating between 47 deaths in 1961 and four in 1974.

Analysis by decade shows that more infant and child deaths (36.1%) in Pelletstown were recorded in the 1920s than any other decade followed by the 1930s (33.7%); 1940s (16.3%); 1960s (6.7%); 1950s (4.0%); 1970s (2.6%); 1980s (0.5%) and the 1990s (0.1%).
Information relating to the place of death was available for 3,541 children (97.95% of deaths). Most infant and child deaths occurred in Pelletstown (81.8%), St Kevin’s Hospital (13.2%) or in another external hospital (4.7%). Small numbers of children died at home or in another private address (5); in another children’s home (3); in the Children’s Home, Tuam (1); Cork District Hospital (1) and in the Regina Coeli hostel (1).
Age on death

Information relating to age on death was available for 3,509 children (97.1% of deaths). The majority of deaths (81.2%) occurred during infancy, as follows: perinatal, 0-7 days (5%); neonatal, 8-28 days (9.2%) and infants, 29-365 days (67%). The remaining children (18.8%) were aged between 366 days and five years at the time of death.

Accompanied at time of death

Information as to whether a child was accompanied by a mother at the time of death was available for 3,471 children (96% of deaths). The institutional records show that 2,048 children (59%) were unaccompanied at the time of death and 1,423 children (41%) were accompanied by their mother at the time of death.

Place of burial

The Commission established the burial place of 3,102 children (85.8% of deaths). The majority, 3,097 children, were buried in Glasnevin cemetery. Five others were buried in Mount Jerome cemetery.
Information relating to cause of death was available for 3,511 children (97.1% of deaths). The leading causes of death were non-specific (19.2%) - including congenital debility, delicacy from birth, prematurity and inanition; respiratory infections (18.4%) - mainly pneumonia, bronchopneumonia and bronchitis; gastroenteritis (15.6%) - mainly enteritis, gastroenteritis and gastritis; tuberculosis (8.7%) - mainly tubercular enteritis, general tuberculosis and pulmonary tuberculosis; malabsorption (8%) - mainly marasmus and malnutrition; other causes (5.8%) - mainly pertussis, peritonitis, congenital deformity and a range of one off causes of death; meningitis/encephalitis (4.8%); spina bifida (4.4%) - mainly hydrocephalus; convulsions (3.9%); congenital syphilis (3.2%); congenital heart disease
(2.9%); measles (2.1%); generalised infections (1.2%) - mainly toxaemia and septicaemia; haemorrhage (1.1%) - mainly intercranial and cerebral haemorrhage and diphtheria (0.5%). One death was attributed to influenza.

In the 1920s more than 1 in 3 infant and child deaths associated with Pelletstown were due to either gastroenteritis (19.1%) or tuberculosis (16.5%). In the 1930s, congenital debility, prematurity and respiratory infections were responsible for 46.4% of mortality combined although gastroenteritis (14.4%) continued to take a heavy toll. Despite the opening of St Clare’s Hospital in 1944, gastroenteritis was responsible for over 18% of mortality in the 1940s. Eight children died in St Clare’s in the 1940s after transfer from Pelletstown - gastroenteritis was a factor in all eight deaths. Congenital debility and prematurity continued to be the leading cause of mortality in the 1940s and accounted for 33.2% of deaths. Respiratory infections also featured strongly and were responsible for 16.4% of deaths. In the 1950s, congenital debility, prematurity and respiratory infections accounted for over half of all deaths - spina bifida was also a leading cause of death at that time and accounted for 27% of mortality in that decade. Mortality due to gastroenteritis in Pelletstown had decreased to roughly 2%. By the 1960s, spina bifida had become the single biggest cause of mortality in Pelletstown and was responsible for 35.7% of mortality in that decade - the majority of these deaths (87%) occurred in ‘legitimate’ unaccompanied children. One in four deaths were attributed to respiratory infections, and gastroenteritis had again become prominent and was responsible for over 1 in 10 deaths. In the 1970s, respiratory infections, spina bifida and congenital heart disease were responsible for 62% of mortality combined; the remaining deaths were attributed to a range of mainly one off causes. In the 1980s, infant and child deaths were a fraction of the number recorded in previous decades. Of the 17 deaths recorded four were due to spina bifida, three to congenital heart disease and the remainder were attributed to one off causes.
Cause of death in unaccompanied children

Unaccompanied children made up 31.3% of all child admissions to Pelletstown. However, they accounted for 43.7% of infant and child deaths associated with the home.

Unaccompanied children appear to have been more susceptible to many conditions. They accounted for 39.8% of deaths due to congenital syphilis; 41.1% of deaths due to tuberculosis; 41.7% of deaths due to respiratory infections; 47.4% of deaths due to gastroenteritis; 47.6% of deaths due to congenital heart disease; 55.5% of deaths due to malabsorption and 82.1% of deaths due to spina bifida.
The institutional records suggest that the infant mortality rate in Pelletstown was highest in 1920 - a mortality rate of 50% was recorded that year. Over the remainder of the 1920s infant mortality fluctuated between a high of 35.5% in 1926 to a low of 23.8% in 1927. Infant mortality was on a definite upward trend for much of the 1930s peaking in 1937 when a rate of 41.2% was recorded, but began a staggered decline from then. In the years 1943 to 1945 infant mortality in Pelletstown was 14.8% on average; at this time infant mortality rates of up to 75% were being recorded in Bessborough. Although the infant mortality rate increased to 30% in 1947 a definite decrease is discernible thereafter - by 1954 the rate had decreased to 2.1%. Over the next decade the infant mortality rate stood at 6.5% on average. From the late 1970s the rate rarely registered more than 1%.

Infant mortality rate was calculated as follows: Living children born in the year who died before the age of 1/All living children born in the year.
Chapter 14: Belmont Flatlets

Introduction

14.1 The Daughters of Charity (who worked in Pelletstown - see Chapter 13) bought adjoining houses on Belmont Avenue in 1980 to provide flatlets or hostel type accommodation for unmarried mothers and their children. There were 11 flatlets in total. The current Provincial of the Daughters of Charity told the Commission that the flatlets were established at the suggestion of CURA and its director, Bishop Dermot O'Mahony who was an auxiliary bishop of Dublin. This was not a mother and baby home in the traditional sense. It was more akin to a hostel or supported living facility than to a mother and baby home.

14.2 The Commission has not seen records of the residents of Belmont. It is not clear what records were maintained at the time but there would have been no reason to retain such records when it closed. All the mothers were there with their babies and left with their babies so the issue of tracing would not have arisen. The information in this chapter is based on the report of a social service consultant who conducted a review of the Belmont Flatlets in 2000 at the request of the Daughters of Charity and on a few brief references to Belmont in the minutes of the Eastern Health Board.

Living arrangements

14.3 Belmont provided short term accommodation for unmarried mothers and their children. The public health nurse and social workers visited but it was mainly independent living. There was a Sister who supervised but did not live there. The women paid for their keep and were expected to look after their babies themselves. The mothers would have been eligible for Unmarried Mother's Allowance at the time and may also have received assistance with rent payments (see Chapter 1). The women and babies stayed for between six months and a year. The accommodation was not suitable for crawling children. Sometimes women who had been in Eglinton House moved there.

14.4 In 2000, a social service consultant conducted a review of the Belmont Flatlets at the request of the Daughters of Charity. There were nine women and children resident at the time of the review. The accommodation was described as 'basic but adequate for short-term accommodation'. There were some problems with
laundry facilities, heating and availability of hot water. It was transitional housing but also provided various supports such as education in childcare, budgeting and household management as well as emotional and social support.

14.5 While mothers were responsible for the care of their children, in practice the staff did assist and provided the mothers with some breaks. They also provided assistance with accessing social welfare entitlements and getting accommodation to which they could move after their time in Belmont.

14.6 Women were referred to Belmont by Eglinton House, social workers, health boards and maternity hospitals. They did not routinely refer mothers who might be at risk of being unable to parent and of having the children taken into care. Social workers saw the need for a facility for such mothers but they did not see Belmont in that role. A few such mothers did spend time in Belmont and integrated reasonably well with other residents; there were some unsuccessful such placements.

14.7 There was much discussion during the 1980s about the issue of ‘inadequate’ mothers and about how unmarried mothers could manage to live and work in the absence of affordable childcare.

14.8 The mothers signed a licence agreement with the Daughters of Charity for the use of the flats. It was not a landlord/tenant relationship. There were house rules but they seem to have been reasonably flexible.

14.9 In 1985, the Eastern Health Board paid £10,600 to Belmont.

14.10 The service was closed in 2001.
Chapter 15: The Tuam Children’s Home

Introduction

15.1 The Children’s Home was established by Galway County Council as part of its reorganisation of poor law services (see Chapter 1). In that reorganisation, the workhouse in Glenamaddy was designated as the Children’s Home for children and unmarried mothers and was used as such from December 1921 to 1925. The Children’s Home moved to another former workhouse in Tuam in 1925. It closed in 1961. The Commission regards the Glenamaddy Children’s Home and the Tuam Children’s Home as one institution. The Children’s Home was operated by the Sisters of Bon Secours. In addition to unmarried mothers and their children, the Children’s Home also admitted children of married couples or widowers/widows whose parent(s) was unable to care for them, and married women or widows with their children who were homeless and/or destitute. It was never exclusively a mother and baby home.

15.2 The title ‘Children’s Home’ was used by its owner, Galway County Council, for virtually all of its existence; the first record the Commission has seen of Galway County Council’s use of ‘St Mary’s Home’ dates from 1960. Locally, it was known simply as ‘the home’. The Sisters of Bon Secours used the title ‘St Mary’s Children’s Home’ but the Commission has not been able to establish when it first used this title. The Archbishop of Tuam gave the Sisters approval to set up St Mary’s Home as a separate foundation in 1956. Here the Commission describes it as simply Tuam.

Sources

15.3 The following is a summary of the main sources used for this chapter. A complete list is included in Part 5: Archives.

Institutional records

15.4 The Sisters of Bon Secours told the Commission that all institutional records (that is, records of admissions, births, discharges and deaths which were compiled in the home) were handed over to Galway County Council when the home closed. (The county council was probably the owner of the records anyway.) These records became the property of the Western Health Board when it was established
in 1970. Subsequently they became the property of the HSE in 2005 and the Child and Family Agency (TUSLA) in 2013. In the years since Tuam closed, these records have been used mainly for tracing purposes. The Commission is concerned that some records may have been lost or destroyed over the years. It is impossible to establish if the records currently held by the Child and Family Agency constitute all of the records which existed when Tuam closed in 1961. The Commission made digital copies of all these records.

15.5 A health board/HSE social worker dealing with adoption used these records to assist children born in Tuam who were adopted to trace their birth family. She told the Commission that there was only one box of records relating to American adoptions and it was not large. She stated that the box contained two passport photographs, correspondence relating to US adoptions from the 1990s and some details on 22 former residents of Tuam who were adopted in the USA between 1951 and 1958. She gave the Commission a copy of the database which she constructed from this documentation.

15.6 The institutional records contain the following:
- Admission registers
- Maternity register
- Children’s registers
- Mother returns
- Billing register

**Sisters of Bon Secours**

15.7 The Sisters of Bon Secours told the Commission that their archive contained 281 boxes and there were only two boxes that related to Tuam. They supplied the Commission with historical accounts and personal letters that make reference to the Tuam home including statements to the Commission to Inquire into Child Abuse (the Ryan Commission). Some of these were created in the years subsequent to the closure of the home.

**Galway County Council**

15.8 The extant minutes of the Galway Board of Health are held by Galway County Council. There is almost a complete set for the period 1922 - 1941 but there are some gaps and there are no surviving minutes for the year 1937. The meetings of Galway County Council, the Board of Health and its subcommittees were held in
public and received extensive coverage in the local newspapers. The Commission has searched these newspapers for any references to the Tuam home. The Commission has examined the managers’ orders for the period 1942 - 1961. Managers’ orders were not discussed in public and consequently they were not reported in the local newspapers. Unless otherwise indicated, evidence that relates to Galway County Council or one of its committees comes from this source. Evidence relating to the council that is taken from local newspapers is footnoted.

**Department of Health records**

15.9 The records relating to Tuam held in the National Archives or provided under discovery by the Department of Health are limited. There are references to Tuam in the published annual reports of the Department of Local Government and Public Health (DLGPH) between 1922 and 1945 but the earliest reference in government files appears to be from 1942 and it would appear that department officials, apart from the department’s inspector, Miss Litster, had little knowledge of Tuam before then. The maternity section was inspected under the *Registration of Maternity Homes Act 1934*; however the Commission has had access to only a small number of these inspection reports; these are described below. The main files used for this chapter were

**Archdiocese of Tuam**

15.10 The Commission has also accessed some records held by the Tuam Archdiocese; these are mainly concerned with the closing of the home.
Other Records

15.11 James Fergus, who was a curate in Glenamaddy in the 1920s and later became the Bishop of Achronry, wrote a short account of the work of the Sisters of Bon Secours in Glenamaddy and Tuam. This is undated. It is included in *Milestones on a Faith Journey*, compiled by Sr Reginald O'Sullivan, SBS, (Cork 1998) which was published to mark the 175th anniversary of the founding of the Bon Secours Sisters.

Governance

15.12 The Children's Home, first located in Glenamaddy and later in Tuam, was a local authority institution that admitted unmarried mothers and children, expectant unmarried mothers, destitute married women with their children and the children of married or widowed parents who were unable to care for them perhaps because of a mother's long-term physical or mental illness, or because the child had a disability. In 1931 an agreement was reached with Mayo County Council to admit women and children from that county to Tuam. The vast majority of the women and children admitted were from counties Galway and Mayo.

15.13 Tuam was owned by Galway County Council, which was responsible for maintenance and improvements. The key decisions relating to it were taken by the Galway Board of Health which was composed of members of Galway County Council. The County Homes and Home Assistance Committee (CHHAC), which was a sub-committee of the Board of Health that included non-council members, was also involved in decisions. The Board of Health and the CHHAC held a number of meetings in the Tuam home. There is evidence that they visited it on several occasions. Local authority records mention a visiting committee but the Commission does not have further information about this.

15.14 A minute from the CHHAC, dated 1 August 1922, noted that it had invited the department’s views on the interpretation of the per capita agreement made between the Sisters of Bon Secours and the County Board of Health for the maintenance of mothers and children in the Children’s Home in Glenamaddy. The Commission has not seen a copy of this agreement and it is not known if it was ever implemented. When the *Public Assistance Act 1939* and the *County Management Act 1940* came into effect in 1942, many of the decisions were made by the county manager by way of managers’ orders. The home was registered
under the *Registration of Maternity Homes Act 1934* in December 1937, which meant that thereafter the maternity unit was subject to inspection but, as already stated, the Commission has seen only some of these inspection reports.

15.15 The Galway and Mayo local authorities paid the Sisters of Bon Secours a capitation fee for each woman and child in Tuam. Galway County Council paid for external repairs to the building, rates, water rent and insurance as well as the salaries of the chaplain, the medical officer, and the maternity nurse.

15.16 As already stated, the Department of Local Government and Public Health (DLGPH) had very limited knowledge of the Tuam home. Sometime between 1942 and 1946 the department became aware that its status was irregular. This arose in the context of an application for approval for increases in the capitation rate. The irregularity arose because Tuam was owned by the local authority but the staff were not directly employed by the local authority. Pelletstown (see Chapter 13) was owned by the local authority and its staff were local authority employees. The ‘extern’ homes (Bessborough, Sean Ross and Castlepollard) were owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. The department recommended that Tuam should close and then be handed over to the Sisters of Bon Secours and re-opened as an extern institution, similar to the Sacred Heart homes. A draft agreement was drawn up with the Sisters of Bon Secours in an effort to clarify the status of Tuam. No decision had been made by November 1946. The Commission has not seen a copy of this draft agreement and is unclear about when it was drafted, when it was forwarded or by whom. It was noted on 9 January 1948 that consideration of the transfer of the home to the Sisters of Bon Secours seemed to have been interrupted the previous April when the file was taken from the legal section in the Department of Health ‘without discharge’. In December 1948, a departmental official noted that the order for transfer of the premises had not yet been prepared by the legal section which promised ‘action soon’. It appears that the Sisters refused to sign this agreement until Galway County Council agreed to carry out extensive improvements and install central heating. In March 1951, Galway County Council told the Department of Health that it was unreasonable of the Sisters to expect this. However a Department of Health official informed the council that it was his opinion that Tuam was vested in the Galway public assistance authority. Therefore, its maintenance and repair was the responsibility of Galway County Council. He pointed out that if the Sisters of Bon Secours decided to discontinue their work, the public assistance authority would
have to maintain and operate the home. He made it clear that the public assistance authority had no option but to carry out the repairs and install central heating if they wished Tuam to continue in operation. The department did have the power to order the council to carry out these repairs (see Chapter 1) but the Commission has not seen any evidence that it considered using this power.

15.17 The Sisters of Bon Secours who worked in the Glenamaddy workhouse, and later in the Glenamaddy Children’s Home were employees of the poor law guardians/local authority and they received a salary. When Glenamaddy closed and transferred to Tuam the Sisters received a gratuity totalling £900 from the local authority. Yet, although the Sisters who had worked in Glenamaddy transferred to Tuam, which was also owned and controlled by the local authority, they were no longer regarded as local authority employees and they did not receive a salary. The local authority paid the salary of the chaplain and the medical officer; this was also the practice in workhouses and county homes. There is no indication that the local authority paid the wages of a male handyman/caretaker, so it is likely that he was paid by the Sisters out of their capitation income.

The premises

Glenamaddy

15.18 In Glenamaddy, the hospital wing of the workhouse became the Children’s Home (the main workhouse had been burned by the IRA in 1921). Admissions were made on order from either the County Home and Home Assistance Committee (CHHAC) or the Hospital and Dispensaries Committee (which was also a sub-committee of the Galway Board of Health). The order had to be signed by either a member of the CHHAC or by its secretary.

15.19 The Sisters of Bon Secours asked Galway County Council to construct a modern laundry at the home, catering for public demand, where the women could work and be trained for employment after they had left. In April 1923, the CHHAC issued an order that a committee, consisting of Bishop O’Doherty¹ chairman of the board, a medical inspector from the DLGPH and the secretary to the committee, should inspect Glenamaddy, consider all the circumstances and report back. This committee’s report was adopted at the June meeting. By 1924 it was becoming increasingly clear that Glenamaddy was too costly to maintain and there were

¹ Bishop of Clonfert 1919-23; Bishop of Galway 1923-36.
difficulties securing a suitable water supply. The committee received an estimate of £130 for the installation of a new water pump and an order was made asking the DLGPH to sanction its installation. In June 1924 the Connacht Tribune published a long article, titled ‘Children of Misfortune’, which described the Glenamaddy home: the waifs and strays, the orphans and the abandoned, the nameless little ones of the county … Under the care of Bon Secours nuns, who have been charged with the task of lifting the blight from their young lives and sending them into the world cleansed and self-respecting members of society, they are to grow up in happiness and peace.

15.20 There were 87 children ‘from infants in arms to little boys and girls of nine’, and 26 mothers in the home. The article said that:

The nuns have achieved marvels in the old ramshackle home into which they were thrown without preparation. Yet the place remains a blight and a scandal upon county administration; and the sooner this repository of all the orphaned and the helpless in the county is shifted to a more suitable centre, the better for the credit of those who control our public health.

15.21 Glenamaddy was further described as insanitary with a high infant mortality rate. The description of the building was excoriating:

There are walls which reek with damp in winter, that have not seen the mason’s trowel or the painter’s brush for years. There are long, narrow and gloomy corridors. Water has to be carried for the children’s ablutions. There is not a single permanent bath, and the babies have to be bathed in portable fixtures with water carried by the good nurses whose heavy responsibility is increased tenfold by the inadequate accommodation provided.

15.22 By this time it had been decided that the home would move to either Portumna or Tuam. According to the Connacht Tribune, Tuam could accommodate 200-300 ‘inmates’ and it had the added attraction of having convent and Christian Brothers schools nearby.²

Tuam

15.23 The Tuam workhouse was constructed on a six-acre site on the Dublin Road between 1840 and 1841. It was based on the standard workhouse design and had

² Connacht Tribune, 21 June 1924
accommodation for 800 ‘inmates’.\(^3\) James Fergus contended that the Sisters chose Tuam as the best location for a transfer. ‘One or two of the Tuam Town Commissioners voiced some opposition to the transfer to the town of a home with unmarried mothers but the protest came to nothing’.\(^4\) The former workhouse had been occupied by the Irish army during the civil war, and there is evidence that Galway CHHAC had removed furniture and bedding from the former workhouse, presumably for use elsewhere.

15.24 In May 1924 the Galway authorities contacted the Minister for Defence to secure vacant possession of the former Tuam workhouse and arrangements were made for it to be handed over. In October 1924 the CHHAC requested an estimate of the work needed before the home could transfer from Glenamaddy. The county surveyor provided a list (not recorded) of proposed repairs costing £8,493, though efforts were being made to reduce the cost. The Sisters of Bon Secours moved to Tuam in May 1925. The CHHAC minutes noted that that ‘they’ were busy cleaning and painting the building (it is not clear if this was the committee or the Sisters). They had sought £159 for urgent works; most of this went on a new range (stove) and repairs to the existing one. In September, the superior of the Sisters of Bon Secours, who was based in Dublin, told the local authority that urgent work was needed in the kitchen, laundry and drying room; doors had to be installed and windows and fireplaces replaced. In March 1926 the contractor who carried out these works - at an estimated cost of £147 - submitted an additional bill of £190 for other works that he had carried out on the instructions of the sister-in-charge which had not received prior approval from the local authority. These included repairs to windows and doors, lavatories, baths and a temporary drying room. Figures suggest that repairs cost an additional £591 between March 1926 and December 1927; £172 was spent on repairs between April 1927 and April 1930. (This does not appear to include the cost of the drying chamber - see below). The women and children moved to Tuam on 2 June 1925.

15.25 The Commission has not seen any description of the state of the Tuam home when it was first used as the Children’s Home. It is likely that it was a typical workhouse with unceilinged dormitories, stone stairs and heated by open fires (with the exception of a stove in the kitchen). The 1927 Report noted that it had been arranged that the board of health would put the home in order but, when the

\(^4\) James Fergus, *The Bon Secours Sisters and St Mary’s Children’s Home at Glenamaddy and later Tuam.*
members of the commission visited in 1925, this had not been done and ‘signs of dilapidation and decay were painfully evident’. It further noted that ‘its continuance in the condition in which we saw it would be a grave injustice to the Sisters and militate very much against its usefulness for the purposes to which it has been allocated’.\(^5\) One Bon Secours Sister recalled that ‘The building, though spacious, was - like all such Institutional structures - primitive and irregularly spread out’ in spite of the various renovations and improvements that had been made.\(^6\) An undated manuscript, titled *Memoirs of a Bon Secours Sister* was written by a Sister who came to Tuam in 1927. She described the former workhouse as ‘primitive enough for anything. The convent, a three-storey building, was in good repair and there was a nice chapel, heated by a furnace which swallowed up bags of turf’. There was no central heating; ‘turf fires all over the place - people were not so cold conscious then I think. No running water except in the surgery and kitchenette which were situated near the nursery’. The convent had a bath with hot and cold water and there were only oil lamps; electric lighting was installed in 1927.\(^7\)

15.26 In 1927 the local authority approved spending £200 on a drying chamber, while noting that four drying horses would not be sufficient, but six would not fit into the chamber.\(^8\) Later evidence suggests that the drying room was heated by a boiler. The sister in charge, Sister Hortense, asked the local authority to install electric light; she claimed that it would reduce the risks (presumably of accidents and fires). She secured an estimate of £60 from the Tuam electricity company and this was approved by the local authority. When the large water tank burst in 1928 and was deemed to be ‘useless’, she sought permission to remove the tank from Glenamaddy and install it in Tuam.

15.27 With the exception of the maternity unit, which is discussed in a later section, there was little additional expenditure on Tuam during the 1930s. The Galway board of health never submitted an application for significant funding for Tuam to the Hospitals Commission, which provided substantial capital funding to Pelletstown and the three Sacred Heart homes. Tuam received £400; this was two-thirds of the cost of erecting a new laundry and disinfecting equipment. A later application

\(^7\) Document provided by the Sisters of Bon Secours.

\(^8\) A drying horse was a frame that could be used to hang clothes for drying/airing.
for a new entrance gate and wall was rejected.⁹ Given the conditions in Tuam, a wall and new entrance should have ranked low on the list of priorities.

15.28 The Tuam home was located on higher ground and on the fringe of the existing town; it was outside the town boundary. This peripheral location and the fact that it was on higher ground created difficulties in securing an adequate supply of piped water and access to an urban sewerage system.¹⁰ The superintendent of the Tuam waterworks visited in December 1929 and discovered that day-time pressure was insufficient to reach the home; it could only secure water from the urban system at night, otherwise it was dependent on rainwater that was collected in a tank. The fact that it was outside the town boundary led to disputes over who was responsible for the cost of extending water and sewerage to it: Tuam Town Commissioners or Galway County Council. There are numerous references in Tuam Town Commissioner records to the inadequate water supply to the Dublin Road - where the home was located. In November 1929 the commissioners were unable to guarantee a continuous supply to the Dublin Road. Some months later it was decided that, in order to give residents on the Dublin Road a chance to get water, the water supply would have to be cut off from the rest of the town and let up the Dublin Road on Sunday, Tuesday and Thursday nights.¹¹ Plans were drawn up for a new water scheme in 1931, but it was not carried out. By 1932 plans for new housing schemes were being delayed by the lack of an adequate sewerage system.

15.29 A meeting of Galway County Council in 1934 agreed to make the cost of the Tuam sewerage scheme a county charge (on account of the Children’s Home). It was specifically stated at this meeting that the home had yet to be provided with or connected to a sewerage scheme. The council agreed that if there was an outbreak of fever in the institution, which was a real possibility, it might prove much more costly to the public services than the proposed sewerage scheme.¹² However progress was slow. In 1935 the secretary of the CHHAC inquired whether the new sewerage scheme would extend to the home. He described the existing system as defective, ‘being merely drains without pipes leading to a septic tank outside’. Work began in 1936; it was carried out in two phases that extended

⁹ Reports of the Hospitals Trust list all applications for funding, both successful and unsuccessful.

to 1939/40. At some point during these years, the home was connected to the town sewers. However, problems relating to drainage continued. In 1945 a consulting engineer was asked to advise on this.

15.30 In 1937, the CHHAC approved a tender for drainage work at the home and the county engineer recommended that a new lavatory system should be installed. He specifically mentioned that the type of cisterns then in use were inadequate. The new cisterns would ‘give an almost continuing flushing system, which is desirable for an institution of this kind’. The engineer described the buildings where the current lavatories were installed as ‘all in a very dilapidated condition and without light or ventilation’. He recommended construction of a new building with tiled floors and walls and proper light and ventilation. His recommendation was accepted, subject to the approval of the DLGPH. The Commission does not know if this new building was constructed but it seems unlikely to have been.

15.31 The inadequate water supply remained a major problem for the Dublin Road area. In 1937, the medical officer attached to Tuam told the CHHAC that there were frequent shortages in the water supply and this had become more acute with the construction of a nearby housing scheme. He noted that the area where the home was located was always the last part of the town to get water from the town reservoir. The medical officer reiterated this message the following year when he noted that the addition of a maternity hospital and proposed laundry in the home would result in an increased demand for water. The supply was irregular and this might present a significant danger if new boilers were installed. The Emergency brought to a halt major investments in water, sewerage and other infrastructure because supplies of essential equipment were not available. In October 1946 county councillors passed a motion calling for a consulting engineer to prepare specifications for the proposed extension of the town water scheme to the home. In September 1948 the county manager reported that work on an extended water scheme had begun, but Tuam Town Commissioners reported complaints from residents that water was being turned off at night to parts of the town to ensure supply of water to the Children’s Home. Water shortages and low pressure remained a problem and in 1954 plans were again submitted to Galway County Council for measures to provide an adequate water supply to the home and to

14 _Connacht Sentinel_, 16 November 1937.
Tubberjarlath. The engineer reported that there was negligible pressure during the
day and night because of the demands of the laundry at the Convent of Mercy.

15.32 Although the Commission has not seen any description of the Tuam premises until
the 1950s, all the evidence indicates that many features of the nineteenth century
workhouse survived until it closed in 1961. Capital expenditure in county homes -
which were former workhouses - appears to have been negligible until the 1950s.
When the DLGPH carried out an inspection of Tuam in 1945, it reported that the
matron was anxious to have central heating installed and the department inspector
believed that this would tend to reduce infant mortality in the winter months. The
matron also wanted to demolish the entrance block and construct an isolation unit.
By 1945 a number of mother and baby homes had created isolation units where
mothers or children were kept when they arrived at the home, until the authorities
were satisfied that they were not carrying an infectious disease. This was widely
seen as an effective means of reducing sickness and mortality. When Tuam was
inspected in 1947 it appears that one room in the maternity unit was being used as
an isolation room for women giving birth but there was no isolation unit for children
and other women who were admitted.

15.33 In 1949, a county councillor, Miss Ashe, drew attention to the recommendation of
the visiting committee that a water heating installation should be provided at the
Children’s Home. The county manager explained that an
application should be made by the Sisters of the Home to the Hospitals Trust
for a grant towards this work; that, in fact, it is understood that representatives
of Hospitals Trust had inspected the Institution recently in connection with the
matter.

15.34 The visiting committee reported in August 1950 that the most urgent matters
needing attention were repairs to the floor in the nursery and the provision of
sanitary accommodation and central heating. They described the home as ‘very
clean and well-kept and in first class order considering the conditions that the nuns
labour under’. The dormitories were large workhouse wards. No effort had been
made to divide them. There were no floor coverings and the only furniture
consisted of beds and cots; some rooms had no heating. The inspections carried
out by the DLGPH/Department of Health stated that one of the worst aspects of
Tuam was the lack of washing and toilet facilities on the second floor of the
building. The kitchen equipment was supplemented with redundant equipment.
from the Central Hospital. The general layout of the building left a lot to be desired and the ‘minor kitchens throughout the building are in a poor state of decoration while the milk kitchen in the nurseries would have to be replaced’. Hot water was available in only three locations apart from the laundry.  

15.35 By 1951, plans had been submitted to the Department of Health for improvements to Tuam at an estimated cost of £82,590 and the local authority was seeking a grant from the Hospitals Trust Fund. The county council was informed that the minister would approve a 50% grant from the Hospitals Trust but councillors replied by requesting a grant of at least 75%; they expressed the opinion that the Hospitals Trust should meet the full cost, but the department refused to agree to more than 50%. By 1952 it would appear that the council was willing to accept a grant of 50% but the county manager explained that the Hospitals Commission was insisting on more extensive improvements costing approximately £150,000 as a condition for securing the grant. This was accepted by the council.

15.36 The Department of Health files show further evidence of its poor understanding of the status and ownership of the Tuam home because ‘At one stage the question arose as to whether the cost should be a charge on the Hospitals Trust Fund or regarded as part of the county home scheme’ and it was eventually decided that it should come under the county home scheme. In 1953 Miss Ashe described Tuam as ‘a disgrace’, she claimed that the Sisters had been trying to get hot water installed but had failed to do so. There was little improvement in the following years.

15.37 The planned scheme of major improvements was a casualty of the economic crisis in 1956 which resulted in massive cuts in public capital expenditure; improvements to county homes were among the casualties. The local authority drew up plans for more modest improvements to Tuam, which would be carried out over several years - with an outlay of £39,000 in 1959/60 and £40,000 the following year. By 1959 a full renovation would cost approximately £200,000 and there were fears that this would result in further damage to the building because, when central heating was installed in other former workhouse buildings, dry rot had spread rapidly. An official of the Department of Health suggested that the building should be evacuated and closed; ‘in the meantime the appalling conditions would persist.

---

15 Galway County Council, Attendance Book, Council Members, 1945 -1950 (GC/2/1).
16 Connacht Tribune, 24 October 1953.
as it would be a waste of money to try to improve the Home if it was to be completely evacuated in a few years’. Consideration was given to demolishing it and replacing it with a modern single-story building to the rear of the maternity unit, but by 1959 there were unfilled spaces in Ireland’s mother and baby homes.

15.38 The report of the visit by Department of Health officials to Tuam in November 1959 was damning about conditions there:

A visit to the institution is the only way one can get an accurate impression of this poorly maintained, uncomfortable, badly heated and totally unsuitable building in which upwards of 140 children ranging from infancy to six years are accommodated ... Throughout the years since the adoption of the building for its present purpose maintenance appears to have been minimal.

15.39 The report noted that the only money provided to Tuam was via a capitation rate; there was no allowance for maintenance or building costs. Money was first allocated for maintenance in 1957, and the annual grants ranged from £660 to £2,700, sufficient to paint, re-plaster and re-floor a number of rooms and purchase some new sanitary equipment. On the day of the inspection the heating was:

most inadequate even though the day was not particularly cold…some rooms had stoves, some open fireplaces; some children's day rooms had small radiators that were filled with water that was heated on a stove or on the open fireplace and then poured into the radiators.

15.40 The day rooms had a minimum amount of furniture and play facilities. The room for slightly older children had a rubber ball and two seats. It had no floor covering; children aged one to two were in their bare feet. The dormitories were a major fire hazard with children sleeping on the second or first floor in large workhouse wards with no subdivision; many had ‘absolutely no heating’, no floor covering and no furniture other than beds and cots. Access was by ‘the typical stone stairways common to all County Homes with a very dangerous turn near the top in every case’. There were no washing facilities or toilets on the first or second floors; facilities on the ground level were described as very poor. Hot water was available at only three locations apart from the laundry: the kitchen, a kitchenette in the maternity block and in a ward ‘which supplies a bath’ and the water came from small domestic boilers. The departmental officials contrasted conditions in the county home in Loughrea, which they had recently visited, as part of their review of the reconstruction of county homes:
the chief impressions gained from the inspection was the good effect achieved by the consistent maintenance and improvements. Loughrea county home, although grossly overcrowded reflects great credit on the county council, its officers and on the matron and staff.

Funding

15.41 When Tuam opened, the local authority agreed to pay a capitation rate of 10s a week for each mother and child. In 1927 a member of the Galway Board of Health demanded that the 1925 agreement should be terminated and the payment reduced to £20 a year because he believed that £26 was 'too much'; he claimed that children had been maintained in the workhouse for six to seven shillings a week. The capitation rate for Tuam remained at 10 shillings a week between 1925 and 1942. In 1944, Sister Hortense asked that it be increased to 11 shillings a week. While the county manager approved this, it was subject to final approval by the DLGPH. It was at this point that the department expressed concern about the irregular status of Tuam. However, there are no contemporaneous documents setting out the department's views. In 1947 the county manager recommended an increase to 12s 6d a week, subject to ministerial approval. In December, Sister Hortense informed the local authority that she could not pay for provisions, clothing and other outgoings unless the capitation rate was increased. The increased capitation rate was eventually approved in January 1948.

15.42 When this application was being considered by the department, officials asked Miss Litster for information about Tuam. She outlined the costs which were directly met by Galway County Council, though she pointed out that there was no audit, apart from admission and discharge books. She said the rates applicable in Sean Ross, Castlepollard and Bessborough (the extern homes) were not a fair comparison as Galway County Council paid directly for many of the overhead costs in Tuam. The community running the three extern homes (the Congregation of the Sacred Hearts of Jesus and Mary) had bought and equipped the homes and bore these costs. (However an inventory when Tuam closed suggested that the Sisters of Bon Secours appear to have borne many of the running costs, such as the purchase of blankets and equipment.) Miss Litster was aware that there were discussions about making Tuam an extern home and she was reluctant to make any recommendations until she had more up to date information. There were 330

17 Connacht Tribune, 26 March 1927.
residents maintained in Tuam on 31 March 1947 so the capitation increase would have meant an additional £1,200 a year.

15.43 The department calculated that if the increase were granted, the income of Tuam would be £207 10s a week. The charge for the same number of women and children in Sean Ross would have been £244 8s 6d (28s 6d for mother and child and 15s for child). There was an incomplete attempt to assess the value of overheads borne by Galway County Council. Slightly different figures were given for the capitation rates in Sean Ross and Bessborough. If Tuam received Bessborough capitation rates it was estimated that its income would be £1,900 a year higher. The official who was making these calculations considered that £1,900 was more than the costs of the overheads borne by Galway County Council in respect of Tuam, although no estimate of these costs was provided. When the council was seeking departmental approval for an increase in the capitation rate in 1950, it stated that this was sought following a recent visit by a representative of the Department of Health to Tuam.

15.44 In 1951, the county manager claimed that the Tuam rate compared favourably with capitation payments in Castlepollard and Sean Ross when allowance was made for the fact that the local authority bore the cost of overheads. In 1952 the superior in Tuam sought a further increase to 18s. When applying for departmental approval, the county manager stated that he had approved an increase on the basis of details submitted by the home of the amounts paid for provisions and clothing over the previous year. In the memorandum approving this payment, the department noted that the 'special homes' rates were 40s (for a mother) and 25s for a child. A further increase to £1 was approved in January 1953 to compensate for the withdrawal of food subsidies. When approval was sought in 1955 for an increase to 22s 6d, the county manager told the department that Castlepollard and Sean Ross were paying £2 for a mother and £1 for a child. He claimed that the overheads in Tuam, which were borne by the local authority, amounted to 15s 5d for a mother, making comparable Tuam rates equivalent to £1 15s 5d for a mother and £1 for each child. The county manager was in favour of increasing the capitation rate for mothers by 5s while holding the children's rate constant; the ratio of children to mothers in Tuam was much higher than in other homes, given that children remained there until approximately six years of age, so that proposal would have brought limited benefits to the home. A statement of income and expenditure submitted by the Sisters of Bon Secours (not seen by the
Commission) recorded a debit balance of £402 16s 6d at the end of 1954, compared to £196 6s 5d the previous year. This included a sum of £370 7s 6d for the Sisters and ‘this is the only remuneration for eight Sisters employed in the institution apart from maintenance’. In 1958 the county manager requested departmental approval to provide £100 for Christmas fare. He was told that the department would have no objection to him allocating £150, even if ‘it were irregular in the sense that it did not fall within existing authorisations’. A department official noted that £100 would mean an extra 10s for each mother and child which was ‘frugal enough’. £150 was allocated for Christmas fare in 1959. The Department of Health seems to have treated it as a Section 65 grant.  

15.45 It should be noted that Galway County Council collected payments from some parents of women in Tuam and from putative fathers. It also tried to collect contributions from mothers whose children remained in Tuam or their parents. In 1957 a local doctor claimed that the local authority received £4,000 from this source. The Commission has seen no evidence that would confirm this amount. A handwritten note dated in 1955 states that 15 affiliation cases were referred to county solicitor in the past year, all were unsuccessful. In 1957 a father wrote to Galway County Council on several occasions asking that his daughter should be permitted to leave Tuam without taking her child, who was less than one year old. This man, a small farmer was in poor health and he relied on his daughter to assist him on the farm. He was prepared to pay 6s a week for the baby’s maintenance in Tuam until the child was one year old. The local authority had contacted the putative father of this child asking that he contribute £2 5s weekly to cover the cost of mother and baby in Tuam, however he had denied paternity: ‘How many names could she put down and until I am found guilty I am not prepared to pay to her maintenance’. In one case where a man had agreed to pay for mother and child he then disappeared from his address. In a number of cases the putative father was said to have left the area, and he had no known address; this was stated by the family of a farmer’s son, who had gone to England around the time that the pregnancy became known.  

---

18 Section 65 of the Health Act 1953 allowed health authorities to provide money to various bodies which provided services similar or ancillary to the services directly provided by the health authority. It was the legal basis for practically all health authority payments to voluntary organisations until 2005. It was a rather strange legal basis for a payment to what was a service directly provided by a health authority. 

19 Tuam institutional records.
15.46 By the late 1950s, Tuam was facing a similar problem to the other homes that were supported through a capitation rate. The number of women and children in the home was falling and women were staying for shorter periods, so income was declining. In December 1959 the Galway assistant county manager noted that the capitation rate was inadequate but total costs to the council were higher than the cost of maintaining mothers and children in Castlepollard, which would have cost £10,705 10s, compared to £12,580 in Tuam. His figure included an estimate of £4,000 for overheads. He claimed that the cost of maintaining women and children in Tuam was higher because of the low numbers, and the high cost of repairs and improvement to the old building, which had cost £2,729, or 7s for each ‘inmate’ in the past year, whereas the extern homes were ‘probably good buildings’ with lower maintenance costs.

Capitation Rates
15.47 The capitation rates in Tuam were as follows:

- 1925-1944: 10s a week
- 1944: 11s a week

Running the home
15.48 The undated memoir by Bishop Fergus states that there were four Sisters in the Tuam home when it opened; three appear to have transferred from Glenamaddy. The Sisters of Bon Secours supplied the Commission with a list of Sisters who worked in the home, but it appears to be incomplete, because the only Sister identified as working there before the 1940s was Sister Hortense. The record is more complete for later years. This list indicates that, from the 1940s, a number of the Sisters working in Tuam were State Registered Nurses (SRN) and one who worked there in the 1940s is described as having qualified as a children’s nurse in the UK. A Sister with a domestic science qualification from Cathal Brugha Street worked in the home from 1955 until it closed. However an inspection carried out in 1950 under the Registration of Maternity Homes Act 1934 stated that Sister
Hortense was a RGN; this was not noted in a 1945 inspection. An affidavit provided by the Sisters of Bon Secours stated that there were five or six Bon Secours Sisters in addition to the superior, plus lay staff, with one person doing the books, one in the kitchen, one in the laundry and one in the nursery.

15.49 The Commission has not seen a contemporaneous record of the number of religious or lay staff or their roles. In 1930 a local councillor suggested that ‘the appointment of the ordinary staff, wardsmaids, etc., be left in the hands of the sisters’.

An inspection under the Registration of Maternity Homes Act carried out in 1950 records under the heading ‘other staff’ 22 domestics (including whole building)’. These were presumably mothers who were resident in the home. The mothers were allotted various duties in the home - in the kitchen, nurseries, feeding children, or assisting in the maternity unit; they carried these out under the supervision of the Sisters. Given the fact that children remained in the home until approximately the age of six, and mothers left approximately a year after the birth, there were many more unaccompanied children in Tuam than in the extern mother and baby homes. This meant that women in Tuam would have had heavier workloads with more children to care for and more laundry than women in the extern homes. In this respect their workload would have been more comparable to unmarried mothers in county homes but less onerous (see Chapter 10). In his memoir Bishop Fergus mentioned ‘three women who, from its beginning in Glenamaddy to its end in Tuam, served the Sisters well and were worth their wealth in gold - Bina Rabbitte, Annie Kelly and Mary Wade’. It is probable that the ‘maid’ who slept in the maternity unit with the women in 1946 was one of these women.

**Women in Tuam**

15.50 A total of 2,219 women were admitted to the Tuam home between 1923 and 1961; the largest number of admissions was in the 1940s. The highest number of births recorded was in 1943 when 143 babies were born or admitted; the second highest was in 1945 when 135 were born. Not all of these babies were born in Tuam. The modal age of mothers in the 1920s, 1930s and 1940s was 20 rising to 21 in the 1950s.

---

20 *Connaught Tribune*, 28 June 1930
15.51 The data on occupations of the women are incomplete as there is no information for almost one-quarter of the women. The occupations that are recorded were representative of young single women in the west of Ireland in the years 1920-1960: 41% were recorded as domestic servants; 32% were reported to be engaged in ‘home duties’. Just under 60% of the women were from Galway, 28% from Mayo; there is a scattering of women from other counties; no information on county of origin is available in 10% of admissions.

15.52 Tuam was not confined to women on their first pregnancy; just under 10% were on a second or third pregnancy. The secretary of the Galway board of health told the Commission on the Sick and Destitute Poor:

Originally it was decided to send all second offenders to the Magdalen Asylum Galway, and the children to the Children’s Home. That worked for a short time until the Ministry insisted on having an agreement with the Nuns in charge of the Magdalen Asylum. The Nuns refused to sign any agreement, and the whole thing has fallen through. Now second offenders are not allowed into the Children’s Home, and when they are discharged from the maternity hospital they are allowed to go broadcast through the Country.

15.53 The records of admission pathways are very incomplete, but of those that exist, the most common referrals were by the local health authority or by a dispensary doctor/medical officer. Galway local authority records show that officials made serious efforts to pursue the putative fathers of these children for maintenance or to secure a contribution from the woman’s family. In June 1930 the CHHAC recommended that all women admitted to Tuam should be interviewed by the county solicitor. In December 1930 the Senior Assistance Officer (SAO) (see Chapter 1) visited and interviewed all the women. He reported that they were mostly servant girls; the putative fathers tended to be labourers or servant boys. He provided the committee with a list of women and putative fathers. He indicated there was written evidence of the sixth mother on the list having met the putative father on several occasions. He claimed there was enough evidence for the county solicitor to pursue this case as he was a man of means. Additionally, numbers two, three, five and twenty stated that they could prove paternity. Numbers one, two, three, four, five, sixteen and twenty were living at home with their parents ‘when they got into trouble’ and he recommended that the committee

---

22 Connacht Tribune, 28 June 1930
should pursue their parents for maintenance in Tuam or ‘have themselves or their babies sent home’. Numbers fifteen, seventeen and twenty-two came from other counties, ‘but had been employed as maids in Co. Galway when they got into trouble’. It should be noted that this report, without names, was published in a local newspaper.

15.54 This SAO had presented a paper to a conference in Dublin’s Mansion House some months earlier, titled ‘The administration of home assistance’. In the course of this paper he argued that a large number of unmarried mothers in Galway were ‘mentally defective’. He also suggested that ‘imbeciles and harmless lunatics’ should not be given home assistance, arguing that their proper place was in an institution where they would be able to receive suitable treatment. He claimed that many young women in this category become unmarried mothers: ‘a contingency doubly abhorrent, increasing the large number of imbecile children already in the country’.

15.55 The solicitor for Galway County Council was zealous in pursuing both putative fathers and the families of unmarried mothers to recover some of the cost of running the Tuam although it is probable that many of his efforts were not successful. Farm labourers and servant boys would have been incapable of contributing money towards a child’s maintenance. Nevertheless the extant managers’ orders, the minutes of the CHHAC and reports in the Connacht Tribune record extensive discussion about this issue. If the putative father was a soldier or a member of An Garda Síochána, Galway County Council approached the relevant ministers, asking for deductions from their wages, but it is not clear whether this happened.

15.56 In 1943 the county manager examined a list of cases submitted by Sister Hortense and directed that proceedings be taken in those cases that she recommended. The following year an expectant mother arrived in Tuam; she was a native of Athenry and had been working in a Limerick hospital for the previous six months. The assistance officer refused to give her an admission ticket - presumably because she had been working outside the county. Sister Hortense admitted her for one month because she had nowhere else to go and the woman agreed to pay £2 for her maintenance. The county manager ordered that she be asked to make

---

23 Connacht Tribune, 25 January 1930
24 Connacht Tribune, 12 July 1930.
a statement as to the putative father and if she refused to do so she would not be admitted. In 1945 a manager’s order reported that a named woman wished to be admitted as an expectant unmarried mother. She was prepared to pay £5 for admission; her mother would pay a further £5 at a later date. The county manager ordered that she should be admitted, having paid £5 down; consideration should be given to discharging mother and child after three months if she did not assist in the prosecution of the putative father. The question of a further charge for maintenance would be considered after three months. In 1947 he issued an order relating to future admissions of unmarried mothers to Tuam:

I hereby direct that admissions to the Children’s Home Tuam in future be only made on order issued direct from county council office after receipt of application form completed by expectant mother giving name and means of putative father, whether she is willing to swear against him with particulars as to her own means and contribution (if any) to be made. This form must be endorsed by her medical attendant giving probable date of confinement and stating where admission is recommended.

15.57 There is evidence that this order remained in force into the late 1950s. In 1957 a GP from Co Galway, who was a member of a deputation from the Irish Medical Association to the Department of Health (they were discussing maternity provisions under the Health Act 1953), complained about the difficulty of getting unmarried mothers admitted into Tuam. He reported that the local health authority insisted on the name of the putative father being provided before a woman was admitted. He acknowledged that the health authority was collecting £4,000 a year ‘from such individuals, but he felt that the present approach was an unhuman one’. He also noted that some unmarried mothers required a level of care that could not be provided in Tuam and this delay presented risks for both mother and baby. Pregnant single women whose medical condition required admission to the Central Hospital in Galway had first to be admitted to Tuam and transferred from there to Galway. Names of putative fathers are recorded on 399 entries out of a total of 2219 entries (almost 18%); it is not possible to know if any of these names is accurate.

The Maternity Unit

15.58 When Tuam opened as a children’s home it did not accommodate pregnant women. Pregnant women who sought the assistance of the local authority were admitted to the county home in Loughrea and transferred to the Central Hospital in
Galway for the birth of their child. Mother and baby were then brought to Tuam. In 1926 the CHHAC expressed concern at the ‘unnecessary expense’ of ambulances to transfer mothers and babies and a ‘still greater concern is that while this class of patient is in the Central Hospital, wives of labourers artisans etc. for whose use the Central Hospital was primarily intended will not seek admission’.

15.59 Discussions about a maternity ward commenced shortly after the home moved to Tuam. The medical officer at the home expressed the opinion that the former Tuam fever hospital (which was part of the workhouse complex) would be suitable, provided that it was modernised. It had no hot water supply, no suitable range (stove) in the kitchen; an extra bath, bathroom, beds and bedding were required as well as two or three extra nurses. He emphasised that complicated cases should continue to be sent to Galway. The CHHAC was less than enthusiastic about providing a maternity home at Tuam, given the additional costs. The County Galway Hospitals and Dispensary Committee was more positive because they wished to exclude unmarried mothers from the Central Hospital. One member suggested that ‘there should be a shed erected at the County Home’, to cater for unmarried mothers. However the chair of the committee, Canon McAlinden, countered that these women were not ‘hospital cases. They are coming in as refugees’. Having examined the options, a decision was taken to fit out a ‘room’ in the Tuam home, ‘as the present arrangements…cannot be allowed to continue’. Galway County Council asked local newspapers to publish a denial of a rumour that coloured illegitimate children were born in the Central Hospital.

15.60 The local authority engineer reported that the proposed maternity ward (the former fever ward) was sufficiently large but needed major improvements. The interior needed to be thoroughly cleaned, bathrooms and toilets installed and a new sewer system laid down. He estimated that these works would cost approximately £500. In September 1930, Galway County Council sanctioned the raising of a loan of £2,000 for rewiring the county home and repairs in Tuam, ‘including the provision of a maternity ward’. The loan was approved almost immediately by the DLGPH.

15.61 The maternity unit opened in 1935. A total of three ‘illegitimate’ babies were born in Tuam in the 1920s; these births presumably occurred before mothers could be

---

26 CT 8 September 1928
27 CT 8 November 1928
transferred to Galway. In the 1930s the numbers born in Galway (200) still exceeded births in Tuam (168). There was no resident midwife. When plans were being drawn up for the maternity ward, the local authority decided to increase the salary of the medical officer by £25 from an initial £90 and to pay the local dispensary midwife an additional £20 to attend at births in the home. In 1932 the matron (Sister Hortense) informed the local authority that she had been given permission to supervise the proposed maternity ward (either by the bishop or by the order), ‘but she would not be allowed to undertake the nursing in connection with same’. The Vatican prohibition of religious sisters engaging in midwifery was removed in 1936. This change does not appear to have impacted on nursing/midwifery practices in the Tuam home. The 1945 inspection carried out under the Registration of Maternity Homes Act 1934 noted that the staff was adequate to meet the needs of the maternity unit. It stated that the nurse (presumably the midwife) slept at home and attended for confinements. The 1950 inspection noted that the patients were delivered by the district midwife. A Department of Health file looking at provisions for unmarried mothers under the Health Act 1953 noted that ‘the medical officer attends daily and is on call as required’. This would have been the position in many small private maternity homes at the time.

15.62 Institutional statistics show that from the 1930s women were admitted to Tuam on average 50 days before giving birth. The department’s inspector, Miss Clandillon, stated that the possibility of a woman in Tuam receiving pre-natal care was dependent upon the length of time elapsing between admission and confinement. No such care was possible in some cases because women sought admission immediately prior to or after confinement. The way to ensure that women could receive appropriate care was to secure their admission three months before confinement. However, there was a challenge in trying to get local authorities to agree to this because of the cost. In 1947 Miss Litster also commented that many Tuam mothers received no ante-natal care. She criticised the county manager for issuing an order that prohibited the admission of expectant mothers, chargeable to Co Galway, prior to the seventh month of pregnancy. She suggested that this would place a good deal of hardship upon women ‘whose condition must become a matter of common knowledge before they are admitted and whose efforts to conceal their condition must have a bad effect upon the health of their infants. It

28 Canon 489 ‘Maternity Training for Missionary Sisters’. Margaret MacCurtain, ‘Catholic sisterhoods in the twentieth century’ in Alan Hayes and Diane Urquhart (eds), The Irish women’s history reader (Routledge, 2000), p. 149
might be well to enquire the reason for making this order’. There is no evidence in the managers’ orders that this prohibition, which was introduced to reduce costs, was removed.

15.63 The Tuam home was registered under the Registration of Maternity Homes Act 1934 on 1 December 1937. An inspection carried out on 11 July 1945, the earliest inspection report which the Commission has seen (although clearly not the first inspection), stated that the maternity wing was a new building, well-equipped and fit for purpose. It consisted of a six-bed ward, one bath and shower and three WCs. It noted that the medical officer wanted Wasserman tests (a blood test to determine if a woman was a carrier of venereal disease) to be carried out before women were admitted; otherwise he had to send the blood tests to Galway for analysis. The inspection noted that 97 babies were delivered in the past year; no miscarriages or stillbirths were recorded, but there were 10 infant deaths since the last inspection. The inspector, Dr Florence Dillon, noted that the matron was ‘most anxious to have the home centrally heated’; no details were given about heating in the maternity home in this report. A further inspection in 1947 confirmed the 1945 details about the premises; it also mentioned that the unit included one single room, which would appear to have been used as an isolation unit for mothers. There were 86 confinements in the past year and six infants had died. The Grove, a private nursing home also run by the Sisters of Bon Secours in Tuam, which was also inspected at this time, recorded 92 confinements over the same period and two infant deaths. In May 1950 the figures for the Tuam home were 82 births, six stillbirths, one maternal death and 11 infant deaths. The inspector noted that Tuam had no arrangements for dealing with cases of puerperal pyrexia or sepsis - these cases were transferred to hospital.

15.64 The inspection in May 1950 noted that there were three new-born infants in the nursery but the cots did not have the usual bed clothes, sheets, pillowcases, mattress saver, mackintosh etc. One infant was wrapped in a large grey blanket. Two others had old looking jerseys on and the inspector remarked ‘I think the cots and the infants should be properly dressed’. When Tuam was inspected in 1951 it was noted that there were only one or two patients in the maternity unit at any one time. The number of births was falling, 53 since the last inspection; four infants had died. The cot clothes had been replaced. The report recalled that they had been very poor at the last inspection.
15.65 Documents relating to the 1951 inspection noted that when the Chief Medical Officer of the Department of Health made his observations on the inspection carried out in May 1950, he suggested that an investigation should be carried out into the infant mortality rate. ‘In view of attached (illegible) it would appear that the matter was overlooked’. It noted that the causes of the high death-rate were discussed ‘in A section’s file A11/255’; the Commission has not seen this file. The memorandum indicated that a number of causes were given for the high death rate, the ‘chief one being lack of pre-natal care, a cause which the authorities of the home cannot remedy’. It added that ‘several other improvements in the home itself are necessary both in personnel and facilities’.

15.66 This was a reference to the medical officer to the home, Dr Costello. He had been the medical officer to the Tuam workhouse and was appointed as medical officer to the Tuam home when it was opened. He was also the local dispensary doctor which was a salaried post and he served as medical officer of health for the local authority. The doctor divided his time between all of these duties. In 1932 he applied for an increase in his salary as medical officer to the Tuam home. He highlighted the increased work resulting from the admission of women and children from Mayo from 1931 and the opening of the maternity unit. In 1932 he claimed that ‘the ante-natal Galway cases’ had increased his workload; in 1937 the local authority agreed to award him a salary increase of £70. Galway CHHAC told the department that a portion of his salary would be charged to Mayo Board of Health in proportion to the number of Mayo women and children in the home. This would also apply to the £120 salary paid to the chaplain. Over one-third of the women and children in the home were from Mayo.

15.67 Dr Costello retired as medical officer to the Tuam home in 1951 but continued to serve as the dispensary doctor. He was born in 1864 so he was 87 at this time. The county manager and at least one Galway TD supported his claim to draw pensions from his former roles as medical officer to the Tuam home and the former Tuam workhouse, while continuing to serve as a dispensary doctor but the Department of Health refused to approve this, deeming it illegal. Dr Waldron succeeded Dr Costello as medical officer to the home.

15.68 The Commission has discovered very few details about medical practice in the home. In 1943 there is evidence that the medical officer had sought the assistance of another doctor in a difficult midwifery case and he asked the local authority to
approve a fee payment to his colleague; this was not the only such occasion. In 1945 the county manager approved the purchase of ‘special medicine’, not specified, for Tuam, subject to ministerial approval. Another order approved the purchase of 4.5 gallons of Hysan, the purpose of which is not clear. In 1947 approval was given to purchase a quantity of penicillin that Dr Costello required ‘in connection with an epidemic of measles in the home’. In December of the same year approval was given to purchase penicillin at a cost of 4s 3d to treat influenza. These would have been quite early instances of penicillin being used in Ireland. A letter in the records of the Sisters of Bon Secours, dated November 1946, from Sister Hortense stated that she had £1,000 in the St Mary’s bank account: ‘I was holding it for the theatre equipment as the contractor will require payment when the stuff is delivered’. This suggests that the maternity unit was acquiring additional equipment at this time.

15.69 In 1951/2 there would appear to have been some concerns about the register for the maternity home. A letter from the county secretary to the Department of Health, dated July 1952, reported that:

The County Medical Officer states that on his inspection of St. Mary’s Nursing Home, Dublin Road Tuam on 15th February last, he checked the register and that he recently re-checked it, and interrogated the matron, but could find no evidence of the omission alleged in the last paragraph of your letter of 21st June to the County Secretary29 in which you stated that the death of one infant was not entered in the record of the Home. I shall be obliged if you will let me have further particulars concerning the alleged omission.

15.70 The Commission has identified three infant deaths in the home in February 1951 that are not registered in the General Register Office (GRO). There clearly was some problem with registrations of death at this time.

15.71 In 1953 all the maternity homes in Co Galway were inspected by the county engineer to assess fire safety. The Tuam maternity home had fire extinguishers and this is recorded in a number of inspections. The county engineer stated:

No special report is being made on this building as plans are prepared for extensive alterations which are due to begin in the near future. These will include new escapes. It is recommended as in other cases that a system of

---

29 The Commission has not seen this letter.
fire and evacuation drills be devised and that printed instructions be posted in
Staff Quarters setting out actions to be taken in case of fire.

The Commission has seen no evidence that this happened but the fire risks were
highlighted in November 1959 when a decision was taken to close the home.

15.72 Tuam maternity home did not include a separate nursery. In earlier inspections it
was stated that the infants stayed with their mothers (which would have been
conducive to breastfeeding). However, in 1953, an inspection noted that a
kitchenette was being used as the nursery which was contrary to the specified
standards. According to a note on a Department of Health file, Miss Reidy (a
department inspector) had discussed the matter of infants being left in the
kitchenette with the Galway chief medical officer. She recorded that he was
satisfied ‘that in view of the limited no. of deliveries in this Home the nursery
provision is adequate’. The memorandum continued: ‘The Home is closely
associated with the Local Authority and I suppose it should comply with our
standards, but is it worth-while following up the point’.30 When the home was
inspected in 1956 it was noted that the maid slept in the same ward as the
patients. Infants were nursed in a spare room with their mother when they were ill.
The kitchenette was occasionally used as a nursery and, yet again, it was noted
that this was contrary to recommended standards.

15.73 By this time there should have been no reason to use the kitchenette as a nursery.
In 1955 it was reported that births had fallen to approximately one a fortnight; 29
babies were born between 20 July 1956 and 26 August 1957; there was one
stillbirth and six infants died. One was described as ‘delicate and difficult from
birth’; another as ‘delicate from birth and very poor weight gain’; one had a
congenital heart disorder; the mother of one of the children was in a sanatorium
both before and after the birth. Three children died from pneumonia or respiratory
infections.

**Women’s exit pathways**

15.74 Women remained in the home for less than a year. The average stay after giving
birth ranged between 200 - 259 days; the shortest stays, an average of 204 days,
were in the 1940s and the longest, 259 days, was during the 1950s. This was
shorter than in the Sacred Heart homes. Just under half of the mothers (1101)

---

30 The Department of Health had set standards for maternity homes but these were not statutory and not legally binding.
gave birth in the Tuam maternity home; 558 gave birth in hospital in Galway; 87
gave birth at home and 91 in hospital in Castlebar. Twelve mothers died in the
home between 1923 and 1961.

### 15.75

Thirteen mothers are recorded as going to Magdalen laundries and one to an
unspecified Good Shepherd Home (which was probably a Magdalen laundry).
Most files give no indication as to the exit pathway of the mother so these figures
should be regarded as the minimum number admitted to Magdalen homes. In
1928, during a lengthy debate over the cost of maintaining unmarried mothers and
their children the local authority adopted a resolution calling on the Dáil ‘to
introduce legislation to giving power to commit second offenders to a Magdalene
Asylum’.\(^{31}\) This motion was consistent with the recommendations of the 1927
Commission on the Sick and Destitute Poor. While no such legislation was ever
drafted, there is evidence that the local authority attempted to send some mothers
who were pregnant for a second time to Magdalen homes. In 1945 a manager’s
order stated that a named woman should be transferred to a Magdalen home when
she was due for discharge from the Tuam home; if she refused, her child should be
discharged with her. This woman had previously given birth in Tuam in 1939 and
her child had died. On this occasion she was transferred to Tuam from Regina
Coeli; this child also died and the mother left the home shortly after the death.
There is no record of where she went. Institutional records relating to children in
Tuam show that 84 mothers were admitted to a Magdalen laundry some time after
their discharge from Tuam. It is most likely that these women were on their second
or subsequent pregnancy and, in line with Galway County Council policy, were
directed to enter a Magdalen laundry when they sought public assistance. In 13
other cases children were admitted to Tuam unaccompanied while their mothers
were admitted to a Magdalen laundry - these women had never been in the Tuam
home. A further 22 women, all admitted to the Tuam home on second or
subsequent pregnancies, were directed by Galway County Manger to seek
admission to a Magdalen laundry or to remove their child from the Tuam home.
The Commission could not establish whether these women subsequently entered
a Magdalen laundry. Four children who were born in or admitted to the Tuam home
were subsequently admitted to a Magdalen laundry in their teens or in early
adulthood.

---

\(^{31}\) *Connacht Tribune*, 8 September 1928.
Children in Tuam

15.76 The Tuam institutional records show that there were a total of 3,349 children resident in Tuam; 2,694 were the children of unmarried mothers; 655 were the children of married or widowed parents. As already stated, Tuam was not exclusively a mother and baby home. It accommodated unmarried mothers and their children from counties Galway and Mayo. It also accommodated the children of married couples or widows/widowers with or without their mothers and orphans. The women were often wives of men who had gone to England but were not sending money home; there was also an occasional prisoner’s wife and other homeless and destitute women. There are several reports of families being evicted. Similar cases can be found in county homes during these years.

15.77 Tuam accommodated significant numbers of unaccompanied children - children of unmarried mothers whose mother had left the home and unaccompanied children of married or widowed parents. The number of unaccompanied children peaked in the 1940s. The average number of unaccompanied children per decade was:

<table>
<thead>
<tr>
<th>Decade</th>
<th>Average Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1920s:</td>
<td>72</td>
</tr>
<tr>
<td>1930s:</td>

</tr>
<tr>
<td>1940s:</td>
<td>251</td>
</tr>
<tr>
<td>1950s:</td>
<td>51</td>
</tr>
</tbody>
</table>

15.78 The unaccompanied children of married parents were in the home for a variety of reasons. There are detailed lists of these children in the manager’s orders; the details given here relate to 1943. One father whose daughter was in the home, explained that he could not take her home because his father who was living there had an advanced case of TB and was not expected to recover. Another child was deemed ready to leave the home because her mother had been discharged from a mental hospital. The father of one family of children was working in England ‘and will probably take them home on his return’. One girl whose father refused to contribute towards her maintenance in the home ‘appears to be mentally defective’. The father of one boy was in the army and his mother was in hospital; this boy would return home when she was discharged. One family of children was sent to the home by the National Society for the Prevention of Cruelty to Children (NSPCC). Their father had been evicted and the NSPCC inspector ‘doesn’t know what happened to the parents’. The father of another family of children had gone to England and left them with his mother, but ‘she gave them back to his wife’.
There are numerous cases where one or both parents was suffering a long-term mental or physical illness; or a father, and occasionally also a mother, had gone to England and left the children behind. The local authority sent these children to the home and tried where possible to make the parents contribute towards their upkeep. Children in similar circumstances continued to be admitted to the home until it closed.

15.79 By June 1935, the home was becoming overcrowded. The number of children admitted (which includes those born in the home) peaked in the 1940s; 132 were admitted in 1942, 139 in 1944 and 142 in 1946 but the numbers fell sharply after 1947. In a report dated October 1940, Miss Clandillon, a DLGPH inspector, stated that there had been an increase of one-third in the number of children in the home to 80 and consideration needed to be taken to increasing the numbers being boarded out. In 1944, Miss Clandillon said the numbers of children and mothers being maintained in Pelletstown and Tuam was excessive and a vigorous boarding out system was needed to reduce it. On 31 March 1943, there were five children to every mother in Tuam and the home was struggling to limit the numbers that could be admitted.

15.80 The home was under considerable pressure during the 1940s. The numbers of ‘legitimate’ children in the home peaked in 1943, probably reflecting wartime disruption: fathers going to work in England or joining the army. The number of ‘illegitimate’ children also rose - as happened in other mother and baby homes.

15.81 The high ratio of children to mothers would have made it difficult to provide adequate care for toddlers and children. Tuam was again described as overcrowded in 1944 when there were 301 residents, 198 from Galway and 103 from Mayo. By August 1948, there were 75 children, which was a reduction from Miss Clandillon’s previous report. She described Mayo as ‘one of the few counties in any area which has not been affected by the war’; the supply of foster homes did not appear to have been diminished. She criticised the practice in Galway and Mayo of boarding out children with elderly foster mothers; she suggested that this should be avoided as far as possible.

15.82 Approximately half of these children were born in the home; the highest proportion was during the 1940s, when over 60% of children were born there; the proportion fell to just over 50% during the 1950s.
15.83 While women left Tuam on average less than a year after the birth of their baby, the children remained there for several years. The policy of the DLGPH was to encourage boarding-out when children were two years old and there was sustained pressure on mother and baby homes and county homes to place children who were over two years of age in foster homes though local authorities often failed to comply with this. However Galway was unique in having an agreement with a dedicated home to keep the children of unmarried mothers until school-going age. The agreement drawn up between Galway County Council and the Sisters of Bon Secours when the home opened provided for this. When an agreement was reached with the Sisters of Bon Secours in 1931 to admit women and children from Mayo, one clause stated ‘That ages for boarding out children be the same in Mayo as for Galway, namely, boys 5 years, girls 7½ years, each Board to deal with their own boarding out arrangements.’

15.84 When Mayo attempted to change this arrangement in 1935 and remove children at an earlier age, the Sisters informed the local authority that their agreement about the Tuam home would not be renewed. Galway Board of Health expressed the view that the Sisters were acting in the best interests of the children. On occasion when the cost of the home threatened to result in an increase in the rates, a councillor would suggest that children should be sent home to their mothers.

15.85 When a mother left and her child remained in the home, the local authority tried to ensure that mothers contributed to the child’s maintenance. In 1943 Miss Clandillon stated that some mothers in Tuam and Pelletstown were permitted to leave the home in order to take up employment. They could leave their children in the homes under agreement and contribute to their maintenance, although this was not the usual procedure following birth in an institution. In that year a Co Galway manager’s order, headed ‘Maintenance Cases Children’s Home Tuam’ recorded that two mothers had agreed to pay 5 shillings a month towards maintenance of their children in Tuam. In another case (1947) where the mother had left the home and was reported to be going to England, the manager ordered that the ‘Secretary of the passport office be requested to refuse permission to this girl to emigrate to England’ and that the county solicitor issue proceedings against

33 Connacht Tribune, 17 June 1933
34 Travel permits were required for travel to Britain during the war years and until 1948.
her for deserting her child’. The assistant secretary had secured the address in England of the mother of a child in the home and he had written to her asking what amount she would pay towards the cost of maintaining her daughter in the home.

15.86 The local authority put pressure on Sister Hortense to ensure that mothers signed an agreement to contribute to their child’s maintenance before they left the home. Managers’ orders report that Sister Hortense agreed to ask mothers when they were leaving the home whether they were ‘willing to contribute something towards the cost of maintenance of their children there’. The county secretary was directed to draft an agreement to this effect that mothers would sign before they left the home. A later report stated only three mothers with children in the home had been discharged during the quarter ending 30 September 1943 and all three mothers had signed agreements guaranteeing payment of £3 a year towards their children’s upkeep. The Commission has no knowledge of the number of mothers who signed such an agreement or of the amounts, if any, that they might have contributed. The majority would have taken jobs as domestic servants or in institutional service where their earnings would have been meagre.

15.87 In 1956 the secretary of Galway County Council wrote to the Department of Health about the requirement to contact the mothers of children who were either in Tuam or boarded-out. This arose in the context of a requirement to secure the mother’s written consent if the child was undergoing an operation. This was difficult when the child had been abandoned or its parents were incapable of making a decision and it appeared that no express authority had been given to local authorities that would ensure they would be able to grant permission for necessary operations to be carried out as required. He had given instructions to the matron in Tuam to seek a mother’s permission in future where this was possible.

Illnesses and deaths

15.88 The Commission has identified 978 deaths of children who were in the Tuam home; this includes 80 children who died in Glenamaddy; 802 children died in the Tuam home; 80 died in the Central Hospital in Galway and 8 died elsewhere including other hospitals. The Commission has seen GRO records for 972 of these children. The children who died included 108 ‘legitimate’ children. The death of ‘legitimate’ children peaked in 1936 when 17 children died. The deaths of children born to unmarried mothers peaked in the 1940s.
Almost half of the deaths (453 or 47.8%) were of infants aged between one and six months and almost 80% were of infants aged under one year.

The local authority records have virtually no information about deaths or illnesses in the home although it would appear that the medical officer supplied regular reports. In 1943, they note a report from Dr Costello stating that there were ‘only’ 6 deaths in June, one was an infant who had lived only one and a half hours. The other children were under six months of age, and deaths were due to whooping cough and general weakness.

The 1945 inspection

Most of the inspections carried out under the Registration of Maternity Homes Act 1934 reported only on the maternity home; they did not inspect the children or the remainder of the home, but there were some exceptions. In 1945 Dr Florence Dillon completed the standard form. She also included a hand-written report. This stated that ‘as directed’ she had visited the home and interviewed the matron and the medical officer. There were 64 ‘girls’ in the home; ten were described as ‘waiting cases’, and 160 children. She was strongly of the opinion that mother and child should not be separated in the first 12 months of life ‘under any circumstances whatever, & neither should be permitted to leave the Home for this period’.

Dr Dillon commented on the ‘legitimate’ children in the home. She reported that the ‘matron informed me that the county manager sends in children of mothers going to the Central Hospital as patients’, and the NSPCC inspector ‘sends in whole families’. She recommended that these children should only be admitted on a temporary basis, and they should be segregated from the other children because they were a possible source of infection. Dr Dillon reported that ‘The Home appears efficiently managed as far as could be ascertained. The children are well cared, weekly weight charts being kept in the case of non-thriving infants also case histories’.

Among the 160 children in the home there were eight ‘imbeciles all of whom were born in the home and 2 girls of 12 years who were returned from being boarded-out, owing to sub-normal intelligence. Yet another imbecile 8 yrs. was sent to the Home by Galway County Manager last week’. When the county manager received
a copy of Dr Dillon’s report (and he would have received a copy of all inspectors’ reports on the home), he directed that particulars of imbecile children in the Home from Galway and Mayo be sent to the Local Government Department, that they be informed that those children will be sent to St Vincent’s Home Cabra Road, if accepted there. That legitimate children are only taken temporarily and St Vincent’s be asked if they are prepared to admit those children.

The 1947 inspection
15.94 The most comprehensive inspection of the Tuam home which the Commission has seen was carried out by Miss Litster in April 1947. At the time there were 271 children and 61 mothers in the home - a total of 333 residents. She noted that ‘in 1944 the population suggested as desirable by Mr Humphreys was 243.35

Accommodation and health
15.95 Miss Litster described the accommodation and the condition of the children in detail:

Day Nursery 1: The day nursery for babies contained eight wooden cots and one pram. Babies were healthy in appearance, except for two boys; one was described as ‘a baby with mis-shapen head and wizened limbs’, the second as ‘a premature infant’.

Day Nursery 2: There were 18 toddlers in a second day nursery. Miss Litster described them as ‘mainly healthy and normal’ with 7 exceptions:

• a four-year-old boy who was described as ‘epileptic and partially paralysed’;
• a three year-old boy who was a ‘mental defective’;
• a girl aged one-and-a-half years who was also a ‘mental defective’;
• A thirteen-month old boy, ‘a miserable emaciated child with voracious appetite and no control over bodily functions probably mental defective’;
• A ten-month old girl who was described as ‘child of itinerants’, delicate;
• A boy, five years old, who had been ‘refused admission to Cabra M.D. Home36 owing to lack of accommodation’;

35 Mr Humphreys was an engineering inspector from the Department of Local Government and Public Health. It seems that he had carried out an assessment of a number of mother and baby homes to determine their capacity but the Commission has not seen his report on Tuam.
36 St Vincent’s, Cabra (see Chapter 2).
• A boy also aged five years: ‘Atrophied areas, hands growing near shoulders. Arrangements have been made for admission to Orthopaedic Hospital’.

Day Nursery 3: Sun-room and Balcony; 12 of the 31 infants here were described as ‘poor babies, emaciated, not thriving’.
• A three-months old girl with wizened limbs;
• A 13 months old girl: ‘mother epileptic. Infant gets occasional fits’;
• A boy, no age given, ‘delicate child’;
• A girl three weeks old, ‘emaciated and delicate’;
• A girl, two months old, mother 15 years-old;
• A girl about six months, ‘emaciated’;
• A girl, about seven months ‘delicate and wasted’;
• A girl seven months old described as ‘fragile, abscess on hip, boils over body’;
• A girl, no age given; ‘A “wasted” child, now beginning to thrive’;
• A girl 3 months ‘not thriving, wizened limbs, emaciated’;
• Boy, 7 months ‘pot-bellied, emaciated’;
• Girl, no age given, ‘epileptic, mother also epileptic, a very poor baby’.
Approximately ten of these 31 babies were wholly breastfed. The remainder were bottlefed or partially breastfed.

Day Nursery: St Teresa’s: This nursery had 13 infants in wooden cots; all except two were under one year old. All but three infants were described as ‘mainly healthy and normal’. The exceptions were
• A boy aged about nine months, ‘emaciated, flesh hanging loosely on limbs. Mother not normal’;
• A child, sex and age not stated, ‘delicate, beginning to thrive’;
• A child, sex and age not stated, described as ‘delicate, wasted’.

Sun Balcony: St Patrick’s: This had 33 babies aged between one and two. Miss Litster recorded that all seemed healthy and normal, with the exception of one boy, who was deaf and dumb, and was awaiting a vacancy in the ‘Institute for Deaf and Dumb’.
Play-room: This had 92 children aged from three to six years; the older children went to school in Tuam. They were described as ‘mainly healthy and normal’, with three exceptions.

- A six-year-old boy who ‘appears to be educable and might not be classed as a mental defective’. Miss Litster suggested that an effort might be made to have him accepted in an industrial school.
- A girl three and a half years old, ‘sub-normal in intelligence but may not be mentally defective’. The inspector suggested that she should be examined for mental defect.
- A girl aged six, described as ‘mental defective’.

Miss Litster recommended that all the children aged four and over should be boarded out.

Play-Room Children and Toddlers: There were 59 children in this group. All seemed healthy and normal. Three children merited special comment. One was an albino boy, aged about seven who had not been sent to school. ‘He does not appear to be of average intelligence, and is not suitable for boarding-out’. Miss Litster suggested that an effort should be made to place him in an industrial school. Two children needed surgical treatment and Miss Litster reported that ‘accommodation cannot be obtained for them in the Central Hospital Galway’ - one boy had a club foot, the other boy had two club feet. She reiterated that ‘continued efforts’ must be made to secure places in Cabra for four mentally-defective children mentioned above.

Mortality

Miss Litster described the infant death-rate as high. She gave the figures for a number of years:

<table>
<thead>
<tr>
<th>Year ending</th>
<th>Births and Admissions</th>
<th>Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>31/3/43</td>
<td>159</td>
<td>54: 34%</td>
</tr>
<tr>
<td>31/3/44</td>
<td>169</td>
<td>42: 25%</td>
</tr>
<tr>
<td>31/3/45</td>
<td>153</td>
<td>36: 23%</td>
</tr>
<tr>
<td>31/3/46</td>
<td>143</td>
<td>39: 27%</td>
</tr>
</tbody>
</table>
15.97 The death rate had appeared to be on the decrease but had begun to rise again. During the half-year ended 30 September 1946 the number of births and admissions was 66, the number of deaths 21 giving an infant mortality rate of about 32%. The report states that a list of the causes of the deaths in the year ended 31 March 1946 was appended but it is not included in the file provided to the Commission.

15.98 Miss Litster said that it was time to enquire into possible causes of death before the rate became higher. She noted that there was a constant risk of infection because of admissions of entire families, ‘itinerants, destitutes, evicted persons etc. into the Children’s Home’. She remarked that Dr Dillon had previously drawn attention to this in 1945. There was no isolation unit, which meant that children newly-admitted were mingling with others in the home and there was no routine examination and testing for venereal diseases. Dr Costello was praised for his keen interest in the welfare of the children, their progress and diet. However, he was then 80 years old and Miss Litster commented: ‘I think we are entitled to ask that the advice and assistance of a younger doctor with more up-to-date knowledge and methods should be available’. This report stated that the infants ‘received good care in the Children’s Home. The Bon Secours Sisters being careful and attentive and excellent diets were available’. ‘It is not here that we must look for the cause of the death rate’. It is regrettable that the Commission has seen no further detailed reports on the children in the home after 1947.

15.99 There are a number of references to a visiting committee drawn from members of the local authority but, if they compiled written reports on conditions in the home, the Commission has not had access to them. Most local authority statements relating to the home are concerned with costs, not the quality of care and standards of health. In 1959, when plans to close the home were being aired, a member of the local authority, who was a medical doctor, asked for details of the specimen diet of children in the home for a week; the age limits of the children; number of admissions; number of adoptions; number of infants who died and the daily cost. At a later meeting in October 1959, it was recorded that ‘the allegations (not minuted) made by Dr O’Driscoll were unfounded in the views of Councillors Mannion and King. They stated that members of the visiting committee were satisfied with the way that the Children’s Home was being managed’. There was a belief that the allegations made by Dr O’Driscoll were without foundation. It was decided that the information that he had requested at the meeting of 8 August
1959 should be supplied at the next consultative health committee meeting. At a later meeting Dr O'Driscoll explained that he had not made any allegations concerning the Tuam home, he had sought information. It is not clear that he ever received that information.

15.100 When the Department of Health decided in 1959 that the home should close, Miss Reidy, a Department of Health inspector, remarked that there had been a dramatic improvement over the previous twelve months and the Sisters of Bon Secours wanted to improve it further. She was amazed at the progress made following a recent inspection. Toys had been obtained and children organised into play groups. Her comments would suggest that she had inspected the home (and not just the maternity unit) on several occasions. The Commission has not seen reports of these inspections.

**Children’s exit pathways**

15.101 The institutional records show the exit pathways for children as follows:

- Boarded Out: 810
- Boarded Out Parent(s): 1
- Boarded Out Parent(s) Address: 10
- Informal Adoption: 5
- Home (unspecified): 1
- N/A: 535
- Nun: 1
- Nursed Out: 1
- Other Institution: 396
- Parents/Other Family Member: 708
- Placed for Adoption: 77
- Relatives (Unspecified): 2
- Died in the Institution: 802

**Grand Total: 3349**

**Boarding out**

15.102 The most common destination for children who left the home was boarding out in counties Mayo and Galway. The children who went to parents or other family members included many of the ‘legitimate’ children who had been sent to the home. As with the other mother and baby homes, it is not clear that children who
left with parents or other family members stayed with them; many were likely to have been subsequently placed at nurse, boarded out or adopted. The institutions included industrial schools, facilities for children with intellectual or physical disabilities and hospitals.

15.103 The major difference between boarding out from Tuam and elsewhere was the late age that the children left the home. In 1923 the local authority discussed the respective merits of boarding out children from the home or sending them to industrial school. At this meeting, Sister Hortense expressed the opinion that boys over seven should be transferred from the home. She gave the names of seven boys who were over seven and it was suggested that they be sent to the Salthill Industrial School. She also gave the names of five girls over nine years of age who were to be boarded out or transferred to certified schools because it was ‘undesirable to retain girls in the home after they reach the use of reason as their unavoidable association with mothers there would be dangerous’. The county secretary was subsequently directed to ask Sister Hortense at what age it would be desirable to transfer girls from Tuam to an industrial school or to board them out with suitable foster parents who would be prepared to adopt them without payment. In 1926 a member of the CHHAC proposed that children should be boarded out from Tuam when they turned seven rather than five and nine respectively for boys and girls, which had previously been agreed. He claimed there were people without children that would be glad to get either a boy or girl aged seven; he argued that this had economic benefits for the local authority, given that it would cost more to keep them in the home for a further two years. However another member proposed that they adhere to their previous resolution. He believed that ‘the longer these poor children were kept in the Home under the care of nuns the better for themselves in after years,’ and his proposal was carried.38

15.104 A meeting of Galway CHHAC in 1930 recommended that ‘girls be boarded out at the age of 7½ years and boys as at present at the age of 5 years. In exceptional cases it would be advisable to keep girls in the Home somewhat longer, and in such cases the Sisters are willing to keep them at boarded out rates’. ‘When children are being boarded out, it would be advisable when information is required to consult the Sisters as regards foster parents as their information in many cases

37 Ryan Commission: http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL1-12.PDF
38 Connacht Tribube, 14 August 1926.
would be useful. After this meeting the Minister for Local Government and Public Health wrote to the committee, asking about the differentiation in ages and pointed out that the department had recommended that children should be boarded out when they turned two. The minister acknowledged that it might be difficult to secure foster parents for young children and it was suggested that there be a sliding scale of payments according to the child’s age but the Galway committee did not think it was feasible to board out two year olds. A member of the committee who lived in Tuam commented: ‘You should see these children going down to school - how clean and neat they are turned out by the nuns in the Children’s Home.

15.105 In 1935, in order to save costs, the Mayo Board of Health decided to reduce the age at which children could be taken out of Tuam and boarded out. However, there was resistance from the Sisters of Bon Secours who were not willing to renew their agreement with the board if the girls were not left in the home until they reached seven years and the boys five years. The secretary said the board had reduced the age to four years all round. One of those present at the meeting said the Sisters liked to keep the girls under their care until they had made their first Holy Communion, and had been properly instructed in their religion. That would be a great safeguard to little girls going out into the world...the nuns were merely concerned for what they believe to be and what they have found out from experience to be for the good of the children. The nuns’ one object is to make it a means to uplift and help the orphans...the Local Government Department inspectors were in favour of this, and the nuns did not ask for the Mayo children at all. A member of the committee asked was it the Board of Health or the institutions which made the rules; the secretary suggested that a compromise should be agreed. However it appears that the wishes of the Sisters of Bon Secours prevailed.

15.106 The departmental inspectors consistently favoured boarding out children at an early age because this promoted closer bonds between foster parent(s) and children. They feared that boarding out children at later ages encouraged foster parent(s) to see the children as potential sources of labour (see Chapter 11). It is

39 Connacht Tribune, 28 June 1930.
40 Connacht Tribune, 26 July 1930.
41 Connacht Tribune, 28 September 1935.
evident from records of children boarded out by Galway County Council that it was not uncommon for children to be returned to Tuam in cases of illness, changed circumstances within the foster family and cases where the foster parent could not cope with the child. Girls and younger boys were generally returned to Tuam; older boys were sent to the county home in Loughrea.

15.107 Sometimes children selected for boarding out were not placed because of illness. For example, in 1943 Sister Hortense informed the county manager that a particular child would not be fit for boarding out for four months because of illness. It was suggested that her proposed foster parent should be asked if she would accept a different child instead and this was approved. Galway, like other local authorities, found it difficult to identify suitable foster parents. In 1943 the county manager ordered that Sister Hortense should be asked whether she would ask unmarried mothers to obtain foster parents for their children and pay half the costs and full clothing costs of their children with the remainder to be paid by the public assistance authority. Foster parents were to be approved by the county manager and the local unemployment officer was to be consulted regarding the payment of 9s unemployment assistance to mothers, which would enable them to contribute to their child’s maintenance. The manager of the employment exchange in Galway stated that the dependents of those on unemployment assistance should be supported partly or wholly by claimants. Subsequent to this, the county manager ordered that two recently discharged mothers were to apply for unemployment assistance and pay 6s a week for the maintenance of their children. The county manager also issued forms to Sister Hortense, asking her to secure the mothers’ agreement to contributing to the maintenance of their child before leaving the home, with the proviso that no agreement would be necessary where the foster parents had been selected by the mother.

15.108 In a memorandum that appears to be dated 15 August 1952, the Department of Health asked whether alternative accommodation might be arranged for some of the children in Tuam.

The information available to the minister indicates that while the best possible care is provided for the children in the Home, such an institution cannot provide a satisfactory environment for large numbers of children above the age of two and particularly for those above four years of age.

42 The maximum unemployment assistance payable at this time to a woman with one child dependent was 12s 6d (see Chapter 35).
15.109 It emphasised that it was most appropriate that children who could not remain with their mothers should be boarded out at the age of two, so that they might be reared in the atmosphere of a normal household. Those boarded out at a higher age found it difficult to establish satisfactory relations with members of their foster homes and adapt themselves to rural surroundings. The memorandum remarked that boarding out was less expensive than maintenance in an institution, which needed to be considered in the context of works being proposed for Tuam. It suggested that some children might be placed in a neighbouring county, such as Roscommon by arrangement with a children’s officer.

15.110 The inspectors of boarded out children continued to criticise the late age at which children were boarded out from Tuam. In 1959 a report on boarded out children in Co Galway noted that:

a matter which requires urgent attention, and which has been referred to in earlier reports, is the late age at which children are boarded out from the Children’s Home Tuam. The children are usually seven years of age, and may be eight, nine or over. The disadvantages of retaining children in an institution until so late an age are well known. Many tended to be illiterate when coming to school which put them at a disadvantage for their entire school career ‘and only the very intelligent ever overcome it … in comparison with other areas, much has still to be done in Co Galway to provide [continuing] education for boarded out children.

**Destination of children when the home closed**

15.111 In 1959 the Galway assistant manager claimed that one advantage of using Tuam was that it was convenient for arranging boarding out and adoptions and ‘we have some control of the care and treatment of the children there’. If extern homes were used, they would incur expenditure on conveying the children to and from the homes and in visits by the children’s officer for the purposes of adoption and boarding out. When it was decided to close the home the most important decisions concerned the children. When Tuam was inspected in November 1959 - the inspection that led to the decision to close it - there were 103 children resident there:

- Under 6 months: 12
- 6-18 months: 20
- 18 months to 2.5 years: 22
- 4-5 years: 17
5-6 years      18  
6-7 years        9  
Over 7         3  
Total                 103

15.112 By 1959 there was considerable vacant space in the other mother and baby homes. Officials in the Department of Health met in December 1959 to explore the possibility of relocating children from Tuam to Castlepollard, Sean Ross, Pelletstown or Dunboyne. The minutes stated: ‘They had been aware of the suggestion that it was hoped by telescoping accommodation in the three homes at Castlepollard, Roscrea and Bessboro to make the latter home available for mental defectives’, which probably explains why no Tuam children were transferred to Bessborough. A medical inspector expressed the opinion that the children remaining in the home were not suitable for adoption because of various physical and intellectual disabilities. He stressed that this was his personal view and he had not examined the children. Officials agreed that it appeared that other homes had sufficient places to accommodate children transferred from Tuam but they needed to establish if they would be willing to admit them. However one official noted that because the Sacred Heart Homes had received funding from the Hospitals Trust Fund that the Sisters would be obliged to accept any cases referred to them by local authorities. They discussed the merits of an immediate or a gradual evacuation of children from Tuam, but given the conditions there (especially the risks of fire) it was acknowledged that ‘the evacuations should be completed with the least possible delay’. It was suggested that an informal meeting should be arranged with the county manager to discuss the availability of industrial school accommodation.

15.113 The institutional records indicate that 42 children were transferred to Sean Ross and 10 to Castlepollard; 27 were transferred to industrial schools - the largest number went to St Francis Xavier’s industrial school in Ballaghderreen, which admitted girls and younger boys, but others went to St Joseph’s industrial school in Ballinasloe which also catered for girls and junior boys and Lenaboy also in Galway, which admitted girls. Two children were admitted to Stewart’s Institute (an institution for those with acute special needs; see Chapter 2), one to the Loughrea county home; one to a psychiatric hospital and one to a Protestant children’s home. Sister Hortense recommended that one boy aged 13 be placed in Stewart’s Institute for imbeciles ‘because he is a very unsuitable inmate for the Children’s
Home. However, the CHHAC realised that it was a Protestant institution and it recommended that queries be made ‘from ecclesiastical authorities as to the advisability of sending the boy there’. Sister Hortense was keen that he be sent to an institution because ‘it is not desirable to have the other children associating with him’. When Galway County Council learned that one child was being removed to the county home (St Brendan’s, Loughrea) and another to St Bridget’s Hospital, Ballinasloe (a mental hospital) following the closure of the Tuam home the assistant county manager explained that this was due to insufficient space for mentally handicapped children. The child transferred to Loughrea died shortly afterwards. At a meeting of the Tuam Town Commissioners on 4 July 1961, one commissioner claimed that the healthier children had been removed from the home but the more difficult cases were still there. The assistant county manager said that there was an unduly high number of mentally defective children in the home. He criticised the conditions of the home but was forced to retract such statements a month later. Two of the children who were transferred to St Joseph’s, Ballinasloe and who were severely mentally disabled were still there in 1964 in spite of the efforts of the Sister in charge there to get the county council to find a more suitable institution.

Closing the Home

15.114 The practice of keeping children in Tuam until the age of five, six or seven was at variance with the Department of Health’s determination that children should be boarded out at an early age. When Galway County Council applied for capital funding to carry out major improvements to the home, the department responded by demanding that Tuam children should be boarded out at earlier ages, which would reduce the accommodation needed in the renovated premises. The plans drawn up by the architect, based on the views of the local authority and the matron of Tuam, provided for 181 ‘cots’ for children and 71 beds for women and staff. The department estimated that, if children over the age of four were boarded out, there would only be a need for 60 ‘cots’. They also determined that accommodation for 39 mothers would be sufficient. The local authority planned to remove Tuam women and children to the Roscommon county home while renovations were being carried out. A letter from the secretary of the Department of Health to the secretary of Galway County Council dated August 1953 stated that

---

43 Tuam Town Commissioners, TTC/1/14
44 Connacht Sentinel 22 June and 22 July 1961
‘The information available to the Minister indicates that while the best care possible is provided for the children in the Home, such an institution cannot provide satisfactory environment for large numbers of children above the age of 2 years and particularly for those above 4 years of age. The ideal arrangement would be that children who could not remain with their mothers should be boarded out at 2 years of age in order that they might be reared in the atmosphere of a normal household. At present, it is stated the children when boarded out from the Home at a higher age are, due to their former environment, frequently incapable of establishing satisfactory relations with the members of their foster-homes or of adopting themselves to normal rural surroundings’.

15.115 The local authority rejected the department’s proposals, claiming that they would probably delay improvements to Tuam ‘for a very long time’. The proposal to board out all Tuam children over the age of four was dismissed as ‘wishful thinking’ because it was difficult for Galway County Council to find foster parents for children under four years; reducing accommodation for women would make it necessary to hire additional ‘domestic attendance, as much of the work in the Institution is done by the unmarried mothers who are there’. (This statement ignored the proposal to reduce the number of children in Tuam by approximately two-thirds.) The county manager demanded that the accommodation plans submitted by Galway should not be altered. This stand-off meant that improvements to Tuam were postponed until it became evident that there was surplus accommodation in other mother and baby homes. The appalling condition of the premises and the cost of renovation were contributory factors.

15.116 The story of the closure of the Tuam home sheds light on the involvement of the Archbishop of Tuam. The only earlier evidence relating to the home in the archdiocesan archives is a 1952 letter to the archbishop from a local engineer, asking him to intervene with the Sisters of Bon Secours to prevent the transfer of Sister Hortense (who had been in charge of Tuam from its establishment). This correspondent claimed that her departure would be a significant loss to Tuam and the community at a time when there were plans for major reconstruction of the home and consequent disruption. The archbishop relayed this message to the regional superior of the Sisters of Bon Secours; however, he emphasised that ‘that no one, no matter who he is, ought to intervene … I want to make it abundantly clear that I have no desire to interfere in any way in the working of the Institution,
which is capably managed in every way’. Similar concerns were raised at a meeting of Galway County Council in June 1952 when a number of councillors wanted to request that Sister Hortense remain in Tuam, but the county manager stated that it was inappropriate to interfere with a religious order in the control of one of its members. The regional superior pointed out that as Sister Hortense’s time in office in Tuam had already been extended she felt that it would be unwise to prolong it indefinitely.

15.117 It would appear that the local authority had begun to consider the possibility of moving women and children from Tuam to the former Woodlands sanatorium in Galway in 1957. At a meeting of Galway County Council, the county manager reported that the Sisters of Bon Secours and the Archbishop of Tuam might not approve a move to Woodlands, which was being used as an orthopaedic hospital. The county manager wrote to the archbishop. He indicated that moving to Galway would have major advantages, because Galway was a regional medical centre, ‘where specialist obstetrical services and paediatric services are more readily available’; ‘if Woodlands were to be under the control of a religious order, I think it would only be right to offer the acceptance of the control of the home to the Bon Secours Sisters, who have been running the Home in Tuam for so long and so well’. The county manager was aware that the Bishop of Galway would have to consent to the Sisters of Bon Secours entering the Galway Diocese. He wrote to Bishop Michael Browne of Galway explaining that the Tuam home needed major structural expenditure, but ‘in view of the commitments of the Hospital Trust Fund it is considered that it may be possible to avoid this expenditure by transferring the home from Tuam to Woodlands Orthopaedic Hospital’. He sent a copy of this letter to the Archbishop of Tuam and a copy of his letter to the Archbishop was sent to the Bishop of Galway. The county manager explained that, if the home was transferred to Woodlands, the building would have to be leased by the religious order appointed to run it. The capitation charges would be revised, ‘having regard to the fact that under the existing arrangements in Tuam, Galway County Council maintains the premises and pays certain expenses’. The Bishop of Galway replied that the decision about relocating was a matter for the Archbishop of Tuam. The admission of a ‘new community of sisters requires canonical sanction’. The archbishop described the proposed transfer as:

---

45 This presumably means that the Hospitals Trust was unable or willing to provide funds for the reconstruction of Tuam.
undesirable in every way. Anyone who has experience of the workings of a Home for unmarried mothers will tell you that such a Home must be in a place that is quiet, remote and surrounded by high boundary walls. It is most difficult to deal with unmarried mothers. In many cases they are on the look-out to get in touch with men, and some of them cannot repress their excitement even when a man comes to the Home to deliver a message … Many of these unmarried mothers are anxious to get off without delay. The only thing that prevents their leaving is the strict supervision and boundary walls … in some cases it has been known that attempts were made from outside to get at the inmates.

15.118 He further stated that the Sisters had made big sacrifices to ensure that the running of the Tuam home was a success. He reiterated that Woodlands was wholly unsuitable because it was not far from the public road and people had easy access in and out of it. The spread-out nature of Woodlands meant that it would be impossible for the night sister to properly supervise the buildings, especially considering that there had been 240 people in Tuam: ‘it seems to me that the proposal for a transfer has been made by councillors who know nothing about the running of an institution of this kind’. The archbishop claimed that the Tuam home had been a big success and ‘for that reason it ought to be left there’.

15.119 Any decision about Tuam’s future appears to have been postponed for almost two years because of the objections raised by the archbishop. When members of the county homes committee of the Department of Health visited Tuam in November 1959 in order to determine whether carrying out major improvements/rebuilding would be justified, two departmental officials indicated that they had been of the opinion that the views expressed in the Archbishop of Tuam’s letter (which they had obviously seen) had meant in effect that the home must remain in Tuam. However they indicated that it was clear that the ‘Tuam cases’ could be accommodated in other homes and Tuam should be closed. The record of this visit and meeting noted that it was felt that the order might not object to the present suggestion as apparently recruitment to the order was not keeping step with commitments and recently it had had to employ lay nursing staff in the hospital in Cork. However placing the children who were in Tuam would be a slow process.

15.120 The 1960 report of the Irish Province of the Sisters of Bon Secours described their work at Tuam as ‘work especially dear to the Heart of our Divine Lord’. They
feared that Tuam would close because of declining numbers as it would be uneconomic to keep it open. The Sisters had carried out an inventory of the contents in 1960; they claimed that virtually all had been purchased by the community with the exception of the Aga cooker in the girls’ kitchen, the potato steamers and peelers and laundry room equipment.  

15.121 The Minister for Health approved the closure of the Tuam home on 27 July 1960 and the transfer of the children to other institutions. Galway County Council passed a motion to defer consideration of the letter informing them of the minister’s decision. The county manager explained to councillors that ‘the Home was a poor building and an enormous sum would be necessary to make it fit for continued use’. The minister would not consider a scheme of investment when there was accommodation available elsewhere. He informed them that Mayo county council had agreed to send unmarried mothers and children to other mother and baby homes. However, the chairman of Galway County Council, Michael Carty TD said there was a general desire to keep the home open as far as possible. There was a high number of children being adopted from it. Mark Killilea TD said:

they were not all convinced that the economics of the matter could be given effect. There was the cost of sending the parents elsewhere. There had been blundering by the Department too because they had spent all that money on repairs in recent years and should have been able to make up their minds then about it. When the Council suggested the major scheme the Department agreed to give a contribution from the Hospitals Trust but when they went back to Dublin somebody got at them and they changed their minds. The Tuam Home was economic for people it served and it was in better condition than similar institutions elsewhere.

15.122 The county manager explained that the department had two good reasons for closing the home: the fall in the illegitimate birth-rate and the work of the children’s officers had led to falling demand for places in mother and baby homes. It was not desirable for children to be raised in an institution; a home atmosphere and boarding out was preferable. Unmarried mothers preferred to go to a home outside the county. Councillors alleged that Archbishop Walsh wanted to keep the

---

47 This was Mark Killilea Senior who was a TD from 1927 to 1961 and a Senator from 1961 until 1969: https://www.oireachtas.ie/en/members/member/Mark-Killilea-Snr.D.1927-06-23/
48 Connacht Tribune, 8 October 1960.
49 Actually, it was adoption rather than boarding out which caused this result.
home open for another four to five years in order to see whether there was a continuing demand for places. However the manager reported on the contents of a letter that had been sent to the minister. This letter informed the minister that local authority officials had explained to the archbishop that the fire risks meant that the home could not be allowed to continue in operation. When the archbishop was also informed of the financial position and the views of the Minister of Health he withdrew his objections to the closure.  

15.123 The Minister for Health met a deputation about the closure of Tuam in January 1961. He reiterated his decision to close it because of the unsatisfactory condition, the high cost of bringing it up to an acceptable standard and the availability of other accommodation. The medical officer to the home told the minister that declining numbers and efforts on the part of the council to carry out improvements meant that it was much more comfortable for children than in the past. He did not think that its closure was a matter of urgency and if it did close, there was no facility like it elsewhere in the west of Ireland. He claimed that there had been an improvement in the mental development of children in the home since numbers were reduced. However the county manager stated that falling numbers meant that the home was uneconomic; the assistant county manager and assistant chief engineer described it as a serious fire hazard; the improvements that had been carried out did not reduce that risk. The council decided to close the Tuam home at its meeting on 28 January 1961.

15.124 It soon became apparent that there was adequate space for the Tuam women and children in other homes but there were difficulties in relation to children who were handicapped or had special needs. By July 1961 it was reported that the healthier children had been removed from the home while the more difficult cases remained (see above). The Tuam home was officially closed on 31 August 1961.

Witness statements and memoirs

A number of witnesses gave evidence to the Commission about the Tuam home and others provided affidavits. The majority were born in the home and, not surprisingly, had very few memories of the home itself. The main complaint of former child residents was their treatment when they were boarded out. Some gave evidence of what they had heard from their mothers about the home.

---

50 Connacht Tribune 8 October 1960.
The Commission heard evidence from a small number of mothers who had been in the home. It is unlikely that there are many mothers who were resident in Tuam still alive. Statements were provided to Gardaí by a number of people who had connections to Tuam in the period 2013/14. These have been provided to the Commission. There are also some published and unpublished recollections and memoirs which cast some light on the home.

The experiences described by the former residents who gave evidence to the Commission are largely set out in their own words. In some cases, particular information which might identify the witnesses has not been included.

Mothers

15.125 One mother said that she had never seen anything wrong in the Tuam home. She said that Sister Gabriel, Bina Rabbitte and Mary Wade (Nurse) showed great concern for sick and dying children with Bina Rabbitte being upset over the sick children. This was proof to her that they were caring people.

15.126 A mother who gave birth in Tuam in the mid-1950s compiled a statement about her time there. This statement was given by the HSE to Catherine Corless in 2013. This woman described Tuam as a big gloomy building surrounded by iron gates. She said that she was working in the home until shortly before she gave birth. ‘I was told I had a baby girl and it would have been better for the child if it had been born a boy as it would have a better life’. She was kept on the ward for 10 days and subsequently sent back to work. ‘My time there was very hard as we were treated so badly. We were never allowed any kind of recreation, no talking was allowed during meal times or when you were in the nursery attending your baby’. Any letters that were written were censored.

15.127 There was a long table where the children sat to eat their meals and no toys. There was a bucket with disinfectant to clean up any ‘accident’ a children may have had. ‘They were always soiling themselves even though there was a potty in the room which they were put on every half an hour’. The food consisted of porridge for breakfast, mashed potatoes for lunch and bread and milk mashed together for dinner and no solid foods.

15.128 Those who were not on the night shift were woken up at 6am. ‘The night shift was made up of girls who had six weeks left until they would be leaving’. She said that
the women only washed once a week and they were covered in a rash as were the children and a lotion was used to try to deal with it. At the end of the day they would be back in bed at 7.30pm with the baby sleeping beside the mothers ‘and all night long the night shift would be shouting at us not to have our backs to babies’.

15.129 She described her duties in the home as feeding and cleaning up after the children and covering for the other girl she worked with. Two girls were assigned to each room and at feeding time, they went around with a large pot of porridge or mashed potatoes to spoon feed the children who never had their own crockery or cutlery. One girl told the others about ‘the lovely food’ the Sisters of Bon Secours would get to eat while they ‘were fed slops’. She said that the cook made a fruit cake once a week for the Sisters.

15.130 She said that ‘Christmas was no different to any other day. We never had a Christmas dinner or a tree nor were any decorations put up. ‘The children were never given any presents. They may have had presents sent in by their mothers but they never received them. Some mothers sent parcels in after they had left the home. They would have new clothes and some toys in them but the children never got them. The nuns would keep them in case the mothers came back to visit, then the child would be dressed up’

15.131 This woman said that the girls in the home were allowed visitors but no one ever came to visit. ‘No one wanted to know you while you were in there. I think about three girls had a visitor while I was there. I had none’.

15.132 When her daughter was 11 months old this woman was brought to a solicitor in Galway to sign surrender forms for her daughter’s adoption to take place. She believed that this was the best thing for her daughter.

15.133 A woman who swore an affidavit for the Commission to Inquire into Child Abuse (the Ryan Commission) said that the Sisters of Bon Secours never sat beside the children in church but rather in separate pews. She never saw Sister Benigne hit a child and called her a nice lady. She was involved in the Christmas play. She said that the caretaker, Johnny Cunningham, helped to put up decorations in the home and the children got a toy every year. She recalled that Sister Hortense particularly enjoyed doing this.
15.134 Another mother said that she had been treated well in the Tuam home and while the other girls worked hard in the laundry, they were never subject to ill treatment or abuse.

15.135 A mother told the Commission that she did not know what Tuam was before she was admitted in 1955. ‘Tuam was Tuam and we heard about it in Ballina. You knew that girls went there but you didn’t give it another thought. You know it was like telling you were going to a hotel somewhere’. She said she was attended at the birth by a nurse/midwife who came in for this purpose. She got no pain relief. She was aware of a number of children dying in the home.

Former child residents

15.136 A woman who had been born in the Tuam home in the mid-1930s and who lived there until she was 18 told Tuam Gardaí that half of the children went to the Mercy primary school and half to the Presentation primary school ‘so they wouldn’t fall out with either’. She said that Sister Hortense loved children and helped out with them. She recalled a priest coming to celebrate Mass and that people of trust tended to work in the home. She remembered putting on plays as a child. She remembered being in a play herself in the Presentation Convent and she remembered that the other Sisters would come and people would look at the play and she remembers getting a great sense of well-being and joy out of that, that she was out in the public for that. She remembered them having cows.

15.137 A former child resident provided an affidavit in which he said that he had lived in the home for 12 years before being boarded out to a family in the early 1950s. He said that there was a stigma attached to the home but he had no problems during his time there. He said that there was a pleasant atmosphere and the food was plentiful and of good quality. There were swings and other rudimentary equipment for children to play on. There were plays organised at Christmas and some locals were invited to attend. They occasionally went to the cinema on a Sunday or to watch Gaelic football matches at Tuam stadium. He was an altar boy in the Cathedral and was taught Latin responses for Mass. He went to a holiday home in Westport in the summer.\(^51\) He did not recall any fundraising for the home, nor inspections from anyone from government during his time there. He remembers there being proper toilets, bathrooms and electric light, unlike the home to which

\(^{51}\) The Commission has seen photographs of children and Sisters of Bon Secours at this holiday home.
he was boarded out. While not aware of any outside nurses being employed, ‘the women who lived and worked in the home were known as ‘paid maids’. He recalled that they slept in dormitories. The children did not have to wear a uniform but wore their own clothes. An elderly doctor used to visit.

15.138 A former child resident wrote of her memories of the Sisters of Bon Secours in 2002. She described them as ‘the kindest and dearest nuns I had the privileg (sic) of knowing’. ‘I am shocked and appalled at the people who falsely accuse the Bon Secours nuns of abusing the children in their care’. She said that she was well-fed, clothed and kept warm in the winter by the Sisters. The children learned how to sing and step-dance with the nuns and staged plays at Christmas time. ‘We had a good instructor and entertained priests, nuns and high class people of Tuam. We lacked nothing’. She cried when she was boarded out, aged seven but soon grew to love her foster family. Sister Hortense sent a gift every Christmas to her and to other boarded out children. She described Sister Hortense as having ‘a heart of gold’.

15.139 ‘The nuns were supportive and understanding’. Along with four other girls, she helped with the younger children who were cared for and were never mistreated by the Bon Secours Sisters. She never forgot their kindness and visited whenever she was home from the United States.

15.140 A former resident recalled Bina Rabbitte making up bottles for the babies in the home and the mothers helping to feed them. She recalled the food not being very good in Tuam and eating moss off the walls. She does not remember getting three meals a day.

15.141 Another former resident told the Commission that he felt there was a stigma attached to him and he found it difficult to get answers as to who his parents were when he first went looking. He said that as a child he was not allowed to serve Mass and that the local priest put his mother into the home. He said that the priest came around when his mother was pregnant and that she had to leave the parish because

she was pregnant out of wedlock and when she was seven months pregnant, the situation wasn’t great at the home place in the house, because they were very very poor. The father at two o’clock in the morning cycled 20 miles and his son cycled 20 miles in the dark of night to go to a place called Loughrea, in to a home in Loughrea where she had to be put in and they had to do that
all under the cover of darkness so no one would see what went on and come back in, cycle back in in the morning. Up hill, down hill and that's the way she was carried for 20 miles. Just imagine it a heavily pregnant woman having to go through this for what like? No one would believe.

15.142 A former child resident who was in the home for most of the 1950s told the Commission that his mother wanted to take him out when she was leaving (he was aged one at the time) but the nun told her she was not capable of looking after him. His mother got a job in the Bon Secours Hospital (in Tuam it was known as the Grove) and she would walk to the Tuam home and knock on the door in the hope of seeing him. She approached the parish priest where he had been boarded out in an effort to bring him back to England. However, the parish priest told her that he was settled with the family and not to disturb that. His foster parents took care of him. ‘I was born twice. I was born in a prison first and I spent six-and-a-half years in it and then I was born a second time in a home where there was love and care’. ‘I was born in a jail and I spent six-and-a-half years in a jail. I got no love, no care, no education, no nothing. Then my mother spending five-and-a-half years walking up and down making a fool out of her’.

15.143 When asked if he had any good memories of the home, he said: ‘not a good memory in the world, no. Nothing whatsoever, nothing’. He said that the children from the home sat together in school and did not sit with other students in the classroom.

15.144 Another former child resident who was in Tuam in the 1950s recalled very little about the home. He remembered ‘the big walls, the outdoor toilets’ which were similar to the toilets in the small rural school that he later attended (after he was boarded out). These were the only toilets in Tuam that he recalled; the toilet bowls were ‘just full’; they were not flush toilets; he believes that they were in ‘a little lean-to, a shed’.

**Children of a former child resident**

15.145 Two children of a former child resident gave accounts of what their father had said about Tuam. He was a foundling and was there from 1925 to 1936. His earliest memories were of long borders with flowers where the toddlers were brought for exercise along the paths and were encouraged to smell the flowers. He did not recall there being many toys but he remembered playing with them at Christmas.
time and he remembered wooden swords being made both for him and a friend to play with. He went to the local national school in Tuam where he ‘was always conscious that he had boots and socks on his feet and some of the other children “townies” came to school without shoes even in winter time’. He recalled being beaten by a teacher but this stopped when the chaplain to the Tuam home threatened to prevent the teacher from teaching again if he continued with the beatings. He took part in school concerts and sang in the Cathedral choir and recalled that a gramophone was put on in the home in the evenings. He also recalled a farm being attached to the home with milk and fresh food used to supplement the funds received from the local authority. (A photograph from Catherine Corless’s article in the Old Tuam Society shows vegetables being grown.\textsuperscript{52}) ‘Without the farm there were times they would have starved’. (A separate witness said that animals were kept.\textsuperscript{53}) He described the home as having an economy of its own with the handy man sometimes making coffins, but he did not recall receiving any vaccinations. He also remembered that there was a mortuary in the home that was off limits to children.

Sisters of Bon Secours

15.146 There were no surviving members of the Sisters of Bon Secours in a position to give direct evidence to the Commission about Tuam. One Sister had given a statement to the Gardaí in Tuam about her work at the home. She told the Gardaí that she worked there for about three months. She was not too sure of the exact dates but she thought that she started working there in October/November 1957 until January 1958. She was a trained nurse. She remembered working with a toddler group but she did not have any dealings with older children. She recalled each member of the order being allocated a section of the home to work in. She described the nursery on the ground floor. She never remembered seeing a cemetery. She worked with toddlers rather than new-borns. She remembered a Sister Mary Brigid who was a cook in the home. She never saw anybody make their first communion there (this is not surprising if she was there between October/November and January) and she said that a midwife rather than a religious sister was brought in to assist with the birth of a child. She recalled that if the children were to be fostered a social worker was involved but she could not recall a name. It was her assumption that social workers were involved in the fostering of children.

\textsuperscript{52} Catherine Corless in Old Tuam Society (2012)

\textsuperscript{53} The home was on a six acre site so, while it clearly did produce some food, it is unlikely that it was self-sufficient.
15.147 A member of the Sisters of Bon Secours swore an affidavit in 2003 in response to a complaint by a former resident that she had been emotionally scarred for life by her experience in Tuam. She said that: ‘as far as I can ascertain no assistance was given by the local community to the Home. This I understand was due to the fact that it was primarily a home for unmarried mothers … the view in Ireland at that time of unmarried mothers was quite bad and in fact they were shunned by society in general’.

15.148 The Memoirs of a Bon Secours Sister described the early days of life in the Tuam home. This undated manuscript recalls Sister Hortense working hard and getting the women to do likewise. ‘They tilled the garden and produced plenty of potatoes…Sister Hortense believed in keeping them busy and also making improvements at the minimum of expense’. This Sister described the lack of central heating with turf fires all over the place ‘people were not so cold conscious then I think. No running water except in the surgery and kitchenette’. The convent had a bath with hot and cold water and there were only oil lamps with electric light being brought in from 1927. There was a chaplain who was the secretary to the Archbishop of Tuam and he said Mass in the home every morning with priests from the Tuam parish coming in every week to hear confessions, give a lecture and baptise children as there was a baptismal font in the home. The mothers visited the Blessed Sacrament every day with the rosary also recited daily. This memoir stated that the mothers stayed with the babies in the home for a year and if they stayed longer, they were kept as ‘paid hands’.

**Archdiocese of Tuam**

15.149 Fr Fintan Monahan, who is now the Bishop of Killaloe, gave evidence to the Commission when he was the secretary to the archdiocese of Tuam. He said that the Archdiocese of Tuam never had an administrative role in the Tuam home. He said that the role of the archdiocese was pastoral:

The diocese never had an administrative role in the running of the Mother and Baby Home. The role of the diocese was pastoral, making the services of chaplains available for baptisms, funerals, sacramental occasions and whenever a pastoral need arose. The chaplains who worked there are now all deceased.

15.150 Fr Kieran Waldron, a part time archivist with the archdiocese, told the Commission that it was clear to him that the home was not under the direct control of the
archbishop but of the Sisters of Bon Secours who ‘were the agents of the County Board of Health’:

the diocese did not have any micro-management role in the Mother and Baby Home any more than it had in the hundreds of schools, the three hospitals and two orphanages within the diocese. Religious institutions were managed by religious congregations directly responsible to their own superiors. The Tuam Home was even more separated from the diocese than others in that its ownership and effective management was under county council control.

However, Fr Waldron did describe Archbishop Walsh (1940-69) as being ‘so committed to his mission and so scrupulous and finicky in every detail of church government that any observer would have formed the opinion that episcopal rule and administration was in his blood’. Fr Waldron said that ‘no building project or major incident occurred without being referred for his observations. He was involved in the minutiae of administration in every parish in the diocese’. He was described as being authoritarian and centralised in his administration to the point that he gained a reputation of severity and heartlessness on occasion.54

Caretaker’s son

John Cunningham, a journalist who was the son of Johnny Cunningham the caretaker at the Tuam home and who himself spent time between his father’s home and the children’s home after the death of his mother, wrote about the home in the Connacht Tribune in April 1998. He cautioned: ‘one has to be very careful of any impressions gained in childhood, though memories of the Children’s Home can be extraordinarily vivid’.

He said that many young women were ostracised by their families when they became pregnant. ‘I saw the devastation when they were parted from their children ... they nursed the child and looked after it for a year and then they went one way and the child stayed to be adopted, or to be boarded out a few years later. I don’t know if many of them ever recovered from the heartbreak in parting’.

Julia Devaney

Julia Devaney worked in the Tuam home for many years; she first entered there in 1925 when she was nine and left when it closed in 1961. Her memories were

recorded by a local shopkeeper during the 1980s. She was described as an avid gardener and dog lover. She doted on children who had spent time in Glenamaddy before going to Tuam. Other witnesses have commented on her kindness to children. The following are extracts from her recollections as recorded:

We got up about 6am. The mothers would bring their child that slept with them down to the Nursery. The babies would sleep with the mothers from about 9 or 10 days old. The Nursery was way down at the back of the place. Mass was at 8am. Breakfast was after Mass. A good eye was kept on those who were receiving communion. They would be shunted out of the dormitories to go to Mass. Some women’s jobs was to dress the children in the morning and bring them downstairs.

The little ones went to bed summer and winter at 6pm. They had swings and see-saws, but when I look back they were very unnatural children, shouting screeching sometimes laughing, ring-a-ring-a-rosy. The mothers spoke only to each other about the fathers of their children. They’d hate to face home. The lads that were friendly with them outside would ignore them now. Many a girl shed tears - a terrible depressing place. They would not talk to me about themselves. …The nuns in the Home did not condemn the women as sinners, no no. If the girls came in young they were not allowed to finish their schooling. Nuns had very little contact with the children, they wouldn’t even know their names.

The nuns took a house down by the sea in Achill every summer for a month or six weeks. We would take it in turns to spend a week with them, Annie Kelly the nuns’ cook, and myself, and Mary Wade and the other domestics. A yearly treat.

Some of the children wouldn’t use spoons, but use their fists to lift the porridge out of the mugs, and they would get a whack.

Every year the kids would put on a play and the doctor’s kids would come up to the home to see it. Nuala Costello had a rock-a-bye-baby dolls cot with iron fretwork, and a rocking horse, and a dolls house, every inch of it exactly like Dr Fitzgerald’s house. That house was made especially for Dr Fitzgerald’s daughter. Dr Waldron’s wife had a trunk full of books sent up to the Home along with the toys.

Families outside used the home as a threat on their children, that if they didn’t behave, they would be sent there. The nuns were very regimental with the children, doing drills and ring-a-ring-a-rosy with them. They made no effort to develop their minds, the mothers were told to feed them and clean up after
them and put them on the pots. I think that they spent most of their time sitting on the pots.

The home was spotless, a show house, the mothers were always cleaning, but it was a cold and loveless place.

Most of the clothes were made on the premises, the children’s coats as well. We’d get a coat in Mahers and other clothes, we’d just ask the nuns when we needed them, and we could pick our own type of shoes, we were never branded with the same clothes. Sister Hortense would go to Dublin in the sales, Arnotts and Clerys, and order stuff that would be sent down by rail. We got blankets from Foxford in Co Mayo.

I always had an inferiority complex, as we knew it was the outside people paying taxes and rates that covered the cost of keeping us in the home. There was a stove specially to heat the water for baths, it would heat the kitchen taps and you would draw it out for the baths, there were plenty of baths, and more down in the new maternity. The mothers would go down every Saturday.

At the home in Tuam, the county council put in great washing facilities for them, monstrous washing machines and a wringer and a big thing for hot water in later years. In the earlier years there were only wash-boards and sinks. Also, what they called a ‘colander’ for rolling sheets and drying them in the 1940/1950’s. There was a number on the nappies and each mother had to account for her own baby’s nappy. Each mother had a little cubby hole for her own laundry. There was a big cold bath outside the laundry to take the baby’s ‘bowels’ off the nappy (pre-wash), and then it was washed in the laundry.

I think the children who were fostered out fared better. I know Sister Hortense would never give a child to a family with children, as she would know that they only wanted them for work. In the 1950’s children were adopted to the USA. I remember a couple who came for a child, but the child had the measles at the time, so the couple stayed in the hotel for a while, and came up to the home every day to see her, and the man would say when he’d see her ‘Oh she’s too beautiful to touch’, and when she did go to the USA they’d send colour photos of her toys and her lovely bedroom - a lovely home.

Sr Leondra did not like the idea at all of the children going to USA. ‘Why should we be rearing our Irish children for America’, she used to say. I have terrible regrets for the children, I feel a sense of shame that that I did not create a war, but then again what could I have done? It was a rotten ould
place to rear children, marching them around the room to keep them out of trouble.

**Halliday Sutherland**

Dr Halliday Sutherland gives a description of a visit to the Tuam home, probably in 1955. He secured an introduction to Dr Walsh, Archbishop of Tuam, from the wife of a Galway solicitor. The archbishop gave him permission to visit the home and invited him and his companions (the solicitor’s wife and her son, a law student) to tea.

At Tuam I went to the old workhouse now the Children’s Home, a long two-storied building in its own grounds. These were well-kept and had many flower-beds. The Home is run by the Sisters of Bon Secours of Paris and the Reverend [sic] Mother showed me round. Each of the sisters is a fully-trained nurse and midwife. Some are also trained children’s nurses. An unmarried girl may come here to have her baby. She agrees to stay in the Home for one year. During this time she looks after her baby and assists the nuns in domestic work. She is unpaid. At the end of a year she may leave. She may take her baby with her or leave the baby at the Home in the hope that it will be adopted. The nuns keep the child under the age of seven, when it is sent to an Industrial School. There were 51 confinements in 1954 and the nuns now looked after 120 children. For each child or mother in the Home the County Council pays £1 per week. That is a pittance. If a girl has two confinements at the Home she is sent at the end of the year to the Magdalene Home Laundry at Galway. Children of five and over attend the local school. All the babies were in cots and the Reverend Mother said, “we wouldn’t allow a girl to take her baby to bed with her unless it was at least two months old. Then she is probably fond of it. Before then there might be accidents”. The whole building was fresh and clean.

In the garden at the back of the Home children were singing. I walked along the path and was mobbed by some of the younger children. They said nothing but each struggled to shake my hand. Their hands were clean and cool. Then I realised that to these children I was a potential adopter who might take some boy or girl away to a real home. It was pathetic. Finally, I said, “Children, I’m not holding a reception”. They stopped struggling and looked at me. Then a nun told them to stand on the lawn and sing me a song
in Irish. This they did very sweetly At the Dogs’ Home Battersea, every dog barks at the visitor in the hope that it will be taken away. 55

Dr James Fergus

15.156 Dr Fergus had been a curate in Glenamaddy and was in Tuam when the children’s home opened there in 1925. He was later the Bishop of Achonry. He described Sister Hortense as

the most capable woman I have known in my life. She had judgement, courage, initiative, and was unequalled in handling any situation. Better than all that, she had goodness and a kind heart that knew no distinction of persons. I have known her to sit up for several nights in succession by the bedside of an itinerant child, fighting for its life - and winning the battle.

15.157 When the Sisters moved to Tuam, he said that

The surroundings of the place were in an awful state with weeds everywhere and long grass entangled in barbed wire and, in some of the wards, boards had been torn from the floors by the soldiers for firewood. Otherwise the buildings were in fairly good shape.

Gradually the remaining Sisters, mothers and children arrived. The work of clearance and cleaning began; paths were laid out, painting was done where necessary and before long the whole place had taken on quite a respectable appearance. Within a few years the grounds were tilled from wall to wall and were providing crops and flowers. The children went to the Mercy and Presentation schools and were welcome there...

The Sisters did not take long to establish themselves at Tuam and became popular with the townspeople so that St. Mary’s Home came to be regarded as much a part of the town as if it had been there for a century. The local clergy loved to visit it as well as many of the people of the town. The Co Galway Board of Health used to hold some of their meetings there.

The Sisters would have loved to keep the children until they had finished at least their primary schooling, but even at that time boarding out, even of babies was very much in the air.

From time to time the Home was visited by a Local Government Inspector, a troublesome spinster who thought she knew everything about what was best for babies and would like to see them all boarded out. However, for some

55 Halliday Sutherland, *Irish Journey* (Geoffrey Bles, 1956)
years more of the children were left until they had spent a few years at school; then they were boarded out with foster parents, some of whom at least were kind and good.

Some of the children had reached the age for first Communion when they first came to Glenamaddy and the Sisters held on to a number of these. They also kept a few babies whose relatives had given a little money. These children used to take part and win prizes at the local Feiseanna and at Sunday Mass used to sing the Gregorian Chants as beautifully as the best of choirs. They also used to have a play or concert at Christmas and whenever the Sisters celebrated their Jubilees. All or nearly all of them got on remarkably well in life afterwards - in Scotland, England or the USA.

St Mary’s home, while it lasted was a happy and hospitable place. Eventually like the other institutions of its kinds, it was phased out...
The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.
Admissions

From the institutional records, the Commission identified 2,219 women who were admitted to the Tuam children’s home. This includes women admitted to the home when it was located in Glenamaddy (1921-25) and in Tuam (1925-61). Dates of admission were available for 2,217 women (99.9% of admissions). Admissions began a staggered increase from 1927 and peaked in 1946 when 109 admissions were recorded. The period 1938-48 was particularly busy; 44% of all admissions were recorded in those years. Admissions began a staggered decline from 1949; 60 admissions were recorded that year and decreased to 29 admissions in 1960, the home’s last full year in operation.

Marital status was recorded for 2,106 women (94.9% of admissions). The institutional records show that 97% were single expectant women and the remaining 3% were either married, separated or widowed.
Analysis by decade shows that more women (39.7%) were admitted in the 1940s than any other decade followed by the 1930s (25.8%); 1950s (20%); 1920s (13.1%) and the 1960s (1.4%).
Previous pregnancy

Information relating to previous pregnancy was available for 1,171 women (52.8% of admissions). The institutional records show that 80.3% of women were admitted on their first pregnancy; 8.9% on their second pregnancy and 10.8% on their third or subsequent pregnancy.
Age on admission

Information relating to age on admission was available for 2,197 women (99% of admissions). Ages ranged from 13 to 55 years. The mode of age on admission was 20 years; this increased to 21 years in the 1950s and decreased to 18 years in the 1960s. Average age on admission was 24 years. Most women (86.6%) were aged between 17 and 30 years on admission; 10.4% were aged between 31 and 55 years and 3% were aged 13-16 years.¹

¹ The institutional records show that ‘referred to the guards’ or ‘leave in the hands of the guards’ was noted next to admissions aged 16 years and younger.
Information relating to occupations was available for 1,707 women (76.9% of admissions). Most women (55.8%) were recorded as being a domestic servant or unskilled worker; 41.6% were working in the family home or on the family farm; 1.8% were employed in unspecified positions; 0.7% were recorded as a teacher/civil servant/skilled worker and one woman was recorded as unemployed. There was no major change in occupation categories from the 1920s to the 1960s.
Address prior to admission

Information relating to address prior to admission was available for 1,985 women (89.5% of admissions). The institutional records show that most women (66.45%) gave an address in Galway followed by Mayo (30.88%); Dublin (1.66%); Westmeath, Roscommon and Clare (0.15%); Sligo, Tipperary, Limerick and Offaly (0.10%) and Carlow, Cork and Tyrone (0.05%).
Information relating to referral pathways to the Tuam home was available for 818 women (36.86% of admissions). All women admitted to Tuam were public patients maintained in the institution by local authority boards of public assistance. Women were required to secure an admission slip prior to admission or the administrators of the home might ask the relevant local authority to accept responsibility for a woman after admission. The available records show that 96.6% of admissions were referred to Tuam by a local authority board of assistance or its agents; 63.3% were referred by a board of assistance; 21.8% by a dispensary medical officer and 11.5% by other local authority agents combined including named individuals (matrons of county homes and other hospitals, home assistance officers) and women transferred from other local authority institutions. A small number of women were referred by adoption societies, self-referred to the home or were referred by a friend/family member, a voluntary organisation or the probation services. There were no major changes in the referral pathways to the Tuam home from the 1920s to the 1960s. One woman was admitted from an unidentified Magdalen laundry on an admission ticket secured from a dispensary medical officer.
Information relating to birth details was available for 2,190 women (98.7% of admissions). The institutional records show that 61% of women were admitted pregnant and gave birth in the home or were transferred to the Central Hospital Galway and returned to the home with their babies; 36% were admitted with their baby having given birth elsewhere and 3% of women admitted to the home left before the birth and did not return.

Of those who stayed and gave birth, 98.1% delivered living infants; 1.9% of pregnancies resulted in stillbirths.

Of those who stayed and gave birth 83% gave birth in the Tuam home; 16% were transferred to the Central Hospital Galway, gave birth and returned, and 1% were transferred to other hospitals, gave birth and returned.
Information relating to occupancy was available for 2,175 women (98% of admissions). The institutional records show that average occupancy rates increased steadily until the mid-1940s and began to decline thereafter. Average occupancy rates were highest in the period 1942-47, paralleling increased admissions at that time. A woman admitted to Tuam in 1944 could expect to be living in the home with 66 other women; a woman admitted a decade later could expect to be living with 34 other women. By 1960, an average of 20 women were living in the home at any one time.

2 Occupancy is the number of women present on any given day in the institution.
Comparative analysis shows that occupancy rates in Tuam were closely related to the number of admissions recorded in any given year. There was no instance where average occupancy exceeded the number of admissions. This occurrence in other institutions pointed to various degrees of overcrowding, but appears to be absent in Tuam. Admissions and average occupancy were close or on par in 1955, 1958 and 1959 which suggests that women were staying in the home longer in those years.
Length of stay

Information relating to length of stay was available for 2,175 women (98% of admissions). The institutional records show that women admitted in the years 1921-50 spent 237 days on average in the home, this ranged between an average of 185 days for women admitted in 1922 and 281 days for women admitted in 1923 - for women admitted in 1949 the average stay was 202 days. Average length of stay increased somewhat in the 1950s and was frequently above 300 days in that decade. The longest average length of stay was recorded among women admitted in 1956 - a stay of 326 days was the norm for women admitted that year.

Analysis by decade shows that there was no major change in the average length of stay from the 1920s through to the 1940s. An increase in the length of stay can be identified in
the 1950s; women admitted in that decade spent around 50 days on average longer in the home than women admitted in previous decades.

Analysis of length of stay after birth shows that, in the 1920s, 14.7% of women spent 50 days or less in the home after giving birth (this ranged between 2 and 50 days) and 40.5% had left within six months. Most women (33.3%) spent between six and 12 months in the home after birth and 26.2% remained for periods between 12 and 18 months (18 months was the longest stay recorded after birth in the 1920s).
There was little change in this pattern in the 1930s. The percentage of women who left within 50 days of giving birth increased to 17.8% (this ranged between 1 and 50 days) and the percentage who left within six months decreased slightly to 39.4%. Again, most women (39.7%) spent between six and 12 months in the home after the birth. The proportion of women who remained for more than twelve months decreased to 20.7%. One woman remained in the home for 742 days after the birth.

In the 1940s, 28.5% of women left the home within 50 days (this ranged between 2 and 50 days) and almost half left within six months; 23.3% stayed for between six and 12 months. However, the proportion of women who stayed for periods of between 12 and 24 months had increased to 27% (the longest stay was a little over 15 months in the 1940s).

As previously discussed, the length of stay in Tuam increased in the 1950s. The proportion of women who left within 50 days of giving birth decreased to 18.9% (this ranged between 1 and 47 days) and 31.9% left within six months - this was a lower rate than the 1930s. The proportion of women who stayed for periods of between six and 12 months increased to 30.5% and most women (37.6%) remained in the home for between 12 and 24 months (the longest after birth stay recorded in the 1950s was 694 days).

Information about length of stay in the 1960s relates to 1960 and 1961 only. It is clear that at that juncture most women (39.3%) left Tuam within 50 days of giving birth (this ranged between 5 and 38 days). Just over 46.4% of women left within six months, but a considerable proportion of women (32.1%) remained in the home for periods of between six and 12 months. Although 21.4% of women remained in the home for more than a year after giving birth the longest stay recorded in the 1960s was 376 days.
Information relating to exit pathways from Tuam was available for 428 women (19.3% of admissions). The available records record that most women (70.3%) left the institution and returned to the family home or to a private address; 13.6% were discharged to employment; 11.4% transferred to other hospitals (seven to psychiatric hospitals); 3% transferred to Magdalen Laundries; 1.2% transferred to one of the other institutions under the Commission’s remit and one was recorded as having no fixed abode. The 14 transfers from the Tuam home to Magdalen laundries were recorded between 1942 and 1959. Although the institutional records show that 14 women were transferred directly from Tuam to a Magdalen laundry, children’s records show that a further 84 former residents of the Tuam home subsequently ended up in a Magdalen laundry sometime after their discharge from Tuam. In addition, 13 children were admitted to Tuam unaccompanied while their mothers were admitted to a Magdalen laundry; those women had never been in the Tuam home. The available records show that Galway County Council directed a further 22 women to enter a Magdalen laundry on their discharge from Tuam; the Commission could not establish whether these women were in fact admitted to a Magdalen laundry.
Maternal deaths
Through the institutional records, the Commission identified 12 deaths among women admitted to Tuam: representing a mortality rate of 0.54%. Seven deaths occurred in Tuam and five in the Central Hospital, Galway. Six deaths were not associated with pregnancy or childbirth - they were, in the main, due to tuberculosis, measles, pneumonia and cardiac failure. One death due to coronary thrombosis was an indirect obstetric death in the sense that the condition developed during pregnancy and was aggravated by the physiological effects of pregnancy. Five deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were mainly due to puerperal sepsis and albuminuria and post-operative shock (caesarean). Adhering to WHO guidelines the maternal mortality rate in Tuam was 0.27%.³

³Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. https://www.who.int/healthinfo/statistics/indmaternalmortality/en/
Children: Births and admissions

Through the institutional records, the Commission identified 3,251 children were born in or admitted to the Tuam Home. Information relating to date of birth/admission was available for 3,237 children (99.6% of births/admissions). Information relating to status at birth was available for 2,923 children (89.9% of births/admissions). The available records show that 70% of children born in or admitted to Tuam were recorded as ‘illegitimate’ and 20% as ‘legitimate’; it was not possible to determine the status at birth in the remaining children.

Following the move from Glenamaddy to Tuam in 1925 a staggered increase in births and admissions can be identified. Numbers decreased in 1929 and 1930 (51 births/admissions were recorded in both years), but increased throughout the 1930s and early 1940s peaking in 1946 when 142 children were recorded. Births and admissions declined by almost 30% in 1947 and maintained a downward trend until the home closed in 1961. In 1960, the home’s last full year in operation, 37 children were born or admitted there. The busiest period for births and admissions in Tuam was from 1933-49 - 1,841 children (57% of all births and admissions) were born in or admitted to the home in those years.
Analysis by decade shows that more children (35.4%) were born/admitted to the home in the 1940s than any other decade followed by the 1930s (27.7%); 1920s (18.1%); 1950s (17.4%) and 1960s (1.4%).

</tbody>
</table>

Information relating to whether or not children were accompanied on entering Tuam was available for 3,243 children (99.75% of admissions). The institutional records show that 65.6% of children were either born in the Tuam home or admitted there with their mothers; 33.5% were admitted unaccompanied and 0.9% were children admitted to the home with their expectant mothers (accompanied siblings).
Of the 3,237 children with dates of birth/admission 1,084 (33.5%) or 1 in 3 children were admitted to the Tuam home as unaccompanied children. Where the birth status of an unaccompanied child was identifiable 71% were recorded as legitimate children and 29% were recorded as ‘illegitimate’ children.

**Children: Occupancy**

Information relating to occupancy was available for 3,237 children (99.6% of births/admissions). Occupancy rates were highest in the period 1942-50 and peaked in 1946 when 268 children on average were living in the home. By 1960, average occupancy had decreased to 123 children.
Analysis by decade shows that average occupancy was highest in the 1940s - a child born in or admitted to the Tuam home in that decade could expect to be living with another 235 children. This was a substantial increase on average occupancy rates recorded in the 1920s (88 children) and the 1930s (188 children). Average occupancy decreased by around 20% in the 1950s and by 1960, 107 children on average were living in the home. Although this was a substantial reduction on the occupancy rate pertaining in the 1950s it was still greater than occupancy rates recorded in the 1920s.
An annual set of statistical returns forwarded by Tuam to the Department of Health for the years 1950-58 allowed the Commission to undertake comparative analysis of occupancy rates derived from the institutional records relating to the Tuam home and occupancy rates returned to the department. Temporary absences from the home, such as children in external hospitals, are not recorded in the Commission’s calculations which may inflate the Commission’s numbers slightly. Notwithstanding this, it seems clear that occupancy rates in both record sets are broadly in line.
Comparative analysis of admissions and average occupancy shows that children were staying in the Tuam home far longer than children in other similar institutions. This was almost certainly due to the practice of keeping children in the home until they were seven years old before they were considered fit for boarding out. In 1946, 142 children were born in or admitted to the home and 103 were discharged or died in the institution but average occupancy on any given day that year was 268 children. Similarly, in 1960, 37 children were born in or admitted to the home and 71 were discharged or died in the Institution. However, 123 children on average were living in the home on any given day that year.
Information relating to length of stay suggests that 73% of children remained in the Tuam home for a period after their mothers had been discharged. Comparative analysis of child average occupancy as against mothers' average occupancy confirms that children who experienced long stays in Tuam spent much of their time in the home unaccompanied. In 1929, 23 mothers on average were living in the home, but there was an average of 133 children there the same year; it was 35 mothers and 205 children in 1937; 41 mothers and 243 children in 1948 and 23 mothers and 157 children in 1959. The ratio of children to mothers in the home at any given time appears to be close to 6:1.
Information relating to length of stay was available for 3,200 children (98.4% of births/admissions). Length of stay was variable over the timeframe of the home’s operation, in broad terms, however, children born in or admitted to the home in the years 1921-49 were in the home for 774 days on average - this ranged between 1,068 days on average in 1927 to 517 days in 1925; 1,039 days in 1934 and 602 days in 1942. For children born or admitted in 1950, length of stay increased sharply to 1,193 days and remained close to this level until 1955 - this appears to mirror the increased length of stay identified for women admitted to the home in the 1950s. Length of stay began to decrease from 1956 and in 1960, the home’s last full year in operation; children admitted that year spent 232 days on average there. The institutional records show that 20.9%, or 1 in 5 children born in or admitted to the Tuam home, spent less than 50 days there. At the other end of the scale, 16.6% of children spent between five and ten years in the home and seven children spent between ten and 15 years in the home.
Information relating to child’s date of discharge relative to the mother’s date of discharge was available for 1,424 children (43.8% of births/admissions). The available records show that 73% of children remained in the home for some period after their mothers’ discharge; 24% were discharged on the same day as their mothers and 3% were discharged from the home earlier than their mothers.

For mothers admitted in 1950, the average length of stay in Tuam was 272 days; the average length of stay for a child born in or admitted to the home with their mother that year was 1,383 days. Children whose mothers left Tuam in 1950 could expect to remain in the home unaccompanied for 1,111 days on average.
Comparative analysis of length of stay among accompanied and unaccompanied children suggests that, on average, unaccompanied children spent far shorter periods in the Tuam home than those born there or admitted with their mothers. Where the status at birth of unaccompanied children is discernible 71% were recorded as ‘legitimate’ children and were more likely to be discharged to the family home after a relatively short stay. Children born in the Tuam home, or admitted with their mothers, were more likely to be recorded as ‘illegitimate’ children awaiting adoption or placement in the boarding out system - this generally meant an extended stay in the home. In some years the length of stay among accompanied and unaccompanied children is on par, most years, however, show a discrepancy. For example, in 1927 the average length of stay for an accompanied child was 1,775 days while the length of stay for an unaccompanied child was 429 days. Similarly, in 1950, the average length of stay was 1,383 for an accompanied child and 429 days for an unaccompanied child. By 1960, the gap had narrowed to 247 and 200 days respectively.

---

*8.3% of accompanied children (children born in Tuam or admitted accompanied by their mothers) were recorded as ‘illegitimate’ children.*

---
Children: Exit pathways

Information relating to exit pathways was available for 1,922 children (59.1% of births/admissions). The institutional records show that most children were either boarded out (38.29%) or left the home with their mothers (36.99%). Over 20% transferred to a range of other institutions; 3.85% were legally adopted (from 1953); 0.26% were informally adopted (pre 1953) and 0.16% were nursed out from the home. This pattern remained broadly unchanged from the 1920s to the 1960s. Local authority records show that 5.5% of children boarded out from the Tuam home subsequently entered the hired out system aged 16 years.
Comparative analysis of exit pathways among unaccompanied children and children born in the home/admitted with their mothers shows that unaccompanied children were less likely to be boarded out from the home; just 20.15% were boarded out compared to 47.67% accompanied children. As already stated, this is most probably because the majority of unaccompanied children were legitimate children - this is also why unaccompanied children were far less likely to be adopted. The most frequent exit pathways recorded for unaccompanied children was a return to the family home (52.06%) and transfer to a hospital or industrial school (25.95%).
Child deaths

The Commission identified 978 child deaths associated with the Tuam home, including those which occurred when the home was located in Glenamaddy. Child deaths include children who died in the Tuam home, children who were admitted to Tuam and died elsewhere (generally children transferred to the Central Hospital, Galway) and children who were never admitted to the Tuam home, but whose mothers were resident there prior to giving birth (generally after transfer to the Central Hospital, Galway). The Commission located GRO death records for 972 children (99.4% of child deaths).

Most child deaths recorded in Tuam occurred before 1950; 92.6% of deaths occurred between 1921-50. Child deaths spiked in 1926 (41 deaths) and in 1936 (51 deaths). The worst period, however, was from 1942-47 - 305 child deaths, almost 1 in 3 of all child deaths recorded in Tuam occurred over those six years. The available records show that 79% of deaths occurred among ‘illegitimate’ children and 11% occurred among ‘legitimate’ children - status at birth could not be established in relation to the remaining 10% of child deaths.
Unaccompanied children made up 33.5% of admissions to Tuam and accounted for 22.2% of child deaths in the home - although they accounted for 55% and 60% of deaths in 1923 and 1924 respectively; 34% of deaths in 1926 and 43% in 1936. Of the 305 child deaths recorded in the years 1942-47 unaccompanied children accounted for 12%.
Analysis by decade shows that more child deaths (43.5%) occurred in the 1940s than any other decade followed by the 1930s (29.2%); 1920s (18.1%); 1950s (9%) and 1960 (0.2%).
Information relating to place of death was available for all children. Most children (90%) died in the Tuam home - 80 when located in Glenamaddy; 802 when located in Tuam; 9% died in the Central Hospital, Galway; 0.6% died in other hospitals; one died following transfer to a children’s home and one died following discharge to the family home.

**Place of Burial**

The Commission located burial records for 51 children - 50 in Bohermore Cemetery, Galway, and one in Glasnevin Cemetery, Dublin. All 50 children with burial records in Bohermore died in the Central Hospital, Galway. The child with a burial record in Glasnevin died in Our Lady’s Children’s Hospital, Dublin, after transfer there. The Commission established that the memorial garden on the site of the former Tuam home contains human remains which date from the period of the home’s operation and considers it likely that a large number of the children who died in the Tuam home are buried there.

---

Information relating to age on death was available for 932 children (95.3% of child deaths). Most deaths (80%) occurred in infancy as follows: perinatal, 0-7 days (5%); neonatal, 8-28 days (8%); infant, 29-365 days (67%). The remaining 20% of deaths occurred in children aged between 366 days and just under five years.

The available records show that 532 children (55.3%) were accompanied by their mother at the time of death - 430 children (44.7%) were unaccompanied at the time of death.
Infant mortality peaked in 1922 (41.3%) when the home was located in Glenamaddy and decreased dramatically following the move to Tuam in 1925; infant mortality stood at 13.56% in 1927. However, by 1933 the rate had increased to 38.95% and remained above 30% intermittently until 1949. Infant mortality decreased to 19.4% in 1950 and fell to just 3.95% in 1952. Although an increase was recorded in 1953 (18.52%) the infant mortality rate maintained a staggered downward trend until the home’s closure in 1961.

Infant mortality rate is calculated as follows: Living children born in the year who died before the age of 1/All living children born in the year.
Cause of death

Tuam Child Deaths Cause of Death Category

- Non-specific: 177
- Respiratory Infections: 176
- Convulsions: 109
- Other: 105
- Tuberculosis: 82
- Influenza: 55
- Gastroenteritis: 53
- Meningitis, Encephalitis: 46
- Measles: 38
- Congenital Heart Disease: 27
- Haemorrhage: 25
- Diphtheria: 18
- Malabsorption: 18
- Syphilis: 17
- Spina Bifida: 14
- Generalized infections: 12
Information relating to cause of death was available for 972 children (99.4% of child deaths). The leading cause of death were non-specific causes, such as prematurity and congenital debility (18.2%) and respiratory infections - mainly pneumonia, bronchopneumonia and bronchitis (18.1%). Over 11% of deaths were notified as being due to convulsions; 10.8% were due to other causes - mostly pertussis/whooping cough; 8.4% were notified as tuberculosis - mostly general tuberculosis and tubercular meningitis; 5.7% were due to influenza; 5.5% were due to gastroenteritis/gastritis; 4.7% were notified as meningitis; 3.9% as measles; 2.8% as congenital heart disease; 2.6% as being due to haemorrhage - mainly cerebral haemorrhage; 1.9% were due to diphtheria; 1.9% were due to malabsorption - mainly marasmus; 7 1.7% were due to congenital syphilis; 1.4% were due to spina bifida and 1.2% were notified as being due to generalised infections - mainly toxaemia and septicaemia.

There was no major alteration in the leading causes of death in Tuam from the 1920s to 1960.

---

7 Some commentators have asserted that deaths notified as marasmus point to some level of neglect. It should be noted that 8 of 18 such deaths relating to Tuam occurred in the Central Hospital, Galway, and that 10 of the 18 deaths notified as marasmus occurred among children who were accompanied by their mother at the time of death.
Chapter 16: The County Clare Nursery, Kilrush 1922-1932

Introduction

16.1 As described in Chapter 1, in the period 1920-22 changes were made to the operation of the poor law and its institutions. As part of these changes, the County Clare Amalgamation Scheme was agreed by Clare county council in 1921.\(^1\) This scheme provided for the closure of many of the workhouses in Clare and for changes in the use of others. It was agreed that part of the Kilrush workhouse would be used as a county nursery. The fever hospital and infirmary which were attached to the Kilrush workhouse became the Kilrush district hospital. The various boards of guardians in Clare were replaced by the Clare Board of Health. These changes (and others) were given statutory backing by the County Scheme Order, Clare No 1, 1923.\(^2\) This order describes the Kilrush institution as an ‘Auxiliary Home’ for infant children and unmarried mothers. It was also known as the ‘nursery’ or the ‘county nursery’ or the ‘orphanage’; locally, the ‘nursery’ seems to have been the usual name. It was envisaged that it would be a home not only for unmarried mothers and their children but also for children who were already in the workhouse system and thereafter children who were orphaned or abandoned. The Kilrush workhouse closed at the end of January 1922 and the nursery came into operation immediately thereafter. It occupied part of the old workhouse and the rest remained vacant.

Sources

Institutional records

16.2 The Commission has not found any extant institutional records for the Kilrush nursery. The minutes of the Clare Board of Health refer to a register of all children coming into the nursery but the register itself is not included in the archives of Clare county council. It seems likely that records of residents were kept in the same way as in county homes and other similar institutions but they do not seem to have survived.

---

\(^1\) The Clare Champion, 23 July 1921

Local authority records

16.3 Minute books of Clare County Council, the Clare Board of Health, Kilrush Board of Guardians and Kilrush Rural District Council are held in the Clare County Council Archives. The minutes of the Board of Health and its sub-committee, the County Nursery and District Hospital Committee are the most important source for information on the Kilrush nursery and much of the information in this chapter comes from these minutes. The Board of Health met regularly and a meeting of the Nursery and District Hospitals sub-committee followed the Board meeting. The matron or officer in charge of each institution made a monthly report from around mid-1923 onwards. The reports of the matrons of the different institutions were read into the minutes although reports from the nursery did not start to appear until 1924. Orders and proposals by the councillors were also recorded as were orders and instructions from the Department of Local Government and Public Health. The nursery matron’s reports contained information about the condition of the building and facilities, issues relating to the women and children, food supplies, and personnel. Over time, there were fewer references to the women and children. From 1929 until the closure of the nursery in 1932, the matron’s reports were occasional and had very little content.

16.4 The minutes include reports from the Assistance Officers on the boarding out of children. These list the details of children boarded out and the names and addresses of foster parents. It is not clear if all the children listed were from the nursery. There are reports of inspections by Assistance Officers on the living conditions of the foster children and on the removal of children and their placement with other foster parents or their return to the nursery.

16.5 Other relevant information in the minute books includes details of tenders for the supply of milk, food and services to the nursery. There are detailed invoices for goods and services provided. There are invoices for coffins provided to the nursery and the district hospital.

Kilrush Baptismal Records

16.6 The Commission has had access to the baptismal records of Kilrush parish church from 1922-1932. These records contain the names of the children baptised, the mother’s name (sometimes there is reference to a father), the priest who baptised the child and the parish the mother was from.
Local Newspapers

16.7 The *Clare Champion* and *Saturday Record* are available at the Clare Local Studies Centre on microfilm. Both papers reported on meetings of Clare county council and the meetings of the Board of Health. The reporting was extensive and often gave verbatim accounts of meetings. These reports have much more detail on what was said by public representatives than the minute books. The reporting on the setting up of the County Clare amalgamation scheme was detailed and often covered several pages of the newspaper. This gives an insight into the thinking behind the setting up of the institutions and in particular the financial concerns voiced by those representing rate payers. The reporting on the closure of the orphanage is also extensive and explores the reasons for and against put forward by the various interested parties. Both papers carried details of inspections of the nursery and on an enquiry carried out on behalf of the Board of Health on the boarding out scheme.

Department of Health

16.8 The Commission has had access to a small number of Department of Health files mainly from the period 1922-23.

Governance

16.9 Kilrush nursery was owned and financed by Clare county council and was run by the Congregation of the Sisters of Mercy between 1922 and 1928 and by directly employed lay staff from 1928 to 1932. It closed in March 1932.

County Clare Board of Health

16.10 The Board of Health was appointed by Clare county council. The first board which was appointed in November 1921 had 30 members: ten members of Clare county council; four people nominated by that council, one of whom was a priest and one a TD; 11 chairmen of rural and urban district councils; three members of the county insurance committee and two representatives of the county medical association. It established sub-committees to manage the various institutions in Co Clare; the County Nursery committee was established to manage the Kilrush nursery. Initially, the members of the sub-committee were from Clare county council, Kilrush rural district council and two women, one of whom was the chair.\(^3\) The amalgamation scheme had envisaged that the sub-committee for the nursery

---

\(^3\) *The Saturday Record*, 1 April 1922
would include a doctor and ‘at least two ladies’. The legislation did not include this as a requirement. In June 1923, the sub-committee included two priests - one from Kilrush and one from Kilkee. The membership of the sub-committee changed over the years and by 1928, it was all male and seems to have been exclusively county councillors.

**16.11** The intention was that the sub-committee would oversee routine expenditure but all other expenses had to be sanctioned by the County Board of Health.\(^4\)

**Sisters of Mercy**

**16.12** The Sisters of Mercy had been employed in the fever hospital and infirmary which were attached to the Kilrush workhouse since 1875. They were employees of the Kilrush board of guardians and, from 1922, of the Clare Board of Health. Kilrush had a similar status to Pelletstown (see Chapter 13). The Sisters of Mercy are recorded as being in charge of the nursery from February 1922.

**16.13** The role of the Sisters of Mercy in the running of the nursery was that of day-to-day management of the women and the facilities. The status of the nuns was clarified in a letter from the Department of Local Government and Public Health (DLGPH) in May 1923 regarding the appointment of specific Sisters to the positions of storekeeper and matron. A second letter stated that only one person should be appointed.

**16.14** There does appear to have been some controversy about the role of the religious orders in the early days of the amalgamation as is evident from a letter to the Board of Health from Bishop Fogarty of Killaloe which was read into the minutes in January 1922. The letter stated that the bishop had no objections to the Sisters of Mercy taking control of the Central Home (the county home in Ennis) but he could not allow them to carry out night duties as it was against bishops’ regulations and would make it impossible for them to carry out their ‘spiritual exercises’. The Board of Health had resolved that, if the Sisters could not undertake full duties in the county home, including night duty, the board would lose the services of the Sisters ‘with the greatest regret’.\(^5\) The bishop was not impressed by what he regarded as a threat from the councillors to dismiss the Sisters:

---

\(^4\) *The Clare Champion*, 23 July 1921.

\(^5\) Department of Health file: RM/ARC/0/520970
There is a greater necessity for it now than at any time since the nuns took charge of the Workhouse Hospital. Therefore the statement of your committee that there is no alternative but dismissal is to me unintelligible. The desire of your committee to get rid of the nuns in the care of the poor is I fear a bad omen. It is not for gain or pleasure the nuns undertake the care of the poor and infirm but for Christian charity... When the advisors of your committee have turned [on/out] the nuns and staffed the place with young lay nurses, the poor helpless old people shall be carted there (from) all parts of the county and thrown in a heap to rot neglected and uncared for by Divine Love.

16.15 There is no record of a reply from the board to the bishop although there is reference to an appointment of a maternity nurse that was ‘deleted’ pending a meeting with the bishop. It is not clear if the prohibition on night duties also applied in the nursery.

The Department of Local Government and Public Health

16.16 As with all the mother and baby homes which were publicly financed, the Department of Local Government (DLG) and later the Department of Local Government and Public Health (DLGPH) was involved in decisions about policy and spending. In January 1922, the Board of Health asked the DLG to appoint an inspector to assist in the classifying of patients for the purposes of implementing the amalgamation scheme.\(^6\) It appears that the department had a much more active and direct involvement with Kilrush than it did with institutions such as Pelletstown (see Chapter 13) and Tuam (see Chapter 15); however, it may be that this impression is due to the absence of records in relation to Tuam in the 1920s.

Physical conditions

16.17 The outline of the scheme for the county nursery which was approved by the Board of Health in January 1922 stated that the accommodation consisted of a maternity ward with six or seven beds, a day nursery and a night nursery. There was ‘no lack of accommodation’ and no new buildings were needed ‘but a certain amount of painting and decorating and internal structural alterations will have to be carried out. Both the present kitchen and present laundry are quite inadequate’.\(^7\) The

---

\(^6\) Department of Health file: RM/ARC/0/520970  
\(^7\) ibid
scheme included proposals for temporary and permanent changes to the accommodation. This included installation of a bathroom and lavatory, a labour ward and a small isolation unit. The nursery and the district hospital had made a joint report about the water supply, sewerage and sanitary conditions.

16.18 By March 1922, the Board of Health was considering an engineer’s report on the requirements for the nursery so the nursery committee sent a quite detailed report to the board. It asked the board to ‘keep in mind the extreme state of dilapidation of the main building known as the Workhouse, the walls are rough, windows small without proper frames or fittings, no grates, the passages flagged, the wood work rough and defective - all tending in the opinion of the Committee to have a depressing effect on the inmates’. The committee went on to describe what they had done. Initially, they had accommodated the school children in the girls’ school room but this did not work. It was decided to move to the sheds. There were two dormitories there and a ‘dining room on the flat, with outside dry closets, an outside bathroom attached to the old Infirmary and a pump all within a few yards of the sheds’. These new arrangements were ‘very superior’ when compared to the previous arrangements. The main kitchen was closed and all cooking was being done in the infirmary kitchen. The committee said that the Sisters of Mercy were very satisfied with the marked improvement in the children which they attributed to the ‘complete change of environment and attendance at the local schools’.

16.19 The committee said that they could not find a way to improve the day nursery except to remove as many children as possible from it to the school going section. ‘The room is small for the numbers and has an easterly aspect and never gets any sunshine.’ However, the babies with one or two exceptions looked ‘healthy well-fed and clean’. ‘We have visited them frequently and always found them well attended to’.

16.20 The committee asked for painted walls, tiled floors, baths and lavatories. The engineer had been asked to make out separate estimates for the main house, the maternity block and the laundry. The engineer had not told them how he proposed to provide hot and cold water and they were anxious about this. It is not clear exactly what happened to the various proposals but it is the case that no significant improvements were made.

---

8 The Commission has not seen this report.
The physical condition of the Kilrush nursery was always very poor indeed. It was so bad that its closure was considered less than a year after it opened. In December 1922, the Local Government Inspector, James McLysaght, who inspected all the county institutions at the request of a committee of inquiry set up by Clare county council, said that it was a ‘perfect scandal to have anyone in the place’. He pointed out that there was no sanitary accommodation and no water supply and that it would cost a lot of money to make it habitable; he was concerned that the prevailing conditions, ‘would give rise some time or other to an outbreak of fever for which the County Board of Health would be responsible’.

One councillor stated that ‘it was an absolute disgrace’ in the twentieth century. He suggested to the committee that it consider the establishment of a provincial nursery rather than having one in every county. This suggestion was unanimously adopted by the committee.

However, the proposal did not go any further and despite ongoing complaints about the conditions in the nursery, it continued to function with little if any repairs or improvements. In April 1923, the county engineer reported to the Board of Health that there were wells in the yard which could be used for a clean water supply. He was instructed to draw up plans and estimates for providing the water supply to the nursery and local hospital. According to a history compiled by the Sisters of Mercy, reconstruction work was carried out at the former infirmary and fever hospital in 1924 and it then became known as St Joseph’s District Hospital. Nothing seems to have been done about improving the nursery.

The poor conditions in the nursery were a matter of ongoing correspondence between the matron, the Board of Health and the DLGPH. In April 1924, the matron complained that the institution was overcrowded as there were 164 residents in the nursery and children were sleeping two in a bed with ‘every habitable corner occupied.’

In 1927, the Report of the Commission on the Relief of the Sick and Destitute Poor described the conditions in the Kilrush nursery as follows:

---

9 The town of Kilrush had no public water supply at this time and the town of Ennis had a very poor supply.
10 The Saturday Record, 9 December 1922.
Kilrush’ Auxiliary Home is in the old Kilrush Workhouse and was established for unmarried mothers and infant children. The Home is in a very poor condition of repair. There is no water supply and no bathing or sanitary accommodation, and the lighting is by lamps. The Sisters of Mercy, who are in charge of the Home, are themselves very insufficiently accommodated. They have no proper kitchen or refectory or bathing and sanitary arrangements. It is not fair to expect the Sisters to remain under the conditions as they exist.

... The laundry work of the institution and also that of the District Hospital, which is on the opposite side of the public road, is done in a primitive and badly equipped laundry.

The failure of the Board of Health to adapt the workhouse properly for the purpose to which it has been allocated reflects gravely on their administration.

... In the maternity department connected with the Home there is no labour ward. The provision of such is very necessary.

16.26 In August 1927, there was still no electric light despite pleadings by the matron, and the roof was in a dilapidated condition. The Board of Health approved of ‘inviting quotations’. A report in the Saturday Record in February 1930 stated that there were 61 patients; all the buildings were in a very bad state of repair with leaking roofs; ‘the laundry is of the worst type, no baths and no inside sanitary accommodation’. In 1930 the long-awaited water supply was still not in place and the county engineer stated that the cost of laying on water from the Kilrush water supply would be £30. The matter was referred to the ‘Visiting Committee’.

16.27 On 25 March 1931, the Minister for Local Government and Public Health was asked ‘whether he will state the amount of money spent on (a) hospital improvements, including new works, in County Clare; (b) improvements to the County Home in Ennis and Nursery in Kilrush, since the amalgamation of workhouses in 1920’.

16.28 The Minister (General Mulcahy) replied with information on the amounts spent or planned to be spent on a number of hospitals including Kilrush Hospital. He said that large improvement works were contemplated for the county home but they had not yet been undertaken. There was no specific mention of the nursery but the
minister said that there may have been minor works carried out at the county home and the nursery but particulars concerning these were not available to the department. As department approval would have been required for any significant spending on the nursery, this means that no serious attempt was made to improve conditions during the ten years of the existence of the nursery.

### Staffing

16.29 The DLGPH took a detailed interest in the staffing levels and staff conditions in Kilrush. One particular example of its involvement arose in 1925. A woman who was employed as an attendant became ill and was hospitalised whilst working in the nursery in 1925. The department told the Board of Health that it should not pay her food rations and ‘would do well to fix a charge for her maintenance’. The board responded that the woman was married and in poor circumstances and no charge was fixed. This did not satisfy the department who said that the matter was being referred to the auditor. In response the board set a charge of one shilling a day.

16.30 The outline of the scheme for the county nursery envisaged that there would be the following staff: matron (a nun), a lay assistant housekeeper, a nun in charge of the kitchen and stores, two nuns looking after the schoolchildren, a nun looking after the babies with a lay trained children’s nurse and two male porters to attend at the gate, bring supplies of fuel and work the garden. There would also be a visiting medical officer, two midwives and a chaplain.

16.31 In July 1925, the department instructed that the staff of the nursery should consist of a medical officer, two nuns, two maternity nurses, a female attendant, a cook, a laundress and one general male attendant. The department further instructed that one of the nuns be ‘dispensed with’ and the salary of the male attendant be reduced to £2 a week. It raised a question about the attendant for school children and requested that the matron submit a report of this person’s duties. In August 1925, it was recorded that the assistant matron (a Sister of Mercy) was in charge of the school children. Details of the annual salaries of staff employed in the nursery were entered in the minutes for September 1925.

16.32 The chaplain was paid £45 and the general attendant porter £104; neither lived on the premises. The matron, assistant matron, nurse (all Sisters of Mercy) and the

---

12 Dail Debates, 25 March 1931
midwife were each paid £60; they all lived on the premises. Others who lived on the premises were two attendants (paid £36 and £36 8s respectively), a cook who was paid £45 6s 8d and a laundress who was paid £36 8s.

16.33 Dr Counihan who was the medical officer for Kilrush was responsible for the county nursery and Kilrush district hospital. Although not listed in the September 1925 minutes, he is referred to in minutes throughout the institution’s existence.

16.34 In July 1926, the DLGPH questioned the appointment of Sister M B Sheedy, a Sister of Mercy, as the matron because of her lack of qualifications as a nurse. This started a correspondence between the Board of Health and the department about the appointment that resulted in another Sister taking up the position as matron as a short-term appointment. The department refused to approve the employment of a third Sister at the nursery and instructed she should be discharged.

16.35 A letter from the Mother Superior responded to the Board of Health in February 1927 asking why the appointment was temporary considering that the Sister in question had seven years’ experience. She also stated that when the Sisters took charge of the nursery, it was made clear by the department that the matron need not be a trained nurse but experienced in institutional management and, unless the decision was reconsidered, she would withdraw the Sisters from the nursery. She also referred to the fact that Sisters were being trained and that, although there were four Sisters in the nursery, only three were receiving a salary. The department responded stating that the temporary employment contract was a local authority requirement. The members of the Board of Health recommended that the present matron be appointed ‘as they were of the opinion that a Sister can best fill the post’.

16.36 There is no record of a response. The department raised the issue of the appointment of Sister M Baptist Sheedy again in November 1927. This time they requested to know when she would take up the position as matron. In April 1928, the board minutes included a note on the resignation of a Sister due to ill health together with a proposal for her replacement. In August the department wrote stating that, as the replacement was not a trained nurse, this was not acceptable. This was followed by a proposal to replace her with a record keeper. This triggered a response from the Mother Superior stating that the other Sisters were
resigning from their posts at the county nursery. The board accepted these resignations with regret and a plan was put in place to advertise the positions.

16.37 There is a note in the Mercy Archives in 1928 which records that the Reverend Mother had ‘found it necessary’ to withdraw the Sisters from Kilrush due to the reluctance of the ‘Local Government Board’ to sanction the appointment of nuns others than trained nurses. ‘The County Nursery is now in the hands of secular nurses.’

16.38 In December 1928 a lay nurse was appointed as matron of the county nursery and another lay person was appointed as temporary midwife. In September 1930, the new matron asked that her role as matron be made permanent and, in response, the department stated that in view of the ‘contemplated change in connection with the institution, they do not consider it desirable to make a permanent appointment at present’.

**Women and children**

16.39 Because there are no extant admissions registers, it is not possible to establish exactly how many women and children were in Kilrush nursery. From the limited information available, it seems likely that there were between 300 and 400 mothers there and considerably more children.

16.40 The outline of the scheme for the county nursery which was approved by the Board of Health in January 1922 noted that the nursery committee had no statistics available to them nor had they seen the original amalgamation scheme. Consequently, they did not know exactly what had been envisaged by the originators of the scheme. They proceeded on the basis that the object was ‘to take the existing conditions as they stand in each Union and to provide in one Institution for what has hitherto been provided for in the several institutions but of course in a more up-to-date and modern way’. The committee assumed that 40 mothers would be admitted each year; there would be about 160 children up to school age and about 80 school going children aged between five and seven.14

16.41 The March 1922 report of the nursery committee commented on the mothers:

---

13 The Local Government Board was the predecessor of the DLGPH; it ceased to exist in 1922; see Chapter 1.
14 Department of Health file: RM/ARC/0/S20970
The mothers are neglected, they have no proper clothing and no comfort of any kind. They are willing to do any work even the most menial and unpleasant. A certain number worked in the laundry under the old management. The washing was done with scrubbing brushes. We are supplying washboards. A strong mangle is required. We don’t consider it is humane to allow expectant and nursing mothers to wring out heavy twill sheets and blankets as they do at present. We feel strongly that the lot of these poor women should be improved. Some are under 20 years and we feel confident we could get good results both to the women and the Home if we could, with discretion and common sense, give them comfort in their work, food and clothing.

16.42 It would appear that there were a number of unaccompanied children. In March 1922, there were 22 school going children in the nursery.\(^{15}\) The minutes of the nursery committee meeting of 23 March 1922 noted that Clare Board of Health had agreed that children could be retained in the nursery when the mothers were discharged and the committee could use its discretion about admitting children without mothers. There are also references to mothers being discharged for ‘insubordination’ and the children being retained.

**Births in the nursery**

16.43 The nursery was in the parish of Kilrush and the chaplain was the local priest. The children born in the nursery were baptised in the parish, most likely in the nursery chapel. Their births and information on their mothers were recorded in the Kilrush parish register. The register also shows that a small number of the parents were married, as both names are in the register. These were mainly from the town of Kilrush or the surrounding area and may have been people in poor circumstances who needed medical attention. It could also be that Kilrush district hospital, which had a maternity unit, could not facilitate them.

16.44 The first birth recorded for the Co Clare nursery was a baby boy, born on the 9 February 1922; he was baptised the following day. His mother’s parish was named. The last baby born in the nursery was also a boy, born on 21 February 1932. His mother’s parish was also stated. The nursery closed in March 1932. In

\(^{15}\) Department of Health file: RM/ARC/0/520968
the ten-year period, the baptismal records suggest that 330 children were born in the nursery:

16.45 Each baptismal record contained the baby’s name, the mother’s name, the mother’s parish, the priest, the godmother and some additional information. This usually contained the words ‘extra marital, born in home’. The godmothers were other mothers in the nursery and some of these women were godmother to several children. The register also records if and when the child as an adult got married. There are references to people marrying in Britain and the United States as well as Ireland; they would have contacted Kilrush Parish Office for baptismal certificates. There are also a couple of instances where the father acknowledged the child at a later date and this is also recorded. Where a child was found abandoned, the words ‘Infans Expositus’ were entered.

Other children

16.46 Other children lived in the nursery but the number cannot be established. As already stated, the nursery housed not only unmarried mothers and their children but also orphaned or abandoned children. In May 1922, the nursery committee noted that there were three boys in the institution, two aged 10 and one aged 14. In June 1925, the matron’s report to the Board of Health referred to a woman who had been taken in with her children the previous year. The children had been fostered but the mother was refusing to take up offers of employment. Another report related to two children who were admitted to the nursery due to ‘desertion by the mother’. They were aged eighteen months and three years. Their father, who had an army pension of 27s, refused to contribute to their support. This meant that
there were infants, young children, older children and adults all kept in the same environment.

16.47 In 1927, the *Report of the Commission on the Relief of the Sick and Destitute Poor* reported that there were 51 women and 105 children in the nursery; 57 of the children were over two years of age and 37 of these were attending school outside the nursery.

16.48 The DLGPH Report for the year 1928/29 recorded that there were 26 mothers of first-born children and six mothers of two or more children in Kilrush at the end of 1928.

**Length of stay**

16.49 The length of stay was one of the first issues addressed by the nursery committee. At its meeting in April 1922, some members considered that there should not be a defined length of stay as they felt that this would stop some women coming into the nursery.\(^\text{16}\) However, in May 1922, it was agreed that mothers would not be allowed to leave the institution until the child was at least two years old.\(^\text{17}\) This was difficult to enforce as in March 1923, the Board of Health informed the nursery committee that it had no power to detain mothers who were willing to bring their children with them.

16.50 The minutes of the nursery committee meeting of 23 March 1922 noted that Clare Board of Health had agreed that children could be retained in the nursery when the mothers were discharged and the committee could use its discretion about admitting children without mothers.

16.51 The matron raised the matter in a report to the Board of Health in April 1924. She proposed that the children of the mothers who ‘were allowed out’ be kept in the nursery as they were ‘in the most cases placed in the care of indifferent foster parents, badly treated, their education neglected, and brought up in the most objectionable surroundings’. She also recommended that when children reached the age of seven they should be sent to an industrial school. The Board of Health was in agreement and put forward a motion asking that the Minster for Local

\(^{16}\) *The Saturday Record*, 1 April 1922

\(^{17}\) Department of Health file: RM/ARC/0/520964
Government and Public Health change the law in relation to admission to industrial schools (see Chapter 1).

16.52 Her suggestion to keep the children until they were seven was not accepted and in July 1924 Miss Fitzgerald-Kenney, a local government inspector, appeared before the Board of Health and made clear that children from aged two to twelve were to be boarded out.

16.53 In April 1924, on foot of an inspection by county councillors, the board ordered that ‘unmarried mothers and children be kept for a period of two years from the date of their admission order’. There was no legal basis for this although it does seem to have been the approved policy of the DLGPH. It is not clear that this was implemented fully in Kilrush. There are instances where women were ‘detained’ when they should not have been. For example, a woman came to collect her daughter and the daughter’s baby but this was not allowed as the baby was only seven weeks old and allowing her out would cause ‘much dissatisfaction amongst the other inmates’.

16.54 On another occasion, the matron referred in her report to a woman whom she was ‘obliged to discharge’ because of her behaviour. The woman went to live with her father but the matron kept the baby in the nursery as the weather was very cold. The board ordered that the mother take her child within fourteen days. In 1927 a mother left the nursery with her baby but the child was subsequently returned. The DLGPH queried why this had happened and was told by the Board of Health that ‘this child has been deserted by her mother and the Civic Guards are endeavouring to trace the whereabouts of the latter’. In September 1925, the matron protested against an order made by the board to allow a mother to leave without her child who was only eight weeks old. Dr Counihan, the medical officer, supported the matron and the board ordered that both the mother and her baby be discharged at once or that both remain. Another mother was refused permission to leave as her baby was only one year and nine months old.

16.55 There were other occasions when the matron brought cases to the board about a mother and child leaving. In March 1925 a woman called for her unmarried daughter and ‘strongly insisted on taking away the child of the latter’. The matron refused, pending the instructions of the board. The board ordered that the mother be discharged and the child boarded out. On another occasion a mother who had
spent two years in the nursery was ‘most anxious to leave with her four illegitimate children’. The matron stated she did not think this woman was capable of taking care of herself and her children. The nursery chaplain was of the same view and the order from the board was that the woman be ‘retained’ in the nursery. There was no legal basis for the retention of this woman and her children, but she almost certainly was not aware of that.

16.56 In general, it would appear that many of the women stayed for two years unless taken out by their family and then only with the permission of the board. There were a number of ‘escape’ attempts. In May 1924, the matron reported that three women had ‘scaled the wall’ but had been arrested and brought back by the Gardaí. In October of that year, she reported that two women escaped over the wall leaving behind their two children, one aged three weeks and the other five months. The matter was reported to the Gardaí.

16.57 In 1927, the Report of the Commission on the Relief of the Sick and Destitute Poor said that the women were ‘retained’ in the nursery ‘for two years if possible and an endeavour [is] made to find suitable employment for them on discharge and to keep in touch with them’. The number of ‘first offenders’ was 37. The report went on to state that the premises was of ‘sufficient size to permit of separating the less culpable from the degraded, and if the best is to be got from this Home some classification should be made’.

Working

16.58 The outline of the scheme for a county nursery envisaged that a ‘certain amount of labour will be available by mothers’ before they leave the institution and their services could be used in the laundry where all the laundry work for the district hospital could be done. In practice, it appears that women were expected to work while in the nursery and this included working in the district hospital. If a woman refused, as was the case with one ‘insubordinate inmate’, the nursery committee decided that she should be sent to the county home and the child kept in the nursery.\(^\text{18}\) There are references to women being sent to the county home and this was viewed as a punishment. If sent to the county home they would have been expected to work there as well and the work there was likely to be more onerous.

\(^{18}\) *The Saturday Record*, 1 April 1922.
Discipline

16.59 Issues of discipline within the nursery were discussed at a number of board meetings. During a Board of Health inspection in 1924, councillors inspecting the premises referred to interviewing two women ‘who from the way they spoke in our presence, the matron must have great difficulty with them.’ They also referred to a woman who had struck another woman with an iron and another who refused to work and brought her child into her bed ‘causing damage to the bed linen’. In the first case the board ordered that the woman be prosecuted although she was later discharged and her baby kept in the nursery. In the second case the woman was sent to the county home but was refused admittance and returned to the nursery that evening. In December 1926, Dr Counihan referred to ‘one of the inmates being guilty of gross insubordination’.

16.60 In later years, there were fewer references to bad behaviour and ‘insubordination’ but this may be due to changes in the reporting process rather than any changes within the nursery.

Clothing

16.61 It would appear that some form of uniform clothing was provided to the women and children in the nursery. In March 1922, the nursery committee of management noted that the following requisition was submitted by the Sisters of Mercy and approved: 100 yards of flannelette for underwear; 20 yards of navy flannel, 100 yards of grey calico, 8 lbs of black 4 ply thread, 12 sets of knitting needles, a dozen packages of assorted sewing needles, 30 pairs of children’s boots and 30 pairs of women’s boots. 19

Deaths

16.62 The available records do not establish the number of deaths in the nursery; they do refer to the deaths of children and to the conditions which contributed to the deaths.

16.63 The Central Statistics Office figures show details of deaths of illegitimate infants in institutions from 1923, broken down by county. The death rate in Co Clare institutions is very high when compared with the numbers in the baptismal record. As the nursery was the only institution for ‘illegitimate’ children in Co Clare, it is

19 Department of Health file: RM/ARC/0/520964
probable that at least the majority died there. The recorded number of deaths of ‘illegitimate’ infants in institutions in Clare is as follows:20

</table>

16.64 The year 1932 is anomalous as the nursery closed in March of that year and unmarried mothers were to be sent to Sean Ross Abbey in Roscrea. It is possible that this did not always happen and mothers had their children in the county home in Ennis or in the local hospital. In 1933 the records show that twelve ‘illegitimate’ infants died in the institutions in Clare.

16.65 As already stated, there are references in the minutes to the serious concerns of Dr Counihan, the matron and others about conditions in the nursery and the risk they posed to the residents.

16.66 In 1924, Dr Counihan sent a report asking the board to approve a revised ‘dietary scale’ as ‘the mothers were unable to nurse their children satisfactorily’. He also wanted the diet of the school children revised. This was approved subject to sanction by the DLGPH. In June 1927, the department wrote to the board questioning the dietary scale in the nursery: ‘the allowances of bread, potatoes and butter in the amended scale are substantially in excess of those indicated in the Department’s scale and the Ministry see no adequate reason for such increased allowances’. This was despite the fact that in March 1927, Dr Counihan had reported the death rate as ‘appalling’.

16.67 At a meeting of the Clare Board of Health a councillor referred to the death rate:

At one time, the death rate in the Nursery was so high that special precautions had to be taken to protect them. Two nurses had been hired to watch them night and day and the mothers and children had been retained for two years as a further precaution.\textsuperscript{21}

16.68 In the same month, February 1927, the matron reported that she had to requisition a special night nurse as there were twenty-seven children suffering from measles.

16.69 Another indicator of the high mortality rate was the continuous requisitions for coffins which are recorded in the minutes. This record also points to children of different ages dying in the nursery as the coffins were of different sizes. (The figures quoted above refer only to infant deaths.)

16.70 There are few references to specific deaths of infants or older children in the minutes; two exceptions being the cases of Mary Sherlock who was found dead in her mother’s bed in March 1926 and the child (unnamed) of Mary Enright. In the Enright case, in July 1930, the DLGPH requested that an enquiry be set up ‘to ascertain the circumstances and report on the matter’. There are no further references to this case.

16.71 Mary Sherlock’s inquest was held in April 1926 and a full report was carried in \textit{The Saturday Record}. A witness gave evidence that she was an ‘inmate’ of the nursery and that she saw Annie Sherlock take the baby into her bed at about 5.30 in the morning. She said that later than morning when Annie got up, her baby did not move and she called out that Mary was dead. Another witness, a nurse, said that as the place was not properly heated in winter, the mothers took the babies into the bed with them. Dr Counihan examined the baby and said that he found ‘no bruises or marks of violence’ and that the body was well nourished. He concluded that she died from smothering or asphyxia but he could not say how it happened. The jury found that the child died from asphyxia and they ‘attached no blame to anybody’. The investigating Garda Superintendent felt otherwise and stated that the ‘verdict may be all right but it would not do the state. I will have Annie Sherlock arrested and formally charged before the district justice’. A second report in the same newspaper stated:

\begin{flushright}
\textsuperscript{21} \textit{The Clare Champion}, 5 February 1927.
\end{flushright}
At a special court held at Kilrush Barracks, Annie Sherlock was charged with the murder of her illegitimate child aged 7 weeks at the Co Nursery, Kilrush were she had been an inmate and remanded in custody to the District Court at Kilrush.  

16.72 There are no further references to this case in the newspapers, but there is a reference in the minutes to an Anne Sherlock being employed in the county home in March 1927. It seems likely that this was the same woman.

**Closing the nursery**

16.73 The closing of the nursery was on the agenda from a very early stage. The Board of Health put proposals to the DLGPH. In March 1928, the Board of Health was considering the estimates for the new financial year. It made a series of recommendations to the county council, with a view to ensuring economies in administration. They included the abolition of the county nursery at Kilrush, the boarding out of some 90 children who were resident there and the transfer of the unmarried mothers to the county home.

16.74 In January 1929, the department said that the board’s proposal to close the nursery and transfer the ‘inmates’ to the county home ‘appears to commend itself’. It went on to say that it was not possible at that time to say if sufficient accommodation was available.

16.75 In 1930 the Board of Health began to look further afield for solutions. In July that year, a letter from the Sister in charge in Bessborough stated that only ‘first offenders’ were admitted and that the terms were 3s a day. This was noted in the record and it was decided that Bessborough be requested to reduce the cost to 2s a day as they were planning to send a number of cases. In response the department ordered that the board should consider sending suitable cases to Bessborough. Dr Counihan argued that in his opinion, there were fifteen ‘first offenders of whom only one had good Home prospects… In regard to second or more offenders, the prospect of a Home was practically nil’. The board decided to send five first offenders to Bessborough. It is not known if this happened.

---

22 *The Saturday Record*, 10 April 1926.
23 *Nenagh Guardian*, 17 March 1928
Bessborough institutional records do not mention Kilrush nursery as a referring body in 1930-32.

16.76 In August 1930 a letter from the Good Shepherd Convent in Limerick was received stating that it was prepared to take unmarried mothers who were ‘first offenders’. In December 1931, the department made a suggestion that all expectant mothers might be sent to the ‘Home at Shan Ross Abbey, Roscrea where there is more available accommodation than at Tuam’. The secretary of the board reported that the cost of keeping mothers at Sean Ross was 12s weekly and 17s 6d for mother and baby. He reported that ‘mothers were retained as long as possible and situations found for them on discharge’. The board ordered that suitable unmarried mothers be sent to Sean Ross ‘as soon as possible’.

16.77 Again, it is not clear if this happened; the Sean Ross institutional records do not record any referrals from Kilrush nursery. There is some evidence that it did happen. In December 1931, the Board of Health considered an application from three maternity nurses for expenses when conveying patients by ambulance to Sean Ross. The secretary said that when patients were being sent from the nursery at Kilrush to Sean Ross, it was necessary to send one of the nurses with them and they applied for £1 1s expenses. One member said that the nurses were paid and this was part of their job. The secretary pointed out that they had to get meals on the journey. ‘They leave Kilrush about 9am in the morning, and they are not back at Kilrush until about 10pm at night.’ After discussion about the cost of meals, the board decided to pay 7s 6d travelling expenses.

16.78 In the meantime, the newspapers carried extensive reports on board meetings about closure and these reports give verbatim accounts of the county councillors’ comments on the matter. In November 1931, they discussed the benefits of sending the women to Sean Ross and noted that the average cost of keeping a mother and child in Kilrush was 24s as opposed to 21s at Sean Ross, a saving of 3s. This would have to be offset by the cost of having to employ helpers in Kilrush to take the place of the women (presumably in the district hospital).

24 The Good Shepherd Sisters had an industrial school and a Magdalen laundry in Limerick; clearly the offer related to the laundry.
25 Nenagh Guardian, 26 December 1931
16.79 In December 1931, the secretary put forward a plan to move the nursery to another part of the building which would have cost a total of £141. It was also suggested that four women from the nursery be employed in the hospital at £13 per annum. There were varying views among the councillors. One thought it would be throwing good money after bad; others suggested simply using the county home. The question of boarding out the children was discussed. It was argued that foster parents could be found for children aged between two and seven and paid 7s a week but it was considered that no one would take children under two. One councillor said: ‘But if we close Kilrush Nursery, we cannot take the children down to the pier and drown them. You must board them out and even if we have to pay £1 a week it will be cheaper than a new institution.’

16.80 As Sean Ross would take only ‘first offenders’ the board discussed what to do with the women who were ‘repeat offenders’. One councillor said that there were ‘eight or ten such cases there at present and is it not an awful state of affairs to have to maintain an expensive institution for the sake of ten vagabonds’. The secretary stated that there were probably 15 ‘inmates’ in the nursery at that time and the discussion continued with the Good Shepherd Convent Limerick suggested as a place for the second offenders. The problem there was that they would not take the children. It was pointed out that ‘There is a County Home in Limerick and perhaps they may take the class we want to dispose of’.26

16.81 The order for closure was made by the Minister for Local Government and Public Health and the letter of approval was read at a Clare county council meeting. A councillor from Kilrush objected to the closure on the grounds of the loss of business to the town stating: ‘Everything is being brought away from Kilrush and we are now about to send our money to an institution in Roscrea’. Some councillors agreed that there would be a loss to Kilrush but the chairman said that the decision had been made:

In the interests of these poor creatures themselves and in order to give them a decent chance at mending their ways...they would have a chance of learning some useful occupation which may be the means of preventing a lapse into wicked ways.27

26 The Clare Champion, 19 December 1931.
27 The Clare Champion, 5 March 1932.
A letter from Sister De Sales at Sean Ross stated that she was prepared to receive 25 children on a day the following week at a rate of 10s each a week. The Board of Health agreed to pay the amount. The secretary mentioned that two children had been boarded out and then sent back as they were only a year old. He proposed that in the interests of the children, it would be better if they were sent to Sean Ross. He also proposed that the ten or twelve ‘second offenders’ in Kilrush be discharged and their children sent to Sean Ross. One councillor pointed out that this had happened before and they had come back; he asked if they could be sent to a Magdalen home. The secretary said that he had interviewed them and they would go anywhere except to an institution. One councillor remarked that ‘it is all very fine to talk about letting these inmates go, but they are a dangerous type to have roaming the country’. The secretary replied that there was no legal power in the Board to detain any inmate for even an hour if she wishes to take her discharge. The only obligation on the inmate is that she must take her child with her, and that prevents a number of them from going out. That is why I suggest sending the children to the Roscrea institution and letting the mothers off. Every one of these children born in the county costs the rate-payer about £200 each until they reach 15 years of age.\textsuperscript{28}

The board agreed to act on the secretary’s suggestion.\textsuperscript{29} However, at a meeting in April 1932 he stated that there were ten maternity cases in the county home. It is not clear if these were transferred from the nursery or were unmarried mothers.\textsuperscript{30}

Chapter 17: The Sacred Heart Mother and Baby Homes

Introduction

17.1 The mother and baby homes in Bessborough (established 1922), Sean Ross (established 1931) and Castlepollard (established 1935) were owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. They were sometimes called ‘special homes’ in order to distinguish them from county homes. They were regarded by the health authorities as ‘extern’ institutions. This meant that they were not owned by the public assistance/health authorities but were largely paid for by those authorities. They were entitled to take private patients as well as those paid for by the public authorities.

17.2 Before setting up mother and baby homes in Ireland, the congregation ran many institutions in England and Scotland where they undertook welfare work relating to the care of ‘orphans, mentally deficient children and unmarried mothers and their children’ and were regarded as ‘specialists in their work’.¹ They ran St Pelagia’s Home, Highgate, London, which according to the Cork Examiner was ‘world famous’ and since its establishment in the 1880s had ‘been the means of saving many thousands of girls from lives too terrible to contemplate’. The Cork Examiner article continued:

The Home was the first in the world to conceive the idea that the one road which could possibly lead to the permanent good of the mother and child was that both should be together, that the unfortunate mother should not desert her child, but that her love for the child should be fostered and encouraged and help given to her to provide for and bring the child up under a mother’s care. The result of the experiment has surprised the most experienced welfare workers and today the scheme is being adopted generally.²

Sacred Hearts’ attitude in 1922

17.3 In June 1922, the Mother General of the Congregation of the Sacred Hearts of Jesus and Mary wrote to Reverend M H MacInerny regarding an article relating to ‘Rescue Homes’, or lack thereof, for single expectant women in Ireland which Reverend MacInerny had published in the Irish Ecclesiastical Record. The mother general informed him that her congregation was about to open a home for

¹ Cork Examiner, 14 March 1922.
² Cork Examiner, 14 March 1922.
unmarried expectant women and their children in Cork which would be operated in a similar manner to homes in England, Scotland and Wales. She stated:

Mother and child are received into the Rescue Home for one year. The greater numbers, at their own request, remain two, three, or four years, as the case may require…In the great majority of Irish cases, it would seem neither necessary nor desirable to detain girls in the Rescue Home for a year or two after their confinement…of course, they ought to be detained until their child’s life is out of danger…Before their confinement they may need to spend two or three months in the Home, to escape observation and scandal…The sooner a girl can leave the Rescue Home, and return to her proper abode with health restored, the better chance she has of saving her reputation.³

17.4 The mother general stated that, in her experience, ‘girls in trouble’ were ‘filled with a wild terror lest their sin should be detected and talked about’ and would go anywhere ‘to hide their shame, and to prevent their misfortune from becoming known to their relatives and neighbours’. She observed that a feeling of ‘anguish and shame’ caused by the betrayal of ‘some worthless rascal’ is made worse by the overwhelming thought that she had brought disgrace on her family. The mother general stated that the women her congregation dealt with were ‘more sinned against that sinning’ and:

To speak of these unfortunate girls in trouble, even the relapsing ones, as if they were confirmed in evil, is to be guilty of rather wild nonsense…Those who talk so lightly of the need for compelling these girls in trouble ‘to realise the heinousness of their sin’ can have little insight into the psychology of the unhappy victims.⁴

Governance

17.5 All three institutions were under the immediate control of the Congregation of the Sacred Hearts of Jesus and Mary. The local health authorities and the Department of Local Government and Public Health (DLGPH) (the Department of Health from 1947) had significant involvement but their roles were never clearly delineated. The interaction between the local and national authorities and the congregation is described in the separate chapters. The congregation has told the Commission

⁴ Reverend M.H. MacInerny, *Irish Ecclesiastical Record*, June 1922.
that it considers that the local and national authorities had a much greater involvement and influence than is recognised by the Commission.

17.6 Unlike workhouses and county homes, there were no specific regulations governing the extern mother and baby homes. Their maternity hospital sections were required to be registered under the Registration of Maternity Homes Act 1934 and their licences could have been revoked if they were in breach of the registration requirements - see Chapter 1 for details.

The Commission’s dealings with the Congregation of the Sacred Hearts of Jesus and Mary

17.7 The Commission received very few records from the Congregation of the Sacred Hearts of Jesus and Mary. The following is a description of the interactions between the Commission and the congregation in its attempts to get more information about the three institutions.

17.8 On 4 March 2015, the Commission first made contact with the Congregation of the Sacred Hearts of Jesus and Mary by writing to Sister Eileen McLoughlin at the congregation’s mother house in Chigwell near London asking what documentation was held by the congregation relevant to the investigation. The Commission advised that in due course it would seek voluntary discovery of documents as required under the Commissions of Investigations Act 2004. The letter also advised that the Commission would be pleased to accept a written statement from the congregation should they wish to provide same. Sister Eileen replied on 12 March 2015 to say that all documents relating to the three institutions had been handed over to the HSE. The letter also stated that she had asked that a further search be carried out in the congregation’s archives in the mother house in Chigwell for any other material which could be of assistance.

17.9 By agreement with the congregation, a member of the Commission and two staff visited Bessborough and Sean Ross on 19 and 20 March 2015 and were shown around by members of the congregation (who still had a presence in these two premises). The Commission had planned to visit the third premises (Castlepollard) the following month, but was told that, as the congregation had not had any dealings with Castlepollard in over 40 years, it would not be of any benefit for any member of the congregation to accompany them on that date. (Later, the three
Commissioners visited Castlepollard and were shown around by staff of the HSE which currently owns the premises.)

17.10 On 22 May 2015, the Commission requested that two members of the congregation (Sister Sarto and Sister Brigid) attend for hearing on 22 June 2015. The congregation’s solicitor replied on 8 June 2015 stating that Sister Sarto would not be able to attend due to ill health but would submit a written statement. He further said that the congregation here (presumably in Ireland) did not hold any relevant documentation. The letter added that the congregation would be submitting a formal submission before the year end (2015). On 17 July 2015, the Commission wrote stating that it required the congregation’s formal submission be delivered by 30 September 2015. It requested that a sworn affidavit by Sister Sarto and other Sisters with information should be delivered by the same date, 30 September 2015, and set out in detail the issues which should be covered in these affidavits. The issues were:

- Management structure of the Home
- Finance
- Daily routine in the Home
- Rules
- Birthing process
- Length of stay
- Counselling
- Outside agencies
- Burial arrangements

17.11 The Commission also asked what documents were uncovered by the congregation’s search in their archives in Chigwell. In accordance with Section 10 of the Commissions of Investigations Act 2004, the Commission sought formal discovery by way of affidavit on or before 30 September 2015 of all documentation held by the congregation either in Ireland or outside the jurisdiction. The congregation’s solicitor replied saying that his clients would be unable to supply a formal submission by 30 September dealing with over 70 years of engagement in relation to three mother and baby homes and suggested that the original timeframe of end of year stand. He also said that Sister Sarto’s health would not allow her to prepare an affidavit. He further stated that his clients could not address the issues raised in the Commission’s letter of 17 July without access to the documents now
held by the Child and Family Agency (TUSLA) and that sometime in the New Year would be a more appropriate time within which to deliver the affidavits.

17.12 On 27 August, the Commission responded that the time frame for delivery of the submission of 30 September 2015 stood. The requirement that the affidavit of discovery and the affidavits of Sister Sarto and others be delivered by 30 September 2015 also stood. The Commission offered to have one of its archivists attend at the congregation’s premises at Chigwell to assist in the discovery process.

17.13 A formal hearing was held on 15 September 2015. Sister Eileen McLoughlin attended. (Sister Eileen had not ever worked in any of the three institutions) At the hearing it was agreed that statements from two Sisters who had worked in at least one of the homes and an affidavit of discovery would be delivered by 30 September 2015. The length of time within which to deliver a submission was extended until 30 October 2015 as well as the time for delivery of affidavits based on the statements of the two Sisters and others.

17.14 On 29 September 2015, a preliminary submission on behalf of the congregation and an Affidavit of Discovery sworn by Sister Eileen McLoughlin were delivered. The discovery documentation included statements of 17 Sisters each of whom had worked in one or more of the three mother and baby homes. It also included approximately 300 pages of a range of miscellaneous material, for example, letters in relation to tracing; some lists of residents in 1990; some referral letters from the early 1970s (mainly from health boards); and a detailed set of documents on one American adoption in 1952 including the reports on the proposed adopters.

17.15 On 23 October 2015, an unpublished *History of Bessboro* written by Dr Ann Matthews was delivered to the Commission.

17.16 On 4 February 2016, a direction to attend for hearing was issued to Sister Sarto and she attended for hearing on 23 February 2016. She also provided an extensive affidavit dealing with her experiences in Bessborough. A similar direction was issued on 22 April 2016 to Sister Mary McManus and she attended for hearing on 11 November 2016 and provided an affidavit of her experiences in Bessborough and in Castlepollard. On 26 May 2016, directions were issued to two
Sisters who had each worked in Bessborough and they attended for hearing on 15 November 2016.

17.17 On 26 October 2016, the Commission issued a direction seeking discovery of audited accounts and bank statements for the three institutions, as this issue had not been addressed in the affidavits provided by the congregation. Further enquiries were made about the search for documents at the congregation’s headquarters in Chigwell. On 24 November, a reminder was issued regarding the affidavit relating to the archive search for documents at Chigwell.

17.18 On 16 December 2016, an Affidavit of Discovery sworn by Sister Eileen McLoughlin in relation to audited accounts and bank statements for the three homes was delivered. This stated that the congregation did not have these records.

17.19 On 25 April 2017, the Commission issued a direction for discovery of the documentation returned by the Commission to Inquire into Child Abuse (Ryan Commission) relating to vaccine trials. This documentation was delivered along with an Affidavit of Discovery on 23 May 2017.

17.20 On 30 May 2017, the Commission issued a direction that the congregation provide an affidavit setting out all knowledge of post mortem practices including the reporting of deaths, burial arrangements and transfers of remains to educational institutions in relation to all three institutions. On 28 June, an affidavit of Sister Eileen McLoughlin was delivered exhibiting a document written by Dr Ann Matthews entitled *In Context, The Political Agenda for unwed mothers, Mother and Baby Homes in Ireland 1922 to 1953*. On 6 June, the Commission extended the time in which to deliver an affidavit dealing specifically with the reporting of deaths and burial arrangements until 25 July 2017 and this was further extended until 25 August 2017. On 31 August 2017, the congregation provided a further document by Dr Ann Matthews dealing with paragraph 1(iv) of the Commission’s Terms of Reference regarding post mortem practices and procedures. On 17 November 2017, the commission issued a direction in relation to title documents and conveyancing files for Bessborough House.

17.21 On 6 June 2018, the Commission sought details of banks and firms of accountants used by the congregation as the congregation was unable to provide any
information regarding audited accounts or bank statements. This information was provided on 26 June 2018. On 29 June 2018, in response to the Commission's direction, title documents and conveyancing files relating to Bessborough House were provided. On 5 September 2018, the Commission requested that the report of Dr Ann Matthews furnished on 31 August 2017 be provided by way of sworn affidavit and this was provided on 31 October 2018. (In its 5th Interim Report, the Commission described this affidavit as 'in many respects, speculative, inaccurate and misleading'.) On 12 November, the Commission issued a direction to Dr Ann Matthews to attend for hearing and she attended for hearing on 23 November 2018 along with Sister Eileen McLoughlin.

17.22 On 27 March 2019, the Commission wrote to the solicitors for the congregation seeking:

- An update on efforts to uncover financial documentation in Chigwell;
- That the congregation make enquiries of their accountancy firms and banks so as to establish what information they held;
- The congregation's comments on anecdotal evidence that private patients in the three homes paid the sum of £100 for their stay.

17.23 On 4 April 2019, the solicitor responded that the accountancy firms held no correspondence and enclosed copy letters to this effect.

17.24 On 27 May 2019, the Commission wrote to the solicitors citing various documentation referenced by Dr Ann Matthews in her reports which had not been made available to the Commission. The Commission advised that one of the Commissioners, Professor Mary Daly accompanied by a researcher, would attend the congregation's archives in Chigwell to review the records held there. With the agreement of the congregation, Commissioner Daly and the researcher attended at the archives in Chigwell on 6 and 7 August 2019. Access was given to the Congregation of the Sacred Hearts of Jesus and Mary Council Minutes, 1904-37 and the Annals of the Order (Diaries of the Mother General) 1919-99. On 22 August, the Commission asked for copies of documents which had been viewed by Professor Daly in the archives and they were provided.

17.25 On 18 September 2019, the congregation submitted an affidavit of Sister Eileen McLoughlin exhibiting a report by Dr Ann Matthews entitled *Submissions: 1922–1976 Funding the Maternity Hospitals and Mother and Baby unit at Bessboro,*
Cork, St Peters, Castlepollard and Sean Ross, Roscrea. A further affidavit of Sister Eileen McLoughlin was submitted exhibiting a report of Dr Ann Matthews entitled *Entrance and Exit pathways to the three external homes 1922-996*. On 12 November 2019, the congregation submitted an affidavit of Sister Eileen McLoughlin exhibiting a report of Dr Aoife Bhreathnach entitled *Report on Burial Practices at Bessboro Mother and Baby Home 1922-1994*. None of these reports added to the facts already available to the Commission as they were all based on sources which had already been collected and examined by the Commission’s researchers.

17.26 In line with normal procedures, the Commission provided the congregation with drafts of its reports on the three institutions in the period December 2019 – February 2020. In August 2020 the congregation provided an affidavit with a response to the Commission’s report on Bessborough. This did not contain any information which was not already available to the Commission.
Chapter 18: Bessborough

Introduction

18.1 Bessborough mother and baby home was opened in 1922. It was a mother and baby home for the entire duration of the Commission’s remit: 1922-98. During that time, 9,768 mothers and 8,938 children were admitted.\(^1\) It was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. The public assistance/health authorities paid for most of the mothers and their children while they were living in Bessborough but a significant number were ‘private’ patients.

Sources

18.2 The following is a summary of the main sources used for this chapter. A complete list is included in Part 5: Archives.

Institutional records

18.3 Bessborough institutional records are held by the Child and Family Agency (Tusla). As already reported, the Commission made digital copies of these records.

18.4 When a woman entered Bessborough, her personal details and information about her financial situation were recorded in broadly the same way as was done in hospitals and county homes (and, formerly, in workhouses). From 1922 to 1930, the details were handwritten in a type of ledger or copybook. A purpose-designed register was introduced in 1930. The level of detail recorded for each new resident varied somewhat from one person to another and also over time. In general, the following details were recorded: woman’s name, age, address, occupation (sometimes noting the rate of pay), by whom referred, and health district. In some cases, the putative father is named.\(^2\) In the 1920s, the civil war affiliation of the mother’s family and that of the putative father were sometimes recorded. The woman’s education level and the names of her parents were also sometimes recorded. The baby’s name and date of birth were also recorded. The date of discharge of the baby and the mother and the place to which they were discharged were also generally recorded. The stated place of discharge may not be where the woman and child actually went. For example, the baby may be described as

---

\(^1\) A number of women (about 170) are recorded in the Bessborough registers but are not within the Commission’s Terms of Reference because they were not pregnant, or they were married or did not stay for one night.

\(^2\) There is anecdotal, and some limited documentary, evidence that the name given may not be accurate.
‘placed for adoption’ and may subsequently be described as ‘adopted’ or it may be that the adoption placement did not work out and what happened to the baby is not recorded in these records. Sometimes the mother and baby are described as being discharged to family but there is evidence that, in many such cases, the mother may have returned to her family but the child was boarded out, nurses out or, in later years, placed for adoption.

18.5 On admission to Bessborough women were assigned a ‘House Name’ and this is recorded in the registers. The theory behind this practice was that it was necessary to preserve the anonymity of the women.

18.6 Admissions and discharges from the Sacred Heart Hospital, Bessborough (see below) and the Bessborough home were separately recorded. Personal details relating to women who spent time in both the Sacred Heart hospital and the Bessborough home are recorded in the registers of both the hospital section and the home section of the institution. The records of women who spent time in both sections therefore show two discharge dates. It has been suggested that this was a means for the congregation to falsely claim maintenance payments from the public assistance authorities for women who had already left the institution. Where two discharge dates were recorded, the first related to a woman’s discharge from the hospital and the second related to her discharge from the home, which was generally the final date of discharge.

18.7 The institutional records include:

- Bessborough home Admission Books
- Bessborough Maternity Hospital Admission Books and Maternity Books
- Registration of Births, Bessborough Maternity Hospital
- Records and Particulars Book, Bessborough Maternity Hospital
- Private Patients Admission Book
- Maternity Hospital ante-natal records
- Death Register

Other records held by the Child and Family Agency (TUSLA)

18.8 *Records of the Sacred Heart Adoption Society:* these include adoption application files; adoption placement files; adoption orders files; minutes of the
adoption society; foreign applications files and foreign adoption files. The combined records span the years 1936-98.

18.9 **Records of the Catholic Women’s Aid Society (CWAS):** these include records of payments to foster parents books for the years 1920-45; index of babies placed for fostering and adoption for the years 1937-71; and a small number of miscellaneous documents relating to the society.

18.10 **Records of St Anne’s Adoption Society:** Registers are available for the years 1954-99. The registers recorded details of women who were repatriated from the UK to have their babies adopted in Ireland.

**Bessborough Baptismal Registers**

18.11 A complete set of baptismal registers relating to Bessborough for the period December 1930 to January 2010 are held at the Cathedral of St Mary and St Anne (North Cathedral), Cork. The registers recorded a wealth of information including a child’s name, date of birth, date of baptism, mother’s name and address, name of the priest and godparent (usually one of the other mothers in Bessborough), date of discharge and discharge pathway and details of any subsequent marriage. The registers also noted if a child had died and the date of death. Interestingly, the registers also recorded the Board of Assistance responsible for the child’s maintenance in Bessborough and private patients were designated by the letter ‘P’. This information facilitated the Commission’s efforts to establish the number of private patients admitted to Bessborough from 1930 to the late 1940s.

**Cork Local Authority Records – Cork City and County Archive**

18.12 Records relating to the Cork local authorities (the Boards of Guardians, South Cork Board of Health and Public Assistance/Cork Health Authority/Southern Health Board) include:

- Registers of boarded out children 1925-73;
- Cork Board of Assistance payment records for boarded out children 1959-72;
- Registers of children at nurse 1912-65;
- Health authority adoption registers 1935-99;
- Minutes of meetings
- Managers orders
18.13 Cork City and County Archive also held 150 boxes of uncatalogued public health records. A perusal of one box revealed correspondence relating to infant mortality in Bessborough. The Commission sent an archivist to the Cork archives for several months to catalogue this collection for analysis.

**Department of Health records**

18.14 The Department of Health provided a large amount of material to the Commission. There were very few files available from the 1920s and 1930s but there was extensive material from the 1940s onwards. The main files used for this chapter were:

- CCL/INA/0/485547
- CCP/IMP/0/45492
- CCL/INA/0/488268
- INACT/INA/0/426512
- INACT/INA/0/464099
- NAI, A104/2

**Other sources**

18.15 Official publications, newspaper reports and other sources are referenced in the text.

**Origins**

18.16 The Congregation of the Sacred Hearts of Jesus and Mary had been invited to set up a mother and baby home in Cork by Séamus Lankford, who was in charge of the Cork Board of Guardians. In 1921, the matron of the Cork workhouse had made an urgent appeal to the Board of Guardians to provide alternative accommodation for unmarried women and their children in a setting other than the workhouse. Mr Lankford travelled to London to visit a number of relevant services. He was introduced to the Congregation of the Sacred Hearts of Jesus and Mary. After some discussions, the congregation agreed to establish a mother and baby home in Cork. The Archbishop of Westminster agreed to provide financial assistance. It is clear that Bishop Cohalan of Cork approved the establishment of the home and took considerable interest in it, but it is not clear how much involvement he had in the initial decision to establish it. In his 1945 letter (see below) Bishop Cohalan referred to dealings he had had about the establishment of Bessborough with the Department of Local Government and others.
18.17 Mr Lankford identified Bessborough House, a large Georgian house with 210 acres, as being suitable. It was outside the eastern boundary of Cork city and was for sale with ‘a very low reserve’. The council of the congregation agreed to buy it for £6,000.³ Mr Lankford put a deposit of £400 on the property and, according to a congregation member many years later, the rest of the purchase price was provided by the Archbishop of Westminster.⁴ When the vendors discovered that Bessborough was to become a home for unmarried mothers they sought to withdraw from the sale, and offered Mr Lankford £2,000 to withdraw his bid.⁵ He refused and the sale went ahead. On 1 February 1922 the congregation took possession of the Bessborough estate. The Commission has not been able to find any formal written agreement between the congregation and the Cork Board of Guardians but there almost certainly was such an agreement.

**Governance**

18.18 Bessborough was one of the first ‘special’ institutions for unmarried mothers and their children. As already stated, it was owned and run by the congregation but was largely paid for by the public assistance/health authorities. Unlike workhouses and county homes, there were no specific laws or regulations applying to it. The respective responsibilities of the public assistance authorities, the Department of Local Government and Public Health (DLGPH) and the congregation do not seem to have been clearly delineated; this lack of clarity was particularly obvious when attempts were being made to address the very high rate of infant mortality in the 1940s. The congregation has told the Commission that the local and national health authorities had a greater role in the governance of Bessborough than is recognised by the Commission. The Bishop of Cork was involved in many decisions, particularly in the early years, although he had no defined role in the institution.

---

³ Congregation of the Sacred Hearts of Jesus and Mary, Council minutes, 10 February 1922. The congregation’s September 2019 affidavit states that the purchase price was £9,000 of which the diocese of Westminster contributed £2,000. No source was provided for this.

The 1920s

Admission to Bessborough

18.19 In July 1922, Cork county council\(^6\) notified all boards of guardians in Cork city and county that ‘the mansion at Bessborough, Blackrock, has been recently purchased by a religious order having large experience of rescue work and child welfare’ and advised:

This community will direct their attention towards the reformation of unmarried mothers and their children, and for deserted and orphaned children, but no girls who had a second child will be accepted under any circumstances.

18.20 In the following months the various Cork boards of guardians agreed to recognise Bessborough as an extern institution for the care of unmarried mothers of one child, and children up to three years, and agreed to transfer all such cases from the various union workhouses to Bessborough. Séamus Lankford supervised the installation of equipment necessary for Bessborough’s new function and in November 1922 the first women and children arrived from the Mallow, Kanturk, Millstreet, Macroom and Cork union workhouses.\(^7\)

18.21 A letter from the Mother Superior of Bessborough to the Bandon Board of Guardians set out the conditions under which Bessborough would admit an unmarried mother and her two-year-old child who were living in the Bandon union workhouse:

She will produce a doctor’s certificate of health, mental and physical, is willing to remain for twelve months and conforms to the simple rules of our institution. She will be taught knitting, needlework, housework, dairy, and poultry, gardening and necessary laundry for both, also how to care for and treat her child. We hope the Guardians are willing to pay 25/- per week for maintenance of both.

18.22 In this particular case, the woman involved chose not to accept a transfer to Bessborough and subsequently took her discharge from the Bandon workhouse. The indoor registers of the Cork union workhouse show that, of the 76 unmarried

--

\(^6\) In February 1922, Cork County Council had met to discuss the abolition of workhouses and the institutional treatment of unmarried women and their children and deserted and orphan children. The council decided to set up a County Nursery in one of the disused workhouses to accommodate children from infancy to three years and unmarried mothers of ‘first fall’ and their infants. This plan was never implemented because of the opening of Bessborough as a mother and baby home.

\(^7\) Lankford, *The hope and the sadness*,

6

2
mothers living in the workhouse during 1922, just 11 opted to, or were eligible for, transfer to Bessborough.

18.23 Local Government Board inspectors (see Chapter 1) informed boards of health/public assistance\(^8\) of the services provided at Bessborough and urged them to transfer ‘first unmarried mothers’ there rather than maintaining them in county homes. On her inspection visits to various local authorities, one inspector, Miss FitzGerald-Kenney, told councillors that the congregation looked after women and discharged them to paid employment, giving them an opportunity to contribute towards the cost of maintenance of their children.\(^9\)

18.24 Many councillors expressed their opposition to the capitation rate levied by the Bessborough authorities. Many more resented the fact that boards of assistance were obliged to maintain unmarried mothers and their children at all. One councillor said:

Some people may be surprised to learn that the charge is a guinea\(^10\) per head per week for those unmarried mothers. How few decent parents can afford that much on a boarding school for their children?\(^11\)

18.25 The *County Scheme Order, Cork No 1, 1924* gave legal backing to the new arrangements for implementing the poor law in Cork.\(^12\) It provided for the replacement of the various boards of guardians by three boards of health/public assistance - the North Cork county board of health, the South Cork county board of public assistance and the West Cork county board of health. The South Cork board of public assistance was given responsibility for the Cork county home, the Cork district hospital and for Bessborough. The county scheme provided that the Cork county home was to be for ‘aged and infirm persons, chronic invalids, idiots and epileptics’. The attached district hospital would treat medical, surgical and maternity cases and those suffering infectious and contagious diseases. It was envisaged that single expectant women would be admitted to Cork county home to

---

\(^8\) Changes to the poor law saw boards of guardians reconstituted as boards of health/public assistance – see Chapter 1.  
\(^9\) *Cork Examiner*, 17 December 1926.  
\(^10\) A guinea was £1 1s (£1.05 in decimal currency); while guinea coins have not been in circulation for nearly 200 years, bills, especially those for professional fees, were commonly expressed in guineas until recent times.  
\(^11\) *Cork Examiner*, 1 December 1925.  
avail of maternity services only and then transfer to what the county scheme described as the ‘auxiliary home’ at Bessborough with their babies.

18.26 The county scheme directed that admissions to homes and other institutions not under the direct control of a county board (that is, extern institutions such as Bessborough), must be authorised by the board or one of its agents. Single expectant women, and unmarried women accompanied by their children, who sought admission to Bessborough under the public assistance system were, in the first instance, required to get a ticket of admission from a board of assistance officer, a dispensary medical officer or the matron of the Cork county home and district hospital. Administrators at Bessborough forwarded admission tickets to the secretary of the South Cork board of public assistance. In order to maintain anonymity, requests for admission to Bessborough were dealt with by the board’s secretary alone; they were not discussed openly by the board. When a request for admission was granted, the secretary issued an official order to the Bessborough authorities accepting financial responsibility for the maintenance of the woman and her child. The South Cork board agreed to pay the congregation a weekly rate of 10s 6d for each resident (£1. 1s for mother and child). Boards of assistance did not approve the admission of women to Bessborough routinely. For instance, a manager’s order from the North Cork board stated:

The admission of case No.11 (a) to above Institution at the Council’s expense is refused. The patient was not admitted in the proper manner and her guardians would appear to be in a position to pay for her treatment.

18.27 From the mid-1920’s, welfare departments in the UK began to contact Bessborough with a view to repatriating Irish women - see Chapter 7.

Leaving Bessborough

18.28 In the early years of Bessborough’s operation there was some confusion among members of the South Cork board of public assistance and Cork corporation regarding aspects of the running of the home including the right of women to leave the home. For example, in 1924 two women left Bessborough and sought admission to Cork county home. The board’s solicitor advised that the women should be subject to ‘the disciplinary rules as they applied to the workhouse’ and

---

13 The use of the term ‘auxiliary home’ suggests that Bessborough was being regarded as an integral part of the poor law provisions. It was not an auxiliary home in the sense that Pelletstown was. The 1927 Report recognised that it was not under the control of the Board of Public Assistance.

prosecuted ‘for disobeying the rules’. The chairman of the South Cork board and the Lord Mayor agreed that both women should be prosecuted. The solicitor told the board that infants born to both women had died in Bessborough and that is why they left. The solicitor said ‘these women may not like to remain where their babies had died’. The board voted to reverse their decision to prosecute the women. In fact, the workhouse rules did not apply to Bessborough and women living there were legally free to leave. Women living in Bessborough were almost certainly not aware that this was so and, even if they were, many may not have had anywhere else to go. They were not, of course, necessarily entitled to admission to the county home. They were legally obliged to maintain their children but it is unlikely that they could have been successfully prosecuted for abandonment if they left their children in Bessborough - see Chapter 1.

18.29 Sometimes, family members applied to the board of assistance to have their daughter ‘returned’ to them. When this happened, the board asked for a medical report from the Bessborough medical officer as to the fitness of the woman for discharge. The board also asked for a report from the local Assistance Officer on living conditions in the family home. Applications generally included a reference from a parish priest to state that the family would look after the woman on her return to the family home. The major problem with these applications for the ‘return’ of a daughter was that the families were willing to have her return to the family home but were not willing to take her child as well. Board of assistance records include hundreds of applications to the South Cork board from family members wishing to take responsibility for women living in Bessborough. However, the majority of applications stated that they had made private arrangements to have the children fostered. The applications generally included a character reference for the prospective foster parents from a parish priest. All such discharges, and fostering arrangements, were allowed to proceed at the discretion of the board.

**Department of Local Government and Public Health view**

18.30 The *First Report* of the Department of Local Government and Public Health (DLGPH) 1922-25 gave ‘special mention’ to the Congregation of the Sacred Hearts of Jesus and Mary and their efforts to deal with the ‘very difficult problem of the unmarried mother’. It stated that the congregation had established at Cork city:

---

15 *Cork Examiner*, 24 December 1924.
a Home for the reception and reformation of girls who for the first time have had illegitimate offspring, or as they are usually designated - first offenders. The Sisters believe they can influence these cases best by keeping them disassociated from those who have lapsed a second time or oftener.

18.31 It went on to state that the ‘girls’ were usually ‘retained’ for about a year and trained for ‘useful occupations’: housework, cooking, needlework, laundry work, dairy management, poultry rearing, gardening and farming, and that ‘their religious and moral instruction receives special attention from the Sisters and Chaplain’. It was stated that at the ‘end of the period of detention’ the women were placed in situations and that most took their infants with them on leaving. The DLGPH concluded that ‘the results are most gratifying; with two or three exceptions all the discharged have done very well’.

Report of the Commission on the Relief of the Sick and Destitute Poor

18.32 On the 26th day of evidence, 9 February 1926, the Commission on the Relief of the Sick and Destitute Poor discussed the arrangements for unmarried mothers in Cork.

18.33 The secretary of the South Cork board of public assistance gave evidence that there were 21 unmarried mothers and 55 deserted and ‘illegitimate’ nursery children in the Cork county home (Cork city) on 31 January 1926. These 21 were, in most cases, ‘second offenders’. The mothers in county homes were required to work in the hospital and to assist in the general cleaning of the institution.

18.34 He said that there were 53 unmarried mothers and 52 children in Bessborough. Only ‘first offenders’ were sent to Bessborough. The board of assistance considered that it had no direct control over the institution; it simply paid a capitation grant of 3s a day for each mother and child. He said that women stayed at least a year and the Sisters thought two years was desirable. When the mother was discharged she usually took the child with her; in some cases, she left the child in the institution and paid a contribution for its upkeep. Some of the mothers had agreed to pay 5s a week.\(^{16}\)

---

\(^{16}\) The Commission has not seen any other evidence that such agreements were made or implemented.
18.35 The secretary said that Bessborough was considered a thorough success; about 20 women had been discharged at this stage. The Sisters kept in touch with the women who were discharged. The Sisters trained the women in housework, cookery, needle work, laundry work and dairy management. When asked if there was any remunerative work, the secretary replied that the Sisters had a lot of land, they had a dairy and an orchard and they kept all the women employed. He could not say if the institution was run at a profit or a loss.

18.36 He said that the capitation fee was set when the institution was first started; prices were higher then. He pointed out that there were no establishment expenses and no staff paid by the board. When asked if there was an outside committee attached to the institution, he said ‘Well, the Bishop looks after the place very closely and takes a great interest in it.’ When asked about a visiting committee, the board of assistance secretary said that ‘there are some ladies who visit it’ but he did not know if they were a properly appointed committee; they were not appointed by his board.\(^\text{17}\)

18.37 There were 57 children ranging in age from three to 12 in school and 31 in the nursery in Fermoy County Home. The chair of the commission categorised the Fermoy institution as a home for unmarried mothers and their children.\(^\text{18}\)

**Bessborough and the South Cork Board of Public Assistance**

18.38 In 1927, the South Cork board of public assistance realised that increasing numbers of women from outside the Cork health districts were being admitted to Bessborough and that the cost of their maintenance was borne by the South Cork ratepayers. The South Cork board wrote to the boards of health/public assistance in other counties asking them to contribute towards the maintenance of women and children from their districts who were maintained in Bessborough. This was met with blunt refusals to pay any portion of the costs. The South Cork board decided to limit admissions to Bessborough to women from the Cork health districts (South, North and West Cork) and to direct women from other counties to Cork county home. However, many women from outside the Cork health districts

---

\(^{17}\) The Commission has not seen any evidence that there ever was a visiting committee.

\(^{18}\) Although Fermoy was often described as a ‘county home’, the *County Scheme Order* categorised Fermoy as a county hospital whose services included maternity services. The 1927 Report noted that part of the old Fermoy workhouse was occupied by unmarried mothers and their children ‘whose reception is not contemplated by the Scheme’. It further noted that this accommodation was entirely distinct form the hospital and that ‘if these classes are to remain it will be necessary to provide proper sanitary accommodation’.
established addresses in Cork city, usually in a boarding house, in order to secure an admission ticket to Bessborough. By 1930, 25% of admissions to Bessborough were women from outside the Cork health districts and efforts to recoup the cost of maintenance from boards in other counties were largely unsuccessful. The South Cork board asked the Minister for Local Government and Public Health to change the law so that the cost of maintaining women from outside the Cork health districts would either be a national charge, or a charge on a group of counties. Although nine counties subsequently accepted responsibility for the maintenance of women from their districts in Bessborough, disputes regarding the home county address of applicants were frequent.

**Maintenance and improvements**

In 1928, the Mother General of the congregation visited Bessborough. She noted that there were about 100 women and their children there. She found the women’s sleeping accommodation to be ‘unsatisfactory’ and consulted an architect to draw up plans for the improvement of the building. The congregation subsequently spent £5,000 undertaking repairs and renovations in a bid to improve the accommodation.

**Numbers in the 1920s**

The DLGPH reported that, by 1928, an average of 70 women and 64 children lived in Bessborough and the institution admitted about 25 new women a year. In 1929, women admitted to Bessborough were maintained by the South Cork, Kilkenny, Waterford, Tipperary (North Riding) and Kerry boards. The rate of maintenance remained at three shillings a day for each mother and child ‘but if the child dies there is no charge’. The DLGPH lamented that 70% of single women with first-born children continued to be maintained in poor law institutions, such as county homes, ‘where they cannot be dealt with apart from other inmates’ and stated that ‘it is now generally accepted that the number of unmarried mothers in County Homes should be diminished’ and that ‘encouraging results can be anticipated if special provision is made to help them’. Acknowledging that there was ‘a pressing need’ for institutions similar to Bessborough, the DLGPH stated:

By sympathetic help the mother, who is often friendless and inexperienced, can be protected from downgrading influences and enabled to regain her

21 A detailed breakdown of the numbers as calculated by the Commission is available in the Appendix.
footing in the world…The development of training Homes for mothers of first-born children, pre-natal and post-natal, would have splendid results in reducing the numbers that come into the second class. A decline might also be expected in the high death rate of illegitimate infants.

18.41 When it opened in 1922, Bessborough was an institution for unmarried mothers and ‘illegitimate’ and abandoned children. There were no maternity facilities on site. The records compiled within the institution and analysed by the Commission show that, between its opening in 1922 and 31 December 1929, 221 women and 218 children were admitted. Only one woman was admitted before the birth and she did not return after the birth. The majority of the babies concerned were born in Cork district hospital (county home); 13 were born in Thomastown county home and a small number were born in other places. Usually women were admitted within two to four weeks of the birth but a small number were admitted more than a year after the birth. The length of stay of the mothers who entered Bessborough in the 1920s varied from one day to 61 years; 40 were resident for up to one year, a further 51 were there for up to two years.

The 1930s

The Sacred Hearts Maternity Hospital, Bessborough

18.42 In 1924, the bishop of Cork had asked the congregation to consider admitting single expectant women, as well as women who had already given birth, to Bessborough. The minutes of the congregational council show that the congregation was reluctant to take in expectant women but agreed to do so ‘under certain circumstances’. The matter was then dropped until March 1928 when the bishop raised the question again and ‘almost insisted’ that the congregation would admit single expectant women. The congregational council acknowledged that other religious orders were engaged in providing maternity services and decided to adopt this work also.22

18.43 The South Cork board of public assistance proposal to maintain single expectant women in Bessborough was agreed by the Minister for Local Government and Public Health. The minister also agreed to the board’s proposal to pay £120 salary for a doctor to attend the births and £100 to employ a qualified midwife.

18.44 In 1930, the congregation opened a maternity ward in Bessborough. According to a Department of Health note compiled in the early 1950s, this was a separate building but was merely a ‘cottage’ which, when inspected in 1932, had 24 beds.\footnote{The Commission has not seen a report of this inspection.} The Mother Superior asked the South Cork board of assistance for a grant towards equipment for the maternity ward but this was refused. In November 1930, the South Cork board notified hospitals and health officials that all ‘first offender’ unmarried pregnant women, including women from outside the Cork health districts, were to be sent to Bessborough for their confinements.

18.45 In December 1931, the congregation applied to the DLGPH for a grant from the Hospitals Trust Fund to build a maternity hospital at Bessborough.\footnote{They made a similar application for Sean Ross – see Chapter 19.} The congregation argued that a more elaborate structure than the ‘cottage’ was required. The department agreed to provide a grant of £17,105.\footnote{Hospitals Commission First General Report 1933-34} The congregational council regarded the grant as ‘a gift’ and established that its acceptance would not impose any legal obligation on the congregation.\footnote{Congregation of the Sacred Hearts, Council minutes, 5 December 1931.} The DLGPH also gave £1,500 for equipment. The Sacred Heart maternity hospital opened in 1933 and was certified by the local authority under the Registration of Maternity Homes Act 1934 in 1934. It had three eight-bed wards and two private rooms.

Admissions, length of stay and infant mortality in the 1930s

18.46 The DLGPH acknowledged that the South Cork board processed applications for admission to Bessborough discreetly to ensure that ‘publicity is avoided’ and that women would maintain their anonymity. The matron, Sister Martina, advised the department that some ‘girls’ were ‘very weak willed’ and were maintained in Bessborough for long periods ‘to safeguard them against a second relapse’ and that women who were placed in situations ‘get on very well, and good reports are received from employers’.

18.47 In the period 1 January 1930 to 31 December 1939 institutional records show that 1,009 women were admitted.

18.48 In July 1931, Sister Martina notified the South Cork board that 12 women and their children had been living in the institution for extended periods, some as long as six
years. Sister Martina said that she was in a position to place the women in paid employment once their children were boarded out. The board advised that they would only maintain women and children in Bessborough for a period of two years, after which time the board instructed the matron to transfer them to Cork county home. In response, Sister Martina said that she considered that women living in Bessborough had a duty to rear their children and that it was important to the women to remain with their children until they reached school-going age. However, the South Cork board decided that they would not bear financial responsibility for women and children for longer than two years. The evidence suggests that women living in Bessborough for more than two years, who had no wish to transfer to Cork county home and who could make no alternative arrangements, remained in Bessborough as unpaid domestic servants until they were in a position to arrange for the future care of their children. The institutional records show that a small number of women remained in the institution for extended periods after their children had been boarded out and, in some cases, after their children had died. The Congregation of the Sacred Hearts of Jesus and Mary received no maintenance payment for such ‘old girls’ who appear to have remained in the institution as unpaid domestic servants in return for their upkeep. The congregation told the DLGPH that these women ‘have a great influence for good over the newcomers’.

18.49 The DLGPH report for the year ending March 1932 stated that 64 women were admitted to the Bessborough home and 79 were admitted to the maternity hospital. One hundred and three births, 89 discharges and 16 infant deaths were notified for this period. The department lamented that although ‘every facility was given to Boards of Public Assistance to induce suitable cases to seek shelter and attention at an early stage’, large numbers of women continued to present at Bessborough in the last stages of pregnancy. The report stated:

There is ample evidence that the girls who go to these Homes profit by the training they receive and that the Homes are carrying on useful and necessary work. The natural affection of the mother for the child is fostered and in this lies her greatest hope of safety in the future.

18.50 In the year ending March 1933, the DLGPH reported that 93 women were admitted to Bessborough. Sixty seven women were discharged during this period, 10 of whom took up employment in one of the congregation’s institutions in the UK; the remaining 57 women were either discharged to employment or returned to the
family home. Forty nine children were discharged from the institution and a further four died; in each case the cause of death was given as marasmus.

18.51 In the year ending March 1934, the DLGPH reported that:
- 92 women were admitted
- 108 were discharged; eight were placed in employment in one of the Congregation of the Sacred Hearts - run institutions in the UK;
- 34 found employment in Ireland; 29 returned to their family home with their children and 10 women married
- 30 infants died; marasmus and prematurity were the main causes of death.

18.52 The DLGPH commented:
Deaths of infants at these institutions are generally caused by an epidemic of some kind, measles, whopping cough, etc., which spreads quickly among the children and wipes out the weaklings. The nurseries are laid out to accommodate too many children and the provision for isolation is not adequate.

18.53 Bessborough had the highest infant mortality rate of the four mother and baby homes then in existence (Pelletstown, Tuam, Sean Ross and Bessborough). It is very clear from the reports of the DLGPH that it was fully aware of the very high rate of infant mortality in all mother and baby homes at least from 1933 but it seems to have accepted the deaths as inevitable:
Doubtless, the great proportion of deaths in these cases is due to congenital debility, congenital deformations and other ante-natal causes traceable to the conditions associated with the unfortunate lot of the unmarried mother.

18.54 The DLGPH reported that, in the year ending March 1935, 120 infants were born in or admitted to Bessborough and 39 infants had died. In the same period:
- 131 expectant women were admitted to the maternity hospital and an additional five women were admitted to the home accompanied by a child
- 64 women were discharged; 21 left with their child
- 40 infants and children were discharged; 22 were informally ‘adopted’ in the nursed out system, 16 were boarded out and 2 were placed with nurse mothers through a ‘Rescue Society’.²⁷

²⁷ This is likely to have been the Catholic Women’s Aid Society.
18.55 There was an expectation that a woman who left Bessborough to take up employment would contribute towards maintenance in cases where her child was boarded out. The DLGPH said that the ‘generally accepted principle’ was that a ‘working girl’ should be allowed to retain £10 annually for her own maintenance and to contribute the balance of her earnings towards the maintenance of her child. The department determined that, ‘on the whole’, the mother and baby home system had produced ‘satisfactory results’ and that ‘very few girls who have been in these homes have been admitted during the year to county homes pregnant for a second time’.

18.56 In her report for the year 1934-35, the DLGPH inspector of boarded out children, Miss FitzGerald-Kenney, praised the work carried out for unmarried mothers at Bessborough and other special homes.

I am convinced that these homes have done much to prevent infanticide. A girl tortured by her sense of shame will take almost any step to keep hidden from the public the knowledge of her fall. The fact she can turn to one of these homes in her predicament gives her a loophole of escape. It is undeniable that in these specialised homes the character of the inmates is developed, and the girls are given a new and truer outlook on life - an outlook of which they were previously heedless or entirely ignorant. Furthermore, the keeping of mother and child together in these homes has the effect of restraining girls who would be wild and careless if separated from their infants.

18.57 While Miss FitzGerald-Kenney had high praise for Bessborough she advocated training in domestic duties over agricultural work on the basis that domestic work would create more stable employment opportunities while agricultural employment she observed ‘leads more easily to further relapses’. She also recommended that skilled instructresses such as those employed in technical schools, should be employed to instruct residents of the home in ‘technical training’ to allow them to take up remunerative work on discharge. She considered that women should not remain in an institution such as Bessborough for more than two years because, if kept too long, ‘they become accustomed to silence and routine and find it difficult to readjust to ordinary life’.

18.58 In her Bessborough Annual Report, Sr. Martina told the DLGPH that:
The primary object of our institution is the rescue of unmarried women and children...A number of the girls are weak-willed and we are compelled to maintain them for longer periods (free of charge) so as to safeguard against a second relapse...in the case of a child death no charge is made for the mother...It is regrettable that there is one case aged 15 years; her brother is the father of her child. Three others are 16 years...Those placed in situations are getting on splendid, their frequent letters testify to their appreciation of the Home. Have had very good reports from their employers.

18.59 The DLGPH report for 1935-36 reported that, in the year ending March 1936,
- 109 expectant women, and six women accompanied by a child, were admitted to Bessborough;
- 25 infants died;
- There were 127 women and 79 children living there at the end of March 1936.

18.60 The DLGPH reported that, for the year ended 31 March 1937, there was a significant increase in the number of women and children living in Bessborough:
- 150 women and 122 children were living there at the end of March 1937;
- 110 women were admitted and 89 women were discharged during the year;
- 100 births were notified during this period and 22 infant deaths occurred.

18.61 The numbers in residence decreased after this but the infant mortality rate increased. The DLGPH reported that, in the year ending March 1939:
- 80 women were admitted to Bessborough and 120 women and 99 children were resident there in March 1939;
- 81 children were born or admitted during the year and 38 died in the same period.

**Leaving Bessborough**

18.62 Women who left Bessborough without their children, or without making arrangements for their care, could have been prosecuted for child abandonment (see Chapter 1). In September 1932, two women left Bessborough leaving their children who were then aged 18 months and 22 months, unaccompanied in the institution. The Gardaí were notified but did not locate the women. One woman
was subsequently brought back to Bessborough by her father and the other was never seen again. The Gardaí did not pursue women who ‘absconded’ from Bessborough with any great vigour as they seem to have considered that the children were in a safe environment and often a better environment than a woman’s family home. In 1938, the board’s solicitor adopted a more stringent approach to women who left their children in Bessborough. If the mother was located, proceedings were instituted by way of a summons under Section 12 of the *Children Act 1908*. The Commission has not seen any evidence of successful prosecutions.

**Putative Fathers and Affiliation Orders**

18.63 The *Illegitimate Children (Affiliation Orders) Act 1930* provided that unmarried fathers could be obliged to contribute towards the maintenance of their children if paternity could be established - see Chapter 1. In 1934, the Minister for Local Government and Public Health wrote to the South Cork board of public assistance to enquire why the board had not made use of the powers conferred on it by this Act. An audit of the South Cork board, undertaken by the DLGPH for the period April-September 1934, showed that the board had paid £4,600 to the Congregation of the Sacred Hearts of Jesus and Mary for the maintenance of women and children in Bessborough and the minister directed the board ‘to make every effort to recoup all, or part, of such expenditure’. In January 1936, the South Cork board began to forward details of every woman admitted to Bessborough to their solicitor with a view to taking proceedings under the Act. In March 1937, the board’s solicitor reported that he had interviewed a large number of mothers of ‘illegitimate’ children but could not secure corroborative evidence which would satisfy the court should proceedings against a putative father be taken. In 1938, a new firm of solicitors interviewed all new entrants to Bessborough and got sworn testimony identifying the fathers of their children. However, subsequent court proceedings were frequently dismissed, and where orders for payment were secured against putative fathers, the decisions were routinely reversed on appeal.

**Underage expectant girls**

18.64 In June 1935, the matron of Bessborough wrote to the South Cork board about a 15-year-old resident suggesting that ‘the child’s seducer should be punished’. It appears that the board had never previously considered such an action. Its solicitors advised that a criminal charge could be brought against the putative
father. The matter was reported to the Gardaí with a view to instituting criminal proceedings. A similar situation arose in October 1935 and, again, the matter was reported to the Gardaí. The Commission has not found any evidence that prosecutions ensued.

The 1940s

Inspections

As already stated, the Commission has not seen any copy of an agreement between the Congregation of the Sacred Hearts of Jesus and Mary and the Department of Local Government and Public Health (DLGPH) or the Cork board of guardians about the running of Bessborough home. It is highly likely that such an agreement was drawn up but it is not known if any such agreement gave the department and/or the board the right to inspect the institution. However, it is obvious that the DLGPH staff were not clear that they had such rights in respect of Bessborough home. The Registration of Maternity Homes Act 1934 provided for inspections of registered maternity homes by authorised local authority or departmental officials so there was no doubt about the right to inspect the Bessborough maternity hospital.

The first detailed inspection reports by departmental officials which the Commission has seen date from the early 1940s. Specific inspections of the maternity hospital were conducted by a departmental doctor or nurse. Inspections of the home and hospital were carried out by the department’s local government inspector. In the 1940s and 1950s, this was mainly Miss Alice Litster. The Commission has not been able to establish if these inspections were announced or not.

In 1941, Bishop Cohalan of Cork advised the congregation about dealing with inspections. He told the congregation that they were a religious community and not ‘a department of the Cork County Home and Hospital. You are not a Government Institution’. He accepted that government inspection had to be allowed but ‘this inspection must not encroach on your independence as a Religious Community’. He pointed out that the inspection of national schools and industrial schools did not extend to the domestic affairs and the domestic

28 It is clear that inspections were carried out earlier, but the reports do not seem to have survived; in particular, Miss Litster’s comments in 1941 show that she had carried out previous inspections.
expenditure of convents. ‘Why should an inspection of Bessboro’ extend to the 
receipts from your land or from charitable sources; or to the expenditure on 
yourselves, on the inmates, on the Chapel?’

18.68 It seems that the congregation had been asked to give the names of the women 
who were resident, their home address and their present address; this was for the 
purposes of the Children’s Acts, that is, in relation to children at nurse (see 
Chapter 1). The bishop’s response to this request was:

I am sure that no Government would knowingly make a demand that would be 
opposed to Canon Law. In the case of illegitimate births, the name of the 
mother cannot be inserted even in the baptismal register without her consent, 
unless the event be public. In all private cases, whether the mother is rich or 
poor, the illegitimate mother has a right to her name and fame; and the fact of 
the birth cannot be published without her consent. So you must not give 
particulars of name and address in cases where the illegitimate birth is not 
public.

18.69 The bishop went on to say that it might be necessary for him to take this up wit h 
government but the Sisters were not to do anything that was contrary to canon law; 
‘it would be a distinct violation of Canon Law and of natural justice to publish the 
fact of a secret illegitimate birth, with the mother or father’s name, without the 
permission of the mother and father.’

1941 inspection

18.70 The DLGPH report for 1940-41 recorded that, in the year ending 31 March 1941, 
87 infants were born in or admitted to Bessborough and 38 infant deaths were 
notified for the same period.

18.71 In June 1941, Dr Florence Dillon of the DLGPH inspected Bessborough maternity 
hospital. There was a standard format for such inspections but there was also 
scope for the inspector to add comments. In this instance, Dr Dillon added a 
‘Special Report’.

18.72 Her report was critical of a number of aspects of the running of the maternity 
hospital including:

• Although it was ‘a new and modern hospital’, it was overcrowded and 
understaffed. It was approved for the accommodation of 26 women but
there were 31 resident there at the time of the inspection. There were no ‘qualified nurses’ employed in the hospital but there were two registered midwives employed. There were no domestic staff employed and the congregation relied on the residents to undertake duties relating to the running of the hospital. Cleanliness was duly observed in all parts of the hospital and members of staff appeared to be ‘efficient and capable’. However, the inspector recommended that ‘further assistance should be made available’; specifically, one maid was required.

- The Sister in charge of the maternity hospital did not have the necessary qualifications for supervising maternity work; the person in charge should be a qualified midwife.
- There were three baths and five toilets; this would have been adequate were it not for the fact that two toilets had been converted into storerooms and the sink room was used to store mattresses.
- The Maternity Register had not been written up since 1939; as a result, Dr Dillon was unable to get information about miscarriages and deaths in the maternity hospital.
- No register of confinement was kept.
- She was unable to satisfy herself that provision had been made for firefighting as the Sister in charge did not afford her proper facilities for inspection.
- There was apparently a tendency to discourage breastfeeding which might have had a bearing on the high infant mortality rate.
- She was treated with discourtesy; the Sister in charge, Sister Kyran, was ‘discourteous and obstructive’ and there was a general unwillingness to facilitate her in carrying out the statutory inspection.

18.73 The DLGPH subsequently asked Miss Litster to comment on Dr Dillon’s report ‘as she knows a good deal about this matter’.

18.74 In October 1941, Miss Litster outlined her knowledge of Bessborough and her experiences there. She explained that there were two separate buildings - the home and the hospital.

29 A departmental note compiled in the 1950s records that the matron had told the department in 1934 that she needed to use single rooms as wards and needed to increase the numbers in the large wards.
30 Qualified midwives were not necessarily qualified general nurses.
The whole institution is pleasantly situated in well-matured grounds. There is a fair sized lake, good gardens and ample space for exercise and children’s games. The Home is run with a fair degree of efficiency. The general atmosphere, so far as the treatment of the girls is concerned, is one of kindness. That the girls appreciate this, and show an appreciation for the institution, is shown by the presence of some former patients who live in the Home unpaid, apparently quite content to help in the general work. The food appears to be plentiful and good. The children are well-cared for: properly clothed and well-fed. The girls are employed at farm and garden work, butter making, knitting, kitchen and household work generally. A reasonably good training in domestic work appears to be given. The Mother Superior informs me that there is no difficulty in finding employment for discharged patients.

18.75 Miss Litster confirmed that the home was overcrowded and pointed out that this was a feature of all ‘special institutions’ at that time. She said that there was ‘too little interaction’ between women and their children in the home.

18.76 She was more critical of the maternity hospital. She said that the matron appeared to be efficient in the actual management of the hospital but ‘it appears that there is not the same atmosphere of kindness here as in the Home’:

The Matron appears to be a ‘hard’ person and has been described by former patients as harsh, domineering and as ‘a slave driver’. An inspector, however, is unlikely to see any direct evidence of this side of her character. It must be remembered though, that while under her supervision, these girls are not in a normal condition of body or mind, and it is possible that a certain degree of apparent callousness may be an [illegible], even a necessary characteristic… It is difficult for an outsider to form any definite conclusions to her suitability to be Matron of the Maternity Hospital. Dr Dillon says that she has no nursing qualifications, other than experience. That fact alone seems to decide the point, and as there are qualified nurses in the Order, there should be no difficulty in replacing her by one of those.

18.77 Miss Litster noted that there was a problem of record keeping in both the home and the maternity hospital. She said that, in order to assess the number of residents in the institution on any given visit, she was forced to visit each ward and count the number of occupied beds. Furthermore, the annual returns submitted to
the DLGPH by Bessborough were frequently returned for correction and ‘the statistical record relating to the institution bore little resemblance to the facts’.

18.78 There were discussions going on within the DLGPH about the possibility of getting the congregation to replace the matron of the maternity hospital. Miss Litster recommended that the department might ask the Mother Superior of the Bessborough Home, Sister Martina, to place a qualified nurse in charge of the maternity hospital and then, if necessary, raise the matter directly with the Superior General of the congregation in Chigwell. Miss Litster had a letter from the Cork county medical officer of health, Dr Condy, outlining the matron’s qualifications and experience. Dr Condy said that the matron did not have a Central Midwives Board (CMB) certificate, or special experience in maternity work. She had 40 years’ experience in general hospitals, for example, in London and Australia. He said that there was a lay nurse who did have a CMB certificate. He had been informed that this lay nurse conducted the deliveries under the supervision of the institutional medical officer, Dr O’Connor. This qualified midwife had been in Bessborough for ten years and was the only qualified midwife there.

18.79 In January 1942, the DLGPH wrote to Bessborough outlining the concerns that had been raised by Dr Dillon. In reply, the Mother Superior said that, while the hospital was licenced for 26 patients, there was plenty of room to accommodate the extra five patients and that the former local government inspector had given her permission for the extra beds when pressure for hospital accommodation arose. She said that the maternity hospital had been supplied with a register ‘recommended by the Medical Officer of Health’ and that this was up to date at the time of inspection; the same applied to the register of confinements. Another register book had been provided but it was too complicated and was not being used. The Mother Superior excused the alleged discourtesy of the matron by saying that she was ‘far from her usual health at the time of inspection and that any discourtesy felt was not intended’. The Mother Superior strongly disagreed with the assertion that breastfeeding was discouraged and advised that patients were induced to breastfeed ‘even when they feel disinclined to do so’.

---

31 At this time, the Central Midwives Board was responsible for certifying that a person was a qualified midwife.
32 As described above, while the matron had told the DLGPH of her intentions, the Commission has not seen evidence that the department had agreed.
18.80 The DLGPH remained concerned that the control of the maternity hospital was not adequate. In February 1942, the department again wrote to the Mother Superior seeking to have a qualified maternity nurse, subject to the control of the matron of the institution in administrative matters, put in charge of the maternity hospital. The Mother Superior said she would report the complaint of discourtesy by the matron to the Mother General but made no commitment to replace the matron with a qualified nurse. The congregational records show that the Mother General was not happy with the matron’s performance and recognised that a ‘change may be demanded’. The DLGPH pressed the matter and was told by the Mother Superior of Bessborough that a member of the congregation who was a certified general nurse and was undertaking maternity training in the Cork county home and district hospital would be assigned to Bessborough maternity hospital in June of that year. In July, the DLGPH again wrote to find out if this had happened. It had not; the Sister in question had finished her training but had contracted flu and was unable to work. Miss Litster subsequently reported that this Sister had died. In October 1942, the Mother Superior reported to the department that another Sister was on her way from Chigwell to take up duty in the maternity hospital. However, on her next inspection visit to the institution (see below) Miss Litster noted that the maternity hospital continued to be administered by a matron with no nursing qualifications.

18.81 In June 1943, Miss Litster inspected both the home and the maternity hospital. At the time of the inspection, there were 61 women (36 with babies and 25 waiting to give birth) and 97 children living in the institution. Of the unaccompanied children, 26 were maintained by public assistance authorities, mainly Waterford and North Cork boards of assistance. The rest were ‘private motherless children’.

18.82 There were 18 former patients, still living in Bessborough, who were not maintained by a local authority. Nine of these were women whose children were either boarded out or placed at nurse and who were actively seeking paid employment. The remaining nine women were former patients not maintained by a local authority who undertook unpaid work for their keep in the institution and were

33 Congregation of the Sacred Hearts, Annals of the Order, 10 March 1942.
known as ‘old girls’. Miss Litster suggested that these women should be omitted from the annual statistical returns relating to unmarried mothers.

18.83 Miss Litster’s report provides a detailed description of Bessborough in 1943. The children’s accommodation in the home was as follows:

- A night nursery which was ‘clean, airy, bright with ample clothing on cots’ housed 15 toddlers and 22 babies;
- A day nursery and playroom with ‘ample bath and lavatory accommodation’, contained some cots for children taking a mid-day sleep. The day nursery housed 27 infants aged between three weeks and nine months; only eight of the 27 infants were breastfed and only three were ‘fully breast-fed’. The greater numbers of the babies were ‘miserable scraps of humanity, wizened, some emaciated and almost all had rash and sores all over their bodies, faces, hands and heads’. Their cots ‘were clean, and bed-clothing clean and good’.
- The infirmary housed 17 cots: four were occupied by babies covered with rash and sores and one other child with bronchitis. An attendant, who was a resident, stayed up all night to tend to the babies.
- The day nursery housed 33 toddlers and babies many of whom had sores on legs, faces, hands or scalps.

18.84 The condition of the infants and younger children in the institution gave her ‘cause for uneasiness’. In the year ending 31 March 1943, 114 children were admitted to Bessborough and 70 had died. All but one of the 70 deaths occurred in infants under one year old. Miss Litster identified the unsatisfactory milk supply to the home and the failure to breastfeed as the main causes of the high death rate and the unhealthy condition of the children. She said that the cows that supplied milk to Bessborough were not tuberculin tested and that the milk produced was not subject to the same standards governing the general milk supply. The number of infants who were wholly breastfed after leaving the maternity hospital was ‘negligible’. Miss Litster questioned if the failure to breastfeed was due to incapacity on the mothers’ part and if this might be related to an inadequacy in their diet. On the day of the inspection, which she noted was ‘a fast day’, the dinner served in the home consisted of potatoes, cabbage, cheese, tea, bread and
butter. Tea consisted of bread, butter, lettuce, scallions and tea. Breakfast was tea, bread and butter.\(^{34}\)

18.85 Miss Litster reported that the 30 older children living in the home were much healthier in appearance than the younger ones: ‘all were fairly strong and well-developed’. Although a number of children of school going age were living there, there was no provision for their education. She cautioned the Mother Superior that the retention of children aged six years and over in the home, without making provision for their education, contravened the *School Attendance Act 1926*.\(^{35}\) The Mother Superior said that the local authorities responsible for maintaining these children ‘were slow in obtaining foster homes for them’ and that children were routinely maintained in Bessborough ‘long beyond the age of two years’. Miss Litster observed:

> It was not intended that these institutions should be utilised as a nursery for children apart from their mothers. I have from time to time notified the different local authorities maintaining children in Bessborough that children must not be kept beyond the age of two years without their mothers.

18.86 Miss Litster recommended that the DLGPH issue a circular letter to county managers asking that an effort be made to withdraw children over the age of two years to suitable foster homes and stating that ‘sanction will not be continued for payments for maintenance of children over the age of two years’.

18.87 The women’s accommodation in the home was as follows:

- Dormitory 1 had 24 beds all of which were occupied; it was clean and airy; the beds were good; a nun slept at each end of the dormitory.
- Dormitory 2 had 12 beds but 16 occupants. The beds were good but there were no chairs between them and clothes had to be left on the beds.
- Dormitory 3 had 28 beds, all occupied; two nuns slept in cubicles at each end.
- The infirmary had four unoccupied beds.

18.88 Miss Litster inspected all six wards in the maternity hospital. Two wards were retained for private patients and there was one patient in each. An isolation ward was unoccupied. One ward with eight beds was fully occupied. There were seven

\(^{34}\) Fast days were days on which Catholics were expected to eat only one main meal and two collations.

babies, five of whom were being breastfed. The two remaining wards, reserved for expectant women only, were overcrowded. They were each designed to accommodate eight beds but had 14 beds and 13 beds respectively. All were occupied. On the day of inspection, dinner in the hospital consisted of potatoes, cabbage, egg (baked), stewed rhubarb and coffee.

18.89 Following her inspection, Miss Litster met the Cork county manager to discuss her findings and to request that the county medical officer of health, Dr Condy, would undertake an investigation into the condition of the children in Bessborough and the high death rate among infants there. Miss Litster submitted her report, along with a list of infant deaths during the year ending 31 March 1943, to the DLGPH and asked that the information be given to the deputy chief medical advisor, Dr Sterling Berry. The DLGPH sent extracts from Miss Litster’s report to the Mother Superior in Bessborough and asked for her observations and those of the medical attendant of the institution.

18.90 In August 1943, Dr Sterling Berry made the following observations on Miss Litster’s report:

This report discloses a very unsatisfactory state of affairs particularly with regard to infants under one year old. That 60% of these children die would seem to show that very little steps are taken to keep them alive; this is borne out by the fact that the babies still alive are covered with sores. That only three babies are fully breast-fed indicates that absolutely no trouble is taken to induce the mothers to breast-feed. Milk and gruel should be added to the nursing mothers’ diet. The over-crowding of the waiting patients in the Maternity Hospital is most undesirable and should be stopped. The Matron of the Maternity Hospital should be a trained nurse. The keeping of children in the institution until school going age is definitely wrong.

18.91 Dr Sterling Berry also voiced his concern that the capitation rates paid to Bessborough by local authorities ‘were too low with the prevailing prices’ and enquired whether Bessborough had a visiting medical officer. A note to the assistant secretary of the DLGPH said that Bessborough did have a medical officer but also noted that formerly the local authority contributed towards the salary of a medical officer and a nurse for the institution but that this arrangement had been discontinued in 1937.
18.92 In September 1943, the Cork county manager sent the DLGPH a report on infant mortality at Bessborough, undertaken initially by the assistant county medical officer and subsequently by Dr Condy. This reported:

I investigated this Home and figures obtained were: Deaths-68% (Sixty Eight) of the births. Diagnosis in most of these cases was debility; some were given as gastro enteritis and a small number as prematurity. Most of the deaths were from 2-3 weeks to 3 months. This is the period they leave the Maternity Hospital for the Home. The Sister in charge of this Home has no nursing qualifications and no hospital training in infants and children apart from two months in Temple Street Hospital, Dublin. This may or may not be the cause but I suggest that a qualified nurse and specially qualified in infant feeding should be appointed for 6-12 months. This figure could then be compared with the previous term.

18.93 Dr Condy said that he had visited the home, examined all books and registers and inspected the milk supply. He said that milk at the institution was produced and handled under high standards. He said that between March 1942 and July 1943, 32 infant deaths had occurred. He reported that approximately 80% of these deaths were certified as being due to debility and had occurred in the neo-natal period. He observed that this was the most dangerous stage of a child’s life and that the prevention of deaths in infants born in a state of debility or prematurity required skilled medical and nursing attention and that the matron had little success in inducing mothers to breast-feed. In addition, he said:

All births in the institution are of an illegitimate character, and there is frequently a lack of interest in the child’s welfare on the part of the mother concerned.

18.94 He concluded by recommending the provision of a nurse ‘possessing adequate training in Infant Welfare and Hygiene’ for the care of infants in the neo-natal stage and intimated that the matron and medical officer agreed with this suggestion. As Dr Sterling Berry noted, Dr Condy’s report simply corroborated Miss Litster’s. However, they did differ about the quality of the milk.

18.95 In September 1943, the Mother Superior, Sister Martina, responded to Miss Litster’s findings. She said that the rash and sores, as witnessed by Miss Litster,

---

36 This number is more likely to have been between March 1943 and July 1943.
CHAPTER 18 BESSBOROUGH

were contagion from a new admission and that ‘our doctors are very puzzled and do not understand the cause’. She stated that they were doing their best to induce mothers to breastfeed. She lamented that boards of public assistance found it difficult to find foster homes for children under war conditions. She advised that numbers in Bessborough had fallen dramatically since the inspection. She stated that pregnant and nursing mothers had ‘plenty of rest, copious fluids and a good nourishing diet’ but were inclined to be ‘fretful’ and have ‘no love for their infants’. She did not address the high levels of infant mortality. A note at the foot of this letter, from the secretary of the DLGPH, to the minister read:

The replies are not satisfactory. I would like a strong letter drafted. They must get the children out and they must have a Matron with a C.M.B.

18.96 The department wrote to Sister Martina to say that her replies were inadequate and that ‘the exceedingly high death rate in the institution and the very poor health of the children are very disquieting’. The department instructed her to furnish lists of children eligible for boarding out to local authorities responsible for their maintenance without delay and again requested an undertaking that a nurse with midwifery qualifications would be placed in charge of the maternity hospital.

18.97 In October 1943, the DLGPH wrote to county managers, whose boards of assistance maintained children in Bessborough (Cork (North, South and West), Kerry, Kildare, Kilkenny, Leitrim, Monaghan, Tipperary (North), Waterford and Westmeath) telling them that the Mother Superior would furnish them with a list of children eligible for boarding out and directing them to expedite arrangements to find suitable foster homes for each child. County managers were advised to inform the department of any delay in getting the list of children. In November 1943, the South Cork board agreed to implement the minister’s direction that children would not be maintained in Bessborough when they reach two years and would be boarded out as soon as suitable foster parents were secured. The DLGPH found that some boards were selective in their efforts to find foster parents for children maintained in Bessborough: little consideration was given to older children, or to children with a mental or physical disability. A later inspection by Miss Litster in December 1944 (see below), found that Waterford county council had not found foster homes for eight children, aged between four and eight years, maintained by them in the institution. Similarly, the North Cork board had not found foster homes for eleven children, aged between four and six years. Children maintained by
Kildare and Kilkenny county councils, and eligible for boarding out, also remained in the institution.

18.98 In November 1943, Dr Dillon again inspected the maternity hospital. On this occasion, the matron was a registered nurse and the maternity register and associated books were up to date. She considered that it was adequately staffed - there were two qualified nurses, one midwife and two wards maids employed. The available accommodation was limited to 26 beds, spread over three wards and two private rooms. The bathing and sanitary accommodation was ‘adequate’. There were 106 admissions, 24 infant deaths and three stillbirths recorded since the date of last inspection. There was no heating in the hospital at the time of her visit. It transpired that the institution’s wartime oil allowance meant that the heating system could be run only intermittently.

18.99 In December 1943, a firm of accountants replied to the DLGPH’s September 1943 letter on behalf of their clients, the Congregation of the Sacred Hearts of Jesus and Mary. The accountants’ letter confirmed that lists of children eligible for boarding out had been circulated to the relevant boards and that this had been done on many previous occasions but with little effect. They said that a qualified nurse, Sister Redempta, had become the matron of the maternity hospital in September 1942\(^{37}\) and that she was assisted by a qualified midwife. Another qualified midwife was about to take up duty and the congregation was prepared to hire another external midwife if the department thought it necessary to do so. The letter dealt with infant mortality as follows:

As to mortality, the Community regrets the high death rate and has taken every precaution in this respect. The Rev. Mother desires to point out that the children at one period suffered from an epidemic of scabies through infection, and at that time the children did in fact look rather emaciated while the epidemic prevailed. It should be noted with satisfaction that the Institution of Besboro’ since its inception has never had an epidemic of measles or other contagious diseases other than the scabies referred to. The mortality rate among infants is not peculiar to Besboro’ as indicated by the many Press references to this subject. We have the temerity to refer to a press cutting from the Irish Times dated 4\(^{th}\) September last. The Community wish to assure

\(^{37}\)This must be September 1943 as both Miss Litster and Dr Condy noted that the matron was not a qualified nurse in June–August 1943 and Dr Dillon noted that the matron was a qualified nurse in November 1943.
you that this problem is their primary concern and that they share the
Minister’s anxiety in this connection.

18.100 The *Irish Times* article in question, ‘Irish Doctors Baffled’, related to 241 deaths among Dublin infants between January and September 1943 and stated that Irish doctors were baffled in the search for the bacterial cause of the deaths. The City of Dublin chief medical officer was quoted as saying that the infant deaths ‘were caused by diarrhoea and enteritis, which in a very serious form, has been attacking children. The highest mortality is among children under three months’. The medical officer said that 24 children under two years had died in Dublin in one week alone. He said that no specific bacterial cause had been discovered and advised that the best way to combat the diseases was for mothers to breastfeed their infants.38

18.101 The letter from the accountants also included a report on deaths in the Bessborough maternity hospital, March 1942-March 1943 by the visiting medical officer to Bessborough, Dr O’Connor:

In the Maternity Hospital, two adults died during the above period, one from Puerperal Eclampsia, and one from Purpura and Intestinal Haemorrhage. The infant deaths were made up of 4 twins born prematurely and in a weak condition. One lived three days and the other lived between two and three weeks. The others were born in a completely weak condition and lived between two and four weeks. One died of Bronchitis when a month old, and one died of Catarrhal jaundice.

The older children who died in the Nursery during the same period, the principal causes of death were Gastro Enteritis, Congenital Venereal Disease and Marasmus. In this latter condition no matter what feeding or medical treatment was given they did not thrive. This is not due to insufficient or defective food, as the most scrupulous attention is paid to the diet, and in every case, unless there is some indication to the contrary, breast feeding is insisted on.

To the children who are artificially fed the milk given is of the best quality. This fact has been established by analysis made by the Veterinary Surgeon attached to the Department of Health of Cork Corporation. It was found on examination to be free of Tubercle Bacilli and to contain a high percentage of

38 *Irish Times*, 4 September 1943.
fat. This is given suitably adulterated according to age, and every precaution is taken to render it suitable for the infant. Besides milk, various other kinds of food were used, such as Chicken broth, meat juice, Benger’s Food, Extract of Malt, cream, Halibut Oil, Cod-Liver Oil and Sister Laura’s Food. In spite of this selection some of the children lost weight and died. An explanation of this is that some children show a remarkable difficulty in digesting food, and this is due to a primary failure of the processes of assimilation, whether for a particular food, or for food in general; even in some cases where the child is breast-fed, they do not assimilate the nourishment of the milk. This is probably more remarkable in illegitimate children.

It must be remembered that the period of gestation of these children is far different to that of the married woman. The girl worries a great deal and is mentally upset over her condition. She is constantly trying to conceal the fact that she is pregnant, and in some cases every effort is made to get rid of the foetus. All this has undoubtedly a most injurious effect on the developing foetus resulting in weak and defective children who have a poor resistance to diseases, and defective powers for assimilating food.

Other causes of death were congenital venereal disease. In numbers of these cases, in spite of treatment, severe marasmus results, caused probably by gross changes in the mucus membrane of the intestine which prevents absorption of food.

Gastro-enteritis caused some deaths. This is a disease common in infants in late Summer and early Autumn, occurring in epidemics and is sometimes very fatal. Considering the number of children in the Nursery the number of deaths was small from this particular affliction.

1944

18.102 Even though all the relevant authorities - the Congregation of the Sacred Hearts of Jesus and Mary, the Cork county manager, the Cork board of assistance and the DLGPH - were aware of the high infant mortality rate in Bessborough, no concrete steps were taken to address it. In April 1944, the congregation notified the DLGPH that 102 infant deaths occurred during the period 1 April 1943 to 31 March 1944. The vast majority, 96%, were infants less than four months old. The main causes of death were certified as marasmus, prematurity, bronchitis and gastro-enteritis.

18.103 In December 1944, Miss Litster again inspected Bessborough. She examined admission and discharge books ‘to establish the exact mortality rate among infants
born and admitted to the Institution'. At the time of inspection, 108 women
(including 21 expectant women) and 96 children were housed there. The day and
night nurseries housed 21 infants aged between three and seven months and
were:

a stronger and healthier lot of babies than when I last visited the nursery. On
the other hand, they represent, it would appear from the mortality figures, the
survival of the fittest. Few were fully breast-fed; the greater number were
partially breast-fed, with supplementary feeds of milk and water. Only three of
the 21 were definitely emaciated and sickly in appearance. This nursery was
unheated.

18.104 The day nursery also housed 24 older children aged from seven months to two
years old. It was also unheated.

Eleven babies were in cots. Of these eight appeared to be healthy, normal
children. One was not thriving and appeared to be delicate, and one seemed
to be a mentally defective child. The remaining 13 children were sitting or
crawling about the floor. Some of the children wore socks, some were in bare
feet. Most appear to be healthy and thriving.

18.105 The day room housed a further 30 children, all over two years old. One boy
maintained by Kildare county council was six-and-a-half-years old. Eight children
were chargeable to Waterford county council, 11 to the North Cork board and one
child was chargeable to Kilkenny county council. Of the 30 children housed here,
21 had spent between four and six years in Bessborough. They did not go out to
school and received no education in the institution. All 30 children became eligible
for boarding out when they reached two years old and, despite a ministerial
directive to do so, the local authorities responsible for their maintenance were
either unable, or unwilling, to find suitable foster homes for them.

These children appeared on the whole to be healthy, vigorous and thriving,
and all, except two, seemed to be of normal mentality. These two are
evidently mental defectives and should be sent to an institution for mentally
defective children.

18.106 The nursery in the maternity hospital housed ten infants aged from new-born to
about two months. Six were breastfed and the other four ‘appeared to be
unhealthy and wasted’. The room was airy and bright but had no heating. In a
small, heated room on the upper floors there were three sick infants and in another
there were eight babies aged from two to 11 months in cots. These eight babies had been sent from the maternity hospital to the home but were returned to the hospital for extra care due to delicacy. Miss Litster noted that these children appeared to be healthy enough to return to the home. She recommended that the Bessborough authorities should make provision for nursing and proper care of delicate babies as she found it objectionable that the maternity hospital should be used as a hospital for sick babies.

18.107 Miss Litster checked the infant mortality figures provided to the DLGPH and ‘verified that their accuracy can be vouched for’. During the year ending 31 March 1944, 105 infants were born in Bessborough and a further 19 were admitted after birth: a total of 124 admissions. During the same period, 102 deaths among infants under 12 months old were recorded. Miss Litster calculated that this represented a death rate of 82%.

18.108 The infant deaths recorded here did not relate solely to infants admitted during the year under review. Many of these deaths related to infants who were born or admitted before April 1943. The institutional records show that, of the 124 infant births and admissions recorded by Miss Litster, 82 subsequently died. Miss Litster checked the records from 1 April 1944 to the date of her visit on 6 December 1944 and found that 65 infants had been born in Bessborough during this period. Of these, 41 infants (63%) had already died.

18.109 Miss Litster noted that Bessborough differed from other ‘special homes’ because of the number of private fee-paying patients admitted there. Of the 124 infants born or admitted during the year ending 31 March 1944, 40 were private patients. Of the 102 deaths recorded during the same period, 35 were babies born to private patients. Miss Litster calculated that the infant mortality rate among private patients in Bessborough was in the region of 87%. She suggested that one reason for the higher death rate among infants of private patients was the fact that the mothers were frequently allowed to leave Bessborough a short time after their confinement. Their infants were left in the institution unaccompanied awaiting placement by the Catholic Women’s Aid Society.

18.110 Miss Litster reported that the Bessborough authorities took no precautions to guard against the admission of women suffering from venereal disease and did not isolate women and children entering the institution but admitted them directly to the
hospital. She said that the DLGPH had full rights of inspection and control over the Bessborough maternity hospital but had no rights of inspection over the Bessborough home, where she stated ‘it is here and not the Maternity Hospital that the majority of the babies die’. While this is correct, at least 25% of infant deaths recorded occurred in the hospital.

18.111 Miss Litster noted that the only ‘real control’ the DLGPH had over the Bessborough home was the power to prohibit local authorities from maintaining patients there and pointed out that the department had taken such action in relation to Castlepollard in 1941 due to ‘the serious state of overcrowding there’ (see Chapter 20). She recommended that Bessborough should be closed for new admissions for at least three months, that the Mother Superior should be required to furnish returns of infant deaths on a weekly basis and that a survey of the institution should be undertaken to determine the appropriate number of patients who should be maintained there. If it were closed for new admissions, women would have to be sent to the county homes as Castlepollard, Sean Ross, Tuam and Pelletstown were already at full capacity.

18.112 Cork county council and the South Cork board of public assistance were fully aware of the problem of infant mortality in Bessborough. The South Cork board was responsible for the majority of infants housed in Bessborough. It was notified of every discharge and every infant death.

18.113 In September 1944, the North Cork board of assistance directed the superintendent assistance officer (see Chapter 1) to remove all unmarried mothers and their children from the North Cork county home and hospital, Fermoy. No specific reason was given for this move and the board stated that they would grant the women ‘appropriate home assistance allowances’ as a substitute for institutional care. However, in May 1945, the North Cork board discovered that all 14 women discharged from Fermoy were living with their children in Bessborough. It is not clear who was paying for them. The superintendent assistance officer interviewed the women separately and explained to them that the board was prepared to grant them adequate home assistance to maintain themselves and their children in their respective districts. However, all the women said that they had nowhere to go, that they had been ‘turned out of their homes’ by their families and ‘told not to return again’. The women were told that, if they did not accept the manager’s order, their children would be boarded out and they would be compelled
CHAPTER 18 BESSBOROUGH

to leave Bessborough. However, the superintendent assistance officer conceded that the women and their children ‘were well-attended’ to in Bessborough and had no desire to leave.

1945

18.114 It is clear that, by January 1945, in spite of all concerned having full knowledge of the extraordinarily high infant mortality rate in Bessborough, no serious steps had been taken by either the Congregation of the Sacred Hearts of Jesus and Mary, the South Cork board of public assistance or the DLGPH to address the problem.

18.115 The various suggestions made by inspectors and medical officers were not implemented. Attempts were made to have the older children boarded out but this, while it would have reduced the overcrowding, would not have made any difference to the infant mortality rate because children were not boarded out before the age of two. In January 1945, Dr Ward, Parliamentary Secretary, DLGPH, tried again to encourage more boarding out. He appealed to county managers to arrange suitable foster homes for children maintained by their boards of assistance in Bessborough. However, the replies from county managers made it clear that continuing efforts were being made to find foster parents but there were very few people willing to take boarded out children. The main reason given was that the maintenance rates were too low. In addition, rationing, the increased cost and diminished availability of food, fuel, clothes and household items, and wartime conditions in general, had acted as a major disincentive to those who might otherwise have considered fostering a child. Although the Cork maintenance and clothing allowances had increased year on year since 1941, and stood at 10s a week for each child in 1945, they were still considered to be inadequate and failed to elicit a response. The DLGPH granted increases in the boarding out allowance, ‘particularly in areas where the allowances were rather low’ with a view to attracting a sufficient number of suitable foster parents. The Cork public assistance authorities resolved to increase maintenance and clothing rates further from April 1945 and advertised for foster parents at the increased rates. The advertisement, ‘Foster Parents Required’, invited applications from suitable persons to act as foster parents to children aged two to seven years with a maintenance rate of £1 10s a month and an annual clothing allowance of £4 10s a year. The response to the advertisement was reportedly ‘poor’.39 In June 1945,

39 Cork Examiner, 7 June 1945.
further advertisements were placed in the *Cork Examiner* for five children specifically. Two replies were received: assistance officers found one applicant to be ‘unsuitable’. Further advertisements placed in the *Youghal Tribune* and the *Southern Star*, publications with more rural readerships, elicited 16 replies. Although some applications came from districts outside the South Cork board’s functional area, application forms were sent to prospective foster parents and assistance officers were directed to inspect their homes.

18.116 More direct action was finally taken by the DLGPH in January 1945. Dr Ward decided to implement Miss Litster’s recommendation to close the institution to new patients for a period and directed county managers to send expectant women to county homes ‘pending a decision on future policy’. This instruction was issued to the relevant health authorities on 10 January 1945. Women admitted to Bessborough, whose applications had not been processed before the direction to close the home to new admissions, were transferred to Cork county home. The DLGPH sent a copy of Miss Litster’s December 1944 report to the Cork county medical officer of health, Dr Condy, and requested that he:

- would, in future, investigate the circumstances surrounding every infant death at Bessborough;
- get information about arrangements for medical attendance at the home, including the hours of duty of the medical officer and his terms of employment;
- get weekly returns for the following three months showing infant deaths at Bessborough and the medically certified cause of death in each case.

18.117 In reply, Dr Condy agreed to investigate all future infant deaths at Bessborough. He also provided an overview of the role of Bessborough’s medical officer. The Bessborough medical officer had been the institutional medical officer since 1922; he had no fixed hours of attendance and visited twice weekly on average and when called on to deal with an emergency. There was no written agreement about his conditions of service and his annual fee of £120 was paid by the Congregation of the Sacred Hearts since 1937. He did not see every infant on his routine visits and proper medical records such as weight records were not kept for each child.

---

40 Dr Ward considered that the policy of keeping mothers for long periods was unsound and wanted children to be boarded out at the earliest possible moment. The Commission has not seen any evidence that he made efforts to have this policy pursued.

41 The Commission has not seen any evidence that he did do this.
Dr Condy brought this to the attention of the Mother Superior and the Bessborough medical officer and recommended that the Bessborough medical officer should undertake daily visits to the institution as a minimum requirement. Dr Condy also recommended that each patient should be subject to a Wasserman test on admission.

18.118 Dr Ward, the Parliamentary Secretary at the DLGPH, considered that the medical supervision of children in Bessborough, as reported by Dr Condy, was ‘criminally casual’ and directed Dr James Deeny, the recently appointed chief medical advisor to the department, to inspect children living in the home. On 6 January 1945, Dr Deeny, accompanied by another DLGPH doctor and by Dr Condy visited Bessborough. Dr Deeny reported:

I inspected Maternity Hospital Block of the Home and found the Institution to be well-maintained and perfectly equipped and seemingly suitably staffed for its present Maternity work. Further inspection of the part of the special home devoted to the children under the care of the order revealed a similar state of affairs. In fact, the whole place was fresh and spotlessly clean. Special inspection of rooms reserved for milk storage and formula preparation also showed cleanliness etc. Owing to the appalling infant mortality I stripped and examined almost all infants in the home and as a result discovered certain facts.

(1) The vast majority of the infants had excoriated buttocks and were grossly inflamed, obviously the result of neglect to change napkins sufficiently.

(2) Most of the napkins were soiled and motions found were almost always green - indicating unsuitable feeding, insufficient feeding or bowel infection.

(3) Most of the children revealed a number of infectious lesions. For instance, the slightest scratch seemed to become infected and turn septic. Many babies apart from the raw buttocks showed numbers of septic sores. This in my opinion is due to a heavy infection of the home with some organism which is transmitted from child to child.

(4) The Rev. Mother was completely unaware of this state of affairs. The clean counterpanes of the sheets etc., satisfied her - she had little or no knowledge of what was hidden below.
(5) The situation revealed gross ignorance on the part of the Sister responsible. No person with even a smattering of knowledge of child health would allow such a state of affairs to continue.

(6) No attempt has been made to help the mothers in the care of their children or if such an attempt has been made the results prove that it was a lamentable failure.

(7) Medical attention must be of a most superficial nature. In this respect I regard the M.O. of the home as distinctly culpable. In view of the death rate he must have known that something was wrong with the care the children were receiving and if he did, he should then have sought the cause which on a simple examination was immediately revealed. There is no doubt that in this case - and in view of the hundreds of children whose lives have been lost - his complacency or ignorance should be regarded as criminal. I am convinced that a continuation of his services would be detrimental to the home and that he should be dismissed.

(8) The Reverend Mother should be replaced with someone with ability to administer an institution dealing with Maternity and the care of infants and children.

(9) The nun in charge of the infant’s Dept is both stupid and ignorant. The state of the children under her care is so terrible that they fail to lessen queries of child neglect. She, above all others, must be held primarily responsible for the hundreds and hundreds of babies under her charge who have died in the last few years. She should be removed from her post immediately. I recommend the employment of two nuns or nurses who have training in children’s nursing to try to bring up the children to a normal level of health and get rid of the infection.

(10) Dr Condy must keep a close eye on the institution and investigate all deaths, which must be reported to him immediately.

(11) Letter to Superior General as arranged with minor modifications suggested and enclosing excerpts from Miss Litster’s report.

18.119 Dr Ward decided that the issues highlighted by Dr Deeny required ‘drastic action, and sustained effort’ to remedy. He considered that ‘interference from an outside agency would not have any lasting effect’ and that reform should come from within the institution itself. In January 1945, he wrote to the Superior General of the Congregation of the Sacred Hearts in Chigwell. He said that the very high infant
death rate at Bessborough and the staffing of the institution had been under review by the DLGPH for a number of years and that ‘the failure of the authorities at Bessborough to deal with both issues had been very pronounced’. He repeated the department’s request for the appointment of a new Mother Superior, qualified in midwifery and child care, and said that local authorities had been instructed not to send any further unmarried mothers and expectant women to Bessborough until acceptable management and staffing arrangements were put in place there.

18.120 The Superior General replied expressing her shock on reading Miss Litster’s report and stating that she would have implemented any necessary improvements at Bessborough if the DLGPH had asked her to do so. She said that she understood that the existing Mother Superior was still quite capable of running Bessborough. However, she accepted that the facts presented in the report were ‘all too serious’ and gave an undertaking to make whatever changes the DLGPH thought necessary.

I shall make the necessary change as soon as possible and trust that in the very near future the past failures shall be corrected and the complete management of the Home shall reach your expectations.

I am distressed that you should have cause to be alarmed with the present state of the Home, I beg you to have patience with us, we shall endeavour to re-organize as quickly as possible.

18.121 In a follow-up letter, she told the minister that she proposed to transfer Mother Rosemonde McCarthy, the Mother Superior of Sean Ross, to Bessborough as a replacement. Miss Litster considered Mother Rosemonde to be of ‘outstanding character and unquestionable ability’ but worried that her removal from Sean Ross, even temporarily, would be detrimental to that institution. However, Dr Ward welcomed the proposal and asked to be informed when she took up her position at Bessborough.

18.122 In February 1945, Bishop Cohalan wrote to the DLGPH to complain about the department’s role in the removal of the Mother Superior from Bessborough. He argued that this was an ecclesiastical appointment over which the DLGPH had no jurisdiction. Separately and without informing the DLGPH, he asked the Apostolic Nuncio to Ireland to intervene in the matter and to insist that the Mother Superior
be kept in office.\textsuperscript{42} However, the Department of Foreign Affairs subsequently advised the Taoiseach, who was also the Minister for Foreign Affairs, that the Papal Nuncio was satisfied that the Mother Superior ‘was gravely at fault’ and should be transferred elsewhere.\textsuperscript{43}

18.123 Having made his ecclesiastical point, the bishop conceded that he shared the department’s concern in relation to infant mortality at Bessborough and that the vital matter was to find ‘the cause of the evil and the best remedy’. The bishop discussed the issue with the Mother Superior and with a doctor from the Cork District Hospital and acknowledged that ‘the seriousness of the problem is realised’. He recommended that a young doctor, a specialist in gynaecology, might be well placed to remedy the cause of infant mortality at Bessborough. In reply to the bishop in March 1945, the DLGPH assured him that the ecclesiastic status of the Mother Superior was not questioned but that her position as matron in an institution where unacceptable levels of infant mortality prevailed could not be tolerated. The letter stated that ‘apart from any public scandal which might result’ Dr Ward felt that the case called for immediate action to remove her from her post as to allow her to continue as matron would have meant ‘acquiescence on his part in the state of affairs which has been disclosed’.

18.124 Despite the Superior General’s undertaking to remove the matron, she wrote to the DLGPH again in February 1945 seeking to delay the move until the war ended and to allow the congregation time to arrange their elections so that all superiors would be changed in the normal way. Dr Ward reminded her of the high infant mortality rates which prevailed at Bessborough under the matron’s watch and advised that delays or objections to her removal, based on the internal arrangements of the congregation, would not be entertained. He again pressed the point that, unless the administrative changes already agreed were implemented, the department would be forced to reconsider the viability of sending expectant women and unmarried mothers to Sacred Hearts’ institutions.

18.125 In March 1945, the Mother Superior told the DLGPH that the Sister in charge of the infants department was giving special attention to the issues raised by Dr Deeny and that she had employed a new medical officer, Dr Sutton, who was a ‘specialist

\textsuperscript{42} NAI, DFA10/P99
\textsuperscript{43} NAI, DFA10/P99; In his memoir, \textit{To Cure and To Care}, Dr Deeny incorrectly identifies the bishop of Cork as Dr Lucey. Dr Cohalan was the bishop from 1916 to 1952 when he was succeeded by Dr Lucey.
in maternity work and children’. She suggested that the department send Dr Deeny to undertake a further inspection of the home ‘to ascertain whether the supervision and care of the infants in operation meet with his approval’. In March 1945, Dr Sutton, wrote to Dr Deeny to tell him that he had been appointed medical officer to Bessborough and that after several visits to the institution ‘I just don’t know where to begin or end’. He indicated that many changes and improvements were needed but claimed to have no jurisdiction over some of them. He asked Dr Deeny to come to Cork to discuss the matter. Dr Deeny replied that he would not be in a position to travel to Cork ‘for some time’ and forwarded a copy of his January 1945 report to Dr Sutton so that he may ‘get to work right away to clean up the place’.

18.126 Dr Ward and the DLGPH were under the impression that Bessborough had been closed to new entrants since 14 January 1945. However, in early March, they became aware that expectant women and babies were still being admitted there. When Dr Condy was asked to explain the situation he said that he had never been advised to refuse admissions. It appears that, although Bessborough had stopped admitting patients maintained by boards of assistance in January 1945, they had continued to admit private fee-paying patients. Furthermore, a number of expectant women in the Bessborough maternity hospital at the time of its closure to new admissions subsequently gave birth there and their infants were transferred to the Bessborough home. The DLGPH did not follow up on this matter until August 1945 when the deputy chief medical advisor wrote to Dr Condy requesting information on the number of private patients in Bessborough, the number of infants born there since the institution ‘closed down’ and the number of infant deaths which occurred since.\footnote{Dr Condy had said in January 1945 that he would investigate every infant death in Bessborough. There is no documentary evidence that he did and, if he did, there is no evidence that he sent the results to the DLGPH.} He replied that there were 25 private patients in Bessborough and that 39 infants had been born there from the time of its ‘closure’ on 14 January 1945 to 20 July 1945. He then stated, without comment, that of the 39 infant births recorded in this period, 29 had already died. In this six month period the infants department at Bessborough was under the control of a newly appointed qualified nurse, the institution itself was served by a new medical officer, a specialist in maternity and infant care, and infant deaths at Bessborough were supposed to be under close scrutiny by him. Yet, infant mortality appeared to have continued at a very high rate.
18.127 Dr Deeny telephoned Dr Condy and asked him to submit a report outlining the conditions responsible for the recent deaths at Bessborough. He also suggested that the matter should be reported to the Cork county manager and he should be advised to withdraw the maternity hospital's licence under the Registration of Maternity Homes Act 1934. Dr Deeny noted that events in Bessborough had left Dr Condy in ‘an embarrassing position’.

18.128 Dr Condy’s initial report on infant deaths during the period January to July 1945 suggested that the 29 recorded deaths (25 in the home, four in the maternity hospital) occurred among the 39 infants born during the same period. However, subsequent analysis showed that of the 39 infants born during this period, 15 had subsequently died; the remaining 14 deaths occurred among infants born before 14 January 1945. All 15 infants who were born and subsequently died in the period January to July 1945 were unaccompanied infants born to private fee-paying patients.

18.129 Dr Condy noted that the majority of these infant deaths were of ‘a preventable nature’ and that both he and Dr Sutton were of the opinion that the nursing staff at Bessborough was still inadequate and did not have adequate training and qualifications to care for infants. He said that the Mother Superior, who was also the matron, was not a trained nurse and was almost entirely occupied with the administrative control of the institution and attached farm and appeared to have ‘little touch with the medical aspect of the Home’. He indicated that a new Mother Superior was due to take up her duties at Bessborough in September and asked Dr Deeny if he would liaise with him, Dr Sutton and the Bessborough authorities to discuss steps which should be undertaken to improve conditions in the home. Dr Condy did not address the question of deregistration of the maternity hospital.

18.130 In September 1945, the Superior General of the congregation wrote to the DLGPH to advise that Sister Rosemonde had replaced Sister Martina as matron to Bessborough. She expressed her wishes that in a very short time, Bessborough would be in a satisfactory state. The department decided to give Sister Rosemonde ‘a chance to pull Bessboro together’ before pressing for a withdrawal of the maternity hospital licence.

18.131 In October 1945, Dr Deeny inspected the home and the maternity hospital. He noted that infants were still afflicted with a ‘chronic skin infection’. He
recommended greater division of the nurseries and separate clothing for each child. He reported that Sister Rosemonde was anxious to satisfy his requests in all aspects of the running of the home and had requested that no new residents be admitted until she was satisfied that everything was in order. Sister Rosemonde stated that she would not admit any private patients until the ban on new admissions was lifted. It was agreed that an additional three trained nurses were required in order to run the home efficiently. The congregation had ‘several nuns training as nurses’ and Sister Rosemonde gave an undertaking to employ temporary nursing staff until she was in a position to recruit nursing staff from within the congregation. Sister Rosemonde asked for Dr Deeny’s assistance in two matters. The first was the institution’s oil fuel ration which had been reduced from 840 gallons to 65 gallons a month due to wartime conditions and was not enough to heat the home and the hospital adequately. The second matter of concern was the longstanding problem of finding boarded out places for older children. There were 40 older unaccompanied children in the home despite repeated requests from the DLGPH to county councils liable for their maintenance to find suitable foster homes for them.

18.132 Dr Deeny reported that Sister Rosemonde had asked him to ‘use his influence with the Church’, in relation to finding foster homes as she feared that the manner of her appointment may have prejudiced Bishop Cohalan of Cork towards her and her work. Dr Deeny subsequently spoke to the director of the Catholic Women’s Aid Society (CWAS). The director (who was a priest) cited the views of the bishop and his displeasure at how the DLGPH had handled matters at Bessborough. He set out the considerable difficulties the CWAS was experiencing in getting suitable foster homes during wartime conditions. However, Dr Deeny noted that when the urgency of the situation in Bessborough was explained to him, he ‘was appreciative of the necessity of obtaining greater results’.

18.133 By November 1945, county councils who traditionally maintained women and children in Bessborough began to make inquiries about its status. The resident medical superintendent in the Cork county home and district hospital told the DLGPH that since the introduction of the ban on new admissions to Bessborough the maternity section of his hospital was ‘frequently congested’. The chaplain to the Cork county home complained that women and children were ‘accumulating there at a very rapid rate’. In the same month, Sister Rosemonde told the DLGPH that all required adjustments to the nursery had been made, that three qualified
nurses were now working there and that she had advertised for another qualified nurse to take up duties when admissions resumed. She said that she had numerous applications from expectant women seeking admission to Bessborough and requested that the hospital be re-opened for new admissions.

18.134 In November, the Superior General of the Congregation of the Sacred Hearts of Jesus and Mary and Sister Rosemonde met Dr Ward. The Superior General expressed ‘sincere regret’ about the conditions that had prevailed at Bessborough and said that all recommendations made by the DLGPH had been carried out. In December 1945, the DLGPH wrote to county councils and boards of public assistance to inform them that the staff at Bessborough had been ‘reorganised and considerably augmented’, that necessary improvements in the institution had been effected and that public assistance authorities could resume sending unmarried mothers and expectant unmarried women to the institution.

18.135 The authorities at Sean Ross and Castlepollard recouped the cost of a medical officer, nurse and two public health visitors from the DLGPH Maternity and Child Welfare Grants scheme (see Chapter 1). Up to this time, the authorities at Bessborough had made no claims for recoupment of these costs. In February 1946, Sister Rosemonde, who was aware of the grants from her time at Sean Ross, forwarded receipts relating to salaries paid to the medical officer, matron and midwife to the DLGPH for the purposes of recoupment from the fund. The department authorised a grant of £191 on the basis that the unsatisfactory conditions which previously prevailed in Bessborough did not recur. This was half of the relevant salaries which was the maximum available under the scheme.

1946

18.136 Miss Litster’s report on her March 1946 inspection described changes in the general layout of the home since her last visit. She noted that an infant’s day nursery had been converted into a recreational room equipped with a pianola, book case and seats and was a ‘comfortable and pleasant room’. Adjacent to the recreational room, a night nursery had 21 cots and a bed which was occupied at night by one of the patients acting as night attendant. The children’s dining room was not in use, as there was insufficient fuel to heat it, and children had their meals in a heated dayroom.
18.137 A long nursery for infants, where the majority of infant deaths occurred prior to re-organisation, had been divided into three smaller rooms each fitted with radiators and a bath for washing babies. Room 1 contained six cots and all were occupied. Only one of these babies was completely breastfed. Cots were adequately supplied with good blankets. Room 2 contained eight cots and four were occupied. Only one infant was fully breastfed. Room 3 was unoccupied. The ten infants ‘appeared to be healthy, normal babies’ and there was no sign of ‘scalding or excoriation’. A nursery for older infants contained 13 cots; 12 were occupied. The room was heated by three radiators and had three windows. These infants were ‘plump and healthy’ and although some showed the remnants of a rash on their buttocks the condition ‘appears to be clearing rapidly’. An isolation nursery housed five babies, three of whom were unaccompanied by their mothers. None of them appeared to be seriously ill. A day nursery for older children housed 21 children; 12 were without their mothers. For the most part they were ‘fine, healthy children’. A toddler’s playroom housed 18 children aged from two to four years old; all but one were maintained by public assistance authorities. Fourteen were maintained by the Cork boards of assistance; all were healthy and normal and, in Miss Litster’s view, should be boarded out.

There is apparently a proposal that those chargeable to the South Cork Public Assistance Authority should be admitted to Cork County Home and their mothers allowed to take their discharge from the Sacred Hearts Home, Bessboro. This procedure would not commend itself to me for the following reasons:

- There are already too-many children in the County Home.
- The mothers in the County Home will be required to attend to motherless children whose mothers have been permitted to take their discharge. This will make neither for proper care of the children nor for good discipline in the County Home.
- One removal, especially when it involves separation from its mother, is sufficiently disturbing for a child. An effort should be made to ensure that only one disruption of his life is necessary. It should be possible to procure a foster home to which he may be removed directly from the Sacred Hearts Home.

18.138 Miss Litster said that the South Cork board undertook to ‘prosecute a vigorous boarding out policy’ with a view to getting foster homes for children in the Cork
county home and Bessborough. However, the board noted that the stipulation that foster homes must be located in rural areas was making the task difficult and asked that the DLGPH would consider lifting the prohibition on boarding out children in villages and towns to accommodate applicants from such areas (see Chapter 11).

18.139 Miss Litster highlighted other issues which were detrimental to the wellbeing of women and children living in Bessborough. The South Cork board of public assistance would not pay maintenance for women and children once the child was two years old; the congregation accommodated these women and their children without payment. Since the only reason for their continued residence in Bessborough was the South Cork board’s failure to secure foster homes for the children, Miss Litster considered the cessation of payment to be unfair.

18.140 At the time of the inspection, 29 unaccompanied infants were living in the home. The majority of these infants were born to private patients and remained in Bessborough unaccompanied under the auspices of the CWAS. Traditionally, infants who remained in Bessborough in the care of CWAS were placed with nurse mothers a week or two after birth. However, the CWAS had found it increasingly difficult to get nurse mothers and foster homes during the war years. This meant that ‘motherless’ infants were kept in Bessborough for prolonged periods. The congregation decided to discontinue the practice of allowing private patients to leave the institution without their babies and, for all new admissions, it was decided that the mother and her child would be treated as a unit.

18.141 Miss Litster noted that at the time of her visit there were 22 expectant women in the maternity hospital; 18 maintained by public assistance authorities and 4 were private patients. There were seven new-born infants in the nursery, four of whom were completely breastfed. One infant weighed 4.5 lbs. at birth, one was premature and ‘otherwise all appeared healthy and normal’.

18.142 The home had 72 beds in total. Two dormitories were located on the second floor. The first contained 24 beds and was large and bright. Ten new wash hand basins had been installed but were not yet connected to the water supply. The second dormitory contained 16 beds; eight new hand basins had been installed but were not yet connected. A top floor dormitory, a long, bright room, had 32 beds. Miss Litster noted that the dormitories were capable of accommodating a larger number
of beds should the need arise. The ground floor housed airy and comfortable workrooms but the refectories were 'somewhat dark and gloomy'. Dinner on the day of inspection, which was a feast day, consisted of fish, vegetables, sweet, a cup of coffee, bread and butter; 'the food is excellent'. On 6 March 1946, 58 women (seven private patients) were living in the institution: 22 expectant and 36 with children.

18.143 In the period 31 March 1945 to 6 March 1946, 48 infants were born in or admitted to the institution and 23 infant deaths had occurred. Three of these deaths occurred in infants admitted to Bessborough after birth. Sixteen of the 23 infant deaths occurred in infants born to private patients. Since October 1945, when Sister Rosemonde had taken charge, there had been six deaths; two of these were neo-natal.

It is too soon yet to expect any noticeable effect upon mortality of the re-organisation. The general appearance, however, of the infants has improved; instead of emaciated, marasmic babies, as they mostly were on the last inspection visit made, they appear to be thriving and healthy on the whole.

18.144 Statistics submitted by the Bessborough authorities to the DLGPH for the year ending 31 March 1946 showed that 88 women (52 public, 36 private) were admitted to the institution during the year. One case of maternal mortality was recorded; the woman was a private patient. Twenty-four private patients were resident with their infants on the date on which the statistics were compiled which suggests that Sister Rosemonde implemented the policy of retaining private patients in the home until suitable foster homes were secured for their children. Of those women discharged during the year, 65 (29 public, 36 private) were discharged to ‘situations’ and 17 (seven public, ten private) left the institution with parents or relatives. Thirty-eight infants were born in Bessborough during the year and a further 13 were admitted after birth. Of the infants and children discharged during the year, 24 were boarded out by health authorities and 11 were placed at nurse through the CWAS. A further 17 infants (seven public, ten private) were taken by relatives or friends and three infants (two public, one private) were discharged to hospital.

18.145 In October 1946, the DLGPH wrote to Dr Condy asking him to report on infant deaths at Bessborough for the year ending 31 March 1946 and for the six month period ending 30 September 1946. His report showed that, in the period 1 April
1945 to 31 March 1946, 59 births and 24 deaths were notified. However, for the six month period 1 April to 30 September 1946, 91 births and 8 deaths were notified. An inspection report on Bessborough by Dr Murphy, medical inspector, DLGPH, stated that for the year ending 31 December 1946, 136 births and 12 infant admissions to Bessborough were recorded. In the same period 15 infant deaths were notified. Although Dr Deeny considered the infant mortality rate at Bessborough to be still too high, he acknowledged that there had been ‘a tremendous improvement’ and that the actions taken by the DLGPH the previous year had been ‘completely justified’. Dr Deeny decided to send a letter of congratulations to Sister Rosemonde and to notify the Minister for Local Government and Public Health and Bishop Cohalan of the results.

1947

18.146 During his inspection visit in January 1947, Dr Murphy also undertook a medical inspection of infants and children in Bessborough. He noted that the general layout of the institution remained the same as that reported by Miss Litster on her visit in March 1946. Nursery 1, reserved for infants aged one to three months, housed 14 infants; nine were breastfed. Some had cracks and fissures behind their ears but appeared to be doing well on treatment. All infants in this section were ‘normal and well-nourished’. Nursery 2, reserved for infants aged three to six months, housed 20 infants: four were breastfed. One infant was ‘premature and progressing satisfactorily’ and all other infants were ‘normal and well-nourished’. Nursery 3, reserved for infants aged six months to one year, housed 19 infants: four were breastfed; ‘all were healthy, well-nourished and doing well’. There were two infants in the isolation nursery; they ‘were running temperatures, were not seriously ill and showed no other abnormal physical signs’. The toddler’s playroom housed 20 children; they were ‘all normal’. He saw 13 infants ‘all breastfed and in good condition’ in the maternity hospital. There were 34 expectant women housed there along with six puerperal cases. He concluded that the institution ‘appeared to be run on very efficient lines’. He said that the reduced number of deaths ‘speak for themselves’ and that ‘in view of the past history of this Institution the results are certainly excellent’.

18.147 In June 1947 the Cork county manager granted an increase in the maintenance rates in respect of the South Cork board’s patients housed in Bessborough. The rates, back dated to 1 April 1947, were as follows:

i. Ante-Partum Mothers: 16s a week.
ii. Children: 15s a week.
iii. Mother and Child: 28s.6d a week.
iv. Post-Partum Mothers: 13s.6d a week.

1948

18.148 In June 1948, Miss Litster again inspected the home and hospital; 103 children were living in the institution at the time of her visit. All infants except two were ‘healthy and doing well’. She described one infant as ‘punny and delicate’ and the second as ‘the offspring of an incestuous union’. The older infants ‘appeared in good health, contented, well-nourished…healthy, normal children, happily at play’. There were 14 children, aged two years and over and eligible for boarding out, living in the home; she again recommended that the county councils responsible for them should be directed to secure suitable foster homes. Although the South Cork board continued to advertise for foster parents in local and regional publications they faced competition from the Cork Branch of the Save the German Children Society who sought to place 50 German orphans in foster homes. In the period 1 April 1947 to the date of inspection on 5 June 1948, 178 infants were born or admitted to the institution; 23 deaths occurred in the same period. Miss Litster noted that no infant death had occurred in the institution in the period between February and June 1948:

The infant mortality rate in Bessborough compares favourably with that for illegitimate infants in the country as a whole and represents a very considerable drop from that obtaining formerly in the Institution.

18.149 Three of the 23 infant deaths were neo-natal. The remaining 20 deaths were certified as marasmus (four), enteritis (six), pneumonia (six), septicaemia (three) and infantile convulsions (one). Miss Litster undertook a subsequent investigation into infant deaths at Bessborough for the year ending 31 December 1948. In that period, 143 infants were born or admitted to the institution and six infant deaths were recorded.

1949

18.150 In May 1949, Miss Litster again inspected Bessborough. There were 139 women and 114 children living there at the time of her visit. She reported on each ward as follows:

---

Dormitory No.1: Four infants about six months old, all healthy in appearance and thriving.
Dormitory No.2: Nine infants about six months old, all healthy and thriving.
Dormitory No.3: Eleven infants under one year. All healthy; except one suffering from a severe cold.
Dormitory No.4: Infants, transferred from the Maternity Hospital at an average of three weeks old, mainly breast-fed. All appeared healthy except one - an infant born outside and brought in after birth. This is not a vigorous baby but is, according to nurses, making progress.
Dormitory No.5: Four infants about ten weeks old. All four babies are breast-fed and all thriving.
Dormitory No.6: Two infants, both are breast-fed. One does not appear to be thriving. The other, a three months old baby, is wizened and unhealthy looking, but is apparently from records not losing ground.
Toddlers Lower age group: All these 29 children, aged twelve months to two years, are healthy, vigorous and normal.
Toddlers Upper Age Group: All 30 children were outdoors. They appear healthy, contented and normal. They are mostly about two to two and a half years. A few are three years old.

18.151 In the year ending 31 March 1949, 135 infants were born in or admitted to the institution and six infants died. The deceased infants were aged between 36 hours and 11 weeks. The certified causes of death were enteritis, cerebral haemorrhage, prematurity, toxaemia, prematurity and chronic infection, and atelectasis. Four infants were transferred from Bessborough to the Cork district hospital for medical treatment during the year and subsequently died there.

18.152 Miss Litster recorded that there were 43 women in the maternity hospital of whom 29 were expectant. The 14 new-born infants housed there were reportedly ‘normal and thriving’ and all but two were breastfed. The only baby of really unhealthy appearance was a premature infant, another ‘offspring of an incestuous union’. The health of the mothers was excellent, and no complaints were made about the quantity and quality of the diet.
The 1950s

18.153 In November 1951, Miss Litster visited Bessborough to make inquiries about infants who had been discharged from the home and subsequently were housed in the Dunscombe private nursing home, Cork. On this occasion she interviewed mothers and examined records of births, admissions and infant deaths. On the date of inspection, 87 infants and children, aged from one month to three years, were living in the home and seven new-born infants were housed in the maternity hospital. For the year ending 31 March 1951, 83 infants were born and a further 19 were admitted after birth. One infant death was notified during this period. Analysis of the 158 infants born in or admitted to Bessborough in the period 1 April 1950 to the date of inspection on 7 November 1951, showed that two infants subsequently died. Miss Litster recommended better ventilation for the playroom and dining room and suggested that smaller shallower baths would be more suited for infants. She also recommended that public assistance authorities in North Cork, North Tipperary and Clare should again be directed to make arrangements for the removal of children eligible for boarding out.

18.154 Miss Litster drew attention to the fact that the local registrar of births was in the habit of writing the word ‘maid’ in the column where the mother’s maiden name would usually appear; Miss Litster took this to refer to the unmarried status of the mother (which would normally have been ‘spinster’). The Sisters at Bessborough said that the word ‘maid’ meant ‘domestic servant’. Miss Litster objected to this on the basis that no other institution stated the mother’s occupation on a birth certificate and advised that St Patrick’s Guild had found it difficult to get foster homes for children from Bessborough because of the entry ‘maid’ on the birth certificate.

18.155 Subsequent to Miss Litster’s visit to Bessborough in November 1951, the Department of Health (the DLGPH split into two separate departments in 1947) instructed Miss Reidy, nursing inspector, to inspect Dunscombe. The department was prompted to take this action based on information garnered by Miss Litster during her interviews with women living in Bessborough. Sister Rosemonde’s refusal to allow private patients to leave Bessborough without their infants had induced some private patients to discharge themselves and their infant and then admit the infant unaccompanied to Dunscombe. The infant life protection visitor for the South Cork board had become aware of a large number of infant deaths at
Dunscombe and brought the matter to the attention of Dr Saunders, the chief medical officer to Cork City. On 13 November, an inspector from the South Cork board inspected Dunscombe and reported that all was in order there. On the same day Miss Reidy visited Dunscombe and reported that there were four infants in one room which lacked both air and light and smelled of urine. Miss Reidy asked for nappies to be removed. In every case the buttocks were very inflamed and ulcerated in varying degrees.

18.156 Miss Reidy also found that the owner of Dunscombe had not only failed to notify the board of public assistance of the reception of infants born at Bessborough, a requirement under the *Children Acts*, (see Chapter 1) but had also failed to register infant deaths which occurred there. The South Cork board inspector claimed that she had reported the unauthorised maintenance of infants, born in Bessborough, in Dunscombe, and their poor condition, to the Cork local authority on previous occasions and that they had failed to act. A Department of Health memorandum appears to substantiate this claim.

18.157 The owner claimed that infants who died in Dunscombe had been discharged from Bessborough to Dunscombe in a poor state of health. The Department of Health determined that medical staff at Bessborough bore no responsibility for the condition of infants in Dunscombe and Miss Litster rejected the owner’s claims out of hand stating:

> There is no doubt in my mind that the babies who died in the [Dunscombe] Home were not given such care and attention as might induce them to live.

18.158 Miss Litster was also highly critical of the Catholic Women’s Aid Society (CWAS) as it had recommended Dunscombe to private patients seeking an early discharge from Bessborough as suitable temporary accommodation for their infants. All but one of the infants born in Bessborough, and who subsequently died in Dunscombe, were born to private patients and were placed in Dunscombe unaccompanied awaiting foster placement under the aegis of the CWAS. Miss Litster made the charge that the society must have been aware of the infant deaths at Dunscombe but took no action. She recommended that the owner should be prosecuted for the neglect of infants in her care but thought it unlikely that the Cork local authority would press the case.
Miss Litster's report on Bessborough in October 1952 shows that the number of private patients seeking admission to the institution had fallen dramatically. Only two of the 101 women who were resident there on the date of inspection were private patients. Sister Rosemonde's refusal to allow any woman leave the home without her child appears to have deterred private patients from seeking admission to Bessborough. However, the decision continued to make a positive impact on infant mortality there. In 1952, Miss Litster noted that for the period since her last inspection, 7 November 1951 to 2 October 1952, and for the first time in Bessborough’s history, no infant death occurred in the home. Two neo-natal deaths occurred in the maternity hospital; in both cases the women were admitted to Bessborough already in labour. All of the 84 infants and children living in Bessborough at the time of inspection ‘appeared healthy, normal, plump and well-cared for’. There were 38 infants in cots in a newly built solarium.

Miss Litster again asked the Department of Health to direct public assistance authorities responsible for maintaining children in Bessborough to arrange suitable foster homes for those eligible for boarding out. The Cork, Clare, Limerick, Kerry and North Tipperary boards replied stating that they had placed advertisements in local newspapers but were unsuccessful in securing suitable foster homes. The North Tipperary board sought permission from the Department of Health to transfer children from Bessborough to an industrial school but the department did not consider industrial schools a suitable alternative to foster homes. The North Cork board advised the department that they had made an application for the committal of a child to an industrial school at the request of his mother who wished to leave Bessborough, after a stay of four years, to take up employment. As the North Cork board had failed to find a foster home for the child, this appears to have been the only option left open to this particular woman. Although counties that maintained children in Bessborough were asked to find foster parents for one, and sometimes two children, they found it almost impossible to do so. All counties involved told the Department of Health that they had secured foster homes for the Bessborough children but when the department followed up on the matter most of these arrangements had fallen through and the children remained in the home.

In July 1954, Miss Litster again inspected Bessborough. There were 80 infants and children living in the home at the time of inspection and all, except for a two-month-old baby in the infirmary, were outside either in cots in the solarium or at play in the grounds. She noted that on the whole, they appeared healthy and
thriving. Seven older children, aged between three and five years, were living in the home. Three of these children were eligible for boarding out and Miss Litster recommended their discharge to foster homes. Two of the older children were ‘mental defectives’ and she recommended their discharge to suitable institutions. One of the older children was the ‘offspring of incest’ and Miss Litster noted that local knowledge of this would make it impossible to find a foster home for her in her mother’s county of origin. She recommended that this child be sent to a convent industrial school. Arrangements had been made for the remaining child to be adopted to the USA.

18.162 Miss Litster said that the women’s refectory, which was a semi-basement room, had always been ‘dark and gloomy’ but that efforts had been made to brighten the room with natural light. Dinner served on the day of inspection consisted of beef stew with vegetables and milk pudding. Soup was frequently served and stewed fruit when available. Breakfast consisted of porridge, bread, butter and tea. On Sundays and feast days, sausage and egg, and sometimes bacon, were served. Supper consisted of eggs or salad. The diet appeared to be nourishing and ample.

18.163 There were 26 women in the maternity hospital; 13 were nursing new-borns; all but two of the infants were breastfed. Of the 13 nursing mothers, only one would be remaining in Bessborough until her child was boarded out. The other 12 women had made arrangements for adoption or for placing their child at nurse through a welfare society. Miss Litster noted that expectant women admitted to Bessborough were now coming in immediately before confinement and leaving as soon as possible after the birth.

18.164 In the period between inspections, 2 October 1952 to 7 July 1954, 149 infants were either born in, or admitted to, Bessborough. Three infant deaths were recorded during the same period. All three were neo-natal and occurred in the maternity hospital. No infant deaths occurred in the Bessborough home. In his report for 1953, the Cork county medical officer, Dr Condy, stated that 33 infants and two women had died in other private maternity homes operating in Cork county during the year. Miss Litster noted that for the period 1 April 1950 to 7 April 1952, the eight other private maternity homes operating in Cork county in 1953 were: St Anne’s Nursing Home, Fermoy; Bandon Nursing Home, Millbrook; St Philomena’s Nursing Home, South Main Street, Bandon; St Philomena’s Nursing Home, North Main Street, Bandon; St Mary’s Nursing Home, Youghal; Bon Secour Home, Cobb; St Anne’s Nursing Home, North Main Street, Youghal and Braemar House, Old Blackrock Road, Cork.
July 1954, 481 infants had been born in, or admitted to, Bessborough; seven infant deaths were recorded during the same period representing an infant mortality rate of 1.4 %, or 14 per 1,000 births. This compared favourably with the national infant mortality rate which averaged 43 per 1,000 births during the same period.47

18.165 Miss Litster’s September 1955 inspection shows that infant mortality had further reduced. For the year ending 31 March 1955, 86 infants were born in, or admitted to, the home: one infant death occurred in the same period. Ninety two women, 65 infants and 13 children were living in the institution at the time of inspection. All 65 infants appeared healthy apart from one who was coeliac and one suffering from eczema. Arrangements had been made for the adoption of five infants, one locally and four to the USA. Thirteen older children were living in the home: arrangements had been made for the adoption of seven of them in the USA. Miss Litster reported that inoculation against diphtheria was to be undertaken in the institution and that the health of the women was good.

The Home is well-run, diet ample and good; beds comfortable. Great attention is paid to the comfort and wellbeing of the patients. Facilities for recreation are good.

18.166 Miss Litster’s November 1956 report recorded that 73 women and 67 infants and children were living in the institution at the time of inspection; this was almost half the number of residents recorded in 1948 and 1949. The health of both mothers and children was excellent, the diet was good and that the children were well-cared for. Five cases of polio were recorded among children during the year; none proved fatal, but one child suffered facial paralysis.48 Four infant deaths were recorded; three deaths occurred in the maternity hospital among infants aged between four and eight hours old. The remaining infant died in the home, aged three weeks. Seven children were legally adopted in Irish homes during the year and local applications from prospective adoptive parents were increasing. She considered that a good deal of the credit for the increasing readiness of local families to adopt was due to the Bishop of Cork, Dr Lucey, who, according to Miss Litster, pressed constantly on priests and people the superiority of adoption over institutional upbringing or boarding out.

48 There was an outbreak of polio in Cork in 1956.
18.167 The August 1958 inspection was conducted by Miss Reidy, nursing officer, Department of Health. There were 52 women and 55 infants there at the time of inspection. Seven older children were awaiting papers from the Department of External Affairs to travel to adoptive families in the USA. Miss Reidy noted:

The accommodation of both mothers and children was clean, well-kept and adequately comfortable. They all appeared to be in good health. The only physical defect notable amongst the children was squint eye.

18.168 Miss Reidy reported that for the period between Miss Litster’s last inspection in November 1956 to the date of her visit, 132 infants were born in, or admitted to, the institution; 103 were maintained by health authorities. Twelve infant deaths had occurred during the period. The majority of infant deaths were neo-natal and occurred in the maternity hospital. Two infant deaths occurred in the home; both were three months old at the time of death and both died of pneumonia.

18.169 Miss Reidy noted that the majority of the children were recorded as discharged with their mother to the family home or to near relatives of the mother. Adoptions to the USA had decreased and Irish adoptions had increased. Boarding out from the institution had virtually ceased. The infant death rate, 60 per 1,000, was high. The majority of deaths, however, were during the neo-natal period, some attributable to congenital conditions.

The 1960s

18.170 Miss Reidy next visited Bessborough in November 1961. There were 57 women and 60 children there at the time of inspection. Five children were unaccompanied; three of their mothers were in ‘mental institutions’ and the whereabouts of the other two were unknown. One of the unaccompanied children was described as ‘mentally deficient’. She reported that the accommodation for both mothers and children was ‘clean, well-kept and adequately comfortable’ and that the well-being of all was ‘satisfactory’. Since her last inspection in August 1958, 175 infants had been admitted to Bessborough; 160 were born in the institution and 15 were admitted after birth. Over half the children who were

As was often the case, the children were most likely to have been subsequently placed for adoption or boarded out. Statistics recording the final confirmed placement of children born in Bessborough show that just under 75% of those born in the 1950s were adopted; in the 1960s the figure was over 95%.
discharged were placed for adoption. One infant death was recorded during the period under review.

18.171 In April 1964, the secretary of the Cork Health Authority (see Chapter 1) wrote to the Department of Health to advise that it had made arrangements with Bessborough to house children awaiting adoption. The Cork authorities stated that some children in their care were housed in locations not readily accessible to prospective adoptive parents and that they had already transferred children from St Clare’s Home, Stamullen, to Bessborough. Miss Reidy had no objection to the move. She said that the Sacred Heart homes were all excellent and that children who had been transferred from The Children’s Home, Tuam, whom she described as ‘mostly backward’ had thrived both physically and mentally in the care of the Sacred Heart community. The department subsequently agreed to the payment of £3 5s a week for the maintenance of children awaiting adoption in Bessborough.

18.172 Miss Reidy inspected Bessborough again in October 1964. There were 44 women and 54 children living in the home. The accommodation for mothers and children was satisfactory and comfortable. In the period since her previous inspection, in November 1961, 408 women (364 public and 38 private) had been admitted. The number of admissions during this period was more than double that recorded in previous years. Twelve infants born during this period subsequently died; one died in the Bessborough home and the others in St Finbarr’s Hospital. The majority of the children were adopted through a number of adoption societies. One mother and her infant were transferred to Sean Ross ‘for disciplinary reasons’.

18.173 In 1966, the Cork Health Authority asked the congregation if they would admit unaccompanied infants to Bessborough. The congregational council was reluctant to agree to the proposal but expressed concern that a refusal to accept unaccompanied children might lead to the loss of all other work in Cork. The council subsequently agreed to admit unaccompanied infants ‘on a small scale’.  

18.174 A file relating to an infant living in Bessborough in 1966 contained an infant diet sheet. The diet sheet stated that each infant received ABIDEC (vitamin drops) and Vitamin C daily and that the infant feeding regime was as follows:

7am: Gruel

---

50 Congregation of the Sacred Hearts of Jesus and Mary, Council minutes, 12 November 1966.
9am: Rusk in milk
12.30pm: Creamed potatoes, vegetables, minced meat, gravy, milk pudding.
4pm: Bread, milk, whisked egg.
7pm: Rusk in milk.

18.175 In August 1969, the Irish Times published an article in which a journalist gave an account of her visit to Bessborough.51 The Mother Superior told the journalist that she was aware that Bessborough had ‘an unpleasant reputation’ and that ‘many girls from the country still feel that it is a prison’. The journalist noted that this misconception did not distress the Mother Superior in the way one might expect and that her main concern was that such misconceptions prevent women from going there until ‘they are frantic with fear and see it as the only place to hide’.

They do not question the girl too closely about the circumstances of the pregnancy, give her a house name immediately she arrives by which she is known for the rest of her time there, give her an address to which post can be sent, contact her local health authority or County Council with practised discretion, and provide her with medical care before, during and after the confinement, and then with an adoption or fostering service...When a girl arrives at the convent (and they come at many different stages in the pregnancy) she is immediately brought to the Hospital wing for confinement. Two doctors from the city attend there, an obstetrician and a gynaecologist. They do not attend the actual birth, but examine any girl causing the midwives anxiety, and refer difficult or uncertain cases to a city maternity hospital.

18.176 The journalist described the physical conditions as follows:

The nurseries and dormitories were bright clean rooms for two and three, and even some for one girl alone. Birthday cards stood in a gay litter in one room, framed family photographs appeared in a few others. The stringent cleanliness of the whole place indicates the somewhat unpalatable fact that much of the housework is done by the girls themselves… the first stage room is a little cell with an observation window in the wall. The delivery room, its two beds quilted in green brocade, has none of that paralysing strangeness of hospitals, but still looks comfortingly efficient. The girls are not given any information about labour and delivery until the process has in fact begun...There is a television, a somewhat limited book-case, a large room

51 Irish Times, 7 August 1969.
with a piano where the women dance, a recreation room with card tables…in
the nurseries babies were mitted and cosy.

18.177 The Mother Superior told the journalist that they operated a strict rule that the
mother must stay until the child was adopted or fostered. This could be a question
of months, or longer if the infant’s health was uncertain, if the baby was disfigured,
or physically or mentally deficient. In such cases, the Bessborough authorities and
the responsible health authority worked out suitable arrangements for the care and
treatment of the child. She stated:

Of course, if parents were prepared to accept a girl and her child, long stays
in the Home would be really a thing of the past. But our attitudes are not yet
so liberal to permit such generosity, or such a realistic solution of what to do
with the mother and the baby.

18.178 The journalist spoke to three women living in Bessborough at the time of her visit.
One woman, described as ‘a tall graceful girl of 24’ told her that she would never
have known what to do when she realised she was pregnant only for Angela
Macnamara’s ‘Ask Angela’ agony aunt column in the Sunday Press.52

She had told her boyfriend and he insisted that he was not the only man she
had slept with, and refused to admit to any responsibility. She was a clever,
hard-working girl and had an excellent job. She decided to go to England; she
was putting on weight, and she didn’t know what else to do until she read of
the existence of the Catholic Protection and Rescue Society. She was
directed to Bessborough, where she has been for six months now. Her baby,
a girl, is three months old and not yet adopted. Her family know nothing of it
all; she writes long letters describing non-existent activities. She prefers it
that way. Still, she has been under terrific mental strain, the high point of
which will come shortly, as her baby will soon be adopted. She went into
town last week to buy her child special clothes for going away. She dreads it,
‘it’s like a death. I can’t describe it’. If she had any help at all, she would have
kept the baby. She wrote to the father of the child when she was born, telling
him it was a little girl. He never replied. She is still incredulous at his
behaviour, for he is an educated man with a responsible civil service job.

52 See Paul Ryan, Asking Angela Macnamara: an intimate history of Irish lives, (Dublin, 2013).
Another woman, who was described as ‘strikingly pretty and intelligent’ had decided not to tell the father of the child that she was pregnant.

I didn’t want to marry him, so what was the point? Of course it takes a lot to go through, but the Sisters here support you, and you go through it. And knowing that the child has been placed with adoptive parents helps you. You feel that it is the best you can do for it in the circumstances.

This woman’s family would not have helped her at all and she ‘appreciated the protection and security’ she had been given at Bessborough. She expressed her hope that in the future a man that she was likely to marry would ‘accept this part of her life as a failure and that he would forgive it’. The woman then continued:

Is it failure really? You know, here you’re not treated like that. You’re never blamed or reproached. I think we seem to have sinned more against society than anything else. They just have no place for us.

A third woman, whom the journalist described as ‘a serene and sensible young person’ had not told her boyfriend that she was pregnant because she did not want to marry him. She was 20, and had been working in England when she became pregnant. She had contacted the Crusade of Rescue and had been referred to Bessborough. She intimated that over 50 of the girls living in Bessborough had been repatriated from England. The journalist noted that the woman was eager to give birth but stated that she had already decided to have the child adopted.

I don’t really want it now, and I hope I don’t change when it is born. I’m not ready for a baby. I’m not mature’.

The journalist concluded:

The mothers I spoke to were not bitter. They were just sorry that they were not wise enough in time and they would like to see some social acceptance of the unmarried mother and her child… For them it seems as if society is something which they are now safely removed from… The Reverend Mother is reflective. She loves her work, but it involves heartbreak. She would like to see a willingness on the part of the parents to accept the girl and her child, but feels that this will not come for a long time. It is a pity, she thinks, that the man involved can remain free, while the girls are trapped by the consequences of their shared action. She does not know what can be done about it. She only knows that girls in trouble should be aware that there is somewhere for them, while they have nowhere else to go.
The 1970s

18.183 In February 1970, the Mother General of the Congregation of the Sacred Hearts of Jesus and Mary visited Cork. The Sisters working at Bessborough told her that there was no future in the work they were undertaking in the home and asked that the congregational council review the situation. The Mother General met the Bishop of Cork, Dr Lucey, to discuss the matter. Bishop Lucey acknowledged that there was not a large number of women seeking admission to Bessborough but advised that it would be important that the congregation continue its work in Cork. The Mother General was happy to accept the bishop’s recommendation to keep the home open.\(^53\)

18.184 In July 1971, Miss Reidy again inspected Bessborough. Seventy five women (49 expectant and 26 post-natal) and 28 children were living there at the time. The premises were ‘very clean and well-kept’. Miss Reidy interviewed eight women individually. They ‘seemed generally satisfied with conditions in the Home’. In the period 1 November 1969 to 30 June 1971, 246 babies were born in Bessborough and a further 76 women were transferred to St Finbarr’s Hospital and gave birth there. Two neo-natal infant deaths occurred; both infants were born with ‘multiple abnormalities’. Some dormitory accommodation in the home did not afford much privacy for residents. The matron, Sister Hildegarde, acknowledged that the issue of privacy was a concern and that she was ‘gradually having the matter remedied’.

18.185 In December 1972, Sister Hildegarde was interviewed by a reporter from the *Irish Independent*. The article entitled ‘Unmarried Mothers - doors are still closed’ stated that, after 50 years of operations, Bessborough was still regarded as ‘Cork’s banishment house’. Sister Hildegarde was quoted as saying that the ‘the unmarried mother is no more acceptable to society today than she was fifty years ago’. The article went on to state that ‘inmates vary from 13 to 40 years old’ and that ‘a number of abortions were attempted, by various methods, before the unmarried mother enters the Home’. It was reported that one girl had consumed sheep dip compound in the hope that her baby would be born dead.\(^54\)

18.186 In July 1973, the *Sunday Independent* carried an article informed by a former Bessborough resident who claimed there was ‘inadequate food, lack of

\(^{54}\) *Irish Independent*, 10 December 1972.
recreational facilities and minimal medical care’ available at Bessborough. The woman’s main complaint was that she would have to remain in Bessborough after the birth to look after her baby until a foster mother was secured. Sister Hildegarde said that the complainant had been in the home for five days and was not qualified to make such statements. The chairman of the Southern Health Board said that the accusations were grossly unfair and that the board’s senior social worker had said ‘we have never come across adverse criticism from the girls there. I think the allegations are terribly unfair and must be a cause of unnecessary worry to the parents of girls there at present’. The editor of the *Sunday Independent* wrote that he had received a number of letters from former, and present, Bessborough residents repudiating the allegations.

18.187 In January 1974, Miss Reidy’s inspection report stated that considerable alterations, reconstruction and improvements had been carried out since her last visit and that ‘the position in relation to the lack of privacy is greatly improved’. Dormitory spaces had been converted into individual cubicles with wardrobes and lockers. In addition, recreational activities had also been improved and residents could avail of a TV room, recreation room, smoking room and a record room for playing music. All recreational areas were decorated with ‘colourful tapiflex’ and Marley tiles’. Forty-five women were living in Bessborough at the time and six expectant women were absent having gone to spend Christmas with friends. In the period 1 November 1971 to 3 January 1974, 361 babies were born in Bessborough and a further 94 women were transferred to St Finbarr’s Hospital to give birth. Three neo-natal infant deaths occurred during this period; the certified causes of death were gross congenital deformity, prematurity, and pneumonia.

18.188 Miss Reidy again interviewed eight women individually and reported that all spoke well of conditions in Bessborough in general and all expressed ‘much appreciation’ of the Sisters, particularly the community’s ‘appreciation of their problems and their efforts to iron out difficulties’. Four of the women interviewed said that their parents were not aware of their whereabouts. Two women said that only their mother knew where they were. Some criticisms aired by the interviewees related to ‘a lack of bath cleaning materials’ and ‘under-heated dormitories’. Miss Reidy noted that while one complaint was easily remedied, the under heating was the

---

57 *A type of vinyl flooring.*
result of a nationwide shortage of fuel due to the 1973 oil crisis. Miss Reidy herself raised concerns about the amount of light wood which had been used in the provision of cubicles. It was not clear whether fire experts had examined the area and she recommended that the Southern Health Board might clarify the matter. At the city architect’s suggestion, a fire escape corridor was added to the area housing the new cubicles.

18.189 In May 1978, Miss Reidy conducted another inspection. Her report has only partially survived. She noted that, at the time of her visit, ‘the wellbeing of mothers and infants appeared very good’. The premises were clean and well-kept and records were available and ‘properly posted’. In addition, she observed:

My visit coincided with the warm sunny spell. From what I could observe the ‘girls’ took full advantage and spent most of the day out sunbathing. They give little, if any assistance in routine work. The staff are hard at it full-time, and in my opinion are barely adequate for the volume of work involved in Infant Care and to maintain proper standards of cleanliness and hygiene.

18.190 At the time of the visit, there were 28 staff working at Bessborough. The maternity hospital was staffed by five qualified nurses (four of whom were also registered midwives), one midwife and three ancillary staff. The nursery had two qualified nurses and five ancillary staff. Five staff were involved in administration. One Sister and two ancillary staff ran the laundry. One Sister and two ancillary staff ran the kitchen. The matron was qualified in general nursing and midwifery. Dr Sutton remained as consultant gynaecologist and there was also a consultant paediatrician. The community was looking for additional staff and Miss Reidy recommended that the Southern Health Board help them to find extra staff.

18.191 In March 1978, the capitation rates at Bessborough, which were £3.00 per day for women and £1.50 per day for infants, were increased to £25.20 a week for mothers and £12.60 a week for infants. The matron wrote to the Department of Health to acknowledge the increased rates but argued that they were still inadequate considering the level of service provided. It was pointed out that the increased rates failed to match capitation rates prevailing in other similar institutions. A Department of Health memorandum acknowledged that capitation rates paid to mother and baby homes were not standardised and a note stated ‘we
always felt that the discrepancy in rates would arise at some time’. Furthermore, the matron stated that Bessborough was ‘heavily subsidised in terms of finance and personnel by the Order’ and that their finances were so poor that ‘Sisters involved full time on a professional basis are unable to draw their salaries’. She cautioned that although the congregation was most anxious to continue its work, financial difficulties might force it to ‘curtail or reduce the present level of service provided’.

18.192 In May 1978, two staff attached to the finance unit of the Department of Health visited Bessborough to examine the institution’s finances. The institution was stated to have had a deficit of £11,465 in 1977. When salaries owed to the religious staff were taken into consideration for 1978, the deficit would be £78,940. It was also considered that the number of staff employed was below acceptable levels and the matron stated that she required funding to employ an additional five permanent staff. Miss Reidy subsequently confirmed that staffing levels ‘fall short of what would be considered acceptable by present day standards’. In his report to the Department of Health, one of the finance staff recommended that the Southern Health Board provide a grant to the institution to cover some of the maintenance costs and advised that a standard policy on pay and personnel, particularly in relation to religious staff, ‘should be evolved as a matter of urgency’. Miss Reidy’s report for 1978 noted that 12 of the 14 nursing staff at Bessborough were members of the Congregation of the Sacred Hearts of Jesus and Mary.

18.193 Between 1 January 1976 and 19 May 1978, 418 women were admitted to Bessborough. In that period, 247 babies were born in the institution and a further 229 women were transferred to St Finbarr’s Hospital and gave birth there. Two infant deaths occurred. One was recorded as ‘very premature’ and perinatal hyaline membrane was given as the cause of death of the second infant. There were four unaccompanied children there. One child, aged 13 months, had been abandoned by its mother and the health board struggled to find a foster home as the child suffered from outbreaks of eczema. A six-month old infant had also been abandoned by its mother and the health board was trying to contact her. An 11-month-old infant admitted from St Finbarr’s Hospital was awaiting adoption. The fourth child, aged 14 months, had a physical handicap and adoption had been postponed pending surgical intervention.

58 Capitation rates were always higher in Dunboyne – see Chapter 35.
18.194 In February 1977, a fruit and vegetable shop in Cork city, owned by the congregation and run on their behalf by two lay women, was closed. It would appear that the shop premises had been bought by the congregation in 1930 for £350 to sell their farm produce. The farm at Bessborough does not appear to have been in operation after 1960. The money held in the shop's bank account was split between the congregation and the shopkeepers. In 1979, the local authority told the congregation that the land directly in front of the main house at Bessborough was required for a water main for a proposed new development. This work was eventually undertaken in 1982 and the congregation received compensation of £18,000 as the land was out of commission for a number of years. The congregational council decided to give £5,000 of this money to set up a separate bank account for the Sacred Heart Adoption Society (which operated from Bessborough). However, the council envisaged that the adoption society would be phased out over the coming years due to falling birth rates. A request from the Mother Superior, Sister Martha, for the construction of a swimming pool at Bessborough was refused by the congregational council because of the uncertain future of the home and on the basis that women spent relatively short periods in the institution.

The 1980s

18.195 In April 1981, Miss Reidy reported that substantial work had been undertaken at Bessborough. The institution had been fitted out with a new boiler, washing machines and tumble dryers and the kitchen was fitted with a cold room and dish washer and a new gate to allow ambulance access. The major work undertaken was in relation to fire safety which saw fire escapes fitted to the upper floors of the home, seven fire exits installed in the maternity hospital, the complete electrical re-wiring of the nursery and the application of fire-proof plaster board to wooden partitions. Miss Reidy reported that the premises were clean and well-kept, records and registers were up to date and the wellbeing of the residents was satisfactory.

Residents included two third level students respectively, one second level and one art student. Where coaching is necessary it is undertaken on a voluntary basis by teachers. Examination candidates are few and in the main attend the

---

60 Sisters of the Sacred Hearts of Jesus and Mary, Council minutes, 1977-83.
local examination centre. On one occasion, special consent had to be given
to appoint an invigilator to supervise the examinee in the Home.

18.196 In the period since her previous visit in April 1978, 194 babies were born in
Bessborough. A further 101 women were transferred to St Finbarr’s Hospital, and
12 to the Erinville Hospital for delivery there. Five stillbirths occurred among
women transferred to St Finbarr’s Hospital. Two infants died in Bessborough
during this period; the causes of death were given as prematurity and brain
haemorrhage. By this time, Dr Pillay had succeeded Dr Sutton as consultant
obstetrician to Bessborough - see below.

18.197 In May 1981, the Department of Health wrote to the Southern Health Board (SHB),
about the rates of perinatal mortality at Bessborough. The SHB reply, sent in
March 1982, stated that the facts were as reported by Miss Reidy: six neonatal
deaths occurred in the period mentioned, two in Bessborough itself and four in St
Finbarr’s Hospital, and five stillbirths occurred in women transferred to St
Finbarr’s. The SHB acknowledged that this perinatal mortality rate was twice the
national average. The Director of Community Care for Cork investigated the
deaths and determined that ‘little could have been done in any of these cases’.
Four of the women involved had an average age of 17 years. Of the neonatal
deaths, two showed ‘gross deformity’ after birth, and one was ‘extremely
premature’. Of the other three cases, ‘one involved extreme toxaemia, another
pneumonia and another was transferred in labour and delivered as breach (sic)’.
The SHB advised the department that it was considering the future of obstetrical
services at Bessborough.

18.198 The Sacred Hearts Home, Hospital and Adoption Society, Report 1982,\textsuperscript{61} stated:
Our aim is to help the girl accept the new life within her. We do this by
helping her understand her situation, to restore her feelings of self-worth and
esteem. At the same time, we are acutely conscience of the pressures on the
single pregnant girl, from family, boyfriend and from society. There are no
easy solutions to these complex and deeply human problems. We do provide
a comprehensive programme that takes into account the welfare of the girl
and of her baby.

\textsuperscript{61} The Commission has not seen such reports for other years.
The report said that in 1982, services offered by Bessborough included: medical and obstetrical care; child care; individual/group counselling; group living; continuation of school education; adoptions; fostering; post-adoption family counselling and help with extra-marital pregnancies. The maternity hospital was staffed by a matron, six nurses and four visiting doctors. Services included prenatal classes with a psychoprophylactic exercise programme along with information sessions on nutrition and child development. Classes in child care were offered for women who planned to keep their babies. Nurses were available for personal health counselling and the identification and treatment of medical problems. Residents were examined by a resident midwife and by a specialist obstetrician at weekly clinics.

The report said that in 1982, 218 women were admitted to Bessborough. They were referred by Health Boards (35%); General Practitioners (22%); St Anne’s Adoption Society (17%); direct referrals (14%); Catholic Protection and Rescue Society (7%) and priests (5%). The Congregation of the Sacred Hearts placed a further 23 expectant women with families in the community. One hundred and eighty eight babies were born during the year; 150 were delivered in Bessborough and the remaining 38 were born in outside hospitals. Ten women had made prior arrangements with city hospitals for the delivery of their babies and the remaining 28 were transferred to St Finbarr’s Hospital due to twin pregnancies, foetal distress, breech deliveries, disproportion and toxaemia. No stillbirths, neonatal or maternal deaths occurred in Bessborough during 1982.

In 1982, 135 infants were discharged from the Bessborough home; 95 were placed for adoption; 36 were discharged with the mother and four extra-marital babies ‘were dealt with’. Infants who were not discharged during the neonatal period were cared for in the home on a short term basis ‘giving the mother time to come to a mature decision about her baby’s future’.

This report stressed that the main characteristic of the home was ‘Group Living’. The authors acknowledged that some ‘girls’ found group living difficult and women who could not settle in the home were placed with a family in the community until they went into labour. The report stressed that group living was designed to make each woman entering Bessborough aware that her situation was not unique, that she would benefit from the support and understanding of her house mates and that she would see different ways of dealing with her pregnancy in its different stages.
18.203 A section of the report, accredited to a resident of the home, said that group living was, for many, ‘a strange and difficult experience fraught with tensions and frictions’ caused by ‘clash of personalities’ and the fact that ‘many women were under immense emotional strain’. However, the woman went on to state that communal activities such as helping in the nursery, attending shorthand/typing courses and parties organised by a local youth group ‘allowed staff and residents to communicate in an easy and relaxed atmosphere’.

Finding oneself alone and pregnant is a shattering experience especially in a society where one is frowned upon and condemned. It is therefore relieving and comforting to know of the existence of the Sacred Hearts Mother and Baby Home, a refuge where one can have one’s baby away from the knowing stare and the pointed finger… It is consoling to know that ‘I am not the only one’, and supporting to be with others in a similar situation and sharing the same experiences, pregnancy, rejection, etc.

18.204 With regard to the decision to adopt or keep a child, the 1982 report stated:

This is a decision that every single girl has to face. It depends on the personal situation of each individual and the particular circumstances of each case. In some cases Adoption would prove the correct procedure, while in other cases keeping the baby is a practical alternative. The decision should be a well-informed one carefully made by the girl herself once she has weighed up all the pros and cons guided by her Counsellor. It should not be a hasty one made largely in response to family and media pressures.

18.205 If the woman decided on adoption, the baby was placed with Bessborough’s adoption team, headed up by Sister Sarto. In her evidence to the Commission, Sister Sarto said that, in her role as social worker at Bessborough in the 1980s, she counselled birth mothers to help them to come to decisions about the future, both for herself and the child. She and two other social workers at Bessborough helped women to evaluate their options including the possibility of keeping the baby, taking the baby back to the mother’s family home, setting up home with the father of the baby or giving the baby up for adoption. Sister Sarto said that a nursery housed older infants, who were, in the main, children of women who had not yet made up their minds whether to keep their babies or to have them adopted. The women chose to leave their infants in the nursery while they took time to consider future possibilities for themselves and the baby with their families and partners.
When a woman decided that adoption was the best option for her child her appointed social worker explained the legal procedures for adoption to her. Sister Sarto told the Commission that when a baby was handed over to the adoptive parents it was a ‘joyful time’ for the new family and a ‘sad time’ for the birth mother. The women who placed their infants for adoption required much emotional support to cope with the sadness they experienced on parting with the child.

In the early days the mothers would not be present when the babies were handed over to the adoptive parents but as time went on each mother could choose to be there or not… In later years the birth mother could meet the prospective adoptive parents and even choose which family the baby would go to… The mother could also choose the social background of the adoptive couple.

Women who chose to keep their children were assisted with finding accommodation. Sister Sarto told the Commission that she obtained two houses for women leaving Bessborough with their children in the Mahon area from Cork county council which housed four women and their infants. In other cases, she helped women to find private rented accommodation and helped them to pay their rent. She stated that annual fundraising activities supported these initiatives and facilitated the procurement of prams, buggies and clothes for women and their babies. In 1984, the congregational council was asked if they would purchase a newly built house in the vicinity of Bessborough to convert into flats for mothers and their toddlers. The congregational council did not agree but gave a commitment to procuring rental accommodation to accommodate women and their babies who had no other options regarding accommodation when they left Bessborough.  

Educational opportunities

Sister Sarto told the Commission that, in response to increasing numbers of schoolgirls becoming residents, Bessborough’s education centre ran classes based on the secondary school curriculum and that social workers tried to provide girls, still in full-time education, with the means to continue their education through Vocational Educational Committee (VEC) schemes. In addition, AnCO, the Industrial Training Authority, ran a commercial course in the home.  

---

62 Sisters of the Sacred Hearts of Jesus and Mary, Council minutes, 1984-85.
63 An Chomhairle Oiliúna (AnCO) was established by the Industrial Training Act 1967 to provide industrial and commercial training. It was abolished in 1987 by the Labour Services Act 1987 and replaced by An Foras Áiseanna Saothar (FÁS). FÁS
could take courses in typing and hairdressing and a course in electronics was introduced in 1983. An AnCO tutor at Bessborough said that women who took a course were ‘happy and very interested in what they were doing’ and were all ‘anxious to get themselves back to work’. During 1982, 97 women availed of classes in the Bessborough Education Centre: 40 took an AnCO course; 33 took non-examination subjects; 13 were second level students and 11 were third level students. Exam subjects which could not be provided for in Bessborough were undertaken in a nearby secondary school. A preventive education programme, developed by social workers at Bessborough, was presented to teenage school children, male and female, in 14 schools during 1982. Sister Sarto told the Commission that the VEC provided the services of a psychologist who offered individual counselling at Bessborough and the Southern Health Board financed group therapy sessions facilitated by a ‘variety of professionals, many from UCC’.

Concerns about costs

18.209 A Southern Health Board (SHB) memo, dated April 1985, stated that Bessborough had two functions: (a) as a mother and baby home, and (b) as a registered adoption society, ‘which has twice been struck off the register and reinstated later on both occasions’. The SHB was unhappy with the cost of providing the Bessborough services; the cost was given as £450,000. The memo also suggested that the length of stay in Bessborough was generally too long and cited examples where ‘unmarried mothers who received Unmarried Mothers Allowance, and were also involved in AnCO training courses, were receiving free accommodation etc., in Bessborough’. The SHB ‘hoped to cut their £450,000 operating budget to ribbons’. The congregation’s council minutes show that, by 1987, the Bessborough budget has been reduced to £100,000.64

Closure of maternity hospital

18.210 In April 1985, the general hospital services division of the Department of Health wrote to Miss Reidy to say that a ‘nun/midwife’ working in Bessborough had been in contact in a private capacity to state that deliveries of babies should be discontinued there and that women should be transferred to a fully staffed maternity unit when they went into labour. The department considered that Bessborough was ‘more or less’ a matter for the Southern Health Board ‘who don’t

---

64 Congregation of the Sacred Hearts, Council minutes, 9 January 1987.
seem to have a high regard for it’. The letter asked Miss Reidy to keep an eye on Bessborough and added:

I would be interested in hearing any developments re discontinuance of deliveries, a move which the Division would favour in light of overwhelming medical opinion and evidence re non-consultant staffed units.

18.211 In August 1985, the Department of Health directed the Southern Health Board to take steps to phase out obstetrical services at Bessborough. The decision was taken in the interests of the safety of women and their babies and to bring services in the home in line with those provided in similar homes throughout the country. Mother and baby homes should have a ‘social function only’:

Serving as a refuge for unmarried mothers and their children and providing them with counselling and accommodation during the latter months of pregnancy and for a short period after delivery… For the unmarried girls who reside in ‘mother and baby homes’, and their babies, pregnancy and delivery carry a much higher than average degree of risk and this is particularly so during the perinatal period. The significant reduction in perinatal and neonatal mortality rates in recent years has been due to the vast improvement in maternity and neonatal services. To continue to carry out deliveries of this high risk group in a non-consultant staffed unit, funded by a Health Board, would appear to be contrary to the Department’s clear policy on deliveries.

18.212 In September 1985, the Department of Health noted that the Congregation of the Sacred Hearts of Jesus and Mary had agreed to discontinue obstetrical services at Bessborough and the Southern Health Board had made arrangements to transfer women for confinement in St Finbarr’s Hospital. The congregation records show that it favoured this change and agreed with the SHB proposal that women could stay in St Finbarr’s with their babies for up to four days. The SHB also stipulated that the maximum period for a post-natal stay in Bessborough would be six weeks. However, some of the women who gave birth in St Finbarr’s were requesting transfers back to Bessborough two to three hours after delivery. This combined with the compulsory discharge of the mothers after six weeks meant that nurseries at the home quickly became crowded with unaccompanied new-born babies. The SHB accepted that their new policy was not working and agreed to maintain women in the home for periods longer than six weeks. As a trade-off, the SHB insisted that Bessborough would also cater for women with extra-marital pregnancies and women on their second pregnancies. In addition, the SHB
decided that if a woman had decided to keep her baby that she would be obliged to care for her child ‘as any other mother in a home situation - feed, prepare feeds, wash etc. total care’ while living in Bessborough. The SHB also directed the Bessborough authorities that no woman was to be allowed re-enter the home to participate in an AnCO training course and that such courses were to be undertaken on a non-residential basis. The SHB stated their concern that single mothers claiming social welfare payments would also use the Bessborough address to claim a training grant.

**Tracing**

18.213 The congregational council minutes show that there was a significant increase in the number of people contacting Bessborough ‘seeking their roots’ and looking for documentation and information relating to their time in the home. It was noted that this work was time intensive and that the sisters had received around 100 tracing inquiries in the last six months of 1987.65

**Rationalisation of mother and baby homes**

18.214 In February 1986, the Department of Health child care division drew up a rationalisation programme for mother and baby homes and infant nursing homes. The stated rationale of the proposals was to bring the facilities in question ‘in line with modern-day thinking and needs’ and to provide scope for ‘the re-deployment of any surplus resources into the development of support services for these families, in their own communities’. Among other things, this programme suggested closing Bessborough. The department stated that ‘greater tolerance and compassion’ towards the single pregnant girl, along with the development of voluntary organisations providing support, advice and information to single mothers who wished to keep their children, had accelerated a drop in demand for mother and baby homes. The introduction of the Unmarried Mothers Allowance in 1973, the falloff in the number of children being placed for adoption and the rise in the number of Irish women seeking abortions in the UK were cited as further factors which influenced the demise of the mother and baby homes.

18.215 The department noted that there were only 14 women in Bessborough in December 1985. The department proposed that services at Bessborough would be gradually phased out and replaced with a scheme providing ten supervised

---

65 Congregation of the Sacred Hearts, Council minutes, 4 January 1988.
flatlets supported by ‘a strengthened community social work service’ and ‘an expanded fostering programme’. It was envisaged that this scheme would cost in the region of £60,000 each year and would represent a significant saving to the Southern Health Board, which had provided funds of £444,300 to Bessborough in 1984. It was suggested that the surplus resources would be allocated to other child care services.

18.216 In April 1988, the congregation began to develop other services at Bessborough. Sister Sarto formed the Blackrock Heritage Committee whose stated aim was to develop the Bessborough estate as a ‘cultural, educational and leisure amenity and tourist attraction’. The congregation also planned to extend its services for one parent families with a focus on improved accommodation, additional counselling and guidance facilities and wider access to second and third level educational courses.

18.217 In January 1989, a Department of Health official visited various institutions in Cork, including the Bessborough home. In her report, the official stated that, despite an agreement between the Southern Health Board and the congregation, reached three years earlier with a view to phasing out services in the home, institutional services for women and their babies had continued at Bessborough. Furthermore, the Southern Health Board had allocated £300,000 to Bessborough for 1989. There were 22 expectant women living in Bessborough at the time of her visit, two of whom ‘were on their second pregnancy and had toddlers staying with them’. She noted that most of the women attended an onsite FÁS Training Centre during the day.

18.218 In 1991, a report on Bessborough by two members of the congregation noted the varied work which was being carried on there. They noted that the congregation was actively involved in training and educating the pregnant women and that an onsite social welfare officer advised women, and those undertaking training courses, about their social welfare entitlements. In addition to the hostel for single expectant women, the Sisters operated a day nursery and crèche for working mothers and maintained three flats for mothers and babies waiting for housing and a number of short stay flats for mothers and their new-borns. Of the ten infants housed in the nursery at the time of their visit, one or possibly two were going for
adoption. They noted that Sister Sarto was kept busy dealing with ever increasing queries from former residents.⁶⁶

18.219 The congregational council minutes for 1996 noted that, due to the negative attitudes towards the religious in Ireland, the authorities at Bessborough did not see fit to undertake fund raising activities. It was also noted that a negative programme broadcast on Irish radio relating to living conditions in Bessborough during the 1950s further impacted on their ability to raise funds. The Mother General donated £10,000 to the home to help bridge the shortfall.

18.220 Bessborough continued to provide services for single women and their children, as well as married women with extra-marital children. In the period 1986 to 1992, 826 women, or an average of 118 women a year, were admitted to the institution. By 1998 this had dwindled to just 37 admissions. In July 1998, Sister John Vincent wrote to the registrar of the Adoption Board to say that the congregation had decided to withdraw from the placement of babies for adoption but wished to continue its work of ‘search and reunion’ and the care of expectant women. The last single expectant woman was admitted to Bessborough in November 1998 and the last woman and child were discharged in November 1999. Other services for vulnerable women and children continue to be provided.

Evidence of former Bessborough staff

Sister Mary McManus, was in Bessborough 1948-69 and 1970-1998.

18.221 Sister Mary was born in 1926. She entered Bessborough in 1948. She worked in one of the nurseries in the home looking after toddlers. She said that the hospital was completely separate from the home and was run by a matron. The women gave birth in the maternity hospital and were transferred to the home with their babies after around six weeks. The four nurseries in the home were overseen by four registered nurses from among the congregation. Sister Mary said that the social stigma associated with single motherhood at the time was ‘terrible, shocking’. She described the women:

They came in very distressed, very sad and they didn't want anybody to know about them and we tried to protect them all the time. I was trying to make up stories for them and help them, do all I could, you know, so that the

neighbours or the parents or family nobody wanted to know them… Well, we pretended that they were in England or pretended they were in Scotland and the Sisters abroad, we sent the letters over and the Sisters would stamp them… and they would stamp the letters and send them back and pretend that they were working in England… They were rejected by society, it was very sad, shocking and they were lovely girls.

Many women entering Bessborough gave false names to protect their identity. This became obvious when a tracing inquiry was made. In relation to ‘house names’, she said:

That is what they wanted; God help them that is because they didn't want - it was all confidentiality. All the time to protect them, all the time to protect, all my life trying to protect them.

18.222 She remembered that girls as young as 14 were admitted. She remembered one girl turning up at the convent covered in grass and carrying a baby having given birth in a field. In another instance:

This girl came, this girl came at 1 o'clock in the day. She came - now, this was in the early 80s, she came at one o'clock in labour. I answered the door to her and she said to me ”do you think I could be back at 6 o'clock in the evening?” I said ”I am sure you will”. So I took her down to the labour ward and she gives a list. ”Will you ever go down to the shop and get the groceries for me because my mother is in bed an invalid and she doesn't know I am having the baby”. I brought her over and handed her over to the midwife and she had her baby and she was back at 6 o'clock. And we couldn't hold her… We got the doctor and we couldn't hold her. And she went away and she didn't live too far away and she went back and the mother never knew a thing about her. And then she came back after a couple of weeks and sorted things out with us. We rang her doctor and we did everything… She went away after the baby was born, that was the pressure of society on her.

18.223 Sister Mary stated that she was responsible for dress making and sewing in the institution and that, in the early years of the institution, all women dressed the same.

And we, you see, some of them would - we didn't - some of them came in with clothes, some came in just with what they had on them. And we didn't want …
one looking down on the other and that is why we had them all in the same
dress… Until I think it was the 60s then, the girls decided and we decided
that [they could wear their own clothes]

18.224 She said that the women’s clothes were made from simple patterns made from
either blue or red fabric. Many women helped to make the clothes and some
brought their own patterns with them. She taught women tapestry, marquetry and
lace making.

18.225 Sister Mary said that, when the nursery at Bessborough became overcrowded,
children were transferred to St Finbarr’s Hospital [Cork County Home] and children
who could not be adopted were transferred there also. The women’s relatives did
not help in any way and they did not want their children at all. Prior to the
introduction of legal adoption, the Catholic Women’s Aid Society placed babies in
the nursed out and boarded out informal adoption systems.

18.226 Sister Mary remembered that the nights at Bessborough were often ‘great craic’.
The ballet dancer Denise Moriarty often put on shows at the home along with
singers and other performers and they had regular concerts in the home. Danny
Hobbs used to show films in the home. The atmosphere in the home was ‘great’
and she heard few complaints.

I did my very best to make them happy, I knew that they were sad and lonely
and tried to help them and support them best I could. I really loved them and I
gave my whole life to them and I would do it all over again.

18.227 Sister Mary remembered the two Department of Health inspectors, Miss Litster and
Miss Reidy, visiting the institution. Dr Sutton [gynaecologist] and a paediatrician
worked at Bessborough for most of her time there. Dr Sutton visited the maternity
hospital Monday to Friday at 10am. She did not recall any child dying in
Bessborough during her time there. She worked in a nursery with toddlers and
older children and there were no deaths among this group. She explained that a
woman whose child died in the maternity hospital would not be admitted to the
home section of the institution. She never encountered such women as they were
discharged directly from the maternity hospital. Sister Mary did not know anything
about infant burials but stated her belief that infants were buried in the same onsite

67 However, her name is given as the informant on a number of deaths registered with the GRO.
cemetery as the nuns. (See the Commission’s 5th Interim Report) Sister Mary did not agree with the allegations made by June Goulding in her memoir (see below). She was particularly upset by the assertion that women in Bessborough were ‘treated like criminals’ and that they were in Bessborough solely ‘to atone for their sins’.

They were sinned against, the girls never sinned. They were just used. Poor little creatures, God help them… my heart went out to them.

18.228 Sister Mary said that, when she returned to Bessborough in the 1970s, she was on the committee of the Sacred Heart adoption society. She drove members of the committee around the country to interview prospective foster parents.

When the people would write in about adoption, we would ask them to come in and visit us. And we would ask them all about their - why did they want to adopt, all this sort of thing, you know. And we would give them a questionnaire and they would take it home and fill it in. And had a Garda report and all sorts of Garda references and finance and all that and their relationship with each other, did they want to adopt and why did they want to adopt, all that sort of thing. And then they would come in, the couple would come in together and we do, Sister would interview them and then we would bring them in quite a few times. The mother - the lady, the wife would come in on her own and the husband would come in on his own and then we would meet them again, you know, to see everything was in order and all that sort of thing. To make sure they really wanted a baby, you know, things like that. And what else, you know and then we visit the home and see was the home okay and all that sort of thing. And we'd visit the home several times before they got the baby to make sure.

18.229 She said that women in Bessborough put their babies up for adoption of their own ‘free will’. She stated that she had a good relationship with the women and that the decision to place a child for adoption ‘came from themselves’.

If a girl was leaving and she had the baby adopted, she would sign the Form 10, she would sign the Form 10: that was the first. Given the consent we could place the baby. And then when she signed the Form 10 if we - we could place the baby when she signed it. And then when the baby was six weeks old she could sign the final paper but she could still reclaim the baby until the adoption order was made. That could be six months could be 12 months, could be two years.
18.230 She said that ‘once a baby went’ the mothers left Bessborough. The women were free to leave the home then with no restrictions whatsoever.

**Sister Úna Mulvey, [Sister Celeste] Bessborough, 1970-85⁶⁸**

18.231 Sister Celeste worked as a midwife in Bessborough from 1970-85. She worked in the nursery with two lay nurses. Both lay nurses were salaried and, as far as she was aware, were paid by the congregation. Dr Pillay was the visiting obstetrician and Dr Eithne Conlon was the visiting GP during her time there. It was the policy to have one of the midwives present with the obstetrician.

18.232 Sister Celeste said that she observed changes in attitudes towards single motherhood in Ireland during that period. The introduction of Unmarried Mother’s Allowance was ‘a very big thing’ for women because previous to that most single women did not have the financial means to keep their babies. She also stated that there was more social acceptance of single motherhood in the 1980s.

So a number of them then began to rethink and they thought maybe they might keep their babies, you know, because that made a difference. So they were applying for the Unmarried Mother’s Allowance. It was much more acceptable to be pregnant. That was one of the differences I think. I suppose between the time I started there and the time I finished, by the time I finished I saw that, I began to wonder, do we really need to actually do deliveries here [in Bessborough] because most of the women coming no longer needed to hide. It was acceptable to be pregnant and they were out every day anyway down in the town and, you know, all places.

18.233 She said that in 1978 practically all the woman who passed through Bessborough put their children up for adoption but by 1985 a large percentage of women (she estimated 25%) were opting to keep their babies.

18.234 Sister Celeste said that she undertook a survey in 1984 to ascertain if women had any objection to being admitted to St Finbarr’s Hospital in the first instance to have their babies. All but one woman expressed no concerns regarding this suggestion. The woman who did raise an objection was a teacher from the Cork area and it was important to her that she would not be recognised because she feared that it might affect her position in the school.

---

⁶⁸ Sr Mulvey died in May 2020 RIP.
18.235 When Bessborough ceased to provide maternity services in the mid-1980s, they kept St Finbarr’s antenatal forms in the home to be dispatched with the women when they were transferred to St Finbarr’s for delivery. They were careful to maintain the women’s anonymity when filling in the antenatal forms.

When somebody needed to go to St. Finbarr’s I just sent the notes you see because on the notes that we had in the maternity there was nothing that was confidential, you know. It was all to do with the pregnancy and the mother and the baby, the growth of the baby and all that. There was nothing about her background or anything so it was safe enough for that to go with the mother.

18.236 Women continued to be admitted to Bessborough in the antenatal period. Most needed the time to come to terms with their pregnancy and most were ‘unwanted pregnancies’. Many women had been ousted from their family homes and many others had lost their jobs because they were single expectant women. Their time in Bessborough gave them an opportunity to consider their options.

18.237 Sister Celeste acknowledged that some women found institutional living conditions challenging.

Some of the girls would have, you know they would find it difficult, you know, to be with other people like if they were an only child and they suddenly, you know … and especially if they had been rejected and now they are with a crowd and, you know, they might find mixing difficult. So we would listen and we would see what we could do to help the person and that kind of thing.

18.238 She said that Sister Philomena undertook renovations at Bessborough as she was anxious that women would have some privacy while in the home. She put measures in place to ensure that women had their own rooms rather than living under dormitory conditions. Women did not work in the maternity hospital:

From my memory there was no mother, and I put my hand on the Bible, there was no mother who did housework of any description in the maternity. What happened in the rest of the house I cannot say … I don't ever remember a mother taking a brush in her hand.

18.239 Sister Celeste recalled that a woman who had been transferred to St Finbarr’s Hospital in the 1980s had told staff there that she had been involuntarily ‘digging potatoes’ and ‘scrubbing floors’. Sister Celeste stated that there was no farm in
operation at Bessborough during her time there and that floors in the institution were carpeted. There were employed staff in the maternity hospital ‘for cleaning and everything else’. She said that during her time at Bessborough women were busy undertaking AnCO courses and were paid £15 a week. Women could choose courses such as pottery, hairdressing, cooking, horticulture and typing. Many women living in Bessborough in the 1980s were doing the Intermediate and Leaving Certificates.

18.240 Sister Celeste said that she met and examined every expectant woman admitted to the maternity hospital during her time there. The regular contact with women allowed her to form a bond with them and their babies.

You know it is amazing, you know, if you are a midwife and when you are ... a baby in the womb and you know if you are in an outside hospital and you know they are just coming in once in a while, you mightn't see the same women the next time, but in Bessborough, you not only knew the mother, you began to know the baby. You almost had a relationship with the baby because you knew how they were kicking ... We knew them so well and we had a good relationship with them and they were so confident.

18.241 There was one infant death in the maternity hospital during her time there. Dr Pillay had been called to assist and performed a forceps delivery. The baby was born with the umbilical cord knotted around the neck and died after ten minutes.

I remember it so well and I remember Dr Pillay and the two of us we sobbed, we cried. It was the little girl in the bed who consoled us. The mother was the one consoling us. It was only afterwards I knew everything was back to front. We should have been consoling her and she was consoling us we were so upset.

18.242 She believed that the infant was buried in a family plot in St Michael’s Cemetery.

18.243 Sister Celeste stated that the infants born in the maternity hospital were moved to a larger nursery after about ten days. The mother might have gone home at this stage to consider her options. After a couple of weeks, infants were transferred to the nursery in the home and remained there until they were around 12 weeks old. She remembered that one child had been left in the nursery for five months as the mother had not come to a decision about its future. The sister in charge of the
home nursery felt that this was too long for the child to be unaccompanied but they had no interaction with the mother or the prospective adoptive or foster parents.

18.244 Sister Celeste remembered driving Sister Sarto to a farm to speak to a woman about a tracing request. Sister Sarto put some potted plants in the back of the car so that they could pretend to be selling plants when they arrived at the woman’s house. The woman in question had entered Bessborough under a false name but Sister Sarto had managed to locate her. Having arrived at the farmhouse, Sister Sarto asked the woman to sit in the car with her and then revealed who she was and stated her business. Sister Celeste stated that the woman was shocked and upset. The woman said that she thought about her time in Bessborough and the child she had there every day. She said that every night she had planned to tell her husband that she had had a child before she met him but could not bring herself to do so. She said that she could not let her children and grandchildren know this about her. Sister Sarto pleaded with the woman stating ‘the woman [her daughter] just wants to meet you’. The woman replied ‘I cannot meet her. Please leave and don’t ever come back’. Sister Celeste stated that the woman who initiated the tracing was contacting Sister Sarto regularly looking for news and subsequently arrived at Bessborough from America. She stated that Sister Sarto told the woman that she could not bring her to meet her mother and that this caused the woman to become ‘angry’. Sister Celeste stated that Sister Sarto was very upset by the case and felt that the woman held her responsible. She stated that this was just one case and that there were ‘lots more’ tracing cases which ended in this fashion.

18.245 Sister Celeste recalled one woman who arrived at Bessborough in labour. She had her immediately transferred to St Finbarr’s hospital. She arrived back to Bessborough with her child the following day. Later that day, Sister Celeste was told that this woman had ‘put her suitcase out the window’ and she was attempting to leave the home via an upstairs window. Sister Celeste told the woman that she was free to leave by the front door. She cautioned the woman that she may still experience some bleeding so soon after the birth and advised her to stay in Bessborough for postnatal care. The woman could not be convinced to stay in the maternity hospital. She agreed to sign a note stating that she was discharging herself contrary to medical advice. She left without her baby. Sister Celeste said that this woman subsequently returned to Bessborough to put her child up for adoption. The woman was insistent that the paperwork relating to the adoption be
done expeditiously and, as Sister Philomena was away, she drove the woman to a solicitor to sign the adoption papers. Sister Celeste said that about three years later this woman took a legal case against the congregation claiming that Sister Celeste had ‘forced her to sign an adoption order’. Sister Celeste produced the ‘self-discharge’ document. There was a significant time gap between the date of the woman’s discharge and the date on which she had returned to Bessborough to sign the adoption papers and the case against the congregation subsequently failed. Sister Celeste took umbrage with the woman’s claim that her child had been subject to a ‘forced adoption’. However she stated that in her opinion ‘the woman should have got her baby back’.

Sister Sheila Buckley, Bessborough 1971-74 and 1977-90

18.246 Sister Sheila was transferred to Bessborough, along with two nurses, when Castlepollard closed in 1971. There were between 40 and 60 women living in Bessborough at that time. At Bessborough, she worked with Dr Sutton, who visited the home once a week, and Dr Eithne Conlon. Sister Hildegarde was the Mother Superior at that time.

18.247 She did not remember a working farm during her time at Bessborough but there were greenhouses. The women living there were asked if they would prefer to work in the greenhouses or in the home. No woman ever refused to do work incidental to the running of the home and the women ‘weren’t really troublesome’. She never heard any complaints from the women and Sister Hildegarde was very sympathetic with them. She described the atmosphere:

Well they were always wary, when they came in, they made great friends among each other, the other girls that were there, you know. They were always very happy and contented there. They had a smoke room. They smoked a lot in those days, inside and outside. I mean they would play games and cards and that kind of thing. You would hear them laughing all over the place so they weren't really very unhappy. You would be saying be quiet and don't wake the babies in the nursery and things like that to them, you know. They were young as well, you know. But they seemed quite happy and contented, yes.

18.248 She said that Sister Isabella was in charge of the women while they were in Bessborough. Sister Isabella would refer them to a midwife if they were anxious
about their pregnancy. She arranged their meals and clothes and supervised the dining room.

She [Sister Isabella] was very kind to them really. She’d mothered them more than anything I would say. She was very considerate to them and always made sure that they had, you know, clean clothes and looked after their hygiene and things like that.

18.249 Sister Sheila said that there were no uniforms in Bessborough during her time there and that women wore their own clothes.

18.250 She was not aware of any infant deaths in Bessborough during her time there. However, she stated that infants who died in the home were buried in the congregational burial ground onsite at Bessborough.

18.251 In her second period working in Bessborough, Sister Sheila was assistant to Sister Philomena who arranged adoptions from the home. She remembered that women signed an adoption form before they went home but that they could claim the child back at any stage before signing the final adoption papers.

You would talk to them obviously, find out what the reasons behind it all were. Very often it would be the family, you know, that made them change their minds when they went home… Well you would go and approach the adoptive parents and tell them the mother had changed her mind. It all became very upsetting obviously for the adoptive parents but there was nothing that could be done about that.

18.252 Sister Sheila stated that neither she nor Sister Philomena ever put pressure on a woman to have her child adopted. Such pressure came from their families and ‘from society in general’. Women would often tell her that their decision to place their children for adoption was influenced by their own mothers or grandmothers. The women returned to Bessborough when they had made a decision and Sister Philomena would talk with them to make sure that they were happy to proceed with the legalities of adoption. Sister Philomena would then take the woman to a solicitor to sign the final adoption papers.

She would phone to say she was coming back, the mother would, yes, or write, you know … She might stay overnight a night or two but the ones I remember they just came in the morning and, you know, had their mind made
up and just went in and signed the paper, provided the solicitor was available, yes.

18.253 She described the process of handing over a child to adoptive parents:
In a normal case, well if the baby went from the Neonatal Ward where I would be working, I would dress the baby, the mothers provided the clothes, I would dress the baby and take the baby to the parlour. I would meet Sister Philomena and she would do the handing over of the baby… She [the mother] wouldn't be present where the adoptive parents were but she would know. She would be dressing the baby with me if she was still in the home… she would know the parents were coming that day for the baby. She would be with you but she wouldn't go to the parlour with you, not in my time.

18.254 Sister Sheila acknowledged that this was a distressing time for many mothers. The women would have a certain amount of information regarding the background of the adoptive parents but, as far as she was aware, never actually met them.

18.255 There were few supports available to women who wished to take their babies home with them and women who did so would have been dependent on the support of their families.

**Dr Pillany Pillay: Visiting Consultant Obstetrician to Bessborough in the early 1980s**

18.256 Dr Pillay trained in the Royal College of Surgeons Ireland and qualified in 1965. From 1974 to 1980, he was a Consultant Obstetrician at St Finbarr’s Hospital, Cork. He became involved with Bessborough through his association with Dr Sutton who also worked in St Finbarr’s Hospital. Dr Sutton was visiting Obstetrician to the Bessborough Hospital from 1945 until his death in January 1980. Dr Pillay said that women from Bessborough attended St Finbarr’s for antenatal classes. After Dr Sutton died, the Bessborough administrators would call Dr Pillay to attend at a difficult labour and his association with Bessborough grew from there. He stated that there was no official appointment but he received a ‘small cheque’ from the Congregation of the Sacred Hearts every month. Dr Pillay recalled that Sister Martha was the Mother Superior at Bessborough during his time there, Sister Sarto ‘administered’ the institution and Sister Celeste was the resident midwife. Dr Pillay said that Sister Celeste was extremely competent. He said that the women from Bessborough did not like attending St Finbarr’s for
antenatal treatment as they feared being recognised so he decided that he would conduct the antenatal care in Bessborough.

18.257 He also attended deliveries at Bessborough and women were transferred to St Finbarr’s only in exceptional cases. Sister Celeste delivered the majority of the babies and Dr Pillay was called if an episiotomy required repair or if a woman suffered from pre-eclampsia. He said that there was oxygen and nitrous oxide (gas and air) available to women at Bessborough but there were no epidurals available to them; epidurals were not available in St Finbarr’s Hospital at that time either. Local anaesthetic was used in cases where he repaired a birth passage. He said that women in Bessborough were well-fed and healthy. He understood that they did some work in the grounds of the institution and always seemed to him to be ‘quite a happy lot’.

A social worker worked in Bessborough for three months in 1984

The witness grew up near Bessborough and recalled that ‘it was kind of a local fear that if you stepped out of line you go to Bessborough’. She recalled walking through the grounds as a child, with her mother, who told her not to look at the women who were working there. She said that she was an intern trainee social worker at Bessborough. She recalled that there were three social workers there at that time: Sister Sarto and two lay women. There were a number of training courses, such as gardening and secretarial skills, being offered at Bessborough during her time there and she sat in on these during her working day. In the run up to Christmas 1984, she was engaged in making holly wreaths with women living in Bessborough and another social worker. She remembered one girl in particular. She stated:

She was a teenager. She was definitely under 16. I was told initially by Sister Sarto I think it was, or one of the other staff members, that her family had dumped her at the door with her suitcase because she was pregnant as a result of incest and she had an intellectual disability, and I just remember her.

18.258 She also remembered two other expectant women who were waiting for their boyfriends to visit. She said that she did not know how to support them but sat with them as they waited. One man walked up the driveway to the main house and

---

69 Epidurals did not become available on request in Holles Street hospital until the early 1990s: Peter Boylan In the Shadow of the Eighth, Dublin, 2019.
both women ran out to greet him. Neither woman knew that this man had fathered each of their children.

18.259 She never saw the living quarters at Bessborough but stated that she had her meals with the women and staff every day. She recalled:

I never went beyond the dining room. There was a private, kind of where they were living, I was never allowed in there, but I had my meals there every day and I remember the food was really nice... We would have a three course dinner every day.

18.260 She remembered seeing some old women at Bessborough. Some appeared to be as old as 80 and she thought that they had been there all their lives and were institutionalised.

18.261 She said that she sat with the women making holly wreaths and they talked about their issues and about moving into independent accommodation. She stated that the conversations were about ‘typical stuff, boyfriends, labour pains and babies names and things like that’.

One might be kind of crying because her boyfriend didn't write and someone else might be thinking of what she was going to call the baby.

18.262 She remembered visiting some accommodation on the north side of Cork city to see if it was appropriate.

The women who I went to see accommodation with were from the north side of Cork city... They were kind of going back to the area, back to their own area but very much they were going to support in the community. Like, they were setting up home for themselves. It was kind of a positive thing.

18.263 The women did not use their real names during their time in Bessborough; they felt that this was in their own best interest. She never saw a doctor visiting Bessborough but she remembered that the women used to talk about Dr Pillay.

They used to talk about him in a very positive way. That he was gentle and I remember them explaining to me because I hadn't a clue. They were telling me about the different doctors and how it was good to get him. He was the one they were all hoping for.
18.264 The women in Bessborough during her time there were admitted three to six months before their due date. She never witnessed any mistreatment or maltreatment of the women in Bessborough and she recalled that any upset was always more to do with the boyfriends and the women’s own families. She did not see any relatives visit during her time there. She described the general atmosphere:

Well from what I could remember it seemed okay. I was probably glad to get out of there in the evenings but I suppose because I had grown up expecting all this awful stuff it seemed fine you know. It seemed comfortable and it didn't seem like - you know the classrooms didn't seem different to anything else you know. It didn't seem to be a problem… Now I went home when it started to get dark and I wasn’t there at weekends or anything but during the day it seemed ok.

18.265 She remembered that visitors did call to see women in Bessborough. However, these were always planned to avoid lots of visitors arriving together. The women did not speak freely when she was in their company and she was regarded as an outsider. Women formed their own relationships with other women in the home and there was a mix of young girls and ‘older, more streetwise women: they had little in common apart from the fact that they were pregnant’. She remembered some women talking about the processes of adoption and stating that they would have no control over it. She said that this had nothing to do with Bessborough and was determined by each woman’s specific set of circumstances. There was a general assumption that adoption would be the normal kind of outcome. However, she stated:

I think the girls that I went to the house with they stood out. They were kind of breaking the norm at that time. Maybe it was the beginning of people moving out into supported accommodation or whatever but they seemed to be, they stood out because they were doing something different.

18.266 These women were preparing to move into rented accommodation together and to live independently with their babies. She remembered that one of the social workers advised the women on the type of state assistance that was available to them. She stated that the social workers at Bessborough were confident that the women’s families would re-engage with them once they were settled in their own communities.
Yes, the girls were from Cork City. They were definitely from Cork City because I know the area we went up to and it was very near where they were living you know and I know the talk at the time with [other social workers] was that eventually their families would start kind of engaging with them and support them...It was a rented flat. It was nice...there was great excitement about it...Those girls; again I’d say they were young enough. You know I don't think they were even eighteen. They would have been quite young, or they might have just been eighteen, but they were young, but they knew one another so it wasn't just one in isolation.

18.267 She stated that some women had no other option. She did not see women receiving counselling but that that did not necessarily mean that there was no counselling available. Two of the social workers sat with the women every day during their classes.

18.268 She recalled being asked to assess the home of a prospective foster parent and she felt that she should not have been asked to do this due to her lack of experience.

18.269 She said that placentas were burned in an incinerator at Bessborough every Thursday and ‘you could smell them burning all over the grounds’. She wondered what that was like for women who had given birth there.

18.270 She recalled that the holly wreaths were sent into the city to be sold. However, she did not remember the Congregation of the Sacred Hearts operating a shop nor were women expected to sell anything. She said that there was no pressure on women to work quickly and that they sat working and chatting. She said that the older social workers were ‘kind, laid back and gentle’ and were a great support to the women.

18.271 She said that her time in Bessborough as a social worker left a completely different impression than the one she had grown up with and from what she had read about the institution. She remembered that the women living in Bessborough supported each other in their shared experience. She had no ‘heart-breaking or emotional’ memories of Bessborough. She was eager to stress that she was not ‘glamourising’ Bessborough, and that she had been there by choice. However,
she said that if it had been awful she would not have stayed there for three months.

**Sister Sarto, 1981-98.**

18.272 Sister Sarto worked in Bessborough from 1981 to 1998 as a social worker. She graduated from University College Cork and obtained a postgraduate qualification in social work from Glasgow University. She said that she oversaw Bessborough’s transition from a ‘medical’ to a ‘holistic’ system of dealing with women and their babies. She explained that maternity services at Bessborough ceased at the behest of the Southern Health Board around 1986 and that ‘because society was changing’ women could have their babies in St Finbarr’s Hospital and then return to Bessborough to be ‘looked after’.

When I say “holistic” I mean the whole lot. I did out a chart of all of the things, which was; the girl, the girl becomes pregnant but she has other problems as well. She may be a very young girl; she may be continuing her education. I approached the VEC and we got teachers who would do their exams. At that stage it was the Inter Cert and the Leaving Cert. If there was a third level student UCC would offer assistance. That would be, that would be education. Again as time was moving on and more and more girls were keeping their babies there were two, there were two nurseries, nurseries for the older child. The older child, when I say “older” maybe weeks or months, where a girl could not make up her mind whether she would have the baby adopted or not, or could she, we offered her all of the different choices that were available to her. Again as time was changing a lot of the girls were keeping their babies so what we needed was, and they were growing up, and what we needed was a crèche, so we started a crèche again.

18.273 Sister Sarto said that there were two other qualified social workers working at Bessborough during her time there. Their salaries were paid for out of a grant from the Adoption Board but she herself was unsalaried. She described the placement of children for adoption:

Well, first of all, the couple who were interested would have to write to us and we would reply to them, ask them to come for a visit and explain the procedure of adoption. In all we were obliged by the Adoption Board that three meetings had to take place; one to the home and two separate meetings, but it always meant that you would go back a second, maybe a third and a fourth time to see them... We would explain what they needed to
have; like birth certificates, baptismal certificates, character references, all those, Garda clearance, all of that. They would produce all of that. When we had all that all in place we would bring them back in again and discuss with them. We told them that we had a committee and in the committee was people of different disciplines and that we would decide how, what, what criterion would fulfil the need of the girl? The girl in the meantime would be, would be counselled by one of the social workers, [...] and then we had other social workers would come in for a short while. Together we would, the social workers and ourselves would sit down and these are the families, this is what the girl wants. She might not want; she may not want her baby to be placed in the country. She may want the baby to be placed - she may want a professional background or she may not want a professional background… The natural mother would have the control. I just wanted to say too that with the different professionals that we had on the Board they would do their own investigation. Like we had [...] who was a Superintendent of the Guards, he would be asked if there was any question of anything inappropriate he would do the investigation. For example, maybe somebody's husband might have an alcohol problem or whatever or would be known. He would do the investigations from that angle. Dr Conlon from a medical point of view, if there was anything on the medical because they were also asked for medical examination. Garda clearance also would come in. References from the employer. Income, whether the income that they were on would it be sufficient to support a child… In the process then the social worker would be, would be looking after the girl, the girl herself. This would all take place before the baby was born. If a girl came in at whatever time, two months, three months, at any time they would come in, the Social worker would look after her and try to get her to accept what is the best thing for this child, for your child… She would work that through with the mother. Was there a chance of maybe getting married, maybe keeping the baby, maybe the baby going home to grandparents? All of the options that were open to the girl they would be explored by the social worker and given time to absorb all of that. For herself, she would be a disturbed young woman coming in and giving her time to weigh up what she, the knowledge that she was given.

18.274 Sister Sarto said that all children were medically examined before placement for adoption. Any illnesses or physical and mental health issues were always disclosed to potential adoptive parents. The adoption process started when the
woman had made a decision on the matter and once the child was old enough for placement. In cases where a woman could not make her mind up about adoption, Sister Sarto said:

What we would say to a girl is go home if you can and make your mind up. See what it is going to be like if you go home with a baby and to take as long as she possibly could to make her decision. If it was going beyond the stage of maybe three months, four months then the social workers would become worried here is a child and it does not know where it is going. So again we would try and make contact with the birth mother to make, you know not to pressurise her but to make a decision for the sake of the child.

18.275 The Sacred Heart adoption society liaised with various health boards and other adoption agencies when considering the placement of a child.

… we had meetings with the Adoption Board at least once a year. We also had meetings with the Southern Health Board; Kerry, Waterford, Dungarvan and Wexford. If there was a family there that were a more suitable family for a baby then we would liaise with the social worker or the social worker from, we will just say from Kerry, might say well you can't place that baby in Kerry because it will be well known, its family would be well known so they would say will you place the baby for adoption… We would do that. So there was a lot of interaction going on between us. Also the Catholic Protection in Dublin, we had a lot of dealings with them in the past because some of the girls would come, would go to Dublin and get pregnant there, be sent to Cork. So we had a fair amount of dealing with the, I don't know what they are called now but they were called then the Catholic Protection and Rescue.

18.276 According to Sister Sarto, the mother’s wishes were paramount when it came to placing her child; it always came down to the same question ‘What did the mother want?’ Women were generally given a choice of three potential adoptive parents. The woman would be given alternative options if, having met the prospective parents, she did not like them. This was not always the case, particularly in the early 1980s when a relatively high number of women continued to seek admission to Bessborough. As the number of admissions reduced, women had more of a choice. Sister Sarto explained that the reduction in the number of women who sought admission to Bessborough in the late 1980s was due to ‘societal reasons’ and that parents had become more accepting of their unmarried daughters having babies. She acknowledged that the availability of state benefits to single mothers
was also an important factor. She had approached Cork Corporation in the early 1980s and asked them to provide two houses close to Bessborough to house women who were leaving the home with their babies but had nowhere to go. There were four flats in Bessborough that were also used as temporary accommodation for women who were keeping their babies.

I went to the Corporation and I asked for houses for the girls and they were, they gave me two houses. The girls who were keeping their babies needed more attention and they would be - we had, in the beginning the two houses there were three mothers and three babies in each house but then we found that three was too many so we cut it down to two. Then after that we had, we had hopes of building social housing for the babies but that didn't happen and the bust came... We would also have other houses that we might have an eye on. We had a house ourselves down the road, so we tried to cope with the girls who didn't have anywhere to go.

18.277 Women stayed in these houses until their social worker found accommodation for them. Women who needed 'a lot of support' tended to stay in these houses for longer periods.

18.278 Sister Sarto said that the use of 'house names' allowed women to maintain their anonymity while in the home and after leaving the institution but stressed that there was no compulsion on women to do so.

It was for the sake of the girl herself that she would require that, but if she wanted to keep her own name that was perfectly all right. The reason being that should they meet afterwards, two girls might meet afterwards, one may not care who knew it but the other may be conscious of it... and the same with us if we met a girl outside unless she approached us we wouldn't approach her.

18.279 She said that some women who sought admission to Bessborough did not want to stay in the home itself as they did not want to be recognised by other women living there at the same time. In these cases, women were placed with families in the community until the baby was born.

18.280 Two infants died in Bessborough during her time there. She said that both were buried in the congregational cemetery at Bessborough. A third infant had been disinterred from elsewhere and buried in Bessborough also. A plaque in memory
of the children who had died in Bessborough was placed on the folly in 1986 or 1987 and the congregation had organised a commemorative event at that time:

We had a special ceremony for it; we had a little hymn composed in their honour. We had a full day of celebration of this… we had a film director whose child had died. He had a special celebration there as well. So we had a full day of celebrating the deaths of the babies in my time, I think it was about 1986/87.

18.281 Sister Sarto did not know where children who died in Bessborough from the 1920s to the 1970s were buried. She said that she had visited cemeteries in Cork in a bid to ascertain where the children had been buried but could not settle the matter. Many women gave birth in St Finbarr’s hospital and, if a baby was born in St Finbarr’s and subsequently died there, she was not able to find out where they were buried.

18.282 The women admitted to Bessborough during her time there were generally referred by a doctor, priest, teacher or self-referred. The women were assigned a social worker and received counselling during their confinement.

Now when the baby is born a decision would have to be made what was best for her, for baby? If she decided on keeping, we would find accommodation for her and the social worker would continue to help her through any problems she had. In the meantime in the hospital they would be doing all of these exercises; what to do with the baby and how to look after the baby. If the girl, then if she went home she went home and she lived with her parents, stayed with her parents maybe and if she was not they would try to find a place for her. So the social worker would be dealing with all of that; getting her to acknowledge what has happened, to come to terms with what has happened and what is the best thing for your child, and taking her through all of that. Then a decision would be made.

18.283 In the latter years of her time at Bessborough the families of women living in the home became more involved. Mothers and grandmothers would visit women and, on seeing the baby, would advise the mother not to go through with the adoption. This became a more regular occurrence in the latter years of the home’s operation and the congregation encouraged family involvement in the decision making process relating to adoption. The social workers at Bessborough discussed the options available to women that might help them to consider keeping the baby
such as the prospect of marriage or hopes that the father of the child might
become involved. More and more boyfriends were becoming involved and willing
to support the women and their babies in this period.

18.284 Sister Sarto explained the adoption process:

If she decided look this is what I want to do we would produce Form 10 and
take her through Form 10 and what it meant, and that she had a right to
withdraw that consent at any time if she wished even though the baby was
gone for adoption. She was told about the legal side of that, that she had a
right and the adoptive parents have a right to take a Section 3 case... So the
Form 10 would be explained to her. She was told did she want her baby to
go, when does she want the baby to go? She just couldn't walk off and leave
it and we would be reminding her to make, to make her decision, whichever
way it was. If she decided then on adoption she signed Form 10 and a social
worker or anybody could, well the social worker could witness that Form 10.
Then it would be explained to her that after three months that she, you know
she would be making a decision, a final decision. Now if she was not ready
that three months could be extended. Eventually if she wanted to continue
and say, yes, this is what I want to do we would explain to her that she would
have to see a solicitor... The social worker would accompany her to the
solicitor, introduce her to the solicitor, he would have the Form 4 adoption in
front of him and he would explain to her, her legal rights. If she wanted to
continue and sign the paper she would sign. She would be told and this
finishes, you know you are no longer the mother.

18.285 Sister Sarto explained that a child was not placed with a family immediately after a
woman signed a Form 10. The congregation encouraged women to go home and
to think about their decision. Sometimes a woman would return to Bessborough
with a family member and they would take the child home. If the woman could not
make a decision then social workers at Bessborough would advise her not to sign
the adoption forms. If a woman had signed a Form 10 and subsequently decided
to keep her baby, the Form 10 was ‘torn up’. When a woman had made a decision
to put her child up for adoption, she was brought to a solicitor to complete the
process. This involved only the woman and the solicitor but a social worker sat
with the woman if requested to do so. The solicitor would always ask a woman if
she ‘understood what she was signing’ and that it was ‘what she wanted’.
The witness was contacted by Sister Sarto in 1983 to assist with landscaping and other work at Bessborough. He was a civil servant and he worked in Bessborough in a voluntary capacity. Sister Sarto had set up AnCO employment schemes which took on local unemployed men. When he started there, the farm had been neglected for over 40 years and the ‘place was a wreck’. The farm buildings were renovated under the AnCO schemes and he built a garden and courtyard for the women living in the home. He helped to design and build a heritage park at Bessborough in 1986 or 1987. He built a ‘Celtic garden’ with a waterfall feature to the south east of the congregational graveyard in the area adjacent to the folly, a feature he called ‘the Keep’. He dug up trees in the area surrounding the graveyard and folly garden feature.

18.287 He used a JCB to excavate the ground surrounding the graveyard and folly. He had to dig five or six feet deep to dig up the roots of trees. He was never told that he could not undertake ground works in any particular area at Bessborough. Some years later an archaeologist told him that the area surrounding the Sisters’ graveyard and folly was suspected to be a children’s graveyard. He frequently found large bones while digging in this area; he believed these to be the ‘very old bones of animals’. Because of their large size, he was satisfied that they were the skeletal remains of a cow and that he found nothing that resembled a human bone.

I would say that I did a lot of excavation down there and I came across nothing at all…That's why I am here really. To say that in my time down there...I came across nothing that would say that that was a child’s bones or a child’s skull or anything like that. I came across nothing like that.

He was not aware of any children’s burial ground at Bessborough and he never heard anyone speak about a children’s burial ground during his time there. As far as he knew, children were buried in St Finbarr’s cemetery during the time that he worked there and he ‘never saw any funerals down in Bessborough of babies’.

I dug up the water pipe twice, going into the place. So I did, as I said, a lot of excavation. When I went there the place had actually been neglected for
many, many years. So there was a lot of trees had grown up in the wilderness basically. So, when I was clearing the wilderness with the JCB, so I did quite a lot of excavation, but never came across any bones that I could say were children's bones.

18.289 He was working in Bessborough in the period when land to the east of the Bessborough estate, and adjacent to the congregational graveyard and folly, was sold to a private developer. The development of this parcel of land was halted by the economic downturn. He witnessed different stages of the development of this site and he remembered the mounds of earth that were dug up during the site clearance. He stated that he did not hear of any human bones being unearthed during this work.

18.290 He dug a crater 30 to 40 feet wide and around nine feet deep to create a pond in the area to the west of the congregational graveyard and north of the avenue leading to the folly. No human bones were unearthed during this work.

18.291 The witness used maps and aerial photography of the Bessborough estate, dating from 1951 to the present, to provide the Commission with in-depth information on various developments which took place on the Bessborough estate during his time there.

Evidence of former Bessborough residents

The experiences described by the former residents who gave evidence to the Commission are largely set out in their own words. In some cases, particular information which might identify the witnesses has not been included.

Resident A: Mother early 1960s

18.292 Resident A became pregnant when she was aged 18. She travelled to London and told a priest that she was pregnant. The priest put her in contact with the Crusade of Rescue who made arrangements for her return to Ireland. She felt that she should have stayed in England as she would have been able to keep her baby there. She was met at Cork harbour by a car and driver who took her to Bessborough.
I had never been to Cork before and knew no one there. I had no idea where I was going and did not know that once I had gone there [Bessborough] I would not be able to leave again.

18.293 On her arrival at Bessborough, she was given a uniform ‘canvas overall’. She said that her belongings and life savings were taken from her. She said that she was not allowed to leave the home as there were bars on all the windows and the doors were locked.

Even without these measures it would have been impossible to leave: all of our things had been confiscated, we had no clothes and no money. From time to time we were allowed outside but were always escorted by nuns… They marched us around like soldiers. These are the only times I remember being allowed outside.

18.294 She said that she had no rights in Bessborough. She was given a ‘house name’. She never saw anyone from the outside and she was not allowed to maintain contact with family and friends. She wrote letters to her mother which were sent to London first and then posted to her mother in Ireland. The nuns supervised and censored her letters and coerced her to write positive things about the home while she and her baby were ill. She stated that there was a ‘rule of silence’ in Bessborough and that those who broke it were ‘reprimanded’.

At Bessborough we got up at 5am every morning and went to mass. Afterwards we fed the babies in the nursery, but never our own. For the rest of the day we were assigned duties. I scrubbed the stone floors of the long halls and passageways. At around 7pm we were put to work in the community room where 20 or 30 of us sat around embroidering Christmas cards… We were put to bed at 9pm… We worked in this fashion every single day. We were never paid for the work we did. We were made to work even if we were very ill, as I was. No excuses were ever accepted—it was just as if the nuns had no hearts at all. There was no education given to us and no time for recreation. During the day we worked and prayed, prayed for forgiveness… I was often given night duty on the labour ward. If the labour ward was not busy I was made to scrub long, cold stone-flagged passages on my hands and knees all through the night.
18.295 She said that there were about 30 beds in her dormitory and that it was ‘always cold and draughty’. The women whispered to each other at night but were made to stand by the bed as punishment.

You could hear the girls crying at night. We went to bed frightened and always woke up frightened.

18.296 They were able to bathe but were seldom allowed to.

I really only remember eating potatoes during my time there, though we had sausage on Sunday mornings. The sisters lived in the Convent and definitively did not eat the same food we did. They had us to serve and wait on them and lived a beautiful life compared to us… You had to show respect to the nuns every time they passed, and each time they would demean you.

18.297 Most girls ‘towed the line’ and learned how to stay out of trouble. Some tried to ‘escape’ but were ‘captured, brought back and punished’. Women were ‘routinely denied contact with their children’ as punishment.

18.298 She said that she received no medical care during her pregnancy in Bessborough and never saw a doctor or a nurse. She stated ‘I had none in Bessborough, no care at all. I never remember being examined’. She said that her work in Bessborough included scrubbing the hallway and attending in the labour ward at night. There was no one in the labour ward to assist women in labour at night and the nuns only attended for ‘daylight care’.

18.299 She did make friends at Bessborough. She recalled, ‘they were beautiful girls. I mean that’s all we had, we only had each other’. She said that one woman’s mother sent her food. She said that, when she went into labour, she was locked in a room alone for 72 hours. She was afraid and in terrible pain and when she screamed or called for help she was ‘abused’.

I was screaming with the pain, three days screaming with the pain and all you got was, "Oh you should have thought about this nine months ago." "You have got to suffer for your sins and you have got to put up with it." And the more you screamed the more she abused you, which I call abuse now.

On my second day in labour I was given an injection by Sister Veronica Cleary [midwife]. To this day I do not know what the injection was but I believe that this was what caused my baby’s death and almost caused my own.
18.300 She said that she overheard two nuns arguing and one accused the other of injecting her with a dirty needle which had caused an infection. She said that she developed an abscess at the injection site and that she became unwell soon afterwards. Dr Sutton lanced the abscess.

I had an abscess half the size of a football; it was protruding and at the very end I was terribly ill. I could only sit on one side of my bottom and painful even then to sit and I was made to go to church, go to Holy Communion. I was terribly embarrassed, you know, to say the pain. But finally the doctor, Dr Sutton was called: a cruel, cruel individual because I wasn't turned over properly. He never said who he was, never said my name. He just flung you over on the side and brandished this long thin knife in front of me and then there was no preparation, there was no nothing, he just cut you and then went out. I could hear the poison pouring on the floor. They were all just inhuman.

18.301 She said that she wanted to give her son a specific name but the nuns refused to allow her to do so as the chosen name was a ‘protestant name’.  

18.302 She said that Bessborough was always cold and that she was forced to feed her infant in a cold passageway outside the nursery. She was not allowed into the nursery for reasons unknown to her. After two or three days the child ‘would not eat, would not drink his bottle and would not swallow’. She had developed an abscess on her breast and the baby was being bottle-fed. She said that a nun took the child from her, told her that ‘she was not feeding him properly’ and ‘almost smothered the baby by stuffing the bottle down the child’s throat’.

18.303 She subsequently became ill herself. She developed a lame leg, a high fever and a pain in her head but said that the nuns did not want to know. She asked for a nurse for herself, but she was ignored and given nothing to relieve the pain. She was told ‘It was your suffering, your sin and you had to cope with it’. She ‘was left there to die’ and she will never understand ‘the cruelty’. She described the nuns at Bessborough as ‘the most cruel, barbaric individuals’ she ever met.

18.304 The baby was transferred to St Finbarr’s Hospital aged 19 days. He died there 19 days later. The cause of death was given as renal failure and septicaemia.

70 A number of boys born in Bessborough were christened with this name; Resident A’s son was given this as his second name.
My son died at six weeks... My son was a beautiful, blonde-haired boy; perfect. I believe he died as a result of the neglect he suffered from those at Bessborough... Another woman told me that they had kept my son in a dying room. I begged the nuns to take my son to hospital but they only did so after two weeks had passed. My son died in hospital.

I was told by one of the girls that my baby was held in the dying room after he died and I asked where he was kept and I was told by a girl, who had a two-and-a-half year old baby herself that was in another part of the convent that he was in the dying room. I cannot get over this and this is one of the horrors that stays with me... I wasn't prepared for this inhumane treatment.

18.305 One of the nuns told her that her child was buried in the small cemetery at Bessborough.

...she told me my baby had died and I asked her could I go to my baby's burial and I was told I couldn't go, even though I was 100 feet, 100 feet away from the burial now I know he was buried 100 feet from where I was, I wasn't allowed to go with him. I don't know if he was buried in a coffin. I don't know if he was buried in a gown or what he was buried in. I don't know if there were prayers said over him. I have no information.

18.306 She said that if she herself had died she would be buried in an unmarked grave like her baby. A doctor was never called to attend to her or to her baby. She believes that she was discriminated against because she was 'illegitimate' herself.

I am sure there were other girls that were left out as well and other girls did disappear and, overnight with their babies and we presumed they had died.

18.307 She said that, after her child died, she was made to bottle feed other children in the nursery. It was always mothers who had lost their children who were given this task.

The conditions we were in were worse than a prison - prisoners have rights but we had no rights at all. They did whatever they liked to us and said whatever they liked to us. They were unbelievably cruel and could get away with anything because people in those days put them on a pedestal and believed everything they were told. There was nothing we could do about it.

18.308 She was discharged from Bessborough a week after the death of her child.
I could not accept how my baby had been allowed to die without any medical care. There was never even a kind or sympathetic word spoken to me and I was not allowed to attend his burial. The nuns believed in suffering for our sins.

18.309 Resident A was concerned that she did not get full information about her time in Bessborough. She said that other women were given full files relating to themselves and their children’s time in Bessborough but that she ‘received nothing’. Her records contained no information in relation to the injection she received or the treatment she received from Dr Sutton. She returned to Bessborough in the early 1990s to get information on her time. She met Sister Sarto who gave her some information. Sister Sarto brought her to the Bessborough cemetery and told her that she believed that her baby was buried there.71

Resident B: Mother, early 1970s

18.310 Resident B was a student aged 19 when she became pregnant. Her parents brought her to the Catholic Protection and Rescue Society, South Anne Street, Dublin, who recommended that she admit herself to St Patrick’s Mother and Baby Home on the Navan Road (Pelletstown). She did not want to do this as her parents considered the institution ‘too close to home’ and feared that her identity might become known. She finished her university examinations and her father made arrangements for her to live with an elderly couple in London, who it was proposed ‘would nurse her through her pregnancy’. She stayed there for two months:

It was awful. I was actually scrubbing floors and so on. It wasn’t what I expected. I was so unhappy in London and lonely and isolated that I rang home and said look, okay, I will go to Bessborough. That’s it. So I came back. I was seven months pregnant when I arrived there and I was surprised, because for me anyway, it was a bit like going to Boarding School, and I had all these girls around me who were pregnant, and I know this flies in the face of everything you read and so on, but some of the time, we had a great time. Some of the time we had midnight feasts and you know we went out roaming around the grounds and getting up to mischief. Just being, we were basically kids.

71 The Commission has since established that this child was not buried in Bessborough.
18.311 On her admission she was told to choose a ‘house name’. She said she lost her identity in Bessborough and the residents were forbidden to tell each other their real names. She said that there was a two tier system in place at Bessborough:

So, there were the nice middle class girls like myself, sitting around doing absolutely nothing, we had no occupations. We knitted. We went out for walks on the grounds and we were bored. We knew that there were other girls in the kitchens and in the laundries and that there were babies somewhere, but it was all very secretive, and we didn’t know, and I suppose the whole culture was that you didn’t ask questions. You just got on with it.

18.312 She was a private patient; her family paid for her maintenance there. She did not mix with the public patients; private patients were segregated from them.

So you know we were the privileged few and as soon as our babies were born we left whenever we wanted. You know so long as the Adoption Society or whoever was organising it, had made arrangements, you could leave. But we knew that there were other girls that didn’t leave.

18.313 Initially, she shared a room with an older woman. This woman had ‘serious problems’ and Resident B found this experience to be ‘traumatic’. She said that she was ‘absolutely terrified’ of this woman.

She used to masturbate every night. And was very loud. She had apparently had several children. She had come in pregnant and had been kept in and I think she was intellectually challenged. She didn’t speak to me at all. She grunted, she was a very strange person but the other girls, you know the gossip was that she used to go down, there was a farm in the grounds of Bessborough. She used to go down to this farm at night and sleep with the farmhands. So, she had several children and just stayed in the convent and had her children.

18.314 The other girls told her to speak to the midwife to put somebody else in with her. Resident B recalled that the midwife, Sister Martha, was the only nun with whom she built up a relationship. She said that Sister Martha was a ‘very kind woman’ and ‘very competent at what she did’. In contrast, Resident B said that the visiting Medical Officer was ‘awful’ and that his whole demeanour suggested that he didn’t want to interact with the women: ‘He looked on us as fallen women’. She said that the doctor was ‘gruff and old’ but that all the women loved Sister Martha because she was kind and helpful. Resident B said that she ‘pestered’ Sister Martha to
allow her to assist at some of the births. Sister Martha subsequently agreed. Resident B said that this took her mind off her own situation and gave her an insight on what to expect during her own labour. She said that there was no antenatal training in Bessborough at the time. Her aunt had given her a book on a painless childbirth method, but it was all 'gobbledygook' to her.

18.315 Resident B said that she visited Bessborough in 1990 and met Sister Martha. Sister Martha told her that ‘it broke her heart over and over again to help the women in Bessborough to give birth knowing that they were going to be separated from their babies’. She said that she came to the Commission to state that not all her memories were bad. However, she acknowledged that other women did not have the means to leave Bessborough as soon after the birth as she did.

18.316 She recalled that the food in Bessborough was like that served in a boarding school ‘good but bland, and healthy enough at the time’. The women asked their visitors to bring food for some variety; roast chicken was a favourite. She said that public and private patients wore their own clothes and that they received adequate medical attention including Pethidine pain relief during labour. She said that the women’s biggest fear was that they would be transferred to Cork district hospital (St Finbarr’s) due to a complication. She recalled that single expectant women transferred from Bessborough to Cork district hospital shared a ward with other women who had people coming to visit them with presents for their new-born babies. She said that women from Bessborough were left in a corner on their own and found the whole experience to be upsetting.

18.317 Resident B’s baby was christened immediately after birth. She asked the nuns to choose a name for the child as she knew that it would be changed on adoption. Initially, she had planned to keep her child and her parents were supportive of her wishes. Her mother had offered to give up work to mind the child so that she could return to college. However, she was visited by three aunts who ‘ganged up’ on her and told her that she would destroy her mother’s life, that her neighbours would stop speaking to her, that the child would be treated ‘as a bastard’ and have a dreadful life and that nobody would ever marry her if they knew she had an ‘illegitimate’ child. She said that the adoption society (CPRS) also pressurised her and told her not to be selfish and to ‘think of the child and not yourself’. She ‘caved in to all the pressure’. A few weeks later she and the baby travelled to Dublin by train. She was met by her mother who took the baby to CRPS in South
Anne Street. She subsequently had a nervous breakdown and was hospitalised for a 'sleep cure'. A year later, she signed adoption papers and emigrated.

**Resident C: Mother, early 1970s**

Resident C became pregnant at age 18. She and her boyfriend travelled to their hometown to tell her parents. Her mother told her not to tell her father and said that she would 'fix this'. Resident C felt that she and her partner were independent enough to deal with the situation and she did not want her mother to interfere. Following sustained parental pressure, she was admitted to Bessborough as a private patient. Her parents gave a false name and county of origin to the Bessborough authorities. She left Bessborough without her parents' knowledge and went to Dublin to be with her boyfriend. When her parents found out they brought her home for a week and then re-admitted her to Bessborough. Resident C said that her mother was ‘controlling her’ at this stage and she ‘instilled a deep sense of shame’ in her. She was given a ‘house name’ and spent her days looking after babies in the hospital. She said that she was happy to look after the babies, that she had ‘companionship’ in Bessborough and that she was able to discuss aspects of her pregnancy with other girls. She said there were no antenatal classes and there was no discussion about what would happen during labour. Her mother did not discuss the matter with her and remained in complete denial that her daughter was having a baby. Her parents made it known to her that there was no option other than adoption. The option of bringing the baby home was never discussed. She agreed to place her baby for adoption but planned to return to Cork after a few days to reclaim him. She took care of her baby for ten days at Bessborough. On returning to the family home, her mother made her promise that she would not return to Cork to reclaim her child. Her partner went to her home and told her that they would both go to Bessborough and reclaim their child. However, she felt ‘fearful and shamed’ because of the ‘damage’ she had done to her family and she did not want to go against her parents' wishes. She felt ‘brainwashed’ and had ‘damaged her parents’. Her parents put her on sedatives and never discussed the baby with her. They brought her to a solicitor where she signed adoption papers. She recalled that she was ‘too-sedated to fight for her child’. Her parents never acknowledged the child as their grandchild and there was never any option other than adoption considered. The legalities of adoption were not explained to her and she does not feel that she gave her voluntary consent to have her child adopted. Her parents took total control over her and
never allowed her to express her feelings. The adoption proceeded without her having a say in the process.

Resident D: Mother, early 1970s.

18.319 Resident D was herself born in Sean Ross and subsequently adopted through St Patrick’s Guild. She was ‘very much loved’ by her adoptive parents and she had ‘the most wonderful life’. She became pregnant at age 18. It broke her parents’ hearts, particularly her father’s. She was regarded as an outcast by her family and her friends’ parents who warned their children not to associate with her. A neighbour arranged for her to stay with a family but this arrangement only lasted two months. She does not know who arranged it, or how it happened, but she found herself in Bessborough. She later recalled that her father drove her there about four months before she gave birth. She was not sure if she was a private or public patient but thought that her parents probably paid for her maintenance there.

18.320 She was not made to change her name. She and another girl worked cleaning the chapel. She said that Bessborough ran a ‘Magdalen Laundry’ and that she remembered seeing a large number of women working there.72 ‘It was tough going’. She said that, to the best of her knowledge, women working in the laundry were not pregnant.

There was one girl, God love her, she’d had her babies. I don’t know, maybe ten years prior. She stayed on. I don’t think they gave her much choice.

18.321 Her accommodation was in a four bed dormitory. It had four wrought iron beds and four lockers and the living areas were not separated with curtains. Some rooms had six beds. The top floor of the building had four baths and women bathed twice a week. She was used to these living conditions as she had been to boarding school.

They were nicer to me in Bessborough than they were in [the boarding school] and as I said before. [the boarding school] treated us dreadfully, absolutely dreadfully. If you were caught reading a comic, and I was in national school in […], you were locked up. You were made sit in the church and you were locked up in the sacristy. I saw so many girls, including myself who was

72 The Commission recognises that there was not a Magdalen laundry in Bessborough. The laundry was for internal use only.
caught I can tell, locked up in the sacristy, key locked, everything, left there overnight… I ran away from it twice. They kicked me out in the end.

18.322 She felt a sense of relief when she entered Bessborough. At home, her parents and her boyfriend’s parents met to discuss matters and she was left out of the conversation. She felt that an awful lot went on behind her back. Her father hated her boyfriend’s parents with a passion and he had threatened to shoot her boyfriend with his double-barrelled shotgun. Both sets of parents meant well, but didn’t know how to deal with the situation. Getting away to Cork was ‘a blessing in disguise’.

But it was a great sense of relief for me when I went to Bessborough because I discovered that I wasn’t this only girl in the entire world this has happened to because I really felt that prior to going down, do you know what I mean, that I was the only girl. And I didn’t know, like, I mean I knew I was nearly 19 but I hadn’t got a clue. I was so … I thought I knew everything, but you know what I mean, I was naive about pregnancy things and knew everything else about riding horses and going on motorbikes.

18.323 Resident D said that the day in Bessborough began at 7.30/8 am and the women attended Mass every morning. The priest, who did not live on site, was ‘very nice’. All women had to attend Mass on a daily basis and ‘we all just kind of nearly rolled with it’. The nuns in Bessborough were ‘fully garbed’ but she reiterated that they were nicer than the nuns in the boarding school. They would line up for breakfast in the canteen with the other women and had porridge and boiled eggs. The food was generally ‘ok’ and some women helped in the kitchen. They were served dinner in the afternoon, which consisted of meat, vegetables and potato and in the evening they had bread and jam with tea. She witnessed some fights between women in the canteen.

And a couple of times fights would break out in it with girls, you know. Girls slagging off other girls that might have had a hard time having their babies. I remember one big fight broke out where one girl - ‘did you hear […] had her baby and she roared crying and she screamed’ because she had the baby in the home.

18.324 One or two of the nuns were qualified midwives and they were assisted by a lay woman who was a long-term resident in Bessborough. The women got ‘gas and air’. She was examined by the nuns and a doctor visited on a regular basis.
Although the days in Bessborough were very structured, women were allowed to walk around the grounds, to go to a shop outside the convent and to go into Cork city. They had to get permission to go offsite but their movements were not restricted. She met her mother and aunt on a few occasions in Cork city. She remembered going to Roches Stores where she had to buy two baby outfits, one for a boy and one for a girl, for when her baby would be handed over for adoption. Her father never visited her ‘He wasn't happy with this at all’.

She said that there were many women living in Bessborough, whose parents thought they were living and working in England. These women wrote letters to their families while in Bessborough. The nuns sent the letters to one of their convents in England who then sent the letters to the woman’s parents in Ireland. She also said that the telephone operators in the Cork telephone exchange made parents believe that a phone call from their daughter was coming from England, when in reality the woman was ringing from Bessborough.

They were really great guys, like, we never ever met them, but they were - you know, you’d nearly ring them just to talk to them because they were nice, you know what I mean, they weren’t judging us, you know.

Many women who pretended to be in England stayed in Bessborough for extended periods after their children were adopted ‘because they couldn’t just pop up’. Other women stayed on in Bessborough after their babies were adopted because they were ‘very traumatised and didn’t know which way to go’. These women worked for their keep.

She received many letters from her family and friends and her boyfriend. She does not believe that her mail was interfered with or censored. Women were free to walk to the nearest Post Office in Blackrock Village to post mail themselves. However, she remembered that residents of the area did not like to see women from Bessborough in the community and she always felt that she was being judged by them.

When she went into labour, there were complications and she was transferred to St Finbarr’s Hospital by ambulance. She was administered a lot of drugs in St Finbarr’s and felt that they prioritised married women over her. She remembered St Finbarr’s maternity hospital as being overcrowded and she remembered seeing ‘babies on trollies in the corridors’. She was put into a room with other maternity
patients who inquired where her husband was. She was discharged with her son to Bessborough the day after his delivery.

18.330 She had visited the Catholic Protection and Rescue Society with her mother and her boyfriend before she travelled to Bessborough and had decided at that stage that her baby would be put up for adoption. She never had any intention other than to place her baby for adoption. She stated that Father Colleran of the Catholic Protection and Rescue Society counselled her and told her that she may change her mind when the child was born. However, she said that she was 'firm set' and that adoption was the road that she was taking.

18.331 After the birth, she contacted Father Colleran to tell him that the child was born and that she wanted to be home for Christmas. He told her that no prospective adoptive parents were looking for baby boys at that time and that she would have to stay in Bessborough until he could place the child. She told him that she would be travelling home for Christmas regardless, with or without her child. When she told him that she would let the Sacred Heart Adoption Society handle her son's adoption, he agreed to arrange transport for her and her child to Dublin.

18.332 She and her son were met at the railway station by her boyfriend's parents and sister. Her boyfriend was not with them: his parents thought it best that he did not see the child. She went straight to the Catholic Protection and Rescue Society where she handed over her son and signed the initial adoption papers. Six months later she signed formal adoption papers.

I had made up my mind. … and it's not out of that I didn't love him or I didn't care for him, I just wasn't maternal. I wasn't reared up with small - I knew more about a cow having a calf than I would have known about... I know it sounds cruel what I am saying, but that's why I knew what I did was right for him...I knew about the wonderful life I had… So I only could see the same thing happening with [my son]…So that's what my decision was, and it was right.

18.333 Her decision was fully supported by her boyfriend; they subsequently married. Her parents accepted her back wholeheartedly and she went to work with her father in his business.
Resident E: Mother, early 1970s

18.334 Resident E discovered that she was pregnant at age 18. She convinced her parents, who did not know she was pregnant, to allow her to travel to London to live with her aunt. Her older sister had become pregnant previously and ‘all hell broke out at home’. Her parents told her that her sister had died and that she ‘was never to mention her name again’. She and her siblings had been beaten ‘profoundly’ at home and she and her sisters were sexually abused by their father. She applied for a job in London and found out for certain that she was pregnant during a medical examination. She was offered an abortion in a hospital in London but decided against it. Her aunt overheard that she was pregnant and looked after her. She pleaded with her aunt not to let her mother know that she was pregnant. Her aunt rang her mother without her knowledge and told her about the pregnancy. She said that one day ‘three people in black’ were standing in her aunt’s kitchen, ‘forced her into a car’ and told her she was going back to Ireland. It transpired that her mother and aunt had contacted the Catholic Crusade of Rescue who made arrangements to repatriate her to Ireland. She said that she was ‘forced on a plane against her will’ in Heathrow and flown to Cork. She was met by two nuns at Cork airport, one of whom was from St Anne’s Adoption Society and taken to Bessborough.

I remember the grandeur of the desk and the chairs. That is when I met the thing that ran it and she just looked over her glasses at me. I was sick. I was dizzy. I didn't know where I was, nothing. She asked me my name. I said "my name is […]". She got very angry with me. I repeatedly kept saying "my name is …" and she wouldn't believe me. She kept saying "that is not a name, don't be stupid"…I believe her to be the person called Sarto.73

18.335 She was given a bed in an eight-bed dormitory. She worked in the laundry and the kitchen during her time at Bessborough. She was flown to Cork and ‘escaped’ from Bessborough after about a month.

18.336 She said that she experienced some ‘spotting’ during her pregnancy but that the nuns at Bessborough refused her medical attention. She said that she received no medical attention of any sort at Bessborough. She was never seen by a doctor and no doctor ever visited the institution. She got some comfort from talking to the statue in the grotto at Bessborough. However, she had considered committing

---

73 Note: Sister Sarto started work in Bessborough in 1981.
suicide by throwing herself out a window. She said that women were not allowed to
leave the main house at Bessborough but that they were allowed visitors. She was
visited weekly by a woman from St Anne’s Adoption Society who told her that
adoption would be the best option for her baby. Her boyfriend found out that she
was in Bessborough and helped her ‘escape’. She went to her sister’s house in
Dublin. Her mother found out where she was and drove her to St Patrick’s Home,
Navan Road (Pelletstown). She gave birth there and her child was adopted
through St Anne’s Adoption Society.

Resident F: Mother, mid 1970s

18.337 Resident F became pregnant at age 30. She visited a doctor in a town 20 miles
from where she worked who directed her to a local curate. She said that curate
was very nice to her and told her about Bessborough. She told her parents that
she was pregnant. While they were upset, they did not throw her out. She stayed
with her parents for a while after giving up her job. She stayed with friends over
the Christmas period. She drove to Cork and was admitted to Bessborough early
in 1974. She met a nun on arrival and was given scrambled eggs and brought to
her quarters.

I had experience of being in boarding school, where you just had a curtain in
the cubicle but this was a completely enclosed private place with a door and a
key. So nobody could come in. So it was very basic with a wardrobe and a
table at the bedside and a single bed.

18.338 Her job was to make bottles for feeding babies. She and another woman made up
60 or 70 bottles a day. Her afternoons were free and she regularly drove to the
local shopping centre for coffee and to read the newspaper; she had her own car.
At least one other woman at Bessborough had her own car. She could come and
go ‘as she pleased’.

I mean my remembrances of the place was that it was pretty grim and the
food was basic but when I was thinking about it, I don’t remember either being
hungry or cold and it reminded me very much of boarding school, although of
course I was older. The whole thing that was hanging over me then the whole
time was, what was I going to do with my baby?

18.339 Her mother wrote to her regularly during her time in Bessborough and she spoke to
her family on the phone. She recalled that her mother was glad that she had taken
another name at Bessborough so that people in her family’s local post office would
not get suspicious. Her pregnancy would have been regarded as ‘a slur on her whole family’. She worked as a primary school teacher and she would not have been able to get a teaching position in a Catholic school as a single mother. She said that she had no money, no job and no place to stay. Although her parents never told her that she could never bring her baby home, she knew that was never an option. She thought about various scenarios where she would be able to keep her child but none of them seemed viable. She discussed her options with Sister Mary at Bessborough. However, the advice she got at Bessborough was ‘leaning towards adoption’.

Now you could look at that two ways, in that like I am a very practical person and it was definitely the practical solution to have the baby adopted. That's the way it worked out in the end... Because I wanted to be absolutely sure. So when it was coming up to the birth I had decided at that stage that I would give the baby away for adoption but I kept thinking to myself you know maybe I'll just do that now for the moment and see how things go... I knew myself I could change my mind if I hadn’t signed the adoption papers.

18.340 The nuns at Bessborough ‘weren’t falling over themselves to be nice’. However, she never heard any nun say ‘awful things to a girl’. She said that the ‘crippling sense of shame’ expressed by other women who resided in Bessborough was evident during her stay there and she never felt that she was in Bessborough ‘to be reformed’. She did not recall any infant deaths during her time there. Her time in boarding school prepared her for life away from home and living with nuns. She felt that this was a more traumatic experience for other women.

18.341 She remembered that when she went into labour she was brought to a small room. She remembered being assisted by a midwife and another woman. She was given Pethidine when her labour pains increased. She was not given any painkillers after that and gas and air were not available. She had not changed her mind about putting her child up for adoption and did not breastfeed. She felt that the more she did with the baby the more difficult it would be to part with him.

I had seen girls who have stayed in the place for two or three months after, maybe even longer and they were going to have their babies adopted and they were feeding their babies every day and changing them and I thought to myself, there is no way I can do that. There is no way and then give the baby away after a couple of months. So, I had said to [...] that I wanted the baby to go quite soon after the birth.
Her baby was removed to a foster home when five days old and he was placed with an adoptive family soon afterwards. She signed preliminary adoption papers before she left Bessborough and signed the final consent to adoption forms six months later.

So then I kept the papers as I say and one time then, just before Christmas, I decided yes, I am happy with this now. This is what I want to do. So, I can remember well the night I walked down after posting them and said that's it now. That's it.

Resident G: Mother, mid 1970s

Resident G became pregnant at age 17 while she was a second level student. She was six months pregnant when she told her father. A few days later she was on her way to Bessborough with her school books. Her father made the arrangements for her admission without discussing the matter with her. They did not tell her mother about the pregnancy. She said that she would not accept a house name in Bessborough, and she was allowed to use her own name while living in there. Her accommodation was an individual cubicle with a bed, locker and table. Other women were in wards with, four, six or nine beds. On one occasion she was brought into a room with other residents to see the body of a dead infant.

We were brought into a room just off the ward where one or two babies had died and they were laid out in a little, I can't say it was a coffin but on a bed with a kind of a lily flower draped, they were dressed in white and a lily flower and to this day I actually don't understand why they would want you to go in and see a dead baby…I had said what happened to the baby? They said she was born with Spina Bifida but I don't understand the thinking behind marching pregnant girls in to look at dead…⁷⁴

Other residents told her stories about the labour ward and the lay midwife who delivered babies at the hospital.

So when somebody went into labour in that room and it was like the atmosphere in the hospital section completely changed because you knew

---

⁷⁴ The Bessborough institutional records show that there was one infant death in Bessborough during Resident G’s time there. The infant had been born with Myelomeningocele Spina Bifida at St Finbarr’s Hospital. The child’s mother returned to Bessborough without her child and was subsequently discharged to her family home. Medical records show that doctors at St Finbarr’s did not consider the child fit for surgery. The child was subsequently admitted to Bessborough unaccompanied aged 16 days; she died 5 weeks later. It would appear that the scene described was a prayer vigil/funeral service for the child.
that somebody was at the hands of this midwife and the whispering that went on in the washroom was that this woman wouldn't give any sedation. She wouldn't give any painkilling. She was cutting the girls down below and just would tell them this is your punishment for what you have done and you are never doing this again.

18.345 She said that she became very ‘fearful of being at the hands of this woman, the midwife’ and that the stories about her had made her ‘so terrified’ that she told the nuns that she had been very sick as a child so that she would be sent to St Finbarr’s Hospital for her delivery. In relation to ante-natal care she said:

A doctor would come during the week. I don't know whether he was a gynaecologist or a GP. There was a room, an examination room where you would queue up in the corridor and go in to be examined by him. He was quite an old gentleman and from what I remember you wouldn't be given any information about yourself or how baby was doing or how many weeks you were but he would just examine you and then you were told you can go back to your room.

18.346 Resident G said that she did not undertake any work in Bessborough and spent her time studying. There were other school-going girls in the hospital and a teacher came in once a week to help them with their studies. She could not recall much about the food at Bessborough except that there were lots of turnips and she remembered having cornflakes for breakfast.

18.347 She was taken to St Finbarr’s Hospital in an ambulance with another expectant woman. The staff at St Finbarr’s Hospital did not explain anything to her and she was ‘terrified’. Her time in St Finbarr’s Hospital was deeply upsetting.

The night he was born they put me in a ward with other mothers and family were coming in and loving their new little arrivals naturally and I can see myself in the bed, it was just in the door, on the right hand side, and I was able to turn my face to the wall. I was absolutely distraught. So, I was crying so much they took me back out and they brought me back down to a side room of some kind but I just - oh my heart was broken. I just, the whole night I just moaned for him…moaned for him all night. The loss of him…I was just heartbroken. I was absolutely heartbroken.
18.348 No friends or family member visited her while she was in St Finbarr’s and she felt very lonely. She did not see her baby until she was in an ambulance heading back to Bessborough. A nurse in the ambulance with her was holding two babies. She experienced post-partum haemorrhaging and was returned to St Finbarr’s Hospital for some days. When she returned to Bessborough she was brought to the nursery where she held her baby for the first time. She said that her child was baptised by a priest at Bessborough and that she was forced to attend Mass every day.

We had committed a mortal sin and we were unclean and the only way to atone for your sin of becoming pregnant was to pray and pray and pray for forgiveness. That was the over-riding feel of it.

18.349 She had two visitors while she was in Bessborough - her school chaplain and a nun who was a friend of her father. Both visitors told her that her only option was to put her son up for adoption. No other options were discussed with her. She subsequently signed her child over for adoption and a year later she travelled to Cork where a legal adoption was finalised. She said that she did not fully understand the legalities associated with legal adoption and that they were never explained to her.

I was informed that when I signed the paper I was going to sign my rights away. That's what I do remember. Signing that form. I don't remember anyone coming forward to me to say or stand me aside to say are you sure this is what you want to do. It was almost that this was a standard journey... I know I was a student. Financially, I wasn't in a position to take care of him but it - I suppose for me an over-riding feeling of the whole thing is there was no support there for me at the time... There was no options available to me other than adoption... No option whatsoever. Therefore I just felt completely overwhelmed as a young person, and pressured into the baby being adopted... I was railroaded into signing these documents.

18.350 She said that before she gave birth she was sent into Cork city to buy an outfit for her baby that he could wear when he was handed over to his adoptive parents. They would have sent us out to buy an outfit in a shop in Cork. So the baby would wear the outfit you have bought him when he was going to be adopted. That was the outfit that was going to be given, put the baby in to be handed over to the parents. So you can imagine going into Cork City, buying a little
suit, knowing that the suit that you were buying was what he was actually
going to be given away in. The thinking behind it is just horrendous.

18.351 Her family never spoke of her pregnancy, her child or his adoption again except
when her father was dying, he apologised ‘for putting me through what he put me
through’.

To this day, I think I might have mentioned it there, I still feel a shame. If you
ask me where is that coming from, it is like just something in my soul, that
people - that I was 17, and I know that you were unmarried and you have
done this terrible thing. I can't get my head around it.

Resident H: Mother, mid 1970s. This former resident was accompanied by
another woman and they are both active in a helpline for adopted people and
mothers

18.352 Resident H became pregnant at age 21. She went to London and got a job in a
hotel. When she was sent for a medical she told the nurse that she was pregnant.
The nurse told her to contact ‘some sort of agency’. She contacted an agency:

I went in there and they said to me - of course it was all that was bothering me
was nobody would know; this would be over and done with. It was like it
wasn't a baby, it was a problem... That is all it was, it was a problem, nothing
to do with a baby at all. They said to me that I could go to Cork or Dublin and
I said ‘well nobody knows me in Cork’.

18.353 She said that there was no option for her to enter a mother and baby home in
England. The agency arranged for her to travel to Ireland by boat. She was met
by a nun in Cork who drove her to Bessborough. She has little recollection of
entering Bessborough but said that she had her own cubicle and that women wore
their own clothes. She remembered ‘the secrecy, the fear, the not having a mind
of your own, not having an opinion’. She remembers the feeling of ‘being scared
all the time’.

18.354 Her family did not know that she was in Bessborough and thought that she was
working in Scotland. She wrote letters to her family and the nuns arranged for the
letters to be posted from Scotland. Her sisters subsequently found out that she
was in Bessborough and travelled there. She said that an adoption agency
‘brainwashed her family’ into agreeing that adoption would be the best route for
her.
Their main thing was not to upset mammy and daddy that was all, their only motivation was not to upset mammy and daddy. So they became part of the whole railroading of me into adoption.

18.355 She said that when she walked in the door, she lost everything and someone else made all the decisions for her. The ‘whole set up in the place was powerlessness’. She was made to change her name and told not to tell the other women anything about herself. She said that there was a class system at play in Bessborough.

There was a definite class; there was a class system in place. I was considered to be from a respectable family, a country family. I think they had this idea that girls who were from the city, well they would have been Cork girls, you know most of them were Cork city girls, they were of a lower calibre and they were sort of looked down on because there was this idea that oh those city ones they’ll keep the babies because they’re irresponsible and they don’t care about these children. You know the good; the good country girl will just do what she is told and hand over her baby. That was the sort of mentality there.

18.356 She said that working class women regularly left Bessborough with their babies and that they knew all about the social welfare payments available to them. Women were never told about the Unmarried Mothers Allowance in Bessborough and the nuns working there actively dissuaded women from any thoughts of living independently with their babies.

18.357 The nuns asked her:

What are you going to do? Are you going to be in a flat in Dublin with a baby on your own? What are you going to live on? What are you going to do? You’re going to have to give him back after a couple of weeks because you won’t be able to cope.

18.358 Resident H said that the work women were asked to do in Bessborough was based on their backgrounds. If they were from an agricultural/labouring background women were expected to work on the farm and ‘middleclass’ women worked in the nursery. She said that 99.9% of callers to the helpline she now helps to run did not know that the State was paying for their maintenance in mother and baby homes.

Everybody who worked there assumed they were paying for their keep and atoning for their sins but mainly paying for their keep actually. So, they never
questioned when they were asked to perform certain duties; they accepted it without question whatsoever. One image that stays in my mind is the human lawnmower...it is in June Goulding’s book... Well basically the girls were asked to mow the lawn by kneeling and moving forward plucking the grass because this would save getting a man in with a lawn mower to mow the lawn in front of the Bessborough house.

18.359 She said that a doctor called to Bessborough on a weekly basis to examine expectant women. She had heard ‘horror stories’ about the lay midwife working in Bessborough and stated that she ‘was a witch’. She had a good relationship with Sister Anthony who arranged for her to give birth in St Finbarr’s Hospital. She had an ‘absolutely terrible’ experience in St Finbarr’s.

Terrible, absolutely terrible. I never will - it was the most demoralising experience of my life. I remember being left in the room on my own at one stage with my feet in stirrups, freezing cold and nobody with me at all. I was absolutely butchered. I ended up with these big hooky things. They just split me open to deliver the baby. I was given very little pain relief. Now after he was born they put him into the room with me and I couldn't cope at all, I couldn't cope. I said "this is so unfair"... Then the next day I think Sister Anthony rang me and I said "get me out of this place, I'm going to go crazy", because it just felt like I was being treated like I was a second class citizen. I had been left, I was told to shut up a few times when I was crying in pain.

18.360 Sister Anthony arranged for her and her baby to be returned to Bessborough that same day. Sister Anthony told her that there was a bug going around the nursery and that she had arranged a private room for her and her baby.

18.361 The woman who accompanied Resident H was never in a mother and baby home. She said that she sometimes felt jealous of callers to the helpline who had been in a mother and baby home as they offered refuge that she was not afforded during her own pregnancy.

I used to be jealous of the women on the helpline, you know? I know it sounds odd. Sometimes I would think to myself if I had that refuge, I mean I know that they were cruel places but if I had that refuge I might have been able to keep my daughter you know, maybe... For some it was a refuge. I mean in an ordinary physical way...
18.362 Resident H said that she felt safe in Bessborough. She recalled walking the grounds and going out to the shop. She remembered travelling into Cork city to buy a christening outfit for her baby. She contemplated suicide and tried to throw herself in front of a bus in Cork city. She felt that if she was dead that her parents would raise her child.

18.363 Her baby was taken for adoption by St Anne’s Adoption Agency aged three weeks. I still have nightmares of that car. You know what the car looks like? I think my father used to call them Model T because he was mad into cars. I can still see this woman going off in this black Model T from the front of Bessborough with my baby.

18.364 She went to London with one of her sisters to collect her belongings. She ‘was out of it’ at the time and did not know that she had flown back to Dublin and not Cork. She was met by one of her sisters who took her to their uncle’s house. Her family were keeping her away from Cork and were convincing her that adoption was the ‘right thing to do’. Her sisters ‘colluded’ to make sure that she went through with the adoption. They ‘pressurised her’ into signing adoption papers and they kept telling her that the longer she put it off the harder it would be. She did sign the adoption papers. She thought that she could go back to Bessborough at any time and reclaim her child. However, she was drinking heavily at the time and felt that she ‘wasn’t in control of her life’.

**Affidavits received by the Commission**

*The Commission received a number of affidavits from former residents. These are sworn statements and are reported largely in the words used by the former residents. Unlike those who gave direct evidence, the Commission did not ask any questions of these former residents.*

**Resident I Mother, early 1960s**

18.365 Resident I grew up in a traditional Catholic household in Liverpool. She stated that she was sexually abused from the age of 11 and became pregnant at age 13.

I did not know what was happening to me but when it became apparent to my mother that I was pregnant she was ashamed and arranged with our local parish priest that I would give birth in Ireland. My mother and aunt told me that I was going on holiday with them and we travelled together to Ireland when I was about five months pregnant.
18.366 Her mother admitted her to Bessborough as a private patient and she remained there for four and a half months. Her mother visited her once but otherwise she had no contact with her friends or former life. She stated that she could send and receive letters but that they were ‘opened and checked by the nuns’.

I remember that it was very strange and lonely for me in Bessborough. I couldn’t use my own name or wear my own clothes. The other girls looked after me and helped me because I was so young and didn’t know what was happening to me.

18.367 Resident I said that she did not receive any education at Bessborough and occupied herself in a day room with books, sewing materials and wool. She said that she was let off some of her work because she was a private patient. She did scrub floors and collected potatoes from the farm and she worked before and after the birth of her child.

Life was fairly basic in Bessborough, I was warm enough and the food we received was adequate. I was allowed to walk around the grounds accompanied and although there was a rule of silence it was only at certain hours, just before lunch and during ‘quiet time’ in the afternoon.

18.368 She said that the nun in charge, Sister Pius, was very kind to her but remembered that the delivery nun, Sister Veronica, was ‘stern and cold’ and that ‘none of the girls liked her’. She said that she received no medical care in Bessborough and that her child was delivered by Sister Veronica. She never saw her baby as he was taken away immediately after birth. On the day after the birth she was told ‘in a matter of fact way’ that her baby had died.

During this time I carried on with my former work duties and also helped feed the babies in the nursery. It is hard to explain how I felt after the death of my own child; it was heart-breaking.

18.369 She believes the information regarding her child’s death, as contained in the Bessborough records, is incorrect. She believes that there was ‘widespread trafficking of babies in Bessborough by these nuns and their associates’ and she wonders if her child might have lived. She stated that she did not receive a death certificate for her child. She found a report in the Irish Examiner regarding ‘discrepancies’ in the notification of infant deaths at Bessborough to be unsettling.

The Commission has established that the child’s death was notified to the General Register Office.
Resident J Mother mid 1960s

18.370 Resident J was 19 when she became pregnant. Her parents considered that she had brought disgrace on the family and they drove her to Bessborough when she was three months pregnant. They told her that she must never speak about her pregnancy and that she ‘must never come back home again’. She said that, on her admission to Bessborough, she was told:

- never to speak of her identity or where she came from;
- that she was not allowed to have contact with the outside world;
- if she left Bessborough without permission she would be brought back by the Garda.

18.371 She said that she witnessed one woman who left the institution and was returned by the Garda. She also recalled that one woman fell to her death while trying to ‘escape’ from the institution through a very high window.\(^\text{76}\)

18.372 She felt that she was stripped of all her human rights and dignity when she entered Bessborough. She said that she was not allowed to tell anyone her real name and was given a fictitious name which she can no longer remember.\(^\text{77}\) She said that there was a rule of silence in the institution; no visitors were allowed; she was not allowed to send or receive letters; and she was not allowed to listen to the radio. She was subject to ‘psychological abuse’ in Bessborough; the nuns ‘constantly’ told her that she was ‘evil’ and that no one would ever want to marry her. She suspects that her hearing loss was a result of the abuse she suffered at Bessborough. She considers that she suffered ‘severe trauma’ at Bessborough and that she continues to have panic attacks because of her time there.

18.373 She slept in a dormitory which had six to eight beds. She had a single bed with a bedside locker and there was a communal wardrobe. She said that there were no recreational activities and women had to wear ‘a big loose cover-up’. She said that she wore her ‘cover-up’ during her time at Bessborough and that it was never washed. There were one or two bathrooms for each dormitory and, although there were baths available, she could use them only ‘when told to’. She stated that women attended mass every morning and undertook work for the rest of the day. Her days were ‘very repetitive’.

\(^{76}\) There were no maternal deaths notified from Bessborough during Resident J’s stay there.
\(^{77}\) The institutional records indicate that her ‘house name’ was the same as her actual name.
I arrived in Bessborough in mid-July and during the summer months my job was cutting the lawn with scissors. I did this every day in a line with a group of other women. We were not allowed to stop when we felt tired. In the winter months I had to polish and scrub the corridors. Other women were sent to work in the laundries. The work was especially difficult given that I and the other women were pregnant. I worked seven days a week until I went into labour.  

18.374 She said that the food at Bessborough was ‘not nutritious’. She was given ‘watery porridge’ for breakfast, bread and cheese or jam for lunch and stew for dinner. 

It was not nice. I doubt that the nuns ate the same food as us as there was a big farm there with all fresh produce. There was no food available between meals.

18.375 She said that, when women required medical attention, they were taken to St Finbarr’s Hospital, Cork. She was never examined by a doctor during her time at Bessborough [five months]. She was attended to by ‘a nun and another mother’ when she gave birth.

I went into labour while polishing the corridors. Later that evening, as the pain progressed, I was locked in what I can only describe as a cell. There was a single bed in it and a commode and the door had a small window in it, like a prison cell. I was left there all night with no attention. In the morning a nun came into the cell to check on me. My baby’s head was presenting and so she made me walk across the corridor to a room where there was a table for you to lie on. I was unable to get up on to the table and so I lay across it and that’s how I gave birth. After I gave birth to my son he was immediately taken away from me and put in the nursery.

18.376 She said that the only time that she was allowed to spend time with her son was when she fed him. A bell would ring to announce the start of feeding time and she would feed him and change his nappy. She said that women were told to ‘face the wall’ while breastfeeding. 

---

78 The allegation that residents were obliged to cut the grass with scissors was made in June Goulding, The Light in the window, (Ebury Press, London, 2005). Miss Goulding was a newly-qualified 22 year old midwife at the Bessborough maternity hospital from September 1951 to June 1952. Her book was the product of a creative writing class. It is not factually correct about a number of issues and many of its allegations are impossible to prove or refute.
I vividly remember one day going to the nursery to pick up my son as he was screaming because he was very wet and dirty. He was clearly distressed and I believe that it was because he had been in that wet and dirty nappy for some time. As far as I am aware the nuns did not go in between feeding times to comfort the children if they were distressed or crying.

18.377 She said that sometimes the children of women who were unable to breastfeed did not get fed. She said ‘they were hungry; screaming, hungry’. She stated that bottle-fed babies were given the ‘bare minimum’. She said that one nursery at Bessborough housed children aged one to five years old and that they were kept ‘four to a cot’. These children were sometimes wheeled outside in their cots but were never allowed to get out of them.

18.378 Her baby was taken from her when he was six or seven weeks old.
When my baby boy was six-seven weeks old, he was wrenched from my breast by one of the nuns whilst I was feeding him and taken away for adoption… I ran after the nun down the corridor, but there were two big doors that women weren’t allowed to go through and so all I could do was bang on those doors. About an hour later the nun came back and told me that my baby was gone…At no time did I give my consent to my son’s adoption.

18.379 Her parents collected her two days later and put her on a plane to the UK. She later made contact with her son.

18.380 Resident J disagrees with every date relating to her admission and discharge and the birth of her son as recorded in the Bessborough records.

18.381 In a separate statement Resident J said:
I was incarcerated in Bessborough Mother and Baby Home in Cork from [for approximately a year and a half]. During my time I vividly recall a woman telling me she was from Donegal, she had given birth to a mixed race baby boy. At the time I met her, her baby was approximately two and a half years old. I visited the nursery with her one day to meet her son, the room had babies from birth to approximately three years old, they were all mixed race. I cannot give a factual figure as to how many, I would estimate up to ten. I recall a nun stating to me and others that ‘those coloured babies will be here
for a long time as nobody wants them’. I often thought whatever came of these babies and that of their mothers.

Resident K, Mother early 1980s

18.382 Resident K became pregnant at the age of 18 and was taken to Bessborough by her aunt when she was six months pregnant. On arrival, she had her clothes taken from her and was given a ‘smock’ to wear. She was given a ‘house name’ and was allocated a job, which was to ‘polish the wooden floors in a long corridor’.

No one had a choice as to what jobs they were given. We were not allowed to speak to each other. We had to be on our knees to polish the floor…if a nun passed we had to stand up and say ‘excuse me sister’ as if we should not have been there.

18.383 The women went to mass daily and to confession weekly. There was ‘silence at all times’ and she did not remember ever leaving the grounds ‘or even being outside’. She remembered having enough to eat and she never recalled being cold. They had recreation time once a week, when music was played. However, she said that she had spoken with another former Bessborough resident, who was living in the home at the same time, who told her that there was ‘no recreation time and no music’.

18.384 Her only means of communicating with the outside world was by writing letters. Her incoming letters were open when she received them. She didn’t write many letters because ‘there wasn’t anything to say’. She could not write anything about Bessborough ‘because the nuns were reading her letters’. ‘The only thing I could say was that I was OK’. Her uncle visited her in Bessborough but her father and her aunt did not.

18.385 The nuns were ‘tough, strict and straight’. She was not aware of anyone being punished by the nuns but that ‘we were all afraid of them’. ‘We were reminded every day that we were sinners and that we were at Bessborough for our sins’.

18.386 She developed toxaemia during her pregnancy and she was attended by a nun who was a midwife. On the day prior to giving birth, the nuns had told her to scrub the kitchen floor ‘to bring the labour on’. There was no doctor present when she gave birth but she was attended to by a midwife and a helper. Her baby was full term and the midwife ‘took the baby away quickly’.
I never got a chance to see or hold the baby. They told me that the baby was a boy and that he was still-born. There was no more mention of the baby after I gave birth and I accepted that he was dead. I was not invited to the burial nor was I given any details of how the remains were being dealt with. I was not given a death certificate.\textsuperscript{79}

18.387 She didn’t receive any aftercare in Bessborough. Her aunt came to collect her. She suspects that her aunt ‘paid for me to be released’.\textsuperscript{80}

18.388 She visited Bessborough on three occasions in a bid to get information about her time there and records relating to her child’s death and burial. On one occasion a nun told her that her child was buried in the congregational burial ground onsite. She ‘mistrusts the accuracy of the [Bessborough] records’ provided to her. She also stated that she understood that she may have been ‘the subject of vaccine trials carried out in the 1960s on behalf of the Wellcome Foundation’.\textsuperscript{81}

\textbf{Resident L, Mother, early 1980s}

18.389 Resident L became pregnant at age 17. She entered Bessborough, stayed for two months and left before her baby was born.

Bessborough was a solitary place. When I arrived I was shown my room and I spent most of my time in there or in a common area with a television… I refused to work in the nursery where they kept the new-borns. There was no one else to talk to except the other girls, but everyone seemed to ignore one another… The nuns generally kept their distance from us… Other than the social worker, I received no other visitors.

18.390 She said that there was a hierarchy of the girls at Bessborough and some were treated quite well. The women who worked in the home were getting a ‘state allowance’ and ‘generally got what they wanted’. Because she refused to work in the home, she was ‘quite low on the ladder’. She said that when she began to outgrow her clothes all she was given was a safety pin.

We were only provided with basic provisions. The food was non-descript, and the only antenatal care we received was from one sister who took our blood

\textsuperscript{79} It was not possible to register stillbirths at this time.
\textsuperscript{80} This resident was a public patient maintained in Bessborough by Kerry County Council. Women routinely left Bessborough after experiencing a stillbirth or child death.
\textsuperscript{81} The Commission can confirm that no vaccines trial was undertaken in the period that this resident was living in Bessborough; adult residents were not subject to any vaccine trials.
pressure and carried out urine tests. There were no opportunities given to us to do any sort of exercise or recreational activity.

18.391 She said that she had been told that she might be able to complete her Leaving Certificate at Bessborough. She attended one lesson but the teacher ‘paid no attention’ to her so she left and never went back. She considered Bessborough to be a ‘holding pen’ where young women were kept until they gave birth. She stated:

   Although I never suffered any physical abuse in the home, I felt like you were only there because nobody wanted you.

18.392 She said that no woman left Bessborough with her baby and that she herself was not sure that she wanted to give up her baby for adoption. She felt that leaving the institution would be difficult and there seemed to be very little help for girls once they left Bessborough.

   To try to leave on your own was one thing, but to leave with a baby with no support was impossible. I did not know if I was entitled to any welfare support, but I just knew I had to leave if I wanted to keep my child.

18.393 She told one of the maternity sisters that she was leaving for Galway. She said that the Sister tried to get her to change her mind but that she had made up her mind to leave with another girl. She stated ‘we simply walked out the door and left’.

18.394 The evidence of children born in Bessborough was mainly about adoption and tracing. Some recounted what they had been told by their birth mothers about conditions in Bessborough.

18.395 One, who was born in 1949, said that her mother told her that mothers were allowed contact with their babies only when breastfeeding. Babies in the nurseries were left to cry ‘without being given any attention’. The babies’ nappies were made of a rough material and caused them to suffer from nappy rash. Conditions were hard and punishments included ‘being told to cut the lawn with a scissors’. She herself was in Bessborough for over two years. She was then fostered for a brief period and then sent to an industrial school where she remained until she was 16.
18.396 Another, who was born in 1962, thinks that her grandmother arranged her adoption through the Catholic Women’s Aid Society. Her mother told her that £100 was paid to Bessborough ‘so that she could leave the home’.\(^{82}\) She said that Sister Sarto went that ‘extra mile’ to trace her birth mother. She subsequently met her mother and has a good relationship with her. However, she stated that her mother could not bring herself to tell her husband and their children about her.

18.397 Another child resident found her birth mother but her mother did not want her existence known to her husband and other children.

18.398 Some suspected that they might have been involved in vaccine trials. One who was born in 1959 suspected that she may have been involved and she also suspected that a relative who was born a few months earlier may have been involved.\(^ {83}\)

18.399 One who was born in 1961 said that she never met her birth mother but her half-siblings told her that her mother had told them that the nuns in Bessborough treated her very well and that ‘it was not at all like the portrayal of Mother and Baby Homes in the media’.

\(^{82}\) This was most probably the £100 adoption fee charged by the Catholic Women’s Aid Society.

\(^{83}\) The Commission has established that this resident was not involved in vaccine trials but her relative was.
Chapter 18A: Bessborough Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.
Admissions

From the institutional records, the Commission has identified 9,768 women who were admitted to Bessborough between 1922 and 1998. Information relating to date of admission was available for 9,737 women (99.7% of admissions). In the 1920s an average of 28 women were admitted each year. Admissions increased following the introduction of maternity services at Bessborough in 1930 and rose steadily until 1946 when 160 admissions were recorded. (Decreased admissions were recorded in 1932 when Sean Ross opened and in 1945 when the institution was closed to public patients).

The number of admissions decreased considerably between 1947 and 1961. Difficulties in procuring foster homes for children in this period meant that a woman entering Bessborough, who sought to place her child in the boarding out system, could expect to spend three or more years in the home. By the early 1960s, the availability of legal adoption meant that a woman entering Bessborough stayed less than five months. Numbers increased substantially from 1961 and peaked in 1971 when 324 admissions were recorded. Reduced occupancy, because...
of shorter stays, meant that Bessborough could facilitate higher numbers of women without overcrowding.

Admissions remained relatively high until the mid-1980s when they started to decline. Admission remained low throughout the 1990s and ceased in 1998.

Analysis by decade shows that the number of admissions was highest in the 1970s when 2,515 women (26% of all admissions) entered the home followed by the 1960s (17%), 1980s (15%) and the 1940s (13%).
Occupancy
The Commission was able to calculate average occupancy for 9,247 women (95% of admissions). The date of admission and/or discharge was not available for the remaining 5%.

It is clear that occupancy rates in Bessborough were high in the mid to late 1930s and rose steeply in the late 1940s, peaking in 1948 when 138 women on average were living in the home. Occupancy rates decreased steadily following the introduction of legal adoption from 1953. By 1960 average occupancy was 71 - almost half the rate recorded in 1948. By the 1980s, 33 women on average were living in the home at any one time. By 1997, average occupancy had decreased to 13 women.
Occupancy Comparison

The Commission compared occupancy rates calculated from the institutional records to occupancy rates returned by the Bessborough authorities to the Department of Health in the years 1950-73. Temporary absences from Bessborough, where a woman was treated in an external hospital or went home for a period and returned, are not recorded in the Commission's calculations. No date of admission and/or discharge was available for 5% of women and they were excluded from the Commission's calculations. These factors cause the Commission's calculations to fluctuate slightly. However, occupancy rates established by the Commission are largely in line with returns notified by Bessborough to the Department of Health.
Admissions/Occupancy

Analysis of the total number of women admitted to Bessborough compared with average occupancy in the institution shows that, while admissions were relatively low in the 1920s, occupancy rates were relatively high. This indicates that there was not a big turnover of women entering and leaving the institution in this period and that those who were admitted stayed there for extended periods. In the 1930s admissions to Bessborough increased significantly. In this period average occupancy was often higher than the number of admissions. This was due to the number of women admitted in previous years who remained in the institution. Although admissions continued to increase in the early 1940s, occupancy rates fell. This was most likely due to increased infant mortality in this period and the early discharge of women whose children had died. A different trend can be identified from the late 1950s when admissions to Bessborough increased substantially while occupancy rates fell. This was most pronounced in 1971. Although 324 women were admitted to Bessborough that year, occupancy rates suggest that 78 women on average were living in the institution at any one time.
Mothers Age on Admission

The age on admission to Bessborough was available for 9,720 women (99.8% of admissions).

Age on admission ranged from 12 to 49 years as follows:

- Under 18 years: 12.5%
- 18-29 years: 79.5%
- 30 years and over: 8%

Around 5% of admissions were under 17 years and, therefore, below the age of consent.

The mode of age on admission was 19 years. However, this fluctuated by decade. For instance, the mode of age on admission was 21 years in the 1940s and 18 years in the 1950s. The mode of age on admission in the 1980s was also 18 years but increased to 20 years in the 1990s.
Birth Details

Of the 9,768 women admitted to Bessborough, 81% stayed until after the birth; 10% left the institution before giving birth and did not return and 9% were admitted accompanied by their baby who had been born elsewhere.

The available data show that 70% of women admitted to Bessborough gave birth in the institution; 23% gave birth in Cork District Hospital/St Finbarr’s Hospital and returned to Bessborough and the remaining 7% gave birth elsewhere and were admitted to Bessborough with their babies.
Previous Pregnancy

Information relating to previous pregnancies was available for 3,645 women (37% of admissions). The available data suggests that at least 21.5% of women admitted to Bessborough had been pregnant on more than one occasion. Around 15.5% had a single previous pregnancy and 6% had two or more previous pregnancies. Admissions of women on their second or subsequent pregnancy are discernible in records from the 1930s. However, most such cases were admitted from the 1970s onwards. In the 1980s and 1990s, over 20% of all admissions were women on their second or subsequent pregnancy.
**Maternal Deaths**

Through the institutional records, the Commission identified 31 deaths among women admitted to Bessborough: representing a mortality rate of 0.32%. Thirteen deaths occurred in external hospitals - mainly in Cork District Hospital. Twenty deaths were not associated with pregnancy or childbirth - half of these relate to women who were long term residents in Bessborough, one was an accidental death due to electric shock and the others were mainly due to diseases such as tuberculosis, pneumonia, meningitis and leukaemia. Three deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy and generally resulted in cardiac failure. Eight deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were due to nephritis, haemorrhage, septicaemia, eclampsia and toxaemia. Adhering to WHO guidelines the maternal mortality rate in Bessborough was 0.11%.  

Most maternal deaths related to women who were in Bessborough for extended periods. In one case the woman had been admitted to Bessborough in 1922 and died there in 1940. Another admitted in 1927 died there in 1942. A woman admitted in 1925 died there in 1943. Another,  

---

1 Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. [https://www.who.int/healthinfo/statistics/indmaternalmortality/en/](https://www.who.int/healthinfo/statistics/indmaternalmortality/en/)
admitted in 1926, died there in 1957. A woman admitted in 1923 died there in 1974, aged 81 years. Another, admitted in 1922, died in Bessborough in 1984, aged 80. A woman admitted in 1924 spent 60 years in the home and died there in 1985, aged 85. The Commission found GRO records for 29 of the 31 maternal deaths. The Commission found burial records for 12 women in St Joseph’s Cemetery, Cork.
Information relating to occupations was available for 8,437 women (86% of all admissions). Most women (55%) were recorded as domestic servants or as unskilled workers in factories or retail and hospitality sectors. Over 17% of women were recorded as teachers, civil servants and nurses or held managerial, technical, and semi-skilled positions in the private sector. Around 15% of women were recorded as working in the family home or on the family farm; 7% were either unemployed or receiving state assistance and 6% were in fulltime education - mostly secondary school students.

Occupation categories changed over the years in which Bessborough was in operation. For instance, in the 1920s over 80% of women were recorded as domestic servants or unskilled workers. In the 1990s this category represented 17% of admissions. Conversely, in the 1920s around 1% of women were recorded in the teacher/civil servant/skilled worker category. However, by the 1970s this category represented 27%; over 1 in 4 of admissions. Similarly, in the 1920s around 1% of admissions were recorded as students; in the 1990s, 22% were in fulltime education.
Admissions by County

Information relating to address previous to admission was available for 9,666 women (99% of admissions). The available data show that women were admitted to Bessborough from every county in Ireland and Northern Ireland. Most gave Cork as their previous address (37%) followed by Kerry (10%); Limerick (7%); Tipperary (7%); Waterford (7%); Dublin (6%); Clare (4.5%); Galway (3%); Wexford (2%) and Kilkenny (2%). All other counties combined accounted for around 14% of admissions.
Referral Pathways
Information relating to referral pathways was available for 6,131 women (63% of admissions). Most women (around 91%) were maintained in the home by a public assistance/health authority: 38% were referred directly by such authorities. Around 21% were referred by adoption societies; 10% by social workers; 5.5% by priests or nuns; 5% by voluntary organisations; 5% transferred from other institutions under the Commission’s remit; 4% were referred by family or friends; 4% by matrons of county homes and around 3% self-referred. Twenty-eight women (0.5%) were referred from Magdalen laundries or unspecified Good Shepherd Homes - a further five women admitted to Bessborough from Cork County Home had also been residents of a Magdalen laundry.

The available data show that in the 1930s most women were referred by a public assistance authority, a matron of a county home or by family and friends. However, by the 1970s, most women were referred by adoption societies, most notably the CPRSI and St Anne’s Adoption Society.
**Private Patients**

The Commission has established that at least 903 women (9% of admissions) were admitted to Bessborough as private fee-paying patients.

Very few private patients were admitted to Bessborough in the 1920s. From 1922-30 just 22 women were recorded as such. However, following the introduction of maternity services in 1930, the number of private patients increased from three in 1930 to 32 in 1931. In 1932, 57% of admissions were private patients. In the years 1933 to 1944 private patients accounted for around 30% of admissions on average. In 1945, the DLGPH closed Bessborough to public patients maintained by public assistance authorities. The Bessborough authorities, however, continued to admit private patients and they accounted for 85% of admissions that year. In 1946, the Bessborough authorities decided that they would no longer allow private patients to leave the institution without their babies. This seems to have prompted private patients to seek admission to private maternity homes in Cork city so that they could leave soon after the birth and leave their baby to be nursed out, usually through the CWAS. From 1946 to 1970, private patients accounted for around 9% of admissions on average. Very few women were recorded as private patients after this period.
Bessborough Private Mothers Admitted as a percentage of total Mothers Admitted
Length of Stay

Information relating to the length of time women stayed in Bessborough was available for 9,236 women (95% of admissions). A small number of women who stayed in the home for an exceptionally long period of time are excluded from the length of stay calculations. These 11 women stayed on in Bessborough as workers and their stories appear in another section of the report.

Women admitted to Bessborough during the first six years of its operation spent three years on average in the home. Those admitted in the years 1929 to 1940 stayed in Bessborough for between 12 and 18 months on average. For women admitted in the period 1941 to 1945, the average length of stay had declined substantially to around six months. This decline was due in the main to the high number of private patients admitted in those years who left the institution shortly after giving birth and the high number of infant deaths; bereaved women left the institution when their baby died. In the post war years, difficulty in procuring foster homes for children meant an extended stay in Bessborough for women and children waiting for placement in the boarding out system. However, this fell from an average stay of around one year for women admitted in 1950 to an average of around nine months for those admitted in 1960. From
1962, the increased availability of adoptive parents meant that women stayed in Bessborough for far shorter periods and for women admitted in 1970 the average stay was less than three months (90 days). This remained relatively constant in the 1980s and 1990s.

Analysis of the average days spent in Bessborough before giving birth shows that there was little difference between public and private patients. Prior to the 1960s private patients were admitted on average around four days earlier than public patients. In the 1960s and 1970s public patients were likely to have been admitted between two and 12 days earlier than private patients.
However, analysis of the length of stay in Bessborough after giving birth shows a greater disparity between public and private patients. In the 1930s private patients spent 125 days on average in the institution following the birth. Public patients, on the other hand, remained in the institution for 476 days on average in this period, four times longer than their private counterparts. This discrepancy was even more pronounced in the 1950s when the average post-natal stay for a public patient was seven times that of private patients. The reason for such disparity in this period can be explained by the fact that private patients had the means to pay an ‘adoption fee’ to the Catholic Women’s Aid Society (CWAS) who brokered private nursed out arrangements on their behalf. When the CWAS took responsibility for placing a child the mother was free to leave Bessborough. Many public patients relied on local authorities to place their children under the boarding out system. Children could not be boarded out until they were at least two years old and local authorities frequently struggled to secure suitable foster homes. This meant an extended stay in Bessborough for many public patients and their children. The introduction of legal adoption changed this. From the 1960s, growing numbers of public and private patients opted to place their children for adoption. By the 1970s, the length of post-natal
stay in Bessborough had become more uniform among all patients and a public patient was likely to spend around three days more in the institution than a private patient.

The institutional records show that in the 1920s most women (57.2%) admitted to Bessborough spent two years or more in the home and a further 23.1% lived there for between one and two years. Fewer than 5% of women left within 50 days of giving birth in that period. By the 1930s the number of women who left the home within 50 days of giving birth had increased dramatically to 27.3% and most women admitted to Bessborough in the 1930s (54%) were discharged within six months of giving birth. However, almost 23% of women remained in the home for two years or longer in that period. In the 1960s, 41% of women admitted to Bessborough left within 50 days of giving birth and 84% had left within six months. By this time, the number of women remaining in the institution for two years or longer had reduced dramatically to just 1.8%. By the 1980s, almost 90% of women left Bessborough within 50 days of giving birth and 98.4% left within six months.
Exit Pathway

Information relating to exit pathways was available for 5,730 women (58.7% of admissions). The available data show that over 80% of women left Bessborough and returned to the family home or other private address; 7.33% left to take up employment; 5.24% were transferred to external hospitals; 1.71% left to take up employment in another Congregation of the Sacred Hearts run institution (generally in the UK); 1.64% were transferred to another institution under the Commission’s remit (most went to Cork County Home); 1.54% transferred to a Magdalen laundry; 1.03% to supported accommodation and 0.65% ‘absconded’ leaving their babies in Bessborough.

- **Private Mother and Baby Home**: 4
Annual statistical returns sent by the Bessborough administrators to the Department of Health for the years 1951-70 confirmed that the major exit pathways in that period was either return to the family home or discharge to employment. It is clear from the statistical returns that the introduction of legal adoption in 1952 altered exit pathway trends. For instance, in 1951, 26% of women left Bessborough to take up employment. By 1960, 17% left the institution to take up employment and by 1970 this exit pathway accounted for just 8% of discharges.

The annual returns show that the percentage of women who were discharged to their family home or to another private address was also altered by the introduction of legal adoption. In 1951, 70% of women are recorded as leaving Bessborough and returning to the family home. The available statistics relating to child exit pathways show that 54% of women who returned to the family home in 1951 took their babies with them. In 1960, over 75% of women returned to the family home, but the percentage who took their babies with them had decreased to 44%. By 1970, women who returned to the family home accounted for 57% of discharges. By this time just 3% of women had taken their babies with them: 97% had left the institution without their children.

- Total Women Discharged with Child
Children: Births and Admissions
The Commission identified 8,938 children who were either born in Bessborough or admitted there after birth. Information relating to date of birth/admission was available for 8,857 children (99% of births/admissions). The records show that the 1960s, 1970s and 1980s were the busiest periods for births and child admissions to Bessborough. Almost 60% of all births and child admissions occurred in this period.
Information relating to accompanied/unaccompanied children on entering Bessborough was available for 8,926 children (99.9% of admissions). The data show that 94% were either born in Bessborough or admitted there accompanied by their mothers. Almost 5% of children were admitted to Bessborough unaccompanied and the remaining 1% were older siblings accompanied by expectant mothers.
Children: Average Occupancy

The institutional records facilitated the Commission in establishing the average annual child occupancy in Bessborough and represents the average number of children in the home in any given year. The sample size was 8,240 children (92% of admissions).²

In the late 1920s, average occupancy in Bessborough was generally higher than admissions in any given year. Children typically lived in the institution for two to five years in this period and this kept occupancy rates relatively high. From 1926-30 there were 46 children on average living there at any one time. By 1937, however, average occupancy had increased to 87 children. This upward trend was interrupted during 1939-44. Although admissions increased in this period child occupancy largely remained unchanged. This may have been due to the high rates of infant mortality which pertained in the home at this time. Child occupancy rates began to increase again from 1947 and peaked in 1948 when 107 children on average were living in

² In 698 cases a date of admission and/or discharge could not be determined.
the home. Child occupancy decreased steadily during the 1950s. Although admissions to Bessborough increased significantly in the 1960s, the uptake in legal adoptions ensured that occupancy rates continued to decline. Although 288 children were born in or admitted to the home in 1971, average child occupancy for that year was 26 children. By the 1980s there were 16 children on average living in Bessborough at any one time.

### Occupancy Comparison

The Commission compared occupancy rates as recorded in the Bessborough institutional records with occupancy rates notified by the Bessborough authorities to the Department of Health in their annual returns 1950-73. Temporary absences from Bessborough, such as where a child was receiving treatment in an external hospital, are not included in the Commission's calculations. This may inflate the Commission's numbers slightly. However, it is clear from the above chart that the Commission's calculations regarding occupancy are broadly in line with the occupancy rates notified by the Bessborough authorities.
Children: Length of stay

Information relating to length of stay was available for 92% of births/admissions. The date of birth/admission and or date of discharge was not available for 8% of children.

Children born to public patients and maintained in Bessborough by public assistance authorities stayed in the institution for much longer periods than children born to private patients.
In the 1920s, children of public patients spent 794 days on average in the institution while children of private patients spent 218 days on average there. By the 1940s the average stay of a publicly funded child had reduced substantially to 284 days. However, the average stay of a privately maintained child had also reduced considerably to around 103 days. From the 1920s to the 1960s, publicly maintained children spent around three times longer in the institution than their private counterparts. Private patients generally paid an ‘adoption fee’ to an intermediary agency such as CWAS to have their baby placed at nurse. This usually meant that children born to private patients left Bessborough a few months after birth. Children born to publicly funded patients generally had to await a boarding out placement. This could mean a lengthy stay in Bessborough for both mother and child. From the mid-1940s to the early 1950s the length of stay for publicly funded children increased to 348 days on average while the average stay for a private patient continue to decline. The introduction of legal adoption in 1953 influenced a sharp decrease in the length of stay for publicly funded children and by 1970 there was little difference in the length of stay of private and public children.

**Children: Discharge with/without mother**

![Children Discharge Bar Chart]

- **Child Discharged Same Date As Mother**: 3443
- **Child Discharged Before Mother**: 1982
- **Child Discharged After Mother**: 1544
Information relating to the date of discharge of a child, where the mother’s date of discharge was also recorded, was available for 6,969 children. The available data suggest that 49% of children were discharged from Bessborough on the same date as their mothers. Around 29% of children were discharged before their mothers and were most likely either boarded out or adopted. Over 22% of children remained in Bessborough for a period after their mothers’ discharge.

Around 10% of all children who remained in the home after their mothers had left were born to private patients and were awaiting placement through adoption agencies. Around 6% of all children left unaccompanied in Bessborough subsequently died in infancy.

**Children: Exit Pathways**

Information relating to child exit pathways was available for 7,401 children (78.8% of admissions):

- 4,177 (59.3%) were placed for legal adoption (from 1953).
- 1,866 (26.5%) left Bessborough with their mother or with another family member.
- 480 (6.8%) were transferred to other institutions such as specialist hospitals, county homes and industrial schools.
- 233 (3.3%) were boarded out directly from Bessborough.
- 197 (2.8%) were placed at nurse directly from the institution.
- 88 (1.3%) were informally adopted (pre 1953).

---

3 This excludes children who died in Bessborough and children who were admitted unaccompanied.
Institutional and external records identified 180 Bessborough children who were adopted in other jurisdictions. Foreign adoptions from Bessborough were as follows:

- 145 (80.5%) to the USA
- 29 (16%) to Great Britain
- 4 (2.5%) to Northern Ireland
- 2 (1%) to Canada
Annual statistical returns sent by the Bessborough authorities to the Department of Health for the years 1951-70 show how the availability of legal adoption from 1953 altered child exit pathway trends. These records confirmed that the major child exit pathways in that period were boarding out; at nurse through a society; home with the mother and adoption. In 1951, informal adoption accounted for 8% of child discharges from Bessborough. Legal adoption accounted for 25% of discharges in 1960 and by 1967 accounted for 73% of child discharges. Although the percentage of children discharged home with mother decreased from 43% in 1951 to 37% in 1960, by 1967 this exit pathway accounted for just 12% of child discharges. In 1951, child discharges via boarding out and placement at nurse through a society accounted for 21% and 27% of child discharges, respectively. By 1967, both exit pathways appear to have ceased. It should be noted that, although children continued to be recorded as being placed at nurse from Bessborough in 1970 and thereafter, this related to infants who were placed by the Cork Health Authority/Southern Health Board and adoption societies with paid foster mothers (generally retired nurses) while their adoptions were being processed.
The Commission had access to records created by the South Cork Board of Public Assistance/Cork Health Authority relating to children who were boarded out or placed at nurse in the South Cork District and records relating to children who were born in the South Cork District and subsequently adopted. These records are not complete but were useful to follow up on some child exit pathways. For instance, the institutional records had no information on exit pathways for 1,136 children, 402 of whom were maintained in Bessborough by the South Cork Board. Over 50% of children maintained by the South Cork Board were recorded in the board’s boarded out, nursed out and adoption registers. Similarly, of the 1,866 children recorded in the institutional records as having left Bessborough with their mothers, 854 were maintained in the institution by the South Cork Board. Around 14% of these children are recorded in the board’s boarded out, nursed out and adoption registers. The Commission considers that analysis of all local authority boarded out, nursed out and adoption records, were they available, would show that most children who left Bessborough with their mothers were subsequently fostered privately or placed for adoption.
Child Deaths
The Commission has established that 923 children born in or associated with Bessborough died in infancy or early childhood. This includes children who died in the Bessborough home and Sacred Heart Hospital; children who were born in or admitted to Bessborough who subsequently died elsewhere and children who were never admitted to Bessborough but whose mothers had been resident in Bessborough prior to their birth (this generally related to women transferred from Bessborough to Cork District Hospital/St Finbarr’s Hospital to give birth). The Commission confirmed 99% of child deaths with the GRO.

![Bessborough Total Child Deaths per Year](image)

It seems clear that an incremental increase in child mortality in Bessborough began in 1931, the year following the introduction of maternity services there. Six child deaths were recorded in 1930 but a significant increase occurred in 1931 when 28 deaths were notified. Child deaths peaked in the early 1940s. In the years 1940-44, 330 children died in Bessborough. Deaths recorded during these five years accounted for 36% of all child deaths associated with

4 Many children were associated with both Bessborough and Cork county home and may appear in records relating to both institutions. The Commission identified a combined total of 1,401 individual child deaths in both institutions.
Bessborough in its 76-year operation. Almost 11% of all child deaths occurred in 1943 alone when 99 deaths were notified. Following interventions by the DLGPH in 1945 and revised operational structures in Bessborough child mortality fell dramatically; 19 child deaths were recorded in 1946. This trend continued until 1952 when just two child deaths were recorded. The introduction of antibiotics to Ireland in 1946 and the establishment of a specialist neo-natal unit in St Finbarr’s Hospital in 1950 played a central role in addressing infant and child mortality in Cork city and county. The introduction of legal adoption from 1953 ensured that babies born in Bessborough spent less time in an institutional setting which meant that the risk of dying in infancy was reduced significantly. From the 1960s, child mortality in Bessborough remained relatively low. Most deaths in this period occurred in infants who had been born in St Finbarr’s Hospital, or transferred there for medical treatment.

Available records show that almost 79% of children were accompanied by their mothers at the time of death. The remaining 21% died unaccompanied by a parent.
Infant Mortality Rates

Although the number of infant deaths recorded in Bessborough during the 1920s was relatively low, mortality rates were relatively high. For instance, the 16 deaths among infants born in 1926 represented an infant mortality rate of almost 46%. The infant mortality rate decreased to 13.6% in 1930 but increased incrementally from 1931. Infant mortality peaked in 1943 at 75.19%: for every 100 babies born in, or admitted to, Bessborough that year, 75 subsequently died in infancy. Infant mortality rates fell to just over 12% in 1946 and continued a downward trend. By 1952 the infant mortality rate stood at 2.15%. In the years 1958-60 infant mortality increased to around 10%: representing nine deaths on average in these years. The mortality rate decreased to around 2% in 1961 and remained in this low range until the closure of the home in 1998.

---

5 Infant mortality rate is calculated as follows: Living infants born in a given year who died before the age of 1 year as a percentage of all infants born in the same year.
Information relating to the age on death was available for 899 children. Over 96% died in infancy as follows: 13.68% died in the perinatal period (0-7 days); 8.79% died in the neonatal period (8-28 days) and 73.86% died aged 29-365 days. The remaining 3.67% died in childhood aged between 366 days and five years.
Information relating to the place of death was available for 921 children. Most (761) died in Bessborough, either in the Bessborough home or in the Sacred Heart Hospital. One hundred and twenty nine children died in Cork District Hospital/St Finbarr’s Hospital having been born there or after their transfer from Bessborough. Fifteen children died in other city hospitals - most in the South Infirmary and Victoria Hospital. Twelve children died in private addresses following their discharge from Bessborough. These were mainly foster homes. Four children died in private mother and baby homes; three of which occurred in Mrs Grants Home, South Mall, following discharge from Bessborough.
Analysis of infant deaths shows that, although babies born to private patients accounted for 9% of all births and admissions, they accounted for 21% of all infant deaths. Bessborough was closed to public patients for most of 1945 so it is no surprise that deaths among private patients exceeded deaths among public patients in that year. However, increased mortality among infants born to private patients was most pronounced during the years 1939-45. The CWAS found it difficult to procure nurse mothers for infants born to private patients in this period and those infants remained in Bessborough for longer periods. To compound this, they remained in Bessborough unaccompanied by their mothers. The policy which allowed private patients to leave their babies unaccompanied in Bessborough, while awaiting placement by the CWAS,
was halted in 1945. Deaths among infants born to private patients plummeted the following year and accounted for a small number of deaths in subsequent years.

Analysis of mortality rates among infants born to private patients shows that all three such children admitted to Bessborough in 1924 and 1925 died there. Mortality rates among children born to private patients increased steadily from 1939 and peaked in 1943 when a rate of 80% was recorded among this cohort: eight in every ten infants born to private patients in 1943 died in infancy. The mortality rate among private infants reduced to 50% in 1944: one in every two infants born to private patients died that year.
Child Cause of Death

Information relating to the cause of death was available for 912 children. The Commission cross referenced the stated cause of death recorded in the Bessborough institutional records with the records of the GRO and found no major discrepancies. Child deaths were certified and notified as follows:

- **Non-Specific Causes** (184) - generally congenital debility, delicate from birth, prematurity, or weakness from birth.
- **Malabsorption** (169) - marasmus (165), malnutrition (3) and wasting from birth (1).
- **Respiratory Infections** (167) - mainly bronchitis, bronchopneumonia, pneumonia, atelectasis, lobar pneumonia, atelectasis pulmonum and congestion of the lungs.
- **Gastroenteritis** (153) - mainly gastroenteritis, enteritis, and infective gastroenteritis.
- **Tuberculosis** (40) - mainly tuberculosis, tubercular meningitis, tubercular peritonitis, and pulmonary tuberculosis.
- **Haemorrhage** (38) - mainly haemorrhage, cerebral haemorrhage and bowel haemorrhage.
Other Causes (36) - relate to several causes of death such as asphyxia, congenital kidney disease, mastoiditis, cot death, cellulitis, and congenital malformation/deformation/abnormality.

- Congenital Heart Disease (30)
- Syphilis (Congenital) (24)
- Generalised Infections (19) - mainly toxaemia and septicaemia.
- Convulsions (17)
- Meningitis/Encephalitis (17)
- Spina Bifida (16)
- Influenza (2)

Malabsorption was notified as the leading cause of death in the 1920s and 1930s. However, its prevalence waned in the 1940s and had almost disappeared by the 1950s. Conversely, respiratory infections hardly made an appearance as a cause of death in the 1920s but became one of the main certified causes in the 1940s. Similarly, congenital syphilis was all but absent as a cause of death in the 1920s and 1930s but featured as a significant cause of infant mortality in the 1940s. Gastroenteritis, which was a leading cause of infant mortality from the 1920s to the 1950s was largely absent as a cause of death in the 1960s.
Chapter 19: Sean Ross

Introduction

19.1 Sean Ross mother and baby home opened in 1931 and closed in 1969. During that time, 6,414 women were admitted there and 6,079 children were born or admitted there. It was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. The public assistance/health authorities paid for the vast majority of the mothers and their children while they were living in Sean Ross but there were a small number of 'private' patients.

Sources

19.2 The following is a summary of the main sources used for this chapter. A complete list is included in Part 5: Archives.

Institutional records

19.3 Sean Ross institutional records are held by the Child and Family Agency (TUSLA). As already reported, the Commission made digital copies of these records. There are over 14,000 records.

19.4 The institutional records include:

- Indoor Registers (admissions by county)
- Admission Books
- Private Patients Book
- Nursery Admission Book
- Maternity Register
- Records and Particulars Books
- Birth Registers
- Death Register
- Adoption Ledgers/Adoption Orders/Adoption Placements/American Adoption Files

Department of Health

19.5 The main Department of Health files used for this chapter are:

Local Authority Records for North and South Tipperary

19.8 The Commission examined archived local authority records of North and South Tipperary in the Civic Offices, Nenagh, Thurles Library and Tipperary County Archives, Clonmel. Three collections which were of interest to the Commission were identified: Minutes of the South Tipperary Board of Public Assistance, Minutes of the North Tipperary Board of Public Assistance and North Tipperary Managers Orders. These, however, did not have much information of relevance.

Other sources

19.9 Official publications, books and newspapers are referenced in the text.

Origins

19.10 In 1921, like all local authorities, councillors in North and South Tipperary and neighbouring counties were discussing changes to the poor law arrangements. While many Tipperary councillors acknowledged that the workhouse was an unsuitable environment for healthy women and children, initial proposals by members of the Tipperary boards did not consider that unmarried mothers and ‘illegitimate’ children should be housed separately from the ‘aged, infirm and
lunatic’ in these institutions. However, in 1924, and in line with many other county councils, the North Tipperary Board of Health and Public Assistance discussed the possibility of setting up a children’s home. This would accommodate healthy children from North and South Tipperary as well as children from neighbouring counties. Waterford county council said that they had made their own arrangements in this regard (with Bessborough) and Galway county council said that they were about to set up a children’s home in Tuam. The North Tipperary board then proposed to transfer children from county homes and other institutions in Tipperary to St. Francis’ Industrial School for Girls, Cashel, which was run by the Presentation Sisters. However, the superioress of that institution stated that she had no authority to admit children unless they were ‘formally committed by a court’.

19.11 The North Tipperary board regarded boarding out as the preferred alternative to rearing children in institutional settings and proposed an increase in the boarding out allowance to 25s a month in a bid to attract more foster parents. However, the Department of Local Government and Public Health (DLGPH) refused to sanction the increased rate and insisted that it remained capped at £1 (20 shillings) a month. In 1925, the chaplain to Thurles county home complained to the Tipperary board that the county home was ‘full of children running wild and getting no education whatever’. In a bid to alleviate the overcrowded conditions the board appointed a ladies committee to use their influence to secure foster mothers for institutional children and advertised for suitable foster homes in local newspapers.

19.12 By 1930, the North Tipperary board had made little progress in relation to the provision of services for unmarried mothers and their children. Institutional accommodation continued to be in county homes and the number of children in the boarding out system (31) was reportedly ‘practically the same as previous years’. One councillor complained about the cost of accommodating single women and their children in county homes and claimed that ‘poor people who had given service to the nation’, on being admitted there, were forced to mix with ‘part-lunatics’ and ‘a lot of unmarried mothers’.

5 Nenagh Guardian, 21 June 1930.
19.13 In 1930, the DLGPH asked the Congregation of the Sacred Hearts of Jesus and Mary if they would consider opening a second mother and baby home in Ireland (they were already running Bessborough – see Chapter 18). The Mother General of the congregation, accompanied by Mrs Crofts, a DLGPH inspector, visited several dioceses and spoke with several bishops regarding possible sites for a new mother and baby home. The congregation wanted to establish a home in Dublin but failed to get the permission of the Archbishop of Dublin. The DLGPH report for 1930-31 stated that the congregation had agreed to establish a second mother and baby home in Ireland and was considering some sites in Limerick and Tipperary.

19.14 Having considered the available options the congregation decided to buy a manor house and estate at Corville, Roscrea, North Tipperary, at a cost of £6,000. The Bishop of Killaloe, Dr Fogarty, agreed to the congregation’s request to establish a home in his diocese. The main house, described as ‘a large structure in the Grecian style’, was converted for use as a mother and baby home along the lines of that already established at Bessborough. The first superioress was Mother de Sales Gilmartin who was reportedly ‘very sympathetic’ towards the women entering Sean Ross but was upset to see girls from families she had known in Offaly being admitted to her institution and asked to be relieved from her position after two years. She was replaced in 1932 by Sister Rosemonde McCarthy.

19.15 In July 1931, Bishop Fogarty visited Sean Ross, which was reportedly ‘in full working order’ and ready for the reception of single women and their infants. Mrs Crofts visited county homes in Tipperary and in neighbouring counties to encourage health authorities to send ‘first offender’ unmarried mothers who applied for public assistance to Sean Ross. The Minister for Local Government and Public Health wrote to health boards in Tipperary and in neighbouring counties recommending that they direct single women with one child seeking assistance to Sean Ross and that all single expectant women who sought admission to a county home should be directed to Sean Ross also. Mother De Sales wrote to

local health authorities to inform them that women living in Sean Ross would be taught ‘cooking, housework and needlework’ and that she envisaged that a dairy and poultry farm would be established onsite where women would be ‘employed and trained’.\textsuperscript{14} The congregational council minutes show that after a few months in operation Sean Ross was ‘already crowded’.\textsuperscript{15}

19.16 In May 1931, Mother De Sales told the North Tipperary board that the rates applicable were 12s 6d a week for expectant women and £1 1s (21 shillings) a week for mother and child. She recommended that expectant women should be admitted directly to Sean Ross rather than going through a county home. The board agreed that Dr Heenan, medical officer to Sean Ross, would be empowered to admit patients directly to the home and that the local health authorities would be notified of all admissions.\textsuperscript{16}

19.17 In May 1931 the DLGPH wrote to the Offaly Board of Health suggesting that the 26 unmarried mothers living in Tullamore county home should be transferred to Sean Ross.\textsuperscript{17} In support of the suggestion, the chairman of the board said that the 26 women in question were ‘mere girls’ and first time mothers and that every effort should be made to teach them how to become ‘self-supporting’. While the Offaly councillors did not oppose the suggestion in principle, some raised concerns regarding the cost of hiring staff to take on the work performed by these women in the county home.\textsuperscript{18}

19.18 Although the Clare Board of Health had agreed to implement the ministerial direction to transfer single woman and their infants to Sean Ross, the matron of the County Nursery, Kilrush, objected to the move. The cost of maintenance for a woman and child in Kilrush was 24s a week and the Clare board was agreeable to the reduced rate of 21s a week applicable at Sean Ross. However, the matron at Kilrush protested on the basis that if women were transferred from Kilrush to Sean Ross the board would have to replace them with five paid employees to assume their duties (see Chapter 16). The board decided that their duty to unmarried mothers was to ‘reform rather than punish them’ and that the training that women would receive in Sean Ross would provide them with the prospect of future

employment in new surroundings.\textsuperscript{19} The Clare board wrote to Bishop Fogarty to get his views on the matter.

19.19 In his reply, Bishop Fogarty said that the system in operation in Sean Ross was ‘admirable’ and led to ‘merciful results’ whereby many women were placed in situations and were ‘permanently reclaimed’. He also included a description of what he described as the three classes of women who were admitted to Sean Ross:

a) The feeble or weak-minded sort (and a great many of them are such) who will never be able to take care of themselves and are easy victims to the wicked. For these I can see only one form of protection, namely, collect them into institutions under the care of the Nuns. As long as they remain in such institutions, they are quiet, happy and inoffensive, and for the most part they are willing to take shelter in such institutions. I know of no such institutions at present in Ireland. It is a pity the Local Government Department would not take up the question and provide such an institution as far as it may be necessary.

b) The second class of these offenders are girls who are naturally decent but who have fallen through accident or environment. Girls of that class are dealt with by the Nuns at Sean Ross, who get them in a good many cases, as I have said, safe occupation outside and they nearly all remain right: many of them get married.

c) The third class is that of women of a wild and vicious nature, who are a harmful influence wherever they prevail. They are neither amenable to religion outside, nor will they consent to abide permanently in religious institutions. Some of them are taken as penitents into houses under the care of the Good Shepherd Nuns and remain there.\textsuperscript{20}

19.20 The Clare board reportedly approved Bishop Fogarty’s letter in every detail and one councillor said that the letter ‘hits the nail on the head from every point of view’\textsuperscript{21}

19.21 The Clare board also considered the matter of single women with two or more children who were not eligible for admission to either Sean Ross or Bessborough.

\textsuperscript{19} \textit{Nenagh Guardian}, 7 November 1931.
\textsuperscript{20} Killaloe Diocesan Archives, Fogarty Collection
\textsuperscript{21} \textit{Nenagh Guardian}, 2 December 1933.
The secretary of the board said that there was no legal power to detain such women in Kilrush if they wished to take their discharge. However, he pointed out that the only obligation on any woman who decided to leave the Kilrush home was that she must take her child with her and it was this obligation that prevented most women from leaving. The board then proposed to maintain children unaccompanied in Sean Ross so that their mothers could, if they wished, discharge themselves from the Kilrush home to take up employment. However, the DLGPH would not agree to this proposal.

19.22 In September 1931 a Memorandum of Agreement was made between the Tipperary North Riding Board of Health and Public Assistance and ‘Shan (sic) Ross Abbey’, Roscrea, for the reception, maintenance and treatment of persons eligible for relief in institutions not provided or maintained by the board. Sean Ross was approved by the Minister for Local Government and Public Health for this purpose. This agreement was made under Article 15 of the *Tipperary (North Riding) County Scheme Order* which was an order under the *Local Government (Temporary Provisions) Act 1923*. The agreement stated that the superior would be the sole judge of applicants’ suitability for admission to the home, and in consultation with the institutional medical officer, their suitability for discharge. The superior undertook to provide residents with ‘proper food, medicines, accommodation, nursing and medical attendance for such period as may be necessary’. The board agreed to pay 12s 6d a week for expectant women and £1 1s a week for a mother and ‘firstborn’ child. This fee was to cover the cost of maintenance, training and treatment of women and children maintained by the board in Sean Ross. The agreement did not include any express provision for inspections either by the North Tipperary board or the DLGPH, but, as is set out below, such inspections did take place.

19.23 The ministerial directive to transfer single expectant women and single women with a child to Sean Ross was not universally welcomed. In South Tipperary, the cost of maintaining a woman and child in Cashel county home was 12s a week, seven shillings less than the cost of maintenance in Sean Ross. One South Tipperary councillor speculated that the number of single expectant women seeking to be

---

22 *Nenagh Guardian*, 5 March 1932.
23 *Nenagh Guardian*, 30 January 1933.
24 As is explained in the 5th Interim Report, Shan Ross is the correct pronunciation; Sean Ross is the correct spelling.
maintained by the board would double if they thought they were to be accommodated in a mansion such as Sean Ross and concluded that women were very well off in the county home and should be left there. Another councillor reminded the board that every Poor Law Commission that ever sat had recommended that single women and their children should be accommodated outside of the county home system and that the clergy of the country approved of the system in operation at Sean Ross. The chairman of the board declared that they would not be altogether led by the clergy and that the board was not authorised to incur the extra expense involved. In late September, Mrs Crofts addressed the South Tipperary Board and convinced them to accept the ministerial directive to admit single expectant women to Sean Ross instead of Cashel county home.

The 1930s

19.24 The DLGPH report for the year 1932–33 stated that, in the period June 1931 to March 1932, 85 women were admitted to Sean Ross and 74 babies were either born or admitted there in the same period. In its first full year of operation, April 1932-March 1933, 173 women were admitted. It was immediately obvious that infant mortality was a problem. The report noted, without comment, that 35 infants had died in the home during this period. The congregational records show that the Superior General was concerned about infant mortality at Sean Ross. She acknowledged that ‘the babies in Roscrea were not doing well’ and sent Sister Agatha from Liverpool to Sean Ross to investigate the matter.

19.25 In May 1934, the secretary of the North Tipperary Board of Health visited Sean Ross and reported as follows:

The Home is in the charge of the Order of the Sacred Hearts of Jesus and Mary. It is not under the control of any Local Authority. It caters for different counties, and the charge for maintenance and treatment is a per capita one. In the case of Clare, the charge is 10s per head per week for each mother and child. The number of unmarried mothers and children in the Home from this county on the day of my visit was 27 and 40 respectively. The various wards and nurseries in the Home are large and well ventilated. The beds in use are of modern type, and the clothing and bedding are in good condition.

28 Nenagh Guardian, 3 October 1931.
29 Sisters of the Sacred Hearts of Jesus and Mary, Diaries of the Mother General, May 1932.
condition and spotlessly clean. The nurseries deserve special mention, as the babies, their clothing, cots and surroundings are kept in such clean condition that only by untiring attention of a highly trained staff could it be accomplished. Central heating and electric light are installed, and all other requirements necessary for the comfort of the patients, including spacious day hall, and playrooms for the children are available.

The food supplied to the patients is the best available. The milk used is supplied from a herd of milk cows kept on the farm attached to the Home. Other cattle and sheep are kept, consequently all the fresh meat consumed in the Home is supplied from the farm stock. All the bread (plain and fancy) required is baked in a modern bakery in the Home. The garden attached supplies all the vegetables required, so it can be seen that the chief articles of food for this Home must be of good quality.

The unmarried mothers in the institution are admirably dealt with. They are employed at occupations which, in the opinion of the Reverend Mother, they are adapted to. In the bakery, girls are trained to do all classes of baking and, judging by the results, they are highly efficient at their work. In the laundry others are employed at making and repairing clothing and bedding, knitting stockings etc. In the kitchen, where central range and electric cookers are installed, the patients attend to the cooking for the entire House. In the dairy, poultry farm and garden, others are employed.

From the foregoing it can be seen that the unmarried mother at this Home is given every opportunity of becoming proficient in every phase of domestic and other work. Supervision appears to be strict, but the manner in which it is exercised does not tend to impress on the patients that they are in the Home under duress as they all appear happy and contented. I regret to say that the Home is getting overcrowded. At present an extension is being provided at a cost of £28,000. If the good work of the Reverend Mother and Sisters in charge of the Home was more fully realised, the necessity for such an extension may not be necessary as some steps would be taken to assist in a practical manner the work performed by the Order at Sean Ross and also at Bessborough.30

19.26 The DLGPH report for the year ending March 1934 stated that 193 women, 191 of whom were single expectant women, were admitted to Sean Ross. In the same

30 Nenagh Guardian, 12 May 1934.
period, 124 women were discharged: 97 to their parents’ home; 22 to other institutions and five married.

19.27 The report noted that there were 160 births recorded during the year and 60 infants had died. The report noted that the high infant mortality rate in mother and baby homes generally was ‘caused by an epidemic of some kind, measles, whooping cough, etc., which spreads quickly among the children and wipes out the weaklings’. It noted that the nurseries were laid out to accommodate too many children and the provision for isolation was not adequate. It further stated that, in the new building at Sean Ross, no nursery would accommodate more than thirty children and provision for isolation was being made ‘on a much more generous scale that has been possible heretofore’.

19.28 Following her visit to Sean Ross in March 1934 the Superior General reported that she had found ‘a decided improvement in everything’, that she was very pleased with the superior, Sister Rosemonde, and with ‘the spirit of the whole place’.

19.29 In February 1934, a man lodged a claim against the Laois Board of Health alleging ill-treatment of his 23 year old daughter in Sean Ross, which led to her death. A subsequent sworn inquiry heard that Dr Heenan, the Sean Ross medical officer, had suspected that the deceased woman was suffering from venereal disease. As there was no isolation ward or facilities for dealing with such cases in Sean Ross, Dr Heenan arranged for the woman to be admitted to Abbeyleix Hospital. At Abbeyleix, the medical officer, Dr Maher, did not examine the woman and refused to admit her. He stated that ‘an unmarried mother with venereal disease should not have been sent to his hospital’ and that ‘he could not see his way to admit her to the only accommodation in the county for married women’. He directed the ambulance driver to take the woman to the county hospital, Portlaoise. In Portlaoise, the medical officer, Dr O’Connell, examined the woman but also refused to admit her stating that there was no provision for dealing with maternity cases there. He directed the ambulance driver to take the woman to her own home. She was treated in her home by a local dispensary officer but died some days later. Following a sworn enquiry, the Minister for Local Government and Public Health found that the medical officer in Abbeyleix had shown ‘an entire disregard of his duty’ to provide for the treatment of the woman and that he had

used this instance as a test case to press his own view regarding institutional arrangements for such cases’. The minister concluded that the medical officer’s whole attitude demonstrated ‘a callous disregard to the interests of the patient and was most objectionable’. It subsequently transpired that the woman did not have venereal disease and had died of sepsis. The minister insisted that this material fact be put on public record so that ‘the unfortunate girl who died is cleared of this charge against her’.32

19.30 The DLGPH report for the year ending March 1935 stated that 187 women, of whom 168 were single expectant women, were admitted to Sean Ross. The department noted that in the same period, 87 women were discharged with their children and that two maternal deaths had occurred. There were 154 births and 52 infant deaths. Following her visit to Sean Ross in February 1935 the Superior General reported that she ‘found a crowded house’ and ‘all very well’.

19.31 The Hospitals Commission First general report 1933-34 reported that the demand for services at Sean Ross was so great that overcrowding in the institution ‘was evident almost from the beginning’. Additional accommodation, as well as improvements to existing accommodation, was necessary and ‘a matter of extreme urgency’ as infant mortality in the home was ‘exceptionally high’. Overcrowding and unsuitable accommodation were the chief causes of the high infant mortality. The Commission had undertaken ‘a thorough investigation’ of plans for the extension and reconstruction of the home and recommended that a grant of £29,595 would be made to from the Hospitals Trust Fund.

19.32 The maternity hospital at Sean Ross (which was known as St Gerard’s) was licensed under the Registration of Maternity Homes Act 1934 on 1 January 1935.

19.33 In September 1935, Bishop Fogarty blessed the foundation stone of the new Chapel of St Michael the Archangel at Sean Ross.33 The Nenagh Guardian reported that ‘Roscrea was jubilant’ as the bishop led a local troop of boy scouts and ‘hundreds of townspeople’ through the streets of the town and on to Sean Ross. The ceremony, described as ‘very impressive’, was reportedly witnessed by ‘a very large gathering’ which included ‘inmates’ from the ‘rescue house for young

32 Nationalist and Leinster Times, 23 March 1935.
33 Irish Press, 25 September 1935.
women’ who were dressed in ‘brown garb’. One year later, another large crowd attended a high mass at Sean Ross to mark the opening of St Michael’s Chapel. Although Bishop Fogarty’s sermon was almost exclusively focused on the Spanish Civil War, he did refer to the work undertaken at Sean Ross:

Pity for the unhappy Magdalenes of society has created here at Sean Ross a shelter for unmarried mothers and their children, often the victims of misfortune, under the care of the virgin Sisters of the Sacred Hearts of Jesus and Mary. It is a charity of infinite mercy and value. I am grateful to the good nuns for undertaking, at the request of the Government, this work, so arduous in nature. I admire their heroism and self-sacrifice.

In the year ending March 1936, the DLGPH reported that 188 women, 176 of whom were single expectant women, were admitted to Sean Ross. In the same period 80 women were discharged with their children. The department noted that 80 discharged children were placed at nurse by their mothers; 31 were boarded out and 12 were ‘adopted’. There were 157 births and 54 infant deaths; the report did not comment on the death rate.

In October 1936, an outbreak of diphtheria occurred among children at Sean Ross. The chairman of the North Tipperary Board of Health claimed that outbreaks of the disease were a common occurrence in the institution and that some infected infants were less than two weeks old. He said that something must be wrong somewhere and that the board should act to stamp out the epidemic without delay. Dr McCarthy, County Medical Officer for North Tipperary, confirmed that such epidemics had been a regular occurrence at Sean Ross over the previous three years and that 15 children from the institution, including 13 babies, were being treated for diphtheria in the Roscrea district hospital. Dr McCarthy noted that, although the district hospital had accommodation for only eight children, 21 children in total were receiving treatment for diphtheria there.

Dr McCarthy claimed that the regular outbreaks of epidemic diphtheria in Tipperary did not originate among the people of Co Tipperary itself but among the residents of Sean Ross. However, it is clear from coverage of North Tipperary Board of Health meetings in the Nenagh Guardian that diphtheria was endemic in most

35 Evening Herald, 9 September 1936.
36 Nenagh Guardian, 24 October 1936.
North Tipperary districts during this period. On Dr McCarthy’s recommendation, the board decided to cease admissions to Sean Ross until the diphtheria epidemic waned and recommended that all new admissions to the home would receive active immunisation against diphtheria. The board acknowledged that Sister Rosemonde was ‘perfectly agreeable’ to any suggestions which the board might make to further address the matter. However, the issue of who would pay for these precautionary public health measures was cause for debate.

19.37 The North Tipperary board decided that the Congregation of the Sacred Hearts of Jesus and Mary should not bear the expense of an anti-diphtheria intervention at Sean Ross and that all nine counties maintaining women and children in the home had a shared responsibility for the cost. The DLGPH supported the board’s proposal and health authorities in North Tipperary, Laois, Offaly, Carlow and Kildare agreed to meet the costs associated with the immunisation scheme. However, health authorities in South Tipperary, Clare, Kilkenny and Wexford refused to accept liability. The refusal of the Clare Board of Health is of particular interest. Several women admitted to Sean Ross from County Clare had been identified as diphtheria carriers. Clare was the last county to employ a fulltime county medical officer and the Clare Board of Health had not implemented an anti-diphtheria immunisation scheme. Efforts made by individual doctors to introduce anti-diphtheria schemes in Clare were thwarted by the Irish Medical Union and it seems likely that many women and children admitted to Sean Ross from Clare had been exposed to virulent forms of diphtheria.

19.38 The Roscrea district hospital did not have adequate facilities to deal with the increased demand for services resulting from the establishment of Sean Ross. The county medical officer said that the fever hospital, a stand-alone building located behind the district hospital, was designed to accommodate ten patients and was frequently overcrowded. The facilities available there were ‘inadequate according to proper fever hospital standards’. The North Tipperary board’s report for 1937 stated that admissions to the fever hospital were frequently suspended.

due to ‘gross over-crowding’ and the lack of accommodation for patients suffering from infectious disease was reportedly ‘a matter of extreme gravity’.  

19.39 In August 1937, a meeting of the North Tipperary board heard that Roscrea fever hospital was staffed by one nurse and one cook and that the board had been relying on adult patients admitted from Sean Ross to help nurse patients suffering from infectious disease. When the county medical officer, Dr McCarthy, inspected the fever hospital in 1937, he found one nurse caring, or attempting to care for, 27 fever patients. The North Tipperary board did not approve Dr McCarthy's recommendation to hire additional nursing staff, on the grounds of increased expenditure, and gave no consideration to paying women from Sean Ross for their services in the fever hospital. In fact, the records suggest that although these women were admitted from Sean Ross as patients themselves, they were expected to nurse fellow patients, and in doing so, were exposed to a myriad of infectious diseases. 

19.40 Throughout the 1930s, all cases of diphtheria notified in North Tipperary were transferred to Roscrea fever hospital for treatment. Dr McCarthy had notified the board that children admitted there with ailments other than diphtheria were contracting diphtheria in the institution. These children subsequently either died of the disease in the institution or were discharged while still infectious. It is likely that women and children admitted to Roscrea fever hospital from Sean Ross were exposed to virulent forms of diphtheria. The fact that diphtheria was the leading cause of infant mortality in Sean Ross during 1936 and 1937 strongly suggests that women and children discharged from Roscrea fever hospital to Sean Ross brought diphtheria into the institution on their return. 

19.41 An article co-authored by county medical officer for North Tipperary, Dr O'Regan, and the institutional medical officer to Sean Ross, Dr Heenan, which appeared in the Irish Journal of Medical Science, referred to ‘endemic diphtheria in an institution for the care of unmarried mothers’. Although the institution is not named in the article there is little doubt that the study related to Sean Ross and the endemic nature of diphtheria which prevailed there from 1935 to 1942. The

authors described the layout of the maternity building and how the wards were laid out over two floors and concluded that the free communication between the wards facilitated the spread of communicable disease in general, and diphtheria in particular.\(^4^5\)

19.42 The institutional records compiled in Sean Ross and analysed by the Commission show that infant mortality peaked in 1936; 95 infant deaths were notified that year. The cause of death is known in 88 of these cases; 28 were notified as deaths due to diphtheria. Further analysis of known causes of death which occurred during 1936 show that 59 infant deaths were directly attributable to infectious disease: diphtheria (28); gastroenteritis (12); sepsis (ten); bronchitis (four); influenza (two); measles (two) and chickenpox (one). A further 12 deaths attributed to marasmus (five); pneumonia (five) and convulsions (two) may also have been due to underlying infections. Analysis of infant deaths in 1937 shows comparable results. Of the 54 infant deaths notified during 1937, 35 were caused by direct exposure to infectious disease: diphtheria (12), sepsis (ten), gastroenteritis (six), influenza (five) and tuberculosis (two).

19.43 Analysis of infant mortality in Sean Ross in the mid to late 1930s shows that a significant number of deaths occurred in children who had contracted a communicable disease, most commonly diphtheria, in the days after their mothers had returned to Sean Ross from Roscrea fever hospital. In one instance, a 22-year-old woman was transferred from the home to the fever hospital. The woman returned to the nursery at Sean Ross three weeks later. Soon after her return this woman’s six-month-old infant contracted diphtheria and was transferred to the fever hospital. The child died there one month later. In 1937, the child of a 20-year-old woman returning from Roscrea fever hospital fell ill and subsequently died. Although incidents such as these were most common in 1936 and 1937, similar instances of infant deaths following the return of the mother from Roscrea fever hospital can be identified up to 1945.

19.44 For the year ending March 1937, the DLGPH reported that 146 women were admitted to Sean Ross, 172 women were discharged, and 35 children were boarded out. One maternal death was notified in this period. One hundred and

twenty births and 60 infant deaths were recorded; no comment was made about this very high death rate.

19.45 The DLGPH report for the year ending March 1938 stated that 171 women were admitted to Sean Ross. In the same period 93 women were reported as being discharged to their parents; 36 were discharged to take up employment and three married. Three maternal deaths were notified in this period. Forty seven children were discharged with their mothers; 20 were boarded out and 12 were adopted, either privately or through a society. One hundred and thirty eight children were either born in or admitted to Sean Ross during the year and 54 infant deaths were recorded. Although this represented a decrease on the previous year, infant mortality rates at Sean Ross were still very high.

19.46 For the year ending March 1939, the DLGPH reported that 158 women were admitted to Sean Ross. In the same period 101 women were discharged to their parents; 19 were discharged to take up employment and six married. One maternal death was notified. Sixty six children were discharged with their mothers; 13 were boarded out and five were ‘adopted’ either privately or through a society. One hundred and forty eight children were either born in or admitted to Sean Ross and 27 infant deaths were recorded. This represented a considerable reduction in infant mortality and the lowest infant mortality rate recorded in the institution since its opening in 1931. However, even this comparatively low infant mortality rate was still three times the national rate.

19.47 The DLGPH report for the year ending March 1940 reported that 153 women were admitted to Sean Ross. In the same period, 92 women were discharged to their parents; 25 were discharged to take up employment and two married. Seventy three children were discharged with their mothers, eight were boarded out and five were adopted. One hundred and forty three children were born in or admitted to Sean Ross and 19 infant deaths were notified. This represented a new low in the infant mortality rate at Sean Ross. In August 1939, Dr Heenan, the medical officer to Sean Ross Abbey, reported on the health of children under his care. He stated:

   It gives me great pleasure to mention that the health of the children in Sean Ross Abbey was very good during the year. At the present moment the general health is also very good.46

---

46 Nenagh Guardian, 26 August 1939.
Infant deaths in Sean Ross during 1939 were not as frequent as in previous years. However, in the eight years from the opening of the institution in 1931 to the date of Dr Heenan’s statement, over 450 of the over 1,300 children born in, or admitted to, Sean Ross had died in infancy.

The 1940s

The decrease in infant mortality at Sean Ross did not last long. The DLGPH report for the year 1940/1 reported that, in the year ending March 1941, 162 children were born or admitted to the home and 58 infant deaths were recorded.

In 1938 the DLGPH had agreed that counties maintaining women and children in Sean Ross should meet the proportionate cost of an anti-diphtheria immunisation scheme undertaken in the institution between 1 January 1937 and 31 March 1938. However, in January 1940, the department was made aware that nasal swabbing to test for diphtheria and anti-diphtheria immunisation had continued at Sean Ross and that a bill of £419 9s11d had been issued by the North Tipperary board to the relevant county councils. Both Dr O’Regan, county medical officer for North Tipperary and Dr Heenan, medical officer to Sean Ross, told the department that the steps taken were necessary ‘to combat recurrent outbreaks of diphtheria from 1937 to 1940’. The recurrent outbreaks of diphtheria at Sean Ross appear to have been unique to that institution; outbreaks of diphtheria were rare or non-existent in other mother and baby homes. The DLGPH issued a directive to the authorities in the five mother and baby homes (Pelletstown, Bessborough, Tuam, Sean Ross and Castlepollard) recommending that swabbing of patients to test for diphtheria should be discontinued and promoted isolation and prophylactic treatment as the most appropriate way to combat diphtheria in an institutional setting. In 1941, six adults living in Sean Ross contracted diphtheria in a mild form. Although Dr Heenan reportedly ‘got this outbreak under control’ the infection spread to nine infants aged between six and 27 days old. Dr Heenan did not recognise the presence of diphtheria among the infants and failed to make a diagnosis until one of them died. All nine afflicted infants subsequently died. Dr Heenan’s report on the outbreak succinctly stated:

Nine cases - Nine deaths - Mortality 100 per cent.47

---

In March 1942, the county medical officer, Dr O’Regan, notified the DLGPH of another outbreak of diphtheria among infants at Sean Ross. In this instance, seven infants, all under three weeks old, had contracted diphtheria and two new admissions to the home had been clinically identified as diphtheria ‘carriers’. Dr O’Regan stated that he and Dr Heenan had done everything possible to limit the spread of the infection and asked the department to send a medical inspector to investigate the matter. In a subsequent letter to the department, Dr O’Regan suggested that a programme of mass anti-diphtheria immunisation should be undertaken at Sean Ross but said that Dr Heenan, had opposed the idea. Dr O’Regan asked the DLGPH to reconsider its previous directive regarding the swabbing of new admissions to the institution and requested permission to resume this practice at Sean Ross. The department refused to agree to the re-introduction of swabbing and Dr Heenan refused to administer anti-diphtheria serum as a preventive measure and limited the administration of anti-diphtheria serum to confirmed cases of diphtheria only. Diphtheria remained prevalent in Sean Ross throughout 1942 and 1943 and 12 further diphtheria deaths were notified in this period. Of the 91 diphtheria cases notified in North Tipperary during 1944, 20% occurred in Sean Ross.48

In March 1944, Dr O’Regan notified the DLGPH that an outbreak of typhoid had occurred at Sean Ross. Three women had initially tested positive for the disease and within days clinical diagnosis was established in 16 women. All affected women were transferred from Sean Ross to fever hospitals in their home counties. Three were transferred to Roscrea fever hospital. Dr O’Regan cautioned that he expected more cases to develop and that women who could not be transferred to hospital would be treated at Sean Ross. By the beginning of April, 25 typhoid cases had been confirmed in the institution. Women who had been discharged from Sean Ross before the outbreak had been identified were contacted and tested for the disease. A section of the institution was reconfigured to act as a fever ward and isolation unit and the matron hired two ‘fever trained nurses’. By mid-April, 28 women were being treated for typhoid in the institution. Dr O’Regan reported that the matron required additional trained nurses to cope with the growing number of patients but was unable to get suitable staff. Two members of the congregation were drafted in to help in the wards one of whom was the former matron of the Bessborough Maternity Hospital, Sister Kyran, who had been

48 Nenagh Guardian, 26 August 1944
removed from her position at the request of the DLGPH a year earlier (see Chapter 18). Women from the unaffected portion of the institution could not be brought in to assist as they risked exposure to infection. Dr O'Regan advised the department that ‘we hope to straighten things out soon’.

19.53 Throughout April the number of confirmed typhoid cases at Sean Ross continued to rise. Dr O'Regan instructed a workman to inspect the sewage disposal system; it was found to be defective and the workman contracted the disease through his endeavours. On inspection it was found that crude sewage from the convent and nursery buildings was being diverted into a ‘bog drain’ which also took effluent from the maternity building where the outbreak originated. This effluent drained into an adjacent river and Dr O'Regan issued warnings to the inhabitants of Roscrea that the use of river water for any purposes whatsoever was dangerous. Dr O'Regan investigated the water supply to the home (Roscrea town chlorinated supply) and the methods employed to prepare and cook food as possible causes of the outbreak. Suspicion fell on a herdsman employed at the home and on women who had been admitted in the weeks prior to the first confirmed case. The affected section of the home was isolated, women were inspected every morning to determine if they had developed any symptoms and were directed to wash their hands after using the lavatory. In one of his updates to the DLGPH, Dr O'Regan reported that:

The use and abuse of the lavatories by the type of girls who enter this institution and who have not been used to such amenities was such as to convince me that the spread of the disease was due to infection from the lavatory seats.

19.54 While Dr O'Regan blamed women living in Sean Ross for the outbreak he later acknowledged that two workmen had also contracted typhoid. However, he could offer no explanation as to how they had contracted the disease.

19.55 In his annual report for 1944, Dr O'Regan reported that 35 cases of typhoid had occurred during the outbreak at Sean Ross and that four people had died. However, Dr O'Regan failed to note that a further three women, all clinically confirmed typhoid cases who were transferred from Sean Ross to fever hospitals in other districts, had also died. In the case of one woman, who had been transferred to a hospital in Laois, the GRO record states that her death was due to puerperal sepsis even though she had been clinically diagnosed with typhoid prior
to her discharge from Sean Ross. Dr O'Regan also said that most infant deaths during 1944 were caused by pneumonia, bronchitis, diarrhoea and enteritis, premature birth and congenital debility.\footnote{Nenagh Guardian, 11 August 1945.} However, in a later correspondence to the DLGPH, Dr O'Regan reported that six infants born to typhoid infected women had also died. While Dr O'Regan surmised that these infant deaths may have been the result of typhoid septicaemia, no infant death which occurred in Sean Ross during 1944 was notified as a typhoid related death to the GRO.

**Inspection 1944**

19.56 In September 1944, Miss Litster inspected Sean Ross. At the time of her visit 131 women and 118 children were living in the home. She noted that all except one woman were maintained by local authorities. Miss Litster stated that the superioress, Sister Rosemonde, told her that she did not propose to admit private patients in the future.

19.57 Miss Litster noted that there were 28 children aged over two years old in Sean Ross at the time of her inspection and reported on them as follows:

- **Clare:** Four children. One of these children is mentally defective and the local authority has been requested to send her to a suitable institution. She is six years old and not a suitable companion for normal children.
- **North Tipperary:** Seven children. One of these children will be shortly going out to his grandmother. Four are 4 years old. Two are over 3 years. These 6 are normal, healthy children and should be boarded out.
- **Kilkenny:** Five children. All five are over 3 years old and all healthy and normal.
- **Kildare:** Four children. All four are about 3 years old and are healthy and normal.
- **South Tipperary:** Three children. These three are over 2 years. Only one is fit for boarding out.
- **Offaly:** Three children. One is 2 years old, one 3 and one 4. All are healthy and normal.
- **Wexford:** Two children. Neither is fit for boarding out.

19.58 In October 1944, Miss Litster raised concerns with the DLGPH regarding the 28 healthy and ‘normal’ children aged over two years who were maintained by local
authorities in Sean Ross. She wanted the relevant local authorities to provide foster homes for these children. She acknowledged that the mothers of these children had been obliged to remain in Sean Ross for three or four years because the local authorities had failed to board out their children. She further acknowledged that such prolonged stays in the home led women to feel aggrieved and that they became ‘stubborn and intractable’. The DLGPH wrote to all relevant local health authorities asking them to take immediate steps to have the children removed to suitable foster homes and to inform the department of the actions taken in this matter.

19.59 The Kildare board told the department that they had instructed their superintendent assistance officer to suggest suitable homes for children maintained by them in Sean Ross. The Clare board said that the medical officer at Sean Ross had informed them that the older children maintained by them in the home were not medically fit to be boarded out. The Tipperary South board told the department that they were actively seeking foster homes. The Tipperary North board said that they advertised for foster parents in the local press on two occasions and received only one application from a family living outside the county; all those who made applications to foster children wanted children aged ten years and over. The Kilkenny and Offaly boards also said that advertisements for foster parents in the local press failed to secure any suitable homes in those counties.

19.60 During 1945, the DLGPH continued to put pressure on the relevant local authorities to get foster homes for children maintained by them in Sean Ross. However, it appears that their efforts did not meet with any success. In February 1945, Sister Rosemonde wrote to Miss Litster to tell her that the institutional medical officer, Dr Hanley, had advised her to close the maternity hospital to new admissions due to overcrowding. She said that there was a mild outbreak of diphtheria in the hospital and that all patients had received anti-diphtheria immunisation treatment or were in the process of receiving preventive treatment. Sister Rosemonde further stated that the children aged two years and older, whom Miss Litster had seen on her last visit, were still in Sean Ross and that the presence of these children and their mothers was ‘a great drawback to our work’ and was a contributory factor in the overcrowding in the institution. She intimated that she had been asked to take patients from Waterford but that she could not do so due to the conditions in the institution.
19.61 In March 1945, Sister Rosemonde told the department that Sean Ross was at maximum capacity and closed to new admissions on Dr Hanley’s advice. The department acknowledged the decision, made further enquiries about the children aged two and over who were living there and asked if it was stipulated in the agreement between Sean Ross and the local authorities maintaining women and children there that they would maintain children until they were two years old. Sister Rosemonde replied that the agreement did not specify any definite period for which women and children would be maintained but a former departmental inspector, Mrs Crofts, had deemed that children aged under two were unfit for boarding out; this, in effect, meant that women spent about two years in the home. Sister Rosemonde forwarded a list of the older children living in Sean Ross in March 1945. In spite of the departmental pressure on local authorities to arrange foster parents for these children, their number had increased from 28 in September 1944 to 31 in March 1945. Dr Hanley had passed 27 of the older children as medically fit for boarding out and four required medical treatment.

19.62 Boards of assistance in all counties continued to have difficulties in finding foster parents. They cited war-time conditions, the high cost of living and the boarding out rates of payment as major disincentives to couples who would have previously considered fostering a child.

19.63 In March 1945, Miss Litster noted that the position regarding accommodation for women was becoming serious as Sean Ross and Bessborough were closed to new entrants. The department wrote to the local authorities involved and told them that their failure to arrange boarding out of the older children was the cause of the closure to new entrants.

19.64 The local authorities concerned continued to tell the department that they were having trouble getting foster homes. Kilkenny county council said that they had removed six children from Sean Ross to Kilkenny county home, Thomastown, with a view to having the children boarded out from there. In a similar move, Laois county council transferred women and children maintained by them from Sean Ross to Portlaoise county home. Other local authorities reported that they had managed to get one or two suitable foster homes but that their efforts were largely fruitless.
In a bid to attract more applications from prospective foster parents, some local authorities, such as Offaly county council, increased the boarding out rate from 30s to 35s a month and advertised the revised rates in the local press. In other districts it was the assistance officers as opposed to prospective foster parents who required an incentive. In Kilkenny, assistance officers considered that extra foster homes would necessitate extra inspections for them and asked to be compensated for the extra work involved. Assistance officers were paid 2s 6d a year for each boarded out child in their district and the superintendent assistance officer advised that a rate of 10s for each child might be a good incentive for assistance officers to increase their efforts. The DLGPH agreed to the increased rate and ten applications for boarded out children were subsequently received in Kilkenny.

In October 1944 Miss Litster noted that the matron of the maternity hospital at Sean Ross, Sister Conrad McCarthy, was a registered nurse but not ‘specially trained’ in maternity work; she was assisted by two certified midwives. Miss Litster acknowledged that a considerable improvement in the health of infants in Sean Ross had been achieved since the appointment of Dr Hanley and, on her last inspection, she observed that 17 of 19 infants in the maternity hospital were breastfed. Although she reported that Sean Ross had not been overcrowded at the time of her visit, she recommended that a survey like those undertaken at Castlepollard and in the Tuam Children’s Home50 should be undertaken to determine the standard of accommodation available for mothers and children in the home.

In November 1944, the DLGPH engineering inspector, Mr Humphreys, inspected Sean Ross. Dr Dillon and Miss Litster accompanied him. The report of this visit gave a comprehensive overview of the physical layout of the institution:

- The original mansion was a three-storey building with a women’s dining room in a semi-basement; reception rooms on the ground floor and three women’s dormitories (plus two small rooms) on the first floor.
- A three-storey extension to the main house had a 2,200 square feet recreation room in the semi-basement; two dormitories, two bedrooms and sanitary accommodation on the ground floor and a dormitory, two

50 The Commission has not seen these surveys.
bedrooms, sanitary accommodation and a washroom with 31 wash-hand basins on the first floor.

- A wing off the main house had sleeping quarters for the congregation along with a laundry, stores and a kitchen.

- The maternity hospital had a pre-natal reception and isolation block which had been built in 1934. This contained a waiting room, lavatory, sink room, examination room, four-bed ward, bathroom, kitchenette, laundry and drying room on the ground floor and two three-bed wards, congregational accommodation and lavatories on the first floor. One patient was living in the reception and isolation block at the time of inspection.

- The maternity block itself was a two-storey building which had originally been the stables of the former mansion. The ground floor contained the labour ward, bathroom, kitchen, large dining room/day room and a babies’ bathroom. The available facilities to bathe babies were in such poor condition that the institutional medical officer, Dr Hanley, prohibited their use. The upper floor contained two eight-bed dormitories for mothers, a ten-cot nursery for new-born infants, a Sister’s bedroom, sink room and separate lavatory accommodation.

- Adjacent to the maternity block was another two-storey building housing pre-natal patients. The ground floor was used as a work room/dining room with a sanitary annex attached. The upper floor was a 14-bed dormitory also with sanitary annex attached. The women living in this dormitory each had a living space of 49 square feet and Mr Humphreys recommended that the number of beds should be reduced to give a more generous living space.

- The nursery block which had also been built 1934 was single storey except for an administration section located at one end of the building. The administration section had cubicle accommodation for the congregation on the upper floor and an entrance hall, kitchen and doctor’s office on the ground floor. The single-story section of the building was 130 feet long and had day and night nurseries. At the time of inspection, the nurseries were being partitioned into one 70-foot and three 20-foot sections. There were 108 infants living in the nursery block at the time of inspection.

19.68 Mr Humphreys recorded that dormitories, particularly those located in the maternity block, afforded women a living space of around 90 square feet. However,
considering living conditions overall, he suggested that Sean Ross was not equipped to house the 144 women living there at the time and recommended that maximum occupancy should be capped at 120 women. This number was arrived at by apportioning 60 square feet of living space to every adult resident and by maintaining a minimum of five feet between beds. He concluded that there were not enough baths and WCs for the number of residents. There were 38 wash-hand basins, three baths and seven WCs to cater for the 144 women living there. He noted that this represented one bath for every 38 women and one WC for every 16 women.

19.69 Mr Humphreys said that the British Ministry of Health had recommended that infants and children aged under three years should be accommodated separately from older children and that each infant should have between 30 and 50 square feet living space. The ministry had also recommended that large numbers of infants should not be housed in the same building owing to the risk of infectious disease and that dormitories should not contain more than six to eight cots. Sean Ross did not accord with this as, at the time of the visit, the three large dormitories had 40, 24 and 20 cots respectively. Mr Humphreys recommended that the maximum nursery occupancy in Sean Ross should be 80 infants. Some of the accommodation could be partitioned to have six or eight infants in one room but this would not be possible in the nursery block. Mr Humphreys said that Dr Hanley had committed to reducing the number of infants in these rooms.

19.70 Dr Dillon also inspected the maternity hospital at Sean Ross. Sister Conrad McCarthy, a registered nurse, was matron of the hospital and was assisted by one certified midwife. Dr Dillon recommended that two additional members of the congregation, trained as midwives, were required to run the hospital efficiently. The hospital had four wards with a combined total of 11 beds. In the year ending November 1944, 147 babies were delivered in the hospital and ten infant deaths (five stillborn, five neonatal) were notified.

19.71 In December 1944, the Chief Medical Officer at the DLGPH, Dr Deeny, and a departmental colleague visited Sean Ross. A subsequent letter from Sister Rosemonde to Dr Deeny set out the issues discussed during the visit. Sister Rosemonde said that she was quite disturbed by the inferior quality of the labour ward. The building itself was low lying and badly lit and unsuitable for carrying out obstetric work as there was a complete lack of equipment other than that
necessary to deal with a normal delivery. The maternity ward had no sterilising unit, or any other sterilising equipment, and lacked even the most basic equipment to undertake emergency operations. Sr. Rosemonde told Dr Deeny that all patients were admitted to Sean Ross on their first pregnancy and that the percentage of difficult births was higher than hospitals admitting all maternity cases. The absence of equipment necessary to deal with emergencies meant that the maternity hospital could not treat women who presented with toxaemia and haemorrhage.

19.72 Most women were admitted to Sean Ross between 24 and 28 weeks pregnant. Sister Rosemonde said that women admitted with any evidence of haemorrhage at this stage of pregnancy constituted a ‘grave source of worry’ because she had no desire to refuse them admission to the home but worried that the maternity hospital was not adequately equipped to deal with them. She proposed building a new maternity section with a labour ward, sterilising room and combined operating theatre along with ante-partum and post-partum examination rooms all of which would be interconnected and fitted out with the necessary surgical instruments and equipment to deal with difficult births and emergencies.

19.73 Sister Rosemonde also discussed the DLGPH venereal disease scheme with Dr Deeny and said that the medical personnel at Sean Ross would cooperate with the department ‘wholeheartedly’ in this matter. She gave an undertaking that all women admitted to the home would undergo a prophylactic Wasserman reaction blood test for syphilis and that those women who tested positive would be sent for treatment on the basis that the DLGPH would bear the cost of the scheme.

19.74 Sister Rosemonde also raised the issue of anti-diphtheria immunisation. She told Dr Deeny that the practice in the institution was to swab the nose and throat of all women on admission and that those who tested positive for diphtheria were returned to fever hospitals in their home counties for treatment. She said that Dr Hanley had found that women admitted from rural areas had particularly low levels of immunity against diphtheria and consequently failed to confer any level of protection against the disease on their infants at birth. She stated that Dr Hanley proposed to immunise all women against diphtheria on admission and to immunise infants when they reached six months. She said that she supported Dr Hanley’s proposal but added the caveat ‘again the question of finance arises’. 
19.75 Sister Rosemonde told Dr Deeny that the installation of an operating theatre, the introduction of an anti-diphtheria immunisation scheme and a commitment to investigating and making arrangements for the treatment of venereal disease at Sean Ross were all pressing and necessary interventions which would have a positive impact on the health and wellbeing of women and children living in the institution. However, she stated that such services would involve considerable additional expenditure. She provided Dr Deeny with an overview of the financial position of the institution from 1938 to 1943 which showed that Sean Ross received £48,401 in capitation payments from the local health authorities and that expenditure over the same six-year period amounted to £60,892 suggesting that, in 1943, Sean Ross had accumulated deficits of £12,491. Sister Rosemonde said that the yearly deficits were offset by the work of the congregation who received no remuneration. She said that the capitation rate in 1944 (12s 6d for each woman each week) was not enough and would not cover the costs associated with the initiatives that the congregation wished to introduce.

It is clear from the above, and particularly when long term maintenance and repair costs are taken into consideration, that the present per capita figure is entirely inadequate for the efficient maintenance of the institution for its present basis, without any consideration of the proposals set out above.

19.76 Sister Rosemonde also raised the continuing problem of finding foster homes for children aged two years and over. There were 25 children aged between two and five years in the institution over the Christmas period in 1944. Sister Rosemonde thought it unfair that such children and their mothers should have to endure such extended stays and that their presence precluded the admission of 25 expectant women who Sister Rosemonde deemed ‘were in more urgent need of our services’.

19.77 The final issue which Sister Rosemonde raised with Dr Deeny related to childhood vaccination in Sean Ross. She told Dr Deeny that an average of 170 children living in the institution required vaccination each year. She requested that the DLGPH provide the necessary vaccines free of charge and that the institutional medical officer receive the same remuneration as public health doctors who administered vaccines to children at public health clinics. It is not known if, or how, the department responded to this request.
Dr Deeny, in a briefing note, said that he had been pleased by the general condition of Sean Ross during his visit but conceded that the available accommodation for maternity patients was ‘poor’ and ‘quite out of keeping with the rest of the Home’. He stated that he had considered the changes proposed by Sister Rosemonde and concluded that they would give ‘very good accommodation for the amount she proposes to spend’. He said that the institutional medical officer, Dr Hanley, was a former assistant master of the Coombe maternity hospital and was an ‘excellent doctor capable of advanced treatment’. Dr Deeny supported Dr Hanley’s request for the upgrading of the labour wards and said that the proposed anti-diphtheria immunisation scheme was ‘a necessary measure of precaution and treatment’. Dr Deeny concluded that the proposed measures would assist the congregation in carrying out their duties of ‘caring for women during their confinement’ and in their ‘moral and physical rehabilitation afterwards’.

Overcrowding at Sean Ross continued throughout 1945 and 1946 and many children aged two years and over remained there with their mothers. Despite sustained pressure from the DLGPH, local authorities continued to struggle to find foster homes. In November 1945, Miss Litster inspected again and noted that 26 older children and their mothers were still living there.

In February 1946, the Mother Superior, Sister Brigid, wrote to the relevant local authorities to tell them that the institution was again ‘much overcrowded’ and that she could not admit any more expectant women until the older children and their mothers were discharged. In March 1946, she told the DLGPH that there were 181 women and 144 babies living in the institution and it was ‘dangerously overcrowded’. She asked that the department would give the matter ‘serious and urgent consideration’. At the department’s request, the congregation provided the names of the older children and the responsible local authorities. The department again wrote to the local authorities concerned and instructed them to transfer the children to foster homes.

In April 1946, Clare County Council sent an ambulance to Sean Ross to collect six older children and their mothers and transfer them to Ennis county home; the county council disputed that four other children maintained by them were suitable for boarding out on health grounds. Some other county councils also disputed the suitability of children maintained by them for boarding out, also on health grounds. Other councils told the department that they had placed advertisements inviting
applications from prospective foster parents and some intimated that they were in the process of assessing applications. All county councils again reported difficulties in finding suitable foster homes. The superintendent assistance officer for Kildare wrote:

I would like to point out that there has been great difficulty in procuring homes for boarded out children in this County for some time past, every effort has been made and in May 1945 an advertisement was inserted in the local papers for foster homes. Applications were received from five persons, four of those were considered unsuitable. The fifth changed her mind and would not take a child.

19.82 This superintendent assistance officer decided to visit the families of women living in Sean Ross to explain the situation to them and to ask them if they were able to take their daughters and their children into the family home. He reported that the families he approached said that they ‘were not on friendly terms’ with their daughters since their admission to Sean Ross and would not be willing to take their children.

19.83 All other relevant county councils told the DLGPH that they were experiencing similar difficulties. It appears that the only option open to some councils was to transfer groups of women and older children from Sean Ross to county homes. The Tipperary North county manager contacted local authorities in counties who did not maintain women in Sean Ross to inquire if they had capacity to take boarded out children. All responses were negative.

19.84 Some long-term Sean Ross residents made independent efforts to find a place for their children and so enable them to leave. In April 1945, three residents applied for court orders for the committal of their children to industrial schools. The presiding judge asked the women what they intended to do when their children were committed. All three indicated that they wished to take up employment. Fearing an increase in such applications, the judge stated that he was hesitant to grant the orders unless the women were prepared to contribute towards the upkeep of their children in such institutions. All three children were subsequently committed to industrial schools.\textsuperscript{51} In May 1947, a further three residents sought court orders to commit their children to industrial schools. On this occasion, the

\textsuperscript{51} Nenagh Guardian, 21 April 1945.
solicitor to North Tipperary county council opposed the granting of such orders as all three women were maintained in Sean Ross by councils other than North Tipperary. The solicitor argued that if these children were committed to industrial schools in North Tipperary the council would be responsible for their maintenance until they reached 16 years of age. Orders for committal were made; the judge said that he did not have jurisdiction to make another county liable for the maintenance of children in North Tipperary industrial schools.52

19.85 In March 1948, Miss Litster inspected Sean Ross. There were 152 women and 126 children, aged from newborn to three-and-a-half years, living there at the time. Miss Litster noted that the health of the children ‘appeared excellent’, that they were ‘beautiful babies, well-nourished, healthy in appearance, clean and well-cared for’. Of the nine new-born babies in the maternity hospital, just one was bottlefed. Four older children were waiting to be boarded out. In the period 1 April 1947 to 12 March 1948, 120 children were born in the home or admitted after birth. Eighteen child deaths were recorded in the same period. While welcoming the reduction in infant mortality, the Department of Health considered that the rate was still too high. The causes of death were notified as septicaemia (five); congenital heart disease/failure (four); congenital syphilis (two); pneumonia (two); meningitis, marasmus, pertussis, mastoiditis and inter-cranial haemorrhage.

19.86 In the period 13 March 1948 to 9 February 1949, 148 live births and four stillbirths were recorded and 14 children were admitted after birth. Fifteen infant deaths were notified in the same period. Infants were aged between 22 hours and nine months at the time of death. The certified causes of death were: pneumonia (four); congenital syphilis (two); septicaemia (two); prematurity, spina bifida, atelectasis, icterus gravis neonatorum, gastritis, meningitis and congenital heart disease. The department suggested that the Sean Ross medical officer, Dr Hanley, should be contacted about the possibility of administering anti-pertussis vaccine along with the already established anti-diphtheria vaccination scheme in a bid to stamp out deaths due to whooping cough, even though no death due to whooping cough had been notified. The department also recommended that nursing staff in the home should be advised to administer penicillin to sick infants at an earlier stage to minimise the risk of death from pneumonia.

Work and training at Sean Ross

19.87 In July 1946, a Land Commission Court heard that the Sean Ross Estate contained 63 acres of arable land, of which 45 acres were used for growing potatoes, wheat, oats and other vegetables. The Sisters kept 44 dairy cows, which produced 60 gallons of milk a day and they reared their own cattle. All farm produce was used in the home. A portion of the lands at Roscrea was bog land from which the Sisters cut turf, also for use in the home.\textsuperscript{53}

19.88 A former Mother Superior, Sister Hildegarde, later recalled:

\begin{quote}
We had the farm which supplied us with our own potatoes, vegetables and milk…We cut our own timber and turf, all of us, nuns, girls and workmen, worked on the bog.\textsuperscript{54}
\end{quote}

19.89 In addition to providing training in ‘cooking, housework and needlework’ Sister Hildegarde stated that the congregation ran training schemes for the women in Sean Ross. Instructors ran courses in machine knitting and sewing and many women found employment in Clery’s department store, Dublin. Women who worked in the convent bakery were also reportedly ‘well sought after’ and many went on to take up employment in the confectionary and catering industry.\textsuperscript{55}

Fire safety concerns

19.90 An inspection of Sean Ross by an architect in April 1946 raised issues about fire escapes. The recreation/assembly hall at the basement level of the three-storey extension had a large wooden stage at one end; it was used for the purpose of ‘entertainment and cinematograph shows’. The architect recommended that it should not be used as it did not have enough exits in the event of a fire and because the floors of the overhead dormitories were not constructed of fire-resistant materials. The department’s chief engineering advisor confirmed that the three-storey dormitory building constituted ‘a grave fire risk’ and acknowledged that the fire hazard in Sean Ross was ‘acute’. However, the issue of who would pay for the installation of fire escapes and fire-resistant materials at Sean Ross was a matter of dispute, which remained unresolved until October 1950 when the Department of Health authorised a £7,000 grant to undertake the work.

\textsuperscript{53} \textit{Nenagh Guardian}, 6 July 1946.
\textsuperscript{54} \textit{Nenagh Guardian}, 13 August 1988.
\textsuperscript{55} \textit{Nenagh Guardian}, 13 August 1988.
19.91 The Mother Superior, Sister Brigid, was instructed by the department not to use the basement for recreational purposes. This meant that Sean Ross lost the use of its main recreational amenity. Sister Brigid had successfully lobbied to have the cost of a new recreational hall included in the re-development plans. However, when tenders for between £10,820 and £18,500 were received to undertake the planned renovations, the department reconsidered the provision of a recreation hall. A memorandum on the subject shows that the department was reluctant to cut the provision of a recreation hall from the redevelopment plans on ‘purely financial’ grounds and considered that the lack of such a facility in an institution ‘where the rehabilitation of the patients is of prime importance’ would be ‘a serious matter’.

If the girls in this Home are deprived of reasonable entertainment their sojourn in the place will hardly be likely to do them much good…It would be preferable in their own interests to encourage them to stay for the full two years and to reap the maximum benefit of their stay. I consider that this can only be done by providing reasonably adequate facilities for entertainment and amusement and that this in turn is dependent on the provision of a new assembly hall.

19.92 Notwithstanding these concerns, the department was unwilling to fund the provision of a recreational hall. Acknowledging that building costs had increased since the original redevelopment programme was drawn up, the department agreed to increase its grant to £8,050 and suggested that ‘the less essential parts of the work’, which is presumed to refer to the recreational hall, should be omitted.

The 1950s

19.93 The renovation work at Sean Ross began in May 1952. In September 1952, the Mother Superior, Sister Barbara, sent an overview of work completed to the Department of Health. It included work undertaken for the provision of a new assembly and recreation hall. A departmental memo acknowledged that the congregation ‘had no resources of its own’ to meet any overrun on the building costs but concluded that no action was called for. It appears that departmental officials were resigned to the fact that the congregation would seek a supplementary grant. In October 1952 the department authorised a grant of £1,800 from the Hospitals Trust Fund towards the cost of providing a new assembly hall. Sister Barbara was grateful: ‘It will mean a lot to our girls to have a nice bright hall during these sad few years of their young lives.’
19.94 The renovation work at Sean Ross, which included the fitting of fire escapes and other fire safety measures and the provision of a new assembly hall appears to have been completed during 1953.

19.95 Statistics notified by the authorities at Sean Ross to the Department of Health for the year ending 31 March 1951 show that 130 women were admitted to the institution. On that date 148 women (28 expectant women; 120 postnatal) and 133 children were living there. All but nine women were maintained by a local authority. One hundred and twenty eight women were discharged during the year: 108 to parents or friends; 13 to another institution (mainly county homes); five to unnamed Good Shepherd Homes and two were transferred to unnamed hospitals. Eighty five live births and nine stillbirths were recorded during the year and ten children were admitted after birth. Fourteen infant deaths and one child death were notified. Ninety seven children were discharged during the year: 54 to relatives or friends; 23 were informally adopted; ten were boarded out by local authorities; five were placed at nurse by the mother and three children were transferred to a county home for boarding out. One child was discharged to hospital.

19.96 Miss Litster raised a question mark over the accuracy of the figures from all mother and baby homes: ‘A lot of these figures require checking. Do not assume their accuracy until I have made a report on them.’

19.97 The Department of Health files contain no further commentary on the veracity of statistical returns from Sean Ross or any other mother and baby home. The department frequently sought clarification on minor discrepancies and queries were always resolved amicably. Despite Miss Litster’s caution, the Commission has not seen any evidence to suggest that the statistical returns furnished by Sean Ross to the department were wilfully inaccurate. The Commission’s analysis of the institutional records compiled in Sean Ross has confirmed that there are no significant discrepancies between those records and the annual statistical returns sent to the Department of Health.

19.98 In July 1951 a DLGPH inspector, Miss Reidy, inspected the maternity hospital. The departmental record of the previous inspection was not available but the Sister

56 Almost certainly Magdalen Laundries.
in charge said it had been about 1946. The person in charge was Sister Conrad McCarthy, a registered nurse and state certified midwife. She was the only midwife employed and was assisted by ‘inmate help’. She had sleeping quarters in the hospital and was called when a woman went into labour. Miss Reidy stated that the hospital was adequately staffed. She noted that the hospital had two four-bed wards and a two-bed labour ward and that there was adequate floor space to accommodate this number of beds. There were two bathrooms and WCs for patients and one WC for the staff and this was adequate. Miss Reidy reported that the hospital had central heating and that she was satisfied with the accommodation provided to patients and with the fire safety equipment and fire escapes available there. She noted that no instance of puerperal pyrexia or sepsis was recorded in the hospital since the previous inspection in 1946 and that one maternal death occurred in the intervening five years. Twenty infant deaths and 31 stillbirths had been recorded in the same period. There were two small isolation rooms in the hospital to treat infants who were ill and infants were generally housed in a separate nursery. The standards which had been set by the Department of Health for nurseries in maternity hospitals stipulated that there should be a minimum of eight feet between cots. However, Miss Reidy noted that infant cots in Sean Ross were less that one foot apart. Nothing was done about this until February 1953.

In his report for 1951, the Tipperary North county medical officer, Dr O'Regan, noted that many women entered Sean Ross in the late stages of pregnancy, and some while in labour. They did not benefit from the care available from the ‘professional medical and nursing staff’ at the home ‘to bring women and their infants safely through their first confinement’. He noted that in 1951, 118 live births and four stillbirths were recorded in Sean Ross representing 107 vertex presentations, five breech presentations; nine forceps deliveries; one version and one caesarean section. He said that the known neo-natal death rate for 1951 was very high and noted that 50% of women discharged themselves and their infants less than three months after confinement. He recommended that infants should be kept in the institution for at least six months so that they could be fully vaccinated.

57 There was an inspection by an architect in 1946 – see above. The Commission has not seen any report of a general inspection in that year.
58 It seems that Sister Conrad had acquired a midwifery qualification since 1944 when Miss Litster reported that she was not a qualified midwife.
59 These were not statutory requirements. The standards were set out in departmental circulars which were revised from time to time.
and immunised against diphtheria. He presented figures for the years 1947-51 which showed that close to 50% of women were admitted less than one month before confinement; over 21% of women left Sean Ross with their child less than one month after confinement and 34% left within three months after giving birth.

19.100 In February 1952, Miss Litster again inspected Sean Ross. At the time of her visit 141 women and 120 children were living there. Four infants, aged from twelve days to seven months, were under observation in the infirmary but were not seriously ill. St Michael’s Ward housed eight infants under six months old. They were reportedly ‘comfortable, healthy and thriving’. St Kevin’s Ward housed 15 infants aged three weeks to five months. All but two were breastfed and were reportedly ‘healthy and thriving’. One child had returned from Temple St Hospital following treatment for ‘a malformation’. St Brigid’s Ward housed 30 infants aged six months to one year. All were reportedly ‘healthy and contented’. St Philomena’s Ward housed 21 children aged 12 months to two years old. One child ‘about two years old’ was suffering from ‘bad strabismus’. St Anne’s Ward housed 31 children in the higher age groups. Miss Litster noted that all appeared ‘healthy, well-cared for and contented’, and were well supplied with play material, including a sand pit. In the maternity wing, there were 31 women residents (20 expectant; 11 postpartum) and 11 infants ‘who all appeared healthy’.

19.101 There were six children aged between three and five years living in the institution. Arrangements were being made to have three adopted to the USA and two others were due to be boarded out. Miss Litster suggested that one child, whom she described as ‘backward and not of average intelligence’, should be admitted to a convent industrial school.

19.102 Miss Litster reported that, in the period 1 April 1951 to 21 February 1952, 112 babies were born in the institution and eight were admitted after birth. In the same period 14 infant deaths were recorded. Age at death ranged from two and a half hours to nine and a half months and the notified causes of death were asphyxia pallida (foetal asphyxia) (three); prematurity (three); congenital cardiac failure (three); septicaemia/toxaemia (two); pneumonia, marasmus and atelectasis. The three infants whose causes of death were certified as foetal asphyxia, and notified to the department as such, were subsequently deemed stillbirths by the department’s chief medical advisor even though the infants had lived for five,
seven and ten minutes respectively. The department considered that this was in line with notifications from other institutions.

19.103 Statistics returned to the Department of Health for the year ending 31 March 1952 show that 121 women, 24 of whom were private patients, were admitted to Sean Ross during the year. In the same period 133 were discharged: 82 to parents or relatives; 33 to take up employment; six were transferred to hospital; five went to unnamed Good Shepherd Homes; three married; one was transferred to a county home and one to a mental hospital. Two expectant women discharged themselves before giving birth. Ninety nine live births and four stillbirths were recorded during the year and a further 11 children were admitted after birth. Fifteen infant deaths were notified. One hundred and eleven children were discharged: 53 to relatives or friends; 40 were informally adopted; six were placed at nurse by their mothers; five were boarded out by local authorities; four were transferred to industrial schools and three children were transferred to hospital.

19.104 In April 1952, the assistant county engineer for Tipperary North surveyed the fire protection measures in place at Sean Ross. He reported that the premises comprised a three-storey building with convent, nursery, bakehouse and laundry and a two-storey hospital. He noted that the convent block had a night population of around 250 and that the hospital block housed around 50. There was an adequate water supply to the institution to supply one fire engine. He recommended that the Mother Superior delegate responsibility for fire precautions to a responsible person and make provision to sound a fire alarm other than using the chapel bell. There were 16 fire extinguishers and two stirrup pumps on the premises and the hospital had a newly built fire escape. He recommended that a second fire escape was required there and that two fire escapes were required at the convent block. He recommended that all 30 doors on the premises should have keys affixed under glass with instructions for their use. In her reply, Sister Barbara, said that Sister Conrad had been put in charge of fire protection in the hospital block and that Sister Mary Bernard had taken responsibility for the convent block. She stated that Sister Mary Bernard worked in a hospital in London during World War II and that her experience ‘ought to be helpful’. She stated that one fire escape had been erected and that she could not guarantee that the congregation could provide any others due to their ‘present financial condition’. It should be noted that Tipperary North County Council was assessing fire precautions and fire escapes at all maternity homes in North Tipperary at this time.
In February 1953, a Department of Health medical inspector, Dr Fanning, was asked to report on infant accommodation in the maternity hospital. Dr Fanning reported that there were eight cots in the nursery at the time of his visit and that they were in close proximity to each other. There was not enough ground space to ensure that cots could be placed eight feet apart to comply with the department’s own standards. He also inspected nurseries in the home section of Sean Ross and the prescribed distance between cots was not observed there either. Although the nurseries at Sean Ross did not have the floor space to comply with the department’s regulations, Dr Fanning noted that all nurseries were well ventilated. He recognised that if the department was to insist on the prescribed distance between cots then the numbers admitted would have to be radically reduced or extra accommodation would have to be provided. He was not prepared to give unqualified approval to conditions which were in conflict with the department’s standards but, having regard for ‘all the circumstances’ and the ‘experience of the institutional Medical Officer’, he concluded that he would not press for increased accommodation in the home.

Adoptions to USA

In an undated memo on adoptions from Sean Ross, Miss Litster noted that ‘the stream of adoptions to the U.S.A. continues’ and that:

The babies so sent are the best of our children in the Home, the prettiest, the healthiest, the most promising. The restrictions on sending children out of the country, to be incorporated it is hoped in an Adopted Children’s Bill, will doubtless put a stop to this export of children.

Miss Litster inspected Sean Ross again in 1953. She noted that 140 children from there had been adopted in the USA over the previous four years. She considered that the material gain for these children was obvious and that adoptions had been arranged for children who could not be provided for in a similar way in Ireland. She gave an example of ‘a half-caste little boy’ who had been adopted by ‘a negro Catholic family’ in the USA. Notwithstanding this, she found it disturbing to see so many Irish children sent permanently out of the country. She pointed to the fact that the children sent to the USA were carefully selected and examined for health and intelligence while the older children left in Sean Ross for boarding out were those ‘handicapped physically or mentally’. She acknowledged that these adoptions did not infringe the Adoption Act 1952. However, she received an undertaking from Sister Barbara that Irish adopters, when available, would be
given priority over US adopters. In a note on her report, the secretary of the department wrote:

The adoptions abroad do not call for any action by the Department of Health. Extended boarding out arrangements was the only way to keep children in Ireland.

19.108 Statistics returned to the Department of Health for the year ending 31 March 1953 show that 133 women, 26 of whom were private patients, were admitted to Sean Ross during the year. One maternal death (due to coronary embolism) was notified. One hundred and forty five women were discharged: 52 to parents or relatives with their babies; 47 to parents or relatives without their babies; 35 took up employment; eight married; one was discharged to a Good Shepherd Home, one to a county home and one was transferred to hospital. One hundred and fourteen live births and four stillbirths were notified during the year. Thirteen child deaths were notified. One hundred and twenty two children were discharged: 55 to relatives or friends; 55 were adopted; six were placed at nurse through societies; two were transferred to industrial schools; one was placed at nurse by the mother and one was transferred to a county home for boarding out.

19.109 In November 1953, Miss Reidy again inspected the maternity hospital. Sister Barbara Feeney was the Mother Superior and Sister Conrad McCarthy remained in charge of the maternity hospital assisted by ‘inmate help’. Miss Reidy found the hospital adequately staffed and furnished; there was adequate sanitary accommodation for patients and staff, proper fire precautions and precautions relating to the storage of medicines were observed. However, she noted that accommodation for infants still did not comply with the department’s standards. There were nine cots in the hospital nursery: four cots one foot apart; four cots one and a half feet apart and one cot three feet from the others. In the two years since her previous inspection of the hospital, she reported that twelve infant deaths and two miscarriages were recorded.

19.110 In May 1954, a Department of Health memorandum on institutional services available to ‘unmarried mothers and illegitimate children’ gave an overview of Sean Ross. The memorandum stated that the institution had accommodation for 170 women and 170 children. Average daily bed occupancy in 1953 was stated as 124 mothers and 112 children. The memorandum noted that, in 1953, Sean Ross received £17,927 in local authority capitation payments and an additional £355
from the Maternity and Child Welfare scheme. Total receipts for the year were recorded as £23,785; total expenditure was £24,995 leaving a deficit of £1,210. The capitation rate at Sean Ross had been revised upwards in 1953 to £2 a week for each woman and £1 a week for each child. This rate was intended to cover the cost of all drugs, medicine and medical services provided by the institution. The memorandum confirmed that Dr Hanley remained as visiting medical officer to the institution and that emergency deliveries and caesarean sections were dealt with onsite.

19.111 In June 1954, Miss Litster reported that 133 women and 122 children were living in Sean Ross. She noted that, overall, the children appeared healthy, happy and well-cared for. There had been an outbreak of chickenpox and three infants were recovering in the infirmary. The congregation had set up a kindergarten for children aged three years and upwards. It was conducted by a member of the congregation qualified in kindergarten teaching and the area was equipped with a good range of teaching materials. Sixteen children were in the kindergarten group, 13 of whom were about to be adopted. One child was to be adopted in Ireland, one in England and 11 were going to the USA. A new recreation hall had been provided for the mothers. It was equipped with a radio and piano, a bookcase with books and magazines and a raised stage for concerts and plays. Miss Litster described the new semi-basement refectory as somewhat dark but noted that fluorescent lighting and mirrors were being installed to brighten the room. On the day of her visit dinner consisted of soup, meat and two vegetables, and a sweet (semolina and rhubarb). In the evening women were served tea, bread and butter, with sausage, black or white pudding, salad or stewed fruit. Miss Litster noted that new sprung mattresses had been purchased for the maternity hospital beds. In the period 1 April 1953 to 31 March 1954, 145 children were born in, and a further 23 children were admitted to, Sean Ross. Seven infant deaths were recorded in the same period. Six of the seven infant deaths occurred in the first 24 hours of life. Causes of death were given as: premature birth (three); asphyxia pallida (two); infantile hematemesis and neo-natal Infection. One woman, who gave birth to twins, died of eclampsia.

19.112 In June 1954 a Cork based priest contacted the government about one of his parishioners who was living with her new-born baby in Sean Ross. He said that the woman’s parents ‘missed her weekly help very much’ but understood that she was obliged to remain in Sean Ross ‘to pay for the upkeep of her baby’. The
Department of Health replied that the woman in question was not obliged to remain in Sean Ross to pay for the upkeep of her baby and that Limerick County Council was paying for the maintenance of the woman and her child. She was obliged to remain with her child until adoption, or private nursed out arrangements were made but the department said that the most appropriate action would be that the woman’s parents would take their daughter and granddaughter home. Institutional records show that the parents did not take her or her child home. The woman remained in Sean Ross for a further 18 months until her child was adopted to the USA.

19.113 In July 1955, Miss Litster again inspected Sean Ross. One hundred and fifty one women and 125 children were living in the institution at the time. Ten of the children were aged over three years. Adoptions had been arranged for all ten children: five in Ireland and five in the USA. Twelve children aged between two and three years were awaiting adoption. Miss Litster noted that boarding out had practically ceased at Sean Ross at this stage. She observed that, while adoptive parents were readily secured for Irish children in the USA, preference should be given, where possible, to suitable Irish adopters. Miss Litster considered that the placing of ‘attractive and healthy’ children in Irish homes might encourage more Irish couples to consider adoption.

19.114 Miss Litster noted that 71 infants were born in Sean Ross during the first seven months of 1955. Twelve infant deaths were notified in the same period. Three infants died in the maternity hospital aged between eight hours and three days. Three children aged over twelve months died of viral pneumonia or complications associated with pneumonia. Five infants aged between ten weeks and eight months were also notified as having died due to viral pneumonia. In the remaining case, mesenteric thrombosis was given as the cause of death.

19.115 In 1955, Sister Barbara considered undertaking works to improve and expand facilities at Sean Ross. An engineer’s report on the maternity hospital concluded that the costs associated with bringing the existing hospital buildings up to normal hospital standards would outweigh the cost of building a new hospital in a more suitable location. The main concerns raised by the engineer were:

(a) the health risks posed by the close proximity of the maternity hospital to the farm yard;
(b) the fact that all three buildings were not linked and could only be accessed through the farm yard;

(c) ceiling heights and the general accommodation were ‘below normal maternity hospital standards’;

(d) the hospital was low lying and inadequate drainage meant that the site was prone to flooding; and

(e) the general layout of the buildings obscured views of the surrounding landscape and were ‘not very pleasant for patients and staff’.

19.116 In November 1955, Dr Hanley wrote to the Department of Health to support Sister Barbara’s request for financial assistance to provide more modern maternity facilities. He told the department that ante-natal patients were housed in converted coach houses which were low, damp, poorly lit and ventilated and were in close proximity to a farmyard on one side and an open sewer on the other. He reminded the department of the typhoid outbreak in 1944 and cautioned that there could be another epidemic. The Bishop of Killaloe also wrote in support of the request.

19.117 The Department of Health estimated that construction costs for a new maternity hospital would run to £30,000 and the modernisation of the existing hospital would cost even more. The department conceded that, due to the overall financial position in 1956, both proposals would have to be deferred for consideration for some years. However, the department did send a civil engineering inspector to assess the situation.

19.118 In May 1956, the engineering inspector visited the maternity hospital. The first issue which struck him was that of fire safety. This issue had not been considered as part of the modernisation plans submitted by the congregation or the concerns raised by Dr Hanley. The engineering inspector reported that the maternity hospital was a two-storey building which housed 22 women on the first floor. The first floor was accessed by a narrow timber stair and the floors and roof were also timber; he concluded that the building was ‘a major fire risk’. He advised that a veranda should be built at first floor level to act as an alternative escape from the hospital block and that this work should be carried out as a matter of urgency. In addition, he advised that smoke stop fireproof doors should be installed on the first floor.
19.119 The engineering inspector noted that there were two dining rooms for patients; one had seating for 40 women adjoining the hospital block and the other had seating for 100 women adjoining the nursery block. The floors of both dining rooms had very rough surfaces and were badly pitted and he recommended that they be concreted and finished with linoleum. He also drew attention to the fact that there was ‘constant traffic’ between the dormitory, hospital and dining room blocks which were all accessed through an open yard. He noted that this was very unpleasant for both patients and staff, particularly in inclement weather, and recommended that a covered walkway be erected to link these three buildings. He further noted that rain water was discharged into the hospital yard via down pipes which resulted in flooding in some buildings.

19.120 An architect and civil engineer investigated the sewerage system. He reported that the sewerage system serving the hospital, nurseries and main house was adequate but he expressed concern about an open drain which carried effluent from a septic tank to an open stream. He noted that liquid manure ran from the cow house along an open sewer parallel to the hospital building to an open stream. He recommended that all sewage should be piped when discharged and that the existing septic tanks and sewerage systems should be cleaned and overhauled. He told Sister Barbara that the works outlined in his report would cost in the region of £4,000. The Department of Health had previously informed the congregation that, although it did not have the means to fund any major restorative works, it would contribute to the cost of undertaking the minor, but necessary, remedial works. The department now decided that it would give a grant of £1,300 to cover the cost of installing fire escapes, upgrading the sewerage system, connecting downpipes and renovating the dining rooms.

19.121 In August 1956 the Minister for Health wrote to Bishop Rodgers of Killaloe asking his advice on the institutional treatment of unmarried mothers in Sean Ross. The minister told the bishop that all government departments were trying to reduce expenditure and he was concerned about the length of stay of mothers in Sean Ross. The minister said this was usually two years and the average cost of maintenance for a woman and her child was £230 and £100 respectively. The minister said that social workers attached to catholic societies in Britain reported that one of the main reasons why single expectant Irish women left for Britain was that the two year stay in a mother and baby home in Ireland was out of line with the practice of catholic homes in Britain. The department was considering reducing
the period of stay in mother and baby homes to six months after the birth of the baby and asked for the bishop’s views on the matter. The minister also said that earlier discharge would free up accommodation for women on second or later pregnancies who were living in county homes.

19.122 In his reply, Bishop Rodgers said that he sympathised with the minister’s efforts to achieve economy in health spending but urged him to approach the issue of unmarried mothers ‘carefully and cautiously’. The bishop agreed that some women could safely leave after six months but warned that others required ‘a longer period for rehabilitation’. He identified such women as those who were ‘sub-normal’ and those who were ‘ignorant of basic religion and moral principals’. He stated that although such women required longer periods for rehabilitation, he agreed that a stay of two years in a mother and baby home was unnecessary. The bishop was also receptive to the idea that ‘repetitive cases’ should be accommodated outside the county home system and expressed his wish that the Congregation of the Sacred Hearts of Jesus and Mary would look favourably on the minister’s proposals.

19.123 In March 1957, the minister wrote to Sister Antonia, Superior General of the Congregation of the Sacred Hearts of Jesus and Mary, to discuss the congregation’s role in the provision of institutional care for unmarried mothers in Ireland. The minister told Sister Antonia that the congregation played a vital role in providing such services and sought her co-operation in further developing them. The minister said that the prospect of a two-year stay deterred single expectant women from entering mother and baby homes in Ireland and that many opted to leave for the UK as an alternative. He cautioned that the falling demand for admissions to mother and baby homes in Ireland would have serious financial implications for the congregation. He further asserted that the financial position of the congregation’s homes in Ireland would become ‘very difficult’ and their discontinuance might have to be considered.

19.124 The minister also raised the practice of maintaining single women with two or more children in county homes. He pointed out that Dunboyne catered for women with more than one child but conceded that efforts to establish homes elsewhere, with the object of removing such women from county homes, had failed.
19.125 The minister proposed that, as a general rule, women should be discharged from mother and baby homes much sooner after the birth of their babies and that the congregation should retain children, unaccompanied, until their adoption or boarding out was arranged. He qualified this proposal by stating that women who required a two year stay for ‘rehabilitation and re-adjustment’ would not be afforded an early discharge. He further suggested that two of the congregation’s homes could be reserved for single women on their first pregnancy and the third would be reserved for women on their second or subsequent pregnancy exclusively. He stated that, if Sister Antonia was amenable to his proposals, Sean Ross would be the most suitable home to cater for single women on their second or subsequent pregnancy.

19.126 The Commission has not seen any record of a reply from Sister Antonia. The minister took the opportunity to discuss the matter with Sister Rosemonde when she visited the department in April 1957. Sister Rosemonde, who had moved from Sean Ross to Castlepollard, told the Minister that she and the Mother Superiors of Sean Ross and Bessborough preferred that ‘second cases’ (women on their second or subsequent pregnancy) would be taken into all three homes rather than the proposal that a separate home would be set aside for them. Miss Litster, who also attended the meeting, told the minister that the Sacred Heart Homes were already accepting ‘second cases’. Miss Litster further stated that the congregation took care to ensure that a woman who had been in a particular Sacred Heart home on her first pregnancy would not be admitted to the same home on her second. Miss Litster also stated that the congregation would not in any circumstances admit a pregnant woman accompanied by her first child.

19.127 In March 1958, the Department of Health sent a letter to all city and county managers to tell them that the authorities at all three Sacred Heart homes had agreed that ‘in suitable cases’ the early discharge of women was now possible. The department also said that the Sacred Heart homes were also prepared to accept ‘some mothers’ in their second or subsequent pregnancies but that the congregation would not admit mothers accompanied by children.

19.128 In 1958, the Department of Health reviewed the cost of accommodating women and children in the Sacred Heart homes over the period 1950 to 1957. The review concluded that, although the number of admissions to the homes had decreased, the operating costs had increased substantially. The department’s analysis
showed that admissions had decreased from 373 women and 350 babies in 1950 to 299 women and 257 babies in 1957. Expenditure had increased from £55,560 in 1950 to £83,160 in 1956 but decreased to £78,370 in 1957; the average cost had increased from £77 for each person in 1950 to £141 in 1957. The review recognised that the total costs had to come from public funds as the institutions had virtually no other income. The Minister for Health concluded:

The only effective economy in this matter would be to reduce the number of special homes from three to two, as it is now clear that two is sufficient to serve the full needs. I assume, however, that such a step would have to be approached rather slowly and would have to be preceded by some trial of every possible alternative.

19.129 In April 1958, Miss Reidy again carried out an inspection. She reported that there were seven dormitories for women: two twelve-bed units; two fourteen-bed units; one eleven-bed unit; one eight-bed unit and one ten-bed unit attached to the nurseries. The total bed complement for women was 81 beds. There were 72 women resident at the time. The women’s dormitories were converted stables which were ‘clean, comfortable and centrally heated’. The infant accommodation had four units: three thirty-cot units and one twenty four-cot unit, which were described as ‘large, bright and airy’. There were 114 cots for infants but there were 118 infants living there; eight of the children were awaiting transport to adoptive homes in the USA.

19.130 Miss Reidy also inspected the maternity hospital. Again, she recorded that the hospital was well-staffed, clean and well-kept and accommodation and sanitary accommodation for patients and staff was adequate. She noted a slight improvement in nursery accommodation where infant cots were two to two and a half feet apart; the recommended distance was eight feet. One maternal and ten infant deaths were recorded in the three years since her last inspection of the hospital.

19.131 Miss Reidy asked for data about the discharge of children. The congregation said that, in the period 1 August 1955 to 31 March 1956, 67 children were born in or admitted to Sean Ross. In the same period 19 were discharged with their mothers; six were adopted in the USA; four were adopted in Ireland; 20 were discharged to St Patrick’s Guild (presumably to be placed for adoption); two children were boarded out and three had died. In the period April 1956 to 31 March 1957, 109
children were born in, or admitted to, the home; 36 of these were discharged with their mothers; ten were adopted in the USA; seven were adopted in Ireland; 19 were discharged to other adoption societies and 13 children had died. In the period 1 April 1957 to 31 March 1958, 128 children were born in, or admitted to, the home. Of these, 41 were discharged with their mothers; 12 were adopted in Ireland; 26 were discharged to other adoption societies; one to a relative; one to the Catholic Women’s Aid Society; two to Dublin hospitals; one to a Mercy Convent (probably an industrial school) and ten children had died. In the period 1 August 1955 to 31 March 1958, 306 children were born in or admitted to Sean Ross. Fifteen were children of private fee-paying patients.

19.132 Miss Reidy expressed alarm that the infant death rate at Sean Ross had increased since 1954 and had remained high during 1958. Furthermore, it appeared that seven in every ten deaths during this period were due to viral pneumonia. When questioned, the congregation told her that the affected children had been given every medical care available but stated that the facilities available were ‘inadequate to provide proper care for critically ill infants’. The Reverend Mother also drew attention to the high levels of morbidity which prevailed among infants who survived viral pneumonia and the difficulty in finding foster homes for them. Miss Reidy concluded that the continued high infant death rate warranted medical investigation and advised the Department of Health to refer the matter to its chief medical advisor to identify measures which would reduce infant deaths.

19.133 It is unclear whether the Department of Health made any intervention at Sean Ross. However, Miss Reidy’s report for the year ending May 1959 showed a marked reduction in infant deaths. Three infant deaths had occurred. Two were neo-natal and the third occurred in a nineteen-day old infant who contracted influenza from his mother. In Miss Reidy’s subsequent report covering the period 1 May 1959 to August 1960, infant mortality had fallen even further. Of 169 children born in or admitted to the institution during this period two infant deaths occurred.

19.134 In a short report on an inspection visit in May 1959, Miss Reidy said that the general administration of the institution was satisfactory, the hospital was clean and well-kept and that mothers and infants were well-cared for. The accommodation for women was at 92% occupancy; infant accommodation was at 78% occupancy; and the maternity hospital had over 90% occupancy. Seven of the 41 women living in the maternity hospital were mothers of infants housed in the
hospital nursery. These women lived in the hospital block and worked there as female attendants. There were 13 unaccompanied children living in the home. Three had been admitted unaccompanied for adoption; their names did not appear on the books and they were not maintained by a health authority. A further seven children were also unaccompanied. Three of these were described as ‘delicate’ and considered ‘not fit for adoption’ due to impaired health. One child was ‘mixed race’ and the congregation reportedly ‘found it difficult’ to place the child in an adoptive home. The mother of one child was in a ‘mental hospital’ and the child was waiting to be boarded out. Another was recovering from orthopaedic surgery and the remaining child was due for discharge to the USA. Three children aged under two were also in the home unaccompanied. The mothers of two of these children were under treatment in external hospitals and the third child was admitted at the request of a health authority because of his mother’s ‘extreme youth’.

1960s

19.135 In an inspection report in August 1960, Miss Reidy said that the hospital was clean and well-kept and the records were up to date. She reported that a new nursery with central heating and cross-ventilation had been built along with a new feeding room equipped with wash-up sinks and basins. Miss Reidy noted that 39 of the 45 maternity beds were occupied. She noted that 135 deliveries were recorded since her last inspection (six stillbirths); one miscarriage and three neo-natal infant deaths were notified.

19.136 In April 1961, the children’s officer of Wexford County Council wrote to the Department of Health about a 25-year-old woman and her infant who were maintained by the Wexford Board of Assistance in Sean Ross. He described the woman in question as a ‘hopeless mental defective’ who was ‘entirely incapable’ of looking after herself and her child and required assistance with washing and dressing. He said that the Mother Superior at Sean Ross was anxious to discharge the woman and that the woman’s mother wanted to have her back in the family home. However, no member of the woman’s family was willing to accept responsibility for her child. The child could not be placed for adoption until he had been assessed. He suggested that the child be placed in an industrial school so that the mother could leave Sean Ross. The department did not think this appropriate in view of the child’s age and suggested that the child remain in the care of Sean Ross for 12 months so that his mental intelligence could be assessed.
later. Institutional records show that the child remained in Sean Ross for a further 22 months until he was transferred to St Clare’s, Stamullen in July 1963.

19.137 Sometimes politicians made representations about having women discharged from Sean Ross even though no arrangements had been made for the child. Usually, the family wanted the mother to come home but would not take responsibility for the child. In one such case in the early 1960s, the woman’s mother was prepared to take the child but the woman’s brother would not allow the child into the family home. As a result, the mother had to stay in Sean Ross for almost three years. Her child was adopted to the USA. At this stage, her mother did not want her home.

19.138 A TD wrote to the Department of Health in the early 1960s looking for ‘early adoption’ for a child born in Sean Ross. The department made enquiries with the Mother Superior who said that, although ‘all the advantages of adoption’ were put to her, the woman was anxious to keep her baby and would not part with it ‘for any offer’. She said that the congregation in Sean Ross would not dissuade her. The woman herself wrote to the department stating ‘I have no intention whatever of parting with my baby’. The department subsequently told the TD that the woman’s aunt had returned from England to claim her and her child. However, institutional records show that she had remained in Sean Ross for a further 11 months, until her child was discharged for adoption.

19.139 In January 1962, Miss Reidy again reported that the maternity hospital was clean and well-kept and that all records were up to date and available for inspection. In the two years since her last inspection of the hospital, 175 deliveries (three stillbirths) were recorded. No maternal deaths had occurred and two neo-natal deaths (asphyxia pallida and prematurity) were notified. She noted that 38 of the 45 maternity beds were occupied.

19.140 In July 1962, Miss Reidy again inspected the home. The nurseries and women’s dormitories were very clean and well-kept; all records were ‘available and properly posted’ and the wellbeing of both women and children was very satisfactory. There were 106 children living there; 64 were aged under one year. In the period 15 August 1960 to 20 July 1962, 302 children were born in, or admitted to, Sean Ross. Of these, 68 were subsequently discharged with their mothers; 116 were adopted (USA 45; Ireland 65; England five; Scotland one); 68 were discharged to
other adoption societies; 13 to relatives; two to hospital (Cherry Orchard and Temple Street); seven to what was described as ‘schools’ (some went to an industrial school, the others went to orphanages); five to ‘special institutions’; six to St Clare’s, Stamullen, and two to St Patrick’s Home, Navan Road (Pelletstown). A further 16 children were boarded out. Seven infant deaths were recorded during this period. Causes of death were given as pneumonia (three), bronchitis (two), hyperpyrexia and acute gastroenteritis.

19.141 In April 1963, Miss Reidy again inspected the maternity hospital. She reported that the hospital was clean and well-kept and that records were up to date and available for viewing. She noted that 174 deliveries (five stillbirths) had been recorded in the 14 months since her previous visit and that one neo-natal death had been notified. At the request of the General Registration Office (GRO), Miss Reidy made enquiries regarding the registration of births at Sean Ross. She was told by the Mother Superior that all infants in the hospital were registered and that registration took place weekly. Miss Reidy stated that the Mother Superior insisted that all children admitted to the home, whose births were not registered, were subsequently registered at the place of their birth and that a copy of the birth certificate was sent to her. While the Department of Health memorandum did not record the problem relating to the registration of births the department asked Miss Reidy to query registration practices at Bessborough, Castlepollard and St Patrick’s, Navan Road (Pelletstown).

19.142 Miss Reidy’s report in July 1963, again reported that the welfare of both women and children was ‘quite satisfactory’. At the time of inspection 113 women and 77 children were living there. In the period 20 July 1962 to 31 July 1963, 46 children were discharged with their mothers; 66 were adopted (Ireland, 37; USA, 27; England, one; Scotland, one); 43 were sent to other adoption societies; eight were boarded out; six were discharged to relatives; four to hospitals; and seven were transferred to ‘special schools’. Two infant deaths were notified during this period. Causes of death were given as measles and pneumonia.

19.143 In May 1964, the Department of Health studied the audited accounts of the three Sacred Heart homes and queried why the running costs associated with Sean Ross had increased in 1963. Auditors for the congregation told the department that there were no members of the congregation on the nursing staff of Sean Ross
and that increased expenditure there related to the provision of new bathrooms at a cost of £2,800 and renovations to the chapel at a cost of £500.

19.144 In response to statements made during debates surrounding the Adoption Bill 1963, the Department of Health drew up an overview of how single expectant women were catered for in the ‘Special Homes’ and the pathways available to women who were not in a position to support themselves and their child. The department pointed to Section 54 of the Health Act 1953, as the legal basis for maintaining women in Sean Ross, Bessborough and Castlepollard. This stated that persons unable to provide shelter and maintenance for themselves were eligible for institutional assistance in a county home or similar institution. Furthermore, the department pointed to their obligations under the Institutional Assistance Regulations 1954, to provide maternity services to women living in mother and baby homes. The department acknowledged that the legislation did not empower those running and/or operating mother and baby homes to detain a woman against her will. However, it was equally acknowledged that a woman could not leave a mother and baby home without taking her child with her or without planning for the future care of the child. The department set out the principal exit pathways for children on their discharge from a mother and baby home.

19.145 The first and, according to the department, most appropriate pathway was that a child would leave a mother and baby home in the care of the birth mother or her family. Where this was not an option the department considered that the next most appropriate exit pathways were legal adoption, boarding out by a health authority, placement in a foster home by a voluntary agency and as a last resort, placement in a long-stay institution such as an industrial school. The department acknowledged that the latter four options required the formal consent of the mother and often ‘exerted emotional stress on women who had to make a decision regarding the future care of their children’. This being so, and in the interests of infant welfare, the department considered it desirable that women should remain with their children in mother and baby homes until arrangements for their future had been agreed. The department recognised that this was the primary factor which determined the duration of a woman’s post-natal stay in an institutional setting. The department also acknowledged that no complaint had ever been received regarding the duration of a woman’s pre-natal stay in a mother and baby home.
home and concluded that most women ‘were willing enough to withdraw from the social scene when their condition becomes obvious’.

19.146 In April 1964, Miss Reidy inspected the maternity hospital. She again reported that the hospital was clean and well-kept and that records were up to date and available for inspection. In the twelve months since her previous inspection, 146 deliveries (six stillbirths) were recorded and six neo-natal infant deaths were notified. Regarding the stillbirths, the causes recorded were breech and cord prolapse; multiple birth (macerated); face presentation and cord tightly around neck; multiple birth and congenital abnormality; pre-viable prematurity, mother aged 14 years and pre-eclampsia toxaemia (macerated). Causes of neo-natal infant deaths were given as: congenital abnormality (three); hydrops foetalis; atelectasis and prematurity/asphyxia pallida.

19.147 In her October 1964 inspection, Miss Reidy noted that the well-being of mothers and children was ‘satisfactory’. At the time of her visit, 71 women and 84 children were living there. There were eight children aged two years and over in the home but their adoption had been arranged. In the period since her last inspection, 198 children were born in Sean Ross and a further 21 babies born outside the institution were admitted. Two infant deaths were notified during this period. Of the 193 children discharged from the home 150 were put up for adoption (Ireland, 62; USA, 41; UK, one;) and 46 were sent to other adoption societies.

19.148 Miss Reidy’s July 1965 report showed a similar pattern. In the fourteen months since her previous inspection, 203 births and six stillbirths were recorded. One maternal and five neo-natal deaths were notified in the same period. She noted that four cases of abortion (miscarriage) were treated and that three multiple pregnancies had occurred also. She stated that although the babies associated with the multiple pregnancies involved ‘a considerable degree of immaturity’ all six infants thrived. The causes of infant deaths were given as: hyper pyrexia; pre-viable prematurity; intra-cranial haemorrhage and asphyxia neonatorum. She reported that 50% of women admitted in this period were aged 21 years and younger; 16 were under the age of 17. The mother who died was a 21-year-old woman with a history of mental depression who suffered frequent attacks of tachycardia and died of coronary thrombosis.
In May 1966, Fr Colleran of the Catholic Protection and Rescue Society (CPRS) complained to the Department of Health about the behaviour of Louth County Council in relation to a 17-year-old single expectant woman whom the society had repatriated from England and placed in Sean Ross. Fr Colleran outlined how the society made the usual confidential application to the county council. However, an official of the council had called to the woman’s family home, informed her mother that she was expecting an ‘illegitimate’ baby in Sean Ross and asked if she would contribute towards her maintenance. The woman’s mother was reportedly deeply disturbed to hear about her daughter and her husband travelled to Sean Ross to investigate the matter. The woman was deeply upset to encounter her father at Sean Ross. However, he does not seem to have asked for her discharge. He told his wife that the woman in Sean Ross was not their daughter but a woman with the same name from the Dundalk area. As similar cases had come to light Fr Colleran said:

All through the years we have always understood that this confidential information which we disclose to the Officers of the County Councils would in fact be treated as such. May I add that I have rarely had occasion to be concerned that our trust was misplaced. You will appreciate that the whole system and method of helping unmarried mothers in this country must break down completely unless we can guarantee to these mothers that their parents, relatives and neighbours will not be informed of their condition. Secrecy is absolutely vital in the majority of these cases.

In January 1965, Dr Hourihane of the Department of Health medical inspectorate visited Sean Ross. He reported that the hospital labour and delivery wards had 44 beds combined and that Dr Hanley, medical officer to the district hospital, Roscrea, remained as attending obstetrician and medical officer at Sean Ross. In the year ended 31 December 1964, 160 births and six infant deaths were notified. He said that the infant deaths were mainly due to prematurity and congenital abnormalities. At the time of inspection 94 women and 77 children were living in the institution. Dr Hourihane noted that other buildings on the estate included a convent, chapel, laundry, bake house and farm outbuildings and stated that the institution was ‘almost self-sufficient’. Reporting to the chief medical advisor to the department, he said that he was ‘impressed by the general atmosphere in the Home’, that the mothers ‘appeared to be content and well-dressed’ and that the relationship between the mothers and the staff ‘was good’. He reported that all infants were
‘healthy, well-nourished in appearance’, were ‘obviously well-cared for’ and that the overall cleanliness of the home was ‘first-class’.

19.151 He also reported that proposals made by the North Tipperary county council to reconstitute Sean Ross as a home for mentally handicapped children had caused great anxiety among the Sisters in Sean Ross and that they were determined to fight the proposal (see below). The Mother Superior, Sister Barbara, told him that she was reluctant to spend money on maintenance due to the uncertainty of the situation.

19.152 Miss Reidy inspected the maternity hospital in March 1968 and reported that there were eleven pre-natal and four post-natal women in the hospital along with four neo-natal infants. In the three years since her last inspection, 518 women had been admitted and 408 births and ten stillbirths had been recorded. She noted that 110 women admitted to Sean Ross in this period were not subsequently confined there: 65 were admitted with babies born elsewhere; twelve were transferred to other hospitals; nine married and twenty four expectant women discharged themselves prior to giving birth. No maternal deaths were recorded in this period and the hospital treated three abortion (miscarriage) cases. Eleven infant deaths were notified. The causes of infant deaths were given as: atelectasis and asphyxia pallida (three); respiratory failure (three); intra-cranial haemorrhage; C.H.D.; prematurity (multiple birth) and congenital abnormality. Miss Reidy reported that the hospital conformed to the required standard.

**Closure of Sean Ross**

19.153 In 1964 the Department of Health began to examine the occupancy levels in the Sacred Heart mother and baby homes. The department noted that the combined available accommodation in the homes during 1963 was 880 beds and that total occupancy for the year was 485. The department considered that ‘sizeable economies could be achieved’ by closing one.

19.154 The Tipperary Association for Mentally Handicapped Children was trying to establish a centre for the institutional care of children with intellectual disabilities in the county. The association had raised £6,000 and was lobbying for the conversion of the former fever hospital in Roscrea (which had been closed) into a home for the mentally handicapped. The Commission of Inquiry on Mental...
Handicap was sitting at the time and the shortage of residential care centres for people with intellectual disabilities was one of the issues it was addressing.

19.155 In September 1964, the department asked the Superior General of the Congregation of the Sacred Hearts of Jesus and Mary, Sister Bernadette, if she would consider reconstituting one of their institutions in Ireland as a home for ‘mentally retarded girls’. The department said that such a move would represent ‘a worthwhile contribution towards the mentally retarded in this country’ and would help to resolve the financial difficulties experienced by the congregation in Ireland due to the falling numbers of admissions.

19.156 In September 1964, Sister Bernadette, with Sister Rosemonde (Castlepollard) and Sister Barbara (Sean Ross) met the Department of Health to discuss the matter. The department explained that, while low percentage occupancy and the consequent higher maintenance costs were a cause for concern, the more important consideration was the need to make the best use of all accommodation in the national health service. There was a pressing need for additional accommodation for ‘mentally handicapped’ children and the severely handicapped were the most pressing problem. All the institutions catering for the moderate and severely handicapped were full. The department considered Sean Ross to be the most suitable of the three Sacred Heart homes for the care of mentally handicapped people. Bessborough was considered but the Cork Polio and General Aftercare Association was already providing a similar service in the Cork area.

19.157 Sister Barbara said that the congregation was aware for some time that the three homes were not operating to full capacity and was anxious to remedy the matter. She proposed that one of the homes be used to cater for babies and children only. She understood that, in recent years, more women were going to England to have their babies and many of these babies were ‘lost to non-Catholic organisations’. The congregation hoped to encourage more unmarried mothers to have their babies in the special homes in Ireland by letting it be known that women could leave Sean Ross before their babies were adopted. The department took the view that two homes would still be sufficient even if this scheme was introduced. If the congregation agreed in principle that one home could be used for mentally handicapped people, the department would inspect the three homes and then make plans. Sister Bernadette said the issue would have to be discussed by the
congregation’s council. In October 1964, Sister Bernadette told the department that the council had unanimously agreed in principle and invited the department to undertake its inspections. The congregational council minutes show that, although the ‘Sisters in Éire’ were not happy with the proposed changes, the congregation was agreeable to the proposal in principle.

19.158 In November 1964, departmental inspectors visited the three homes and strongly recommended that Sean Ross was the most suitable for use as a home for mentally handicapped children and possibly some adults.

19.159 A meeting was arranged for February 1965 between the congregation and the Department of Health to discuss the matter. The day before the meeting, Sister Bernadette wrote to the department. She said that she had asked the superiors of the three homes to look at the issue through local spectacles. In the period since they had met the department (in September 1964) the numbers in the three homes had increased ‘enormously’ and the homes were at full capacity. She argued that the figures which the department was using about the number of beds in each home were incorrect; one third were extra beds which had been put in because of demand in earlier years. In effect, the ‘past figures meant overcrowding’.

19.160 Sister Bernadette’s letter also pointed out that the original policy of the congregation was to accept first time mothers only. They were now admitting mothers with second or subsequent pregnancies. She said that it was detrimental for very young first-time mothers aged 15, 16 or 17 (they had one 12 year old) to be with women in their late 30s or early 40s ‘who may have had 6 or 7 illegitimate children’. She said that the congregation had considered re-organising so that one of their homes could be put aside to cater for younger women only to assist in their social rehabilitation and that Sean Ross had been the ‘unanimous choice’ for such a home.

19.161 Sister Bernadette said that Sean Ross was the least suitable of the three homes for housing people with mental handicap basically because it was too remote.

19.162 At the meeting, Sister Bernadette was accompanied by her assistant and by Sister Barbara, Sean Ross, and Sister Rosemonde, Castlepollard. The letter was read and the Department of Health officials were clearly somewhat surprised by it. A discussion on the numbers ensued. The congregation set out what they regarded
as a reasonable bed complement which would allow for lockers and wardrobes; in
the case of Sean Ross, this was 126 mothers and 90 children; there were 110
mothers in residence at the time. The department pointed out that the figures
produced by the congregation still meant that two institutions would be sufficient.
However, Sister Bernadette’s assistant said that the congregation could not turn
over one of their homes in Ireland for any other purpose at this time.

19.163 The departmental secretary said that, while reasonably good conditions should
obtain in residential homes for unmarried mothers, ‘super-standards are not
important in the case of able-bodied people only in the Home for a short period’.
He also made it clear that the provision of accommodation ‘for the mentally
handicapped’ was the department’s primary concern. It was agreed that the
congregation and the department would meet again in March. This planned
meeting did not take place as it appears that the Bishop of Killaloe arrived at Sean
Ross and was then told of the proposal. He had baptismal statistics which showed
the increase in the number of children in Sean Ross.

19.164 In April 1965, the Minister for Health wrote a long letter to the bishop outlining the
sequence of events. He said that the congregation had argued that if the homes
were at full capacity they would be overcrowded and that accommodation, once
regarded as appropriate, would not be acceptable to women entering the homes in
1965. He said that, at the meeting with the department, one of the Irish homes
superiors had said that women admitted to the Sacred Heart homes in 1965
arrived with ‘their transistor sets and large kits of beautifying aids’. The minister
accepted that women were entitled to a reasonable standard of accommodation
but pointed out that, while the average stay had previously been around two years,
the average in 1965 was around three months. In this letter the minister said that
his officials had formed the view that, at the February meeting, the Superior
General was agreeable in principle to the release of one of the homes but she was
‘considerably embarrassed by the change of front’ on the part of the
representatives present from two of the Irish houses.

19.165 While the Department of Health and the Congregation of the Sacred Hearts were
discussing the future of Sean Ross, neither party had consulted Bishop Rodgers of
Killaloe. The bishop admonished the Superior General of the congregation and

60 Killaloe Diocesan Archive
the Minister for Health for excluding him from these discussions. In April 1965, after the minister’s letter, the bishop said that he had no wish to be presented with ‘even a partial fait accompli where important religious moral or social issues are involved’. ‘Any change to Sean Ross must not be lightly undertaken.’

19.166 The minister replied that:

I cannot sufficiently express my regret that you were not consulted in the first instance when the proposal to convert Sean Ross into a home for mentally-handicapped children emerged and before any other action had been taken. I can only plead that the extreme pressure which I have been bringing to bear on my Department here to find, and even to improvise accommodation, to meet the urgent demands of the parents and relatives of these poor children and equally pitiable adults was responsible for the oversight.

19.167 In May 1965, the bishop wrote to the department. He denied that he was ‘piqued’ because he had not been consulted about the proposal but said that he was deeply perturbed by

- the fact that a religious community in his diocese had been asked by a government department to give up the work for which they had been admitted into the diocese and
- the records of Sean Ross showed that the need to provide for unmarried mothers, their rehabilitation and the adoption of their children was more pressing and urgent than ever.

19.168 He outlined some statistics in support of his view. He went on to remark that he did not agree that three months was sufficient time for the moral rehabilitation of some women. The department offered to meet the bishop to further discuss the matter even though it was reasonably clear that the bishop did not support the change of use of Sean Ross. The bishop accepted the offer of a meeting but made it clear that he was not interested in the other two homes; Sean Ross was his only concern. A meeting was held in July 1965. The department’s conclusion was that, as far as the bishop was concerned, the department could close any home but not Sean Ross. The department concluded that it could forget about Sean Ross as a possible immediate solution to the problem of accommodation for the mentally handicapped.
The congregational council minutes of November 1966 show that the congregation agreed to the proposal that Sean Ross would be reconstituted as a home for children with mental disabilities. It would appear that this decision was not conveyed to the Department of Health at this time. When the authorities at Sean Ross applied for increased maintenance rates in May 1967 the department raised the issue again. Occupancy rates were falling and, as a result, the Sacred Heart homes had accumulated deficits. In June 1968 the department noted that agreement on the change of use of Sean Ross had been received all round and that discussions regarding the alteration of the institution were in progress. In October 1969 the Congregation of the Sacred Hearts of Jesus and Mary ceased to admit single expectant women to Sean Ross. The last mother and baby were discharged before Christmas 1969 and the institution ceased its operations as a mother and baby home. In August 1970, it opened as St Anne’s Hospital for Mentally Handicapped Children.

Australian Former Child Migrant Project

In 2001, the project manager of the Australian Former Child Migrant Project (UK) wrote to Sister Sarto in Bessborough to inform her that she had located records relating to ten children who were born in Sean Ross and subsequently sent from the UK to Australia under Barnardo’s Child Migrant Scheme. Sister Sarto confirmed that all ten children in question were born in Sean Ross on dates between 1936 and 1946 and that they had been discharged with their mothers who took up employment in Wales. She stated that the women involved had accepted offers of employment at the newly built St Winefride’s private hospital operated by the Congregation of the Sacred Hearts in Cardiff. Sister Sarto said that a retired member of the congregation who knew the women involved had stated that, while the women worked in St Winefride’s, their children lived in ‘an orphanage in Swansea’. The project manager confirmed that the children lived in Nazareth Homes in Swansea and Cardiff. With parental permission, all ten children were subsequently sent to Australia from these institutions under the Barnardo’s Child Migrant Scheme which ran from 1920-65. The project manager said that she was surprised to find children from Ireland among the records of those sent to Australia but acknowledged that Irish children who had been transferred to institutions in Belfast and Derry had also been identified as child migrants.

---

Institutional records analysed by the Commission show that at least 94 children were transferred from institutions under the Commission’s remit to a Nazareth Home in the United Kingdom. In addition, hundreds of women were discharged with their children to take up employment in institutions run by the Congregation of the Sacred Hearts in the United Kingdom. It seems plausible to suggest that more children who were born in, or once resident in, one of the institutions under the Commission’s remit were also transferred to Australia from orphanages in the United Kingdom.

Evidence of former Sean Ross residents

The experiences described by the former residents who gave evidence to the Commission are largely set out in their own words. In some cases, particular information which might identify the witnesses has not been included.

Resident A, Mother, mid 1950s

19.171 Resident A told the Commission that she became pregnant at the age of 15. When her mother found out she was taken to see a doctor. Her mother thought that her pregnancy was ‘a scandal’ and she tried to keep it from Resident A’s 12 siblings. The witness said:

> From then on it was all hullabaloo. It was like, who did it? Who didn't do it? How did it happen? You know, and my father and my mother. Anyhow, I couldn't tell because I didn't actually know any facts of life to be fair, but I knew somebody messed about, you know. When I was out with my sister, he sort of pulled - well, there was two lads and they pulled me into the bushes and whatever happened, it happened, and I didn't even know that that is where babies come from or anything. So, I didn't know. It was like rape I suppose you would call it, you know, they just attacked me... I said two names I thought might be it, and they must have known... it was the day my sister got married this happened.

19.172 She was driven to Sean Ross accompanied by her mother.

> They took me as far as Roscrea, but I didn't know anything until I got out and I saw the big house, and I thought it was a convent, yes, that I was going to, I think it is a convent, I don't know, but I was brought in there and from then on I was a different, different clothes, different everything, and you know
whatever you get on and do your work. You know, I wasn't a child anymore. No education of course, they didn't do it then. So, yes, but you know you got a new name. So, you were never to use your name again while you are there anyhow, and everyone else I assume had a wrong name, but it didn't matter. You were put in a dormitory with - there was quite a lot of people in it.

19.173 She worked in the laundry during her time in Sean Ross. She remembered washing sanitary towels by hand.

Up early for you to go to church every morning, back down to where you got your breakfast, and two slices of bread or toast...Then we were assigned jobs. Mine was in the laundry and it wasn't a very nice job, you know. It was like ... how do I call them, a lady's ... The ladies sanitary [towels], let us say, cloth things, and collect them, put them in baskets. They were put into some baskets, wicker baskets. Bring them into the wash house, wash them out by hand, and when it was fine, the day was fine I had to put them out on stones in this yard, yes. Maybe turn them every now and again, and in the meantime, I helped with the sheets and put them through the mangles, big sheets.

19.174 She was taken out of Sean Ross by her father and one of the nuns on one occasion and questioned about the alleged rape while accompanied by her father. She did not know if the person she spoke to was a doctor or a solicitor. She said that they were trying to find out which boy was responsible. She does not know the outcome of that.

19.175 She said that the food in Sean Ross was sparse and that she was constantly hungry.

You were so hungry, I do remember that bit, you got so hungry and you just had whatever the ration was. You couldn't get anything extra. The bread was in the morning. There might have been something in the lunchtime, like I don't know was it soup or something but very little. I found oh God I was always starving, but you get used to it, nobody else had it. So, you didn't. There were no extras or anything.

19.176 She was not told what to expect during labour and her experience in Sean Ross was 'awful'.
They actually tied me, because I was in pain, I thought I am going to die. They tied me down with some, I don't know, stuff to the bed. It was like the bed was on the floor because it was in case I fell out I suppose, I don't know, and it was absolutely horrific, but anyhow once it is over and I was told I suppose, this will teach you, offer it up for the sins you committed and all that. You felt that too, that that is why you got more pain maybe than maybe another one, you know. There were no painkillers in those days I don't think, I don't know whether there was.

19.177 She said that she had to return to work in the home a few days after giving birth. She took up her duties in the steam room and breastfed her baby three times a day. She said that the women were excited to spend time with their babies at feeding times and in the evenings and were resigned to the fact that they could not spend as much time with their babies as they wanted to. She thought that she would be in Sean Ross for her whole life.

19.178 She said that no one ever discussed her baby’s adoption with her. She remembered that her mother and married sister visited Sean Ross after her baby was born and she suspects that they made arrangements for her baby’s adoption with the nuns. She said that it was not up to her to decide on what happened to her baby and that she did not sign adoption papers. She said that the nuns would not have been able to put her baby up for adoption without her parents’ consent. She got up one morning and was told to put her own clothes on. She remembered that her baby was dressed in a blue suit and that there was a car waiting outside.

He was four months old. I was still breastfeeding him. So I fed him and he got all dressed up and everything and told me … they took the baby, one of the …a nun, took the baby, and there was a driver in the car and I was told to come out. I actually thought we were going somewhere nice, back home or something, and took us to Dublin.

19.179 She followed her mother and one of the nuns from Sean Ross into a house on South Anne Street [Catholic Protection and Rescue Society]. She remembered that she was asked to feed her baby and then he was taken from her. Her father arrived and took her to her married sister’s house. She was not allowed to see her friends or siblings. She returned to South Anne Street when she was 18 or 19 to sign some documents.
I probably knew what it was, but I didn't put any emphasis on it. It wasn't like somebody came with me and explained it, as far as I remember.

19.180 Reflecting on her time in Sean Ross, Resident A said:

It is just the way the regime was when you went into these places. They should have like - I should have been treated maybe - maybe I feel I should have got more food, maybe everyone felt it. Maybe a bit more tolerance, because I was so young... Just I think at the age I was and everything, it stopped, you know, dead on. Maybe I could have had a nicer experience, or because I was ignorant really but I suppose everyone was and maybe I shouldn't have had to do so much work, you know, hardship, and maybe organise for a little bit of education in there or something.

Resident B, Mother, early 1960s

19.181 Resident B told the Commission that she became pregnant at the age of 21 When she was seven months pregnant she told her aunt with whom she was living and the aunt arranged her admission to Sean Ross. Her boyfriend (whom she subsequently married) did not know that she had been admitted.

When the door opened and I met this nun, Sister Hildegarde I am quite sure it was, I can't memorise that end of it, but I was asked who the father of my child was... So, I said I don't know, and they said what was your mother's name and I said Mary and she said right, she said we will call you Molly. She said go off there and get dressed and there was no more about it.

19.182 She said that all the women in Sean Ross wore uniform clothes. They did not wear their own clothes and that everything, including sanitary towels, was provided for them. She said that she worked minding babies in the nursery during her 14 months stay.

19.183 She said that her time in Sean Ross was ‘perfect’. She had been treated as ‘slave labour’ in her aunt’s house and she had not been allowed to progress to secondary school. She said that the nuns were very fond of her and that she had a great relationship with Sister Conrad and Sister Winifred. Her boyfriend visited her in Sean Ross every Saturday but when the nuns found out that he was the father of her child they stopped the visits.
19.184 The birth of her baby went smoothly but she picked up an infection after giving birth. She recovered after some days’ rest. She said that she had to breastfeed the baby and did so every morning before going to mass. She said that she could have left Sean Ross shortly after giving birth if she paid the nuns £105 but that she was adamant that she would try to keep her baby. Her boyfriend would not take her and their baby out of the home or marry her in Sean Ross because of what his family would say about it.

It was the time that was in it. You were blackened, your reputation was gone and they kind of didn’t want to mix with you. You were stained, you know, at that time, you know.

19.185 Her baby was due to be adopted in America and she signed papers for an ‘American adoption’. She said that her boyfriend upset a local priest and the baby was instead given to a couple living four miles from where she lived. She suspects that the parish priest arranged for this to happen. She said that any couple could walk into Sean Ross and adopt a child ‘as long as they had money’. She said that the local priest had his ‘palm well-greased’ for arranging her baby’s adoption and that the priest wanted to disgrace her boyfriend.

You and your wife could walk in and go through the nursery. As long as you had money, this is my theory anyhow, you’d go and you can pick what child you like or you can ask their parent, or their we’ll say, pedigree in life kind of…

You had to give so much money. I think it was what, something around four, about four grand for America and whatever. In Ireland, I don’t know.

19.186 She said that she never actually saw any couple handing money over to adopt a child from Sean Ross and that she had ‘no evidence whatsoever’ that this happened but believes that this was a regular occurrence.

19.187 She said that she was given no other option but to give her baby up for adoption. She had no support in the outside world from anyone. Sister Hildegarde told her that her baby was to be adopted by two doctors in the west of Ireland. Sister Hildegarde oversaw all adoptions from Sean Ross, and she did not remember ever signing any paperwork in the presence of a solicitor.

You signed where you were told and after that then she could have been sent anywhere. You had no say, only dress your child and bring her to the door and that was it. I handed her over to another girl… and I knew she was gone then, and we ran to the window to watch the car going down the
avenue...Sure I cried my eyes out and that was it. There was no - never mentioned after. You were told then that you were going soon.

Resident C, Mother, mid 1960s

19.188 When Resident C became pregnant, her aunt spoke to the local priest and he directed her to the 'Irish Catholic Church Society' [Catholic Rescue and Protection Society] in Dublin who arranged for her admission to Sean Ross. She had no real choice about this decision as her aunt took full control of the situation. She was collected by a car and driver in her hometown and driven to Sean Ross.

19.189 Resident C told the Commission that she was given a 'house name' and a number when she was admitted. She did not want this but had no choice but to accept it. She shared a dormitory with ten or twelve other women.

19.190 Her incoming and outgoing letters were censored. She wrote to her aunt complaining about the food and one of the nuns read her letter in the dining room and then made her eat it. She said that the food was generally 'horrible'. The women in the home were not allowed to speak to each other. She worked in the shop at Sean Ross with Sister Francis and she remembered that the women listed to music from a record player for around two hours every Sunday afternoon.

19.191 She said that her birthing experience in Sean Ross was ‘desperate’:

When I went out first, I was called over to the hospital end. I walked over, they arrange to take you over and this horrible man who was the doctor arrived in and I was really afraid. So, I was shoved down in the bed. Legs strapped and this bucket was brought in. So, the bucket was in case I bleed when he examined me. He never spoke to me or nothing. So just did the examination... That was all the attention and then when it came to the actual birth my waters broke and I didn't know what it was and the nun that was in the dormitory nearly went mad because I had wet the floor.

19.192 She said that she had not agreed to have her baby adopted and that the adoption procedure was never explained to her. She remembered being brought to see a woman who asked her to sign a form. She suspects that this was the form consenting to her child’s adoption. She said that she did not formally consent to have her baby adopted and that she did not sign any final consent forms.
19.193 She bought clothes for her baby for the day that she would leave the home. She was subsequently told by the woman who adopted her baby that the baby was in a nappy and blanket when she received her. The witness suspects that the nuns were selling the same baby clothes multiple times. She recalled one occasion where she was asked to count money with Sister Winifred. She said that the nuns were buying a new safe and had the money in old biscuit tins:

All notes. Money I had never seen before which looked like dollars. So, all in plastic bands. So, I counted it then and passed it to the Sister. She counted it and gave it back to me. I counted it. She finally counted it and then it was registered in the book... I mean but there was quite a lot of tins. Now I can't say if there was money in all of them, but my daughter told me her adoptive mother got letters regularly from them asking by the way how they were and how was the baby and she always sent a donation.

19.194 The witness said that she had no prior notification of the day the adoptive parents would take her child. She said that she hurriedly dressed her baby in new clothes and that she was then taken away by one of the nuns. She became hysterical at that point and does not remember anything else about that day. She left Sean Ross a few days later. She said that a driver drove her to the train station and made some disparaging remarks towards her.

Affidavits received by the Commission

The Commission received a number of affidavits from former residents. These are sworn statements and are reported largely in the words used by the former residents. Unlike those who gave direct evidence, the Commission did not ask any questions of these former residents.

Resident D, Mother, early 1950s

19.195 Resident D became pregnant in at the age of 18. She stated that she was living with her aunt at the time. When her aunt realised that she was pregnant she was taken to a doctor who recommended that she be admitted to Sean Ross. Her brother drove her to Sean Ross accompanied by her aunt. She was admitted when she was seven months pregnant. She remembered that there was a brief hand over before her aunt and brother left her.
I slept in a large dormitory with other women and girls some of whom were pregnant and others who had already had their babies. Most of my memories have been blocked out over the years but I recall being cold at night and that the clothes they gave us to wear were cold and scratchy. No one had any privacy at all. I cannot remember what the food was like, however, I have an abiding memory of always being hungry.

19.196 She said that she worked in the laundry at Sean Ross and that the working day was approximately 8.30am until 4pm.

It was heavy work scrubbing clothes and bedding on boards, washing and ironing all with our bare hands. As far as I could see we were only washing the Abbey’s own laundry and that this was not a commercial operation. We worked a six-day week. On Sundays we would attend a number of masses, but we would not work in the laundry. To the extent that the women and girls had any spare time, I recall that we spent a lot of this time knitting clothes for our children.

19.197 She described the regime in Sean Ross was pretty severe but she didn’t receive many punishments. She stated that on one occasion she was forced to ‘go down on my knees’ to publicly apologise to a nun. This was ‘just another part of the humiliation and shame’ she was subjected to every day. The nuns constantly reminded her that she had ‘committed a mortal sin’ and that ‘her shame would be eternal’. She was given a ‘house name’. Women did not discuss their family or their backgrounds. This was all part of the ‘shame’ she was made to feel every day of her time at Sean Ross. She said that some girls ‘ran away’ but were ‘brought back by the Garda’.

19.198 She said that there was no doctor present during her labour and that ‘there was no formal medical care or any kind of pain relief’ made available to her. Her labour was ‘agonising in accordance with the principle that we had to suffer for our sins’. She gave birth to a healthy boy and spent eight weeks in the maternity hospital looking after her son and breastfeeding him.

19.199 She returned to work in the laundry after eight weeks and she was allowed to spend one hour, 4-5 pm, with her baby. She remembered:

Some of the others had a little money to buy gifts for their children. I had nothing but there was one very kind nun, Sister Annunciata, who would
occasionally give me a bar of chocolate to give him. That same nun took a few photographs of [the baby] and gave them to me. It never occurred to me ask whether I could go home now I had given birth. This was partly because I had nowhere to go. My aunt had disowned me but also because I had to stay until [the baby] was adopted. It was taken for granted that [my baby] would be adopted and it never even crossed my mind that there might be any other option.

19.200 She said that she signed consent to adoption form in the presence of Sister Hildegarde and a man who she assumed was a solicitor. She stated that she was not allowed time to read the document and did what she was told. She said that the contents of the document were never explained to her and she was not asked to formally swear to the document. She said that she was not told when her son would be taken and she was given no information regarding prospective foster parents. She remembered:

When [the baby] was three and a half years old, he was taken away for adoption. I didn’t get the chance to say goodbye but the same kind nun, Sister Annunciata, informed me that he was leaving, and I ran upstairs and looked out of the window and saw him getting into a car. There was no discussion about it in advance and I was given no information afterwards other than that he had gone. Being parted from him broke my heart.

19.201 The nuns arranged work for her in a school in the UK and she moved there shortly after her baby was adopted.

19.202 She decided that she would try to contact her son in 2003 when she was 70 years old. She contacted Sister Sarto at Bessborough who told her that her son had been adopted in America but had since died.

19.203 She stated that she was told by her son’s adoptive sister and another person that the American couple that adopted her baby ‘paid a significant sum of money to Sean Ross Abbey’ and that ‘they paid annual sums thereafter’. She did not know the details of the sums involved and did not have any documentary evidence.

Affidavits from children born in Sean Ross and adopted to the USA

19.204 Not surprisingly, the children who were born in Sean Ross and adopted to the USA did not have any memories of their time in Sean Ross. Their statements were
mainly concerned with their subsequent attempts to trace their birth mothers. Some provided some anecdotal evidence about money changing hands.

19.205 A man who was born in Sean Ross in the early 1960s and was adopted at about the age of three and a half years said he had no memory of his time in Sean Ross but that he had some memory of his flight to his adoptive parents in the USA. He remembered that he was one of four children sent to the USA together in the care of an elderly woman and a priest. He remembered being met by his adoptive parents on his arrival in America. He had seen financial statements showing that his adoptive parents paid money to the nuns at Sean Ross, but his recollection was that this related to itemised expenses such as the cost of his flight to the USA. The supporting letter shows that the cost of his flight to America was paid directly to Pan American World Airways Systems. His adoptive parents paid Pan America $273.40 for a half or child’s ticket. The Congregation of the Sacred Hearts billed his adoptive parents $142.00 to cover one quarter of the accompanying guardian’s air fare (the guardian accompanied four children on the same flight) and their expenses. It would appear that the expenses received by the congregation amounted to $6.00.

19.206 Two other statements dealt with the question of money changing hands in such adoptions. One man said that his adoptive parents did not believe that they thought that they were ‘buying’ a child from Ireland. One woman said that she had been told by a HSE employee that her adoption had been arranged through the ‘black market’.

19.207 One woman who was born in Sean Ross in the late 1950s outlined what her mother had told her about her (the mother’s) stay in Sean Ross. Her mother told her that she had become pregnant aged 15 years and that her family sent her to Sean Ross. Her mother’s family were prepared to let her marry the father of her child, a much older man, but she declined to do so. Her mother told her that she had ‘suffered badly at the hands of the nuns’ at Sean Ross. Her mother said that she had been tied to a bed when she was in labour and that ‘a nun sat on her chest’ to make her push. Her mother told her that the nuns did not give her nappies and was ‘actively prevented from bonding’ with her. Her mother said that she was back ‘working in the fields and laundry’ two days after giving birth.
Evidence of local people to the Commission

Workman 1980s

19.208 The workman told the Commission that he worked at Sean Ross in the 1980s. He remembered repairing the pillars and chains that delineated the infants’ burial ground. He said that the burial ground was in a general state of neglect at that time. The workmen knew that the site was a graveyard but were not told that it was an infants’ graveyard. The nuns’ graveyard was in much better order than the ‘baby plot’.

19.209 The infants’ graveyard area was cleared of briars and sprayed with weed killers. Some time later a tractor was brought onto the site to prepare the ground for grass seed. Shortly after this work commenced, he noticed ‘lots of small bones’ in the ground. He was not present for the rest of the groundwork, but he believes that workers brought a small rotavator onto the site and put down grass seed. He believes that the work to clean up the graveyard was undertaken at the behest of Sister Priscilla.

Local resident

19.210 A local resident told the Commission that he was a carpenter and worker with Maher’s Undertakers in Roscrea in the mid-1950s. He said that an order came in from the Sean Ross mother and baby home every October for ‘six to ten 18-inch to 21-inch coffins’. He knew a man who buried infants at Sean Ross and this man had said that infants at Sean Ross were buried without coffins in ‘quick lime’. The local resident believed that the coffins which were ordered from the undertakers where he worked were for children born to the daughters of ‘respectable farmers’ who would have buried their children in a family plot.
Chapter 19A: Sean Ross Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

Sean Ross Total Mothers Admitted per Year
From the institutional records, the Commission identified 6,414 women who were admitted to Sean Ross between 1931 and 1969. Information relating to date of admission was available for 6,397 women (99.7% of admissions). In 1932, its first full year in operation, 172 women were admitted. More than 200 women were admitted in 1933 and numbers remained relatively high throughout the 1930s. Admissions fell in 1939; 136 women were admitted that year. Admissions increased steadily during the war years. By 1945, Sean Ross was extremely overcrowded and, despite reportedly being closed to new admissions for most of the year, 219 women were admitted. Admissions remained high in 1946 when 199 women were admitted. Mirroring trends in other mother and baby homes, admissions to Sean Ross began to decrease in the late 1940s and remained relatively low throughout the 1950s when 139 admissions on average were recorded annually. Admissions began to increase from 1961 and 182 women on average were admitted annually in the years 1962-69.

Analysis by decade shows that admissions were most frequent in the 1940s (29%) and the 1960s (27%) followed by the 1930s (22%) and the 1950s (22%).
Private patients

The Sean Ross records recorded 721 women as private patients representing 11.2% of all admissions. Information relating to date of admission was available for 720 private patients. Although private patients are identifiable in the institutional records from 1933 their numbers increased dramatically in the early 1960s.
By 1965, private patients accounted for 55% of all admissions to Sean Ross and for around 47% of admissions on average in the years 1962-68.

All mother and baby homes experienced increased admissions in the early 1960s. However, it appears that increased admissions to Sean Ross in that period were driven by increased admissions of private patients. The institutional records show that, prior to the 1960s, private patients accounted for a small percentage of admissions. However, for most of the 1960s one in every two women admitted to Sean Ross was a private patient.

**Referral pathways**
Information relating to referral pathways into Sean Ross was available for just 46 women (0.7% of admissions). The Commission considered this sample size too small to draw conclusions.

**Occupancy**
Information which facilitated the Commission’s calculations relating to occupancy was available for 6,322 women (98.6% of all admissions). Occupancy represents the average number of women present in the institution on any given day.
The Commission compared data relating to occupancy derived from institutional records with annual returns sent by Sean Ross to the Department of Health for the years 1950-69. Temporary absences from the institution, such as instances where women were being treated in external hospitals, are not recorded in the Commission’s occupancy numbers. No date of admission and/or discharge was available for 1.4% of women and these were excluded from the Commission’s calculations. These factors caused the Commission’s calculations to fluctuate slightly. Notwithstanding this, the Commission is satisfied that the occupancy rates forwarded by Sean Ross to the Department of Health were broadly in line with rates which the Commission independently arrived at.

Analysis of occupancy rates against admissions shows that average occupancy in Sean Ross was high from the late 1930s to the late 1950s. In 1939, average occupancy exceeded the number of admissions to Sean Ross for the first time, which suggests that women were staying in the home for longer periods. Admission rates increased during the war years and high average occupancy rates pertained. This led to severe overcrowding in the home from
1945-47. High occupancy rates persisted for most of the 1950s and average occupancy regularly exceeded the number of admissions to the home. As was the case in other mother and baby homes, this trend was altered in 1961. Although admissions increased significantly in the 1960s more women were opting to have their child adopted and consequently spent less time in the institution.

There were similar numbers of women admitted to Sean Ross in the 1940s (1,839) and the 1960s (1,743). A woman admitted to Sean Ross in the 1940s could expect to be living with another 158 women on average. However, a woman admitted to Sean Ross in the 1960s could expect to be living with 94 women on average.
Birth details

Information relating to birth details was available for 6,167 women (96.1% of admissions).

The institutional records show that 89.4% of women admitted to Sean Ross stayed and gave birth there. A further 8.4% were admitted with their baby having given birth elsewhere and 2.2% of admissions left the home before giving birth.

Information relating to place of birth was available for 5,665 women (88.3% of admissions)
Length of stay

Information relating to length of stay was available for 6,322 women (98.6% of admissions)

The institutional records show that the length of stay in Sean Ross increased substantially from 240 days on average for women admitted in 1936 to 433 days on average for those admitted in 1939 and remained relatively high until the late 1950s. Women admitted in 1951 spent over 400 days on average in the home; this had altered little by 1955 when 369 days was an average stay for women admitted that year. Length of stay shortened dramatically from 1961.
Information relating to the length of stay among private patients shows that they spent far less time in Sean Ross than their public counterparts. Although the statistics suggest that the opposite was true in the 1930s the figures for that decade include two private patients who spent more than three years in the institution. In the 1930s private patients generally left Sean Ross between 24 and 66 days after giving birth. Although the number of private patients admitted to Sean Ross in the 1940s and 1950s was small, it is clear that their stay in the home was of far shorter duration than their public counterparts. Most private patients admitted to Sean Ross were admitted in the 1960s. Although most women opted to place their baby for adoption in this period, public patients spent five months on average after the birth in the home whereas private patients stayed for around four months on average.

Analysis of length of stay after birth shows that in the 1930s almost 33% of women, or one in three, left Sean Ross within 50 days of giving birth; by the 1960s almost 44% left within 50 days. In the 1930s, 66.5% of women, or two in three, left Sean Ross within six months of giving birth; by the 1960s almost 79% left within six months. In the 1930s 15.5% of women spent more than two years in Sean Ross after giving birth. This figure increased to 16.6% in the 1940s and to 17.5% in the 1950s. However, by the 1960s just 3% of women spent more than two years in the home.
Information relating to age on admission was available for 6,323 women (98.6% of admissions). Age on admission ranged from 12 to 52 years. The average age on admission was 22 years. The mode of age on admission was 19 years. Most women (87.5%) were aged between 17 and 30 years on admission; 5.9% were between 31 and 52 years and 6.6% were aged between 12 and 16 years.
Information relating to previous pregnancy was available for 1,728 women (26.9% of admissions). The sample shows that most women (97.4%) were admitted on their first pregnancy; 2.1% were admitted on their second pregnancy and 0.5% were admitted on their third or subsequent pregnancy.
Information relating to occupations was available for 2,071 women (32.3% of admissions). Most women (82.5%) were recorded as domestic servants or unskilled workers; 9% were engaged in home duties or working on the family farm; 6% were recorded as teacher/civil servant/nurse/clerical/other skilled worker; 1% were unemployed or in receipt of state benefit and 1% were in full time education. Admissions from the civil servant/skilled worker category were most frequent in the 1960s; 52% of whom were private patients. Similarly, admissions of women working in the family home or on the family farm also increased sharply in the 1960s; 43% of whom were private patients. Increased admissions from these two cohorts in the 1960s may partially explain the increased admissions of private patients.
Information relating to address prior to admission was available for 6,387 women (99.6% of admissions). Institutional records show that women admitted to Sean Ross gave addresses in all 32 counties. Almost 20% gave an address in Tipperary followed by Kilkenny, 11.1%; Laois, 8.6%; Clare, 7.8%; Kildare, 7.5%; Wexford, 6.2%; Offaly, 5.7%; Limerick, 5.6%; Carlow, 4.3%; Galway, 4%; Cork, 3.7% and Dublin, 2%. The remaining counties combined accounted for around 14% of admissions.
CHAPTER 19 A SEAN ROSS STATISTICAL ANALYSIS

Mothers Exit Pathways

Information relating to exit pathways from Sean Ross was available for 5,857 women (91.3% of admissions). Institutional records show that most women (69.8%) returned home or were discharged to a private address; 21.85% were discharged to employment; 4.46% transferred to hospital; 1.88% were discharged to a Magdalen Laundry; 1.45% were placed in situations by the Congregation of the Sacred Hearts and 0.44% transferred to another institution under the Commission’s remit (generally Kilkenny County Home).
Annual statistical returns furnished by Sean Ross to the Department of Health for the years 1951-69 inclusive allow for further analysis of exit pathways in this period and show how the introduction of legal adoption altered trends. For instance, in 1951 around one in ten women were discharged directly to employment; by 1969 over one in seven were discharged in this manner. These records also show that 54% of women who returned to the family home in this period took their babies with them; 46% of women returned to the family home while their babies remained in Sean Ross.

**Maternal Deaths**

Through the institutional records, the Commission identified 37 deaths among women admitted to Sean Ross: representing a mortality rate of 0.58%. Sixteen deaths occurred in external hospitals. Fourteen deaths were not associated with pregnancy or childbirth - half of these were due to typhoid and the remainder were, in the main, due to tuberculosis. Eight deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy and generally resulted in cardiac failure. Fifteen deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were due to eclampsia, puerperal sepsis, toxaemia, nephritis and coronary embolism and thrombosis. Adhering to WHO guidelines the maternal mortality rate in Sean Ross was 0.35%.¹

1¹ Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. https://www.who.int/healthinfo/statistics/indmaternalmortality/en/
Sean Ross: Children

The institutional records show that 6,079 children were born in or admitted to Sean Ross. Date of birth/admission was available for 6,022 children (99% of births/admissions).

Births and child admissions to Sean Ross were consistently high throughout the 1930s and early 1940s and peaked in 1945 when 201 children were recorded. Although births and admissions decreased somewhat in the 1950s, numbers began to increase from 1961 and peaked in 1965 when 201 children were again recorded. It would appear that Sean Ross was busiest in the decade prior to its closure.
Child Occupancy
Information relating to child occupancy was available for 5,935 children (97.6% of births/admissions). Occupancy relates to the number of children who were living in Sean Ross on any given day.

The institutional records show that occupancy rates in Sean Ross were particularly high in the 1940s when 140 children on average were living in the home on any given day and peaked in 1940 when 165 children on average were living in the home. In the 1960s, the same number of children were born in or admitted to Sean Ross as the 1940s. However, occupancy rates in the 1960s were almost half that recorded in the 1940s.
Occupancy Comparison

Annual statistical returns furnished by Sean Ross to the Department of Health for the years 1950-69 facilitated a comparison with occupancy rates independently established by the Commission and those notified by the Sisters of the Sacred Hearts. Occupancy rates established by the Commission may vary slightly as they do not take temporary absences from the institution, such as children transferred to hospital for treatment, into account. Children without a date of admission and/or discharge (2.4%) were also excluded from the Commissions calculations. Notwithstanding this, it is clear that the occupancy rates established by the Commission are broadly in line with those notified by Sean Ross to the Department of Health in this period.
The institutional records show that occupancy rates were high in the 1940s and, although births/admissions decreased in the 1950s, occupancy rates remained relatively high. In 1954 and 1955 in particular, average occupancy was almost on par with average births/admissions. This suggests that children were in the home for prolonged periods in those years. Although births/admissions increased substantially from 1961, occupancy rates began to decrease. This trend continued throughout the 1960s.
Information relating to length of stay in Sean Ross was available for 5,935 children (97.9% of births/admissions). Children born in or admitted to the institution in 1931 spent 522 days on average there. While some children born/admitted in 1931 spent less than 50 days in the home, others remained there for over four years. For children born or admitted in 1935 the average stay had reduced to 195 days but increased substantially for those born or admitted in 1939 when children spent 452 days on average in the home - some children born/admitted that year spent as little as eight days in Sean Ross while others remained there for over five years. Although the average length of stay for children born/admitted in 1942 decreased to 222 days, an upward trend can be identified until 1951 when the average stay for children born/admitted that year was 367 days. Average length of stay declined steadily from then falling to 44 days on average for children born/admitted in 1969. The available information relating to children born to private patients, which relates mainly to the 1960s, suggests that they spent considerably less time in the home than children born to public patients.
Information relating to the child’s date of discharge relative to the mothers’ date of discharge was available for 4,774 children (78.5% of admissions). The institutional records show that most children (66%) left Sean Ross on the same day as their mothers; 28% were discharged before their mothers and 6% remained in the home for a period after their mothers’ discharge.

---

2 The 1,016 infants and children who died in Sean Ross are excluded from this figure.
Child Exit pathways

Information relating to child exit pathways from Sean Ross was available for 4,696 children (77.3% of births/admissions). The institutional records show that 43.9% of children left the home with their mothers or another family member; 35.9% were legally adopted; 10.1% were boarded out; 7.4% transferred to other institutions; 1.7% were informally adopted and 1% were placed at nurse.

In the 1930s and 1940s most children discharged from Sean Ross either left the home with their mothers or were boarded out. Although discharge with the mother remained as the most common exit pathway in the 1950s legal adoption had displaced boarding out as an exit pathway. By the 1960s legal adoption accounted for almost 74% of child exit pathways and the number of children leaving the institution with their mothers declined from almost 66% in the 1940s to just under 19% in the 1960s.

A set of annual statistical returns furnished by Sean Ross to the Department of Health for the years 1951-69 show how the introduction of legal adoption in 1952 altered child exit pathway trends.
The most obvious change was in the number of children discharged to adoptive parents. The figure for 1951 relates to informal adoptions and represents the second most common exit pathway at that time. Following the availability of legal adoption from 1953, it became the most significant exit pathway and by 1969 over 80% of children were discharged from Sean Ross via this pathway. In 1951 the main child exit pathway (over 50%) was recorded as discharge with the mother. However, by 1969 just 15% of children were discharged from Sean Ross in this manner. In 1951 around 1 in 10 children were discharged from Sean Ross to a local authority boarding out scheme. By 1969 less than 1 in 50 children were discharged via this route. The practice of discharging children to a county home with a view to securing foster homes under the boarding out system was a common exit pathway prior to the introduction of legal adoption. However, this practice had ceased altogether by 1969. Similarly, private nursed out arrangements, a popular pre-1950 option among women who had the means to do so, did not feature as an exit pathway in 1969. Although industrial schools still featured as an exit pathway in 1969 just 1 in 165 children was discharged from Sean Ross in this fashion.
Foreign adoptions

The institutional and official external records show that 508 children were placed for foreign adoption as follows: USA (96%); UK (3.9%) and Australia (0.1%).
Child deaths

The institutional records show that 1,090 children born in or admitted to Sean Ross died in infancy or early childhood. These deaths include children who died in the institution, children who died in hospital following their transfer from Sean Ross and children born to women who had been resident in Sean Ross but gave birth outside the institution. The Commission confirmed 1,061 of the deaths (97.34%) with the GRO.

The institutional records show that most infant and child deaths (79%) occurred between 1932 and 1947. Mortality peaked between 1936 and 1942 when 95 and 82 deaths were recorded respectively. The 1930s was the worst decade for deaths in Sean Ross and accounted for 42.5% of all infant and child mortality in the institution. Over 39.5% of mortality occurred in the 1940s; 12% in the 1950s and 6% occurred in the 1960s.³

Although private patients made up 11.2% of admissions to Sean Ross they accounted for just 2% of child deaths. The majority of private patients were admitted in the 1960s when mortality rates were considerably lower than previous decades.

³ Three deaths are excluded from these statistics as no date of death was available.
Sean Ross Total Child Deaths per Decade

- 1930: 462
- 1940: 430
- 1950: 133
- 1960: 62
Place of death

Information relating to the place of death was available for 1,088 children (99.8% of infant and child deaths). Most deaths (93%) occurred in Sean Ross. Around 6% occurred in external hospitals, mainly Roscrea District Hospital. The remaining 1% occurred subsequent to a child being transferred to another institution or private address.
Information relating to age at death was available for 1,061 children (97.3% of infant and child deaths). The institutional records show that almost 95% of deaths occurred in infants as follows: perinatal, 12.91%; neonatal, 13.85% and infancy, 68.05%. The remaining 5% of deaths occurred in early childhood.
Information relating to cause of death was available for 1,061 children (97.3% of infant and child deaths). Most deaths (15.5%) were medically certified as being due to respiratory infections, mainly pneumonia, bronchitis and atelectasis; 13.3% were assigned to non-specific causes such as congenital debility, prematurity and delicate/weak from birth; 13% were attributed to generalised infections such as toxaemia, sepsis and septicaemia; 12% were due to gastroenteritis, gastritis and epidemic enteritis/diarrhoea; 8.1% were assigned to malabsorption - mainly marasmus; 8% to influenza; 7.5% to asphyxia pallida, pyloric stenosis and a range of mostly one off causes such as pertussis, chickenpox, jaundice, heatstroke and sunstroke; 7.2% were due to diphtheria; 4.5% to congenital heart disease; 3.2% to convulsions; 3% to haemorrhage, mainly intercranial; 1.6% to spina bifida; 1.6% to tuberculosis; 0.75% to congenital syphilis and 0.75% to meningitis.
The leading causes of infant and child mortality in Sean Ross changed over the period of the institution's operation. In the 1930s, most deaths were caused by Gastroenteritis (15%), diphtheria (13.5%), non-specific (congenital debility, prematurity) (13%), generalised infection (12.5%), malabsorption (10.5%) and respiratory infections (10%). By the 1950s most child deaths were caused by respiratory infections (42%), non-specific (congenital debility, prematurity) (14%), other - mainly asphyxia pallida (13%) and generalised infections (7.5%).

The institutional records show that in 93% of infant and child deaths the mother was living in Sean Ross at the time of death. The remaining 7% died unaccompanied by a parent.

Infant Mortality Rate

It is clear from the institutional records that infant mortality in Sean Ross was highest in the 1930s. In its first year of operation, an infant mortality rate of almost 31% was recorded. This increased to 41% during 1932 and peaked at almost 50% in 1936. By 1939, infant mortality had declined to just under 18%, but increased again during the war years reaching 42% in 1942. Infant mortality declined to around 10% in 1947 and remained at that rate on average over the intervening decade. Between 1958 and the closure of the home in 1970 average infant mortality ran at just over 3%.

---

4 Infant mortality rate is calculated as follows: Living Sean Ross infants born in a given year who died before the age of 1 year as a percentage of all Sean Ross infants born in the same year.
Chapter 20: Castlepollard

Introduction

20.1 Castlepollard mother and baby home was opened in 1935 and closed in 1971. During that time, 4,972 women were admitted; 4,559 children were born there or admitted there. It was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. The public assistance/health authorities paid for the vast majority of the mothers and their children while they were living in Castlepollard but there were a small number of ‘private’ patients.

Sources

20.2 The following is a summary of the main sources used for this chapter. A complete list is included in Part 5: Archives.

Institutional records

20.3 Castlepollard institutional records are held by the Child and Family Agency (TUSLA). As already reported, the Commission made digital copies of these records. There are about 8,000 records.

The institutional records include:

- Admission Books
- Records and Particulars Books/Maternity Registers of the maternity hospital (which was known as St Peter’s).
- Ante-natal Records
- Private Patients Register
- Babies Register
- Indoor Register, Co Leitrim
- Baptismal Register
- Adoption Orders
- Death Register

Department of Health

20.4 The main Department of Health files used for this chapter are:

- INACT/INA/0/425115
- INACT/INA/0/465642
Congregation of the Sacred Hearts of Jesus and Mary Congregational Archive

20.5 See Chapter 17.

Meath Diocesan Archive

Other sources

20.7 Official publications, books and newspapers are referenced in the text.

Origins

20.8 In 1924, the Meath Board of Health discussed reports that unmarried mothers and their children were ‘accumulating in large numbers’ in Trim county home. Board members considered setting up a standalone ward in the county home to accommodate unmarried mothers and wrote to the Westmeath Board of Health and local authorities in neighbouring counties seeking their support.

20.9 A Westmeath councillor told his board that a very large number of unmarried mothers were housed in Mullingar county home also. He proposed that unmarried mothers in Meath and Westmeath should be removed to a standalone institution where they could be ‘put to work’. He considered it a scandal that ratepayers should ‘foot the bill’ for maintaining unmarried mothers and their children and that if the women were put to work then ratepayers would be ‘relieved of this responsibility’. The Westmeath councillor’s remarks mirrored the views expressed by members of the Meath board who proposed that unmarried mothers should be housed in a central institution to undertake laundry work for other institutions in

---

1 Westmeath Independent, 15 November 1924.
Meath and adjoining counties and to engage in poultry and dairy farming with a view to supplying eggs and milk to same.²

20.10 The discussions about the maintenance of unmarried mothers and their children in Meath was sparked by a letter from the Department of Local Government and Public Health (DLGPH) regarding ‘illegitimate’ children who were sent by the Meath board to St Joseph’s Industrial School, Artane, with some regularity.³ The department advised that, although these children were ‘illegitimate’, they were ‘not criminals’ and that Artane was an institution for youths convicted of an offence. Faced with the prospect of having many unaccompanied ‘illegitimate’ children returned to Trim county home the Meath board was forced to reconsider the provision of services for the institutional care of unmarried mothers and their children.⁴

20.11 In 1927 the Report of the Commission on the Relief of the Sick and Destitute Poor gave an overview of facilities at Mullingar county home. The Commission found that sanitary and bathing conditions in the home were ‘insufficient’ and that the ‘aged and infirm, chronic invalids, idiots, imbeciles, unmarried mothers and their children’ were housed together in the institution. The commission reported that accommodation for unmarried mothers and their children in Mullingar was ‘bad’ and ‘wanting in comfort’. It further stated that a maternity department for single women was attached to the home along with a separate maternity department for ‘respectable women’. In light of the commission’s report, the Westmeath Board agreed that separate accommodation should be provided for unmarried mothers in the county and that such a need ‘had been apparent for years’.⁵

20.12 A report on Mullingar county home, undertaken three years later, suggests that the Westmeath board had not provided any alternative accommodation for unmarried mothers and children outside of the county home and had not addressed the very poor living conditions in the institution. Reporting on the accommodation available to unmarried mothers, a local government inspector, Mr McLysaght, noted that

- The sleeping quarters had no heat or ventilation;
- The milk supply to the institution was suspect;

² Meath Chronicle, 25 October 1924.
⁴ Meath Chronicle, 25 October 1924.
⁵ Westmeath Examiner, 8 October 1927.
• The institution was poorly lit and without proper lavatory accommodation;
• Sanitary conditions were less than satisfactory;
• Drainage was not in a proper state; and
• There was no disinfecting apparatus in the institution.

20.13 The inspector concluded that the Westmeath board should provide better and more suitable accommodation for single women and their children in the county.\(^6\)

20.14 In December 1930, the Westmeath board discussed the costs of maintaining unmarried mothers. The board was told that 22 ‘illegitimate’ children were living in Mullingar county home at a weekly cost of £1 each to ratepayers. One councillor claimed that some unmarried women living there had three and four children and argued that the men responsible should be taken to court and forced to contribute to their maintenance. The chairman pointed out that the ‘moral aspect of the matter’ was not up for discussion by the board but agreed that steps should be taken ‘to make the fathers of the children pay up’. The board subsequently issued proceedings against seven men identified by women as the putative fathers of their children but made no attempt to improve living conditions in Mullingar county home.\(^7\)

**Manor House, Castlepollard**

20.15 In May 1933, Mrs Crofts, a local government inspector, wrote to the Superior General of the Congregation of the Sacred Hearts of Jesus and Mary to ask if the congregation would consider opening a third mother and baby home in Ireland, in the diocese of Meath (the congregation already ran Bessborough and Sean Ross). The congregation ‘reluctantly’ accepted the offer on the basis that a refusal might impact negatively on its future work in Ireland and gave an undertaking to source a suitable property. Early in 1935, the congregation purchased Kinturk House\(^8\) (Manor House), Castlepollard, for £5,000.\(^9\) The estate had been vacant for a number of years and, although the main house was substantial, it was reportedly not in good repair at the time of purchase.\(^10\)

20.16 The congregation spent £1,000 on renovations and, on opening, Castlepollard mother and baby home had accommodation for 37 women and 20 children. In 1937, the congregation applied to the DLGPH for a grant from the Hospitals Trust Fund to extend and improve the institution and to construct a maternity hospital onsite. The estimated cost of the works was £55,950 and the Hospitals Trust sanctioned a grant of £25,000 towards the project. The DLGPH subsequently committed to provide a grant worth £65,000 to the hospital building project and, in November 1942, the new St Peter’s Hospital opened at Castlepollard with capacity to accommodate 109 women and their children.

20.17 In March 1935, Mrs Crofts told the Meath board that Castlepollard was about to open under the stewardship of Sister Leontia. Mrs Crofts described the institution as a home for unmarried mothers who were ‘first offenders’ with a maternity home attached to cater for single expectant women and their babies. She said that Bishop Mulvaney of Meath had given his blessing to the new home and was confident that such an institution would give women a chance to ‘re-establish themselves in life’ and ‘induce them to accept responsibility for the maintenance of their children’. She also said that the congregation would procure positions for the women on discharge and that mothers would bear the cost of maintenance for their children when they secured employment. The Meath board agreed to support a scheme where women from County Meath would be admitted to Castlepollard if it meant the ‘redemption’ of those ‘unfortunate girls’. In June 1935, the Meath Board of Health requested approval from the DLGPH to include Castlepollard as a recognised extern institution.

20.18 In May 1935, the Cavan Board of Health considered a request from the Minister for Local Government and Public Health to send ‘first time’ unmarried mothers to Castlepollard instead of the county home. The board considered that time spent in Castlepollard would be ‘very beneficial’ to such women and, more importantly, would result in a ‘substantial financial saving’ to Cavan county council. The board agreed to notify dispensary medical officers in the county to send all ‘first time’ single expectant women to Castlepollard. However, when Sister Leontia asked the Cavan board to assume responsibility for the first Cavan woman admitted to

---

12 Meath Chronicle, 1 June 1935.
Castlepollard, it refused to do so on the basis that the putative father was from Westmeath.\footnote{Meath Chronicle, 4 May 1935.}

20.19 Castlepollard opened for admissions in June 1935 and by the end of March 1936, 60 single expectant women and 12 women accompanied by a child had sought admission there. Thirty eight births and four infant deaths were notified in this period. The DLGPH report for the year ending 31 March 1936 recorded that 51 women and 33 children were living there. In the year ending March 1937, the department reported that 76 women were admitted. Sixty six births and ten infant deaths were notified during this time. On 31 March 1937, 56 women and 48 children were living there. Mrs Crofts had stated that Castlepollard, when it opened, had accommodation for 37 women and 20 children. Occupancy rates recorded in March 1937 suggest that the home was already grossly overcrowded.

20.20 The Hospitals Commission’s Second General Report 1935 & 1936 stated that Castlepollard was an extension of activities for the care of unmarried mothers under the control of the Congregation of the Sacred Hearts in operation in Bessborough and Sean Ross. The Hospitals Commission acknowledged that such ‘specialised institutions’ could not be provided in every county and necessitated the support of several counties to meet the cost of their maintenance and administration. The report noted that Castlepollard served the counties of Westmeath, Meath, Cavan and Offaly and that proposals to extend accommodation to 100 beds would allow it to also cater for counties Longford, Louth and Monaghan. The report concluded:

The completion of the institution will go far towards meeting the requirements of the scheme initiated by the department [DLGPH] for dealing in an enlightened manner with a particularly important aspect of the unmarried mother problem.

20.21 The establishment of Castlepollard was not universally approved. In October 1937, the matron of Trim county home told the Meath Board of Health that the lack of unmarried women being admitted to the county home had made it difficult to run the institution. The matron explained that the lack of ‘helpers’ in the laundry meant that those working there were unable to get through their daily workload. Furthermore, the matron complained that there was no ‘maid’ to cook for the
nurses and to keep their apartments, that nurses had to undertake these chores themselves and that this arrangement was ‘unsatisfactory’. In another instance, the board received complaints of ‘undesirable practice’ in the county maternity hospital, Trim, where married expectant women were attended by ‘unmarried mothers’ living in the county home. The board decided that this practice should cease immediately and that alternative arrangements should be put in place.

In the year ending March 1938, the DLGPH reported that 83 women were admitted to Castlepollard. During the same period 23 women were discharged to employment, 47 returned to their family home and three left to marry. Three maternal deaths were notified. Seventy five children were either born in, or admitted to, the home during this period. Three infant deaths were notified. Fifty one children were discharged with their mothers, ten were boarded out and four were informally ‘adopted’ through a society. On 31 March 1938, 64 women and 55 children were living there which suggests that overcrowding endured in the institution.

The DLGPH reported that, in the year ending March 1939, 78 women were admitted to Castlepollard. In the same period 29 were discharged to employment, 37 returned to the family home and two left to marry. One maternal death was notified. Seventy three children were either born in, or admitted to, the home during this period. Five infant deaths were notified. Forty children were discharged with their mothers, eight were boarded out and eight were informally ‘adopted’ through a society. On 31 March 1939, 69 women and 60 children were living in the home. The number of women living in Castlepollard in March 1939 was almost twice the number that it was considered could be accommodated. Similarly, the number of children living in the home at that time was three times more than the home was supposed to accommodate.

The 1940s

In January 1940, an inquest into the death of an infant born in Castlepollard was held in the district hospital, Athlone. The infant left Castlepollard with his mother in December 1939 having spent six months in the institution. The woman had arranged that a private nursing home in Athlone would take herself and her child.

---

14 *Meath Chronicle*, 2 October 1937.
15 *Meath Chronicle*, 27 November 1937.
However, the child died one week after discharge. The jury heard that the infant had been ‘weak from birth’ and that the Sisters in Castlepollard had been reluctant to let him leave. The coroner told the jury that the child had died of malnutrition due to congenital deformity of the large intestine.\(^{16}\)

20.25 In the year ending March 1940, the DLGPH reported that 101 women were admitted to Castlepollard. In the same period 29 left to take up employment and 53 returned to the family home. Two maternal deaths were notified. Eighty eight children were either born in, or admitted to, the home in this period. Thirteen infant deaths were notified. Thirty eight children were discharged with their mothers, 26 were boarded out and five were informally adopted through a society. On 31 March 1940, 81 women and 62 children were resident in the home.

20.26 In its report for the year ending March 1941, the DLGPH reported that 135 women were admitted to the home. In the same period 49 were discharged to employment, 56 returned to their family home and six left to marry. Two maternal deaths were notified. During this period, 117 children were either born in, or were admitted to, the institution. Thirty four infant deaths were notified. General Register Office (GRO) records show that eleven infant deaths notified in this period were attributable to whooping cough and a further three were due to influenza. The remaining twenty deaths were notified as either prematurity or congenital debility. Twenty nine infants were discharged with their mothers, 27 were informally adopted through a society and seven were boarded out.

**Inspection 1941**

20.27 In March 1941, the DLGPH inspector, Miss Litster, inspected Castlepollard. She noted that there were 109 women living in the home at the time of her inspection; 104 were public patients - 18 expectant and 86 post-natal patients. All five private patients were expectant women. There were 86 children living in the home. These numbers suggest that the institution housed three times more women and more than four times more children than it was supposed to accommodate. Taking 50 square feet (4.6 square metres) as the minimum desirable living space per patient, Miss Litster calculated that maximum occupancy in Castlepollard ‘without putting undue pressure on space’ should be 40 women and their babies. She

\(^{16}\) *Westmeath Independent*, 6 January 1940.
further stated that, even if occupancy was limited to 40 women and their babies; extra space would still be required for day use.

20.28 Miss Litster reported that the main building was severely overcrowded and, although it was suitable to accommodate around 40 women, 70 were living there. An additional 44 women were sleeping in a loft over stables located ‘some distance away from the main house’. She calculated that Castlepollard housed around 70 women more that it could accommodate and that overcrowding among the adult population of the home was ‘severe’. The 86 children were accommodated in rooms suitable for around half that number. In the year ended March 1941, 34 infants had died in Castlepollard. Miss Litster instructed Sister Leontia to close the home to new admissions and the department instructed local authorities to send women to Bessborough and Sean Ross until overcrowding had eased at Castlepollard. The institutional records show that only one woman was admitted to the home between 20 March 1941 and 27 February 1942 which suggests that the congregation had complied with Miss Litster’s direction to cease admissions. Four infant deaths were notified in Castlepollard in the twelve months following Miss Litster’s intervention whereas 34 infant deaths had been notified in the preceding 12 months.

20.29 Miss Litster reported that the home and maternity hospital were staffed by ten members of the congregation, a nurse and a certified midwife. There was no nurse on night duty in any section of the institution and the procedure appeared to be that one resident sat with women in labour and a nurse was called when necessary. The maternity ward was a large and bright room, with three beds and four cots, heated by a log fire and radiator. The attached dormitories were clean but were grossly overcrowded.

The dormitories are all clean and bright, those on the top floor have low ceilings. Each bed has two blankets and a good mattress. No provision of any kind for hanging or placing clothes at night. Work clothes are generally thrown on the beds—a practice not conducive to cleanliness. No lockers are provided for personal effects. No chairs...The degree of overcrowding at present would not in fact permit the addition of chairs and lockers in most of the dormitories.

17 DLGPH, Report for the year 1940-41
20.30 The living space above the stables was occupied by women and older children. A large space with six windows and no means of heating contained 27 beds with three blankets for each bed. The space was overcrowded. The second loft space was a smaller room with four windows and no means of heating. There was no ceiling in the room and the exposed roof was damaged. This room had 17 beds with three blankets for each bed. Two members of the congregation also shared a small room in the stables. There was one clean WC available for the 44 women living there.

20.31 Miss Litster reported that Castlepollard had no recreational areas. There was one room with a large table, three sewing machines and an apparatus for winding wool. The dining room, located in a basement, was ‘dark and gloomy’. She counted 95 women eating dinner there and stated that ‘there was not elbow room for each’. She observed that ‘less than half that number might be accommodated with some degree of comfort’. She noted that the dinner served that day consisted of peppered herring, potatoes and rice pudding.

20.32 Miss Litster reported that the main nursery, housing infants up to twelve months old, was a large ‘airy and bright’ room with two large wards heated by fireplaces and radiators. It contained 34 cots and a bed for one woman, a resident and not a nurse, who attended to the babies. The cots were comfortable and clean but the ward was overcrowded. A second nursery was also airy and bright and heated by a log fire and radiators. This had nine cots with 15 infants; some cots had three infants in them. A nursery for toddlers, aged over twelve months, was also an ‘airy and bright’ room heated by radiators but was also overcrowded. This room contained 28 cots and a bed occupied by one of the mothers.

20.33 A day nursery was heated by a log fire and radiators. It had three cots and a playpen and was occupied by about 40 toddlers during the day. Miss Litster reported that this room was so overcrowded that there was no room for play materials. Some children slept in cots behind their mother’s beds. There were 12 children aged over two years in the home with their mothers. Miss Litster instructed Sister Leontia to notify the local authorities responsible for their maintenance to have them boarded out as the discharge of these children and their mothers would help to alleviate overcrowding. Miss Litster advised the department that the extent of the overcrowding at Castlepollard was ‘a danger to the health of women and children living there’ and asked that the planned new
hospital would be expedited so that some residents could be transferred there. She also raised concerns about the absence of a fire escape from the upper floor of the main building.

20.34 In April 1941, another DLGPH inspector, Dr Dillon, visited Castlepollard. She confirmed that there had been no admissions since 11 March of that year. At the time of her visit, there were 93 women and 84 children living there. She noted that the maternity ward was staffed by two members of the congregation, qualified in general nursing and midwifery, one qualified midwife and one infants nurse. Dr Dillon reported that the ‘trained nuns’ were always on night duty in the maternity ward\(^\text{18}\) and that the other members of the congregation undertook general duties. She stated that it was still overcrowded and that she could offer no remedy until the new buildings would be available to accommodate women. A note on her memorandum stated:

> The conditions here are very bad and admissions should be stopped until such time as the overcrowding is reduced. There is a serious menace to health in the present conditions.

20.35 In May 1942, just over a year later, Miss Litster and Dr Dillon together inspected Castlepollard. At the time of their visit 56 women and 57 children were living there. All 12 children aged over two years, whom Miss Litster recorded on her previous visit, were still in the home with their mothers. The Meath, Westmeath, Cavan and Monaghan boards responsible for their maintenance had failed to get foster homes for them. The inspectors advised the DLGPH to insist that children aged two years or over not be kept in the home and that local authorities responsible for their maintenance should make a better effort to secure foster homes for them. The inspectors reported that the new maternity hospital at Castlepollard would be ready for occupation in June 1942, that a maximum occupancy should be set and that the authorities at the home should be compelled to adhere to it.

20.36 In June 1943, Dr Dillon inspected the newly constructed St Peter’s Maternity Hospital. Sister Marie Celine Murphy, a registered nurse and midwife, was the matron. There were two nurses and two midwives employed there and they were assisted by women living in the home. The hospital had two eight-bed wards, two one-bed wards for private patients and an observation room with one bed. There

\(^{18}\) This is at variance with Miss Litster’s report of a month earlier.
were two bathrooms and three WCs. The hospital was clean, well-kept and adequately staffed and the accommodation and sanitary facilities were acceptable. However, she was critical of the food women received in the hospital. The diet was not sufficient for nursing mothers as ‘no porridge or gruel was provided’. She also found that no admission register was available for viewing which was a breach of the *Registration of Maternity Homes Act 1934*. While the department followed up on the matter of the admission register with the authorities at Castlepollard they do not appear to have addressed the inadequacy of the diet.

20.37 In January 1944, the DLGPH sent an architect and a clerk of works to inspect the maternity hospital. Although the building was newly constructed in 1942, serious structural defects were detected over the subsequent 18 months. Minor defects were initially addressed by the building contractor but by 1944 a crack extending across the front of the building was severe enough to let rain in. As a result, the architect reported ‘great damp’ in the walls of the building ‘made worse by continual condensation’ due to lack of proper heating. He noted that although the hospital boiler was fired by ‘green logs’ the circulating pumps were not working. The architect’s report concluded that the heating in the building was wholly inadequate and that, while radiators in some parts of the building were warm, most were ‘icy cold’. It transpired that the circulating pumps in the hospital were never turned on because they consumed too much electricity. This was because the institution had been supplying electricity to the town of Castlepollard since 1941. The main power station serving the town was destroyed in a fire in 1941 and Manor House had supplied power to the town as a temporary measure. However, the institution continued to provide power until January 1948 when the town was connected to the national grid.

**Agreement about new maternity hospital**

20.38 The congregation had received a grant of £65,000 from the Hospitals Trust Fund to build the maternity hospital on the condition that the building would be used as a maternity home to cater for ‘unmarried mothers’ and ‘expectant unmarried mothers’ sent there by public assistance authorities or by the Minister for Local Government and Public Health under the *Public Hospitals Acts 1933-40*. The congregation undertook to maintain such women and to provide them with all necessary nursing, food, medicine, and medical and surgical attendance free of charge. The congregation agreed to undertake this work in return for per capita maintenance rates agreed between the congregation and public assistance authorities. The
congregation also agreed that authorised officers from the DLGPH could enter and inspect the home at all reasonable times and interview the ‘inmates’. The terms of the Hospitals Trust Fund grant also stipulated that, if Castlepollard ceased to operate as a mother and baby home, ownership of the estate would transfer to the DLGPH. The congregation later inserted a clause in the agreement enabling them to refuse admission to public patients ‘suffering from disease’, women with a ‘vicious history’ and women who had been in prison.

20.39 In February 1944, Dr Dillon inspected the maternity hospital. Sister Marie Celine was still matron of the hospital and one nurse and one midwife were employed and assisted by ‘non-paid waiting patients’. Dr Dillon discovered that the nurse employed in the maternity hospital had failed her final exams and was not a registered nurse. It appears that Sister Marie Celine was aware that the woman had failed her final exams and stated that she was in the hospital as an ‘assistant’ and had not delivered any babies. There were serious problems with the building - the electric lift was not in working order, hot water was not always available, heating pipes were not working at one end of the hospital and plaster was falling off walls throughout the building. The records prescribed by the maternity homes regulations were up to date and available for inspection. The Mother Superior, Sister Leontia, gave the DLGPH an undertaking to refer all building defects to the congregation’s consulting engineer and not to employ unqualified nursing personnel.

Criminal charges 1944

20.40 In May 1944, six soldiers were charged before Mullingar Circuit Court with committing a serious offence (defilement of a girl under the age of 15) against a 13-year-old girl contrary to the provisions of Section 1 of the Criminal Law Amendment Act 1935. The girl gave birth in Castlepollard in January 1944. The institutional records show that the child died in Castlepollard aged two weeks. The cause of death was given as atelectasis, a common complication in premature infants. None of the soldiers was convicted. In the same sitting, two other soldiers pleaded guilty to the sexual assault of underage girls and were sentenced to three and nine months, respectively. The judge commented that he did not want to suggest that Westmeath was ‘in a bad way’ but expressed his concern at the
number of cases of ‘defilement of the young’ that were coming before the court in the county.  

Complaints about conditions in the institution 1945

20.41 In January 1945, a Westmeath councillor told the county council that women resident in Castlepollard were compelled to undertake manual work ‘more suitable to men’ and that ‘girls’ had to ‘cut timber and wield heavy sledges in all kinds of weather clad in overalls’. He said that conditions in the home were ‘uncivilised’ and ‘like the days of slavery’. The councillor had not verified these claims himself but had read about them in a report of a meeting of Meath county council in the Meath Chronicle. The Westmeath councillors protested that Meath county council had no jurisdiction to discuss matters relating to an institution located in Westmeath and told the councillor ‘not to read accusations against the nuns at Castlepollard’ in the council chambers. In a letter to the editor of the Westmeath Examiner, a Meath councillor restated the claims made against the authorities at Castlepollard and claimed that he was drawing attention to the matter as the institution was ‘extensively subsidised’ by public monies. He said that he had submitted all the information available to him to ‘the appropriate Minister’ and called for a Commission of Inquiry be set up to hear evidence regarding Castlepollard.

20.42 The Meath councillor wrote to Dr Ward, the Parliamentary Secretary at the DLGPH to register the complaints made to him and asked that the department set up a Commission of Inquiry, to include ‘five persons experienced in Social Welfare Work and at least two married women’. He outlined the complaints:

- The ‘girls’ in Castlepollard were cutting up timber in adjoining woods, until the onset of their labour and again after their confinements and they were also carrying out other seasonal forms of farm work unsuited to their physique.
- The ‘girls’ were undernourished and heavily overworked and they started at 5.30 am.
- For most of the year the nurseries were unheated with open windows and the children were lightly clothed.

---

19 Westmeath Independent, 13 May 1944.
20 Westmeath Examiner, 20 January 1945; Meath county council had the same relationship with Castlepollard as did Westmeath; they each paid for some residents.
21 Westmeath Examiner, 10 February 1945.
• The infants were changed to spoon feeding at the age of two months and then to a diet consisting of potatoes and soup at six months which appeared to him to be contrary to all recognised methods of child dietetics.

• The infants were put in their cots at 6 pm and there was no further feeding until the following morning.

• In order to avoid soiling the floors, children, when suffering from diarrhoea, had been kept on nursery chairs for so long that the intestines were known to have on occasion protruded.

• The death rate for infants was unduly high, and on occasion there were four or five deaths on one day.

• Discipline generally was unduly harsh and mothers have been beaten, or otherwise ill-treated.

20.43 He said that, if any of the allegations was true, the institution was not fulfilling its primary purpose of ‘reforming’ women who were ‘more sinned against than sinning’. He said that he was asked to bring the matter to the minister’s notice by a former resident of the home who had made the claims. He argued that councils, including Meath county council, were expending ‘large sums of public monies’ to maintain women and babies in Castlepollard and that each county should have visiting committees to undertake ‘on the spot’ checks in the home.\(^2^2\) He asked the minister to consider sending the departmental inspector on ‘surprise’ visits to Castlepollard and suggested that ‘a widow who was herself a mother’ would be better placed to assess the care of mothers and babies in the home.

20.44 In February 1945, Miss Litster met the Meath councillor to discuss his claims. She told him that the method of feeding infants at Castlepollard was in line with modern practice and that any inquiry based on his own assumptions of what constituted good infant feeding practices would fail. She agreed with his assertion that infant mortality rates in Castlepollard were high but told him that they were not as high as those in other similar institutions. The Castlepollard institutional records show that 17 infant deaths were notified in the twelve months that the complainant had lived there suggesting that the allegation that infants were dying at a rate of four or five every day was unfounded. Miss Litster reported that the councillor did not agree with her view that manual work and especially outdoor work was ‘desirable’ for

\(^{22}\) The Commission has not been able to establish if the various inspections by the DLGPH were notified in advance or were unannounced.
women in Castlepollard. Miss Litster considered that the women were, for the most part, ‘young, healthy country girls, accustomed to farm work and country life’. She undertook to interview the woman who made the complaint and to discuss all her allegations with the Mother Superior, Sister Leontia.

20.45 Miss Litster met the 21-year-old former resident of Castlepollard who had made the complaint to the councillor. Miss Litster described her as ‘a big robust girl, plump, rosy-cheeked, healthy in appearance and full of animal spirits, well over 10 stone in weight’. Miss Litster observed that, if she had been given insufficient food during her twelve months stay in Castlepollard, she would not be in the physical condition in which she found her. Miss Litster examined the baby in his foster home. The foster mother claimed that the baby was in poor condition when she received him and that he was ‘very thin and ravenously hungry’. Miss Litster reported that the child was ‘a fine child, normal in size and weight, healthy in appearance with good colour, teeth normal, limbs straight and flesh firm’. She observed that, if the child had been emaciated when the foster mother received him, he could not have become such a healthy child in such a short time. Miss Litster advised the councillor that the claims made by the former resident regarding the feeding of herself or her baby would not be likely to be proved at an inquiry.

20.46 The former resident told Miss Litster that she spent about six hours a day felling trees at Castlepollard and she described the process of using a wedge, sledgehammer and cross-cutting saw. Miss Litster noted that allegations that women were felling trees in Castlepollard had also been made in 1942. She said that on that occasion Sister Leontia undertook not to allow patients to be engaged in the felling of trees but did not acknowledge that women were ever employed in such work. Sister Leontia rejected the former resident’s claim that she had been felling trees but stated that women were engaged in cutting logs for firewood as well as ordinary farm work in the garden, milking cows and feeding livestock. Miss Litster reported that there could be ‘no objection to this kind of work which provides good physical exercise and helps to maintain the health of the patients’. Miss Litster concluded her report by stating that none of the claims made by the former resident would hold up to the scrutiny of an inquiry. However, she acknowledged that the conduct of the institution had not been ‘wholly satisfactory’. She stated that Sister Leontia was ‘somewhat hard’ and ‘did not err on the side of generosity’. She noted that Castlepollard had been closed temporarily in 1942 owing to
overcrowding and unsatisfactory conditions and ‘the housing of patients in an outhouse’.

20.47 After his meeting with Miss Litster, the Meath councillor wrote to Dr Ward to thank him for the ‘prompt and diligent attention’ given to his complaint and that he was ‘fully confident’ to leave the whole matter in Miss Litster’s ‘very capable hands’. He withdrew his request for an inquiry and said that he was satisfied that the issues raised could be addressed without a public inquiry and could be remedied under Miss Litster’s direction.

20.48 The Westmeath councillor continued to pursue the issue. Westmeath county council decided to send a delegation to Castlepollard to investigate. In March 1945, seven council members, including the county manager and a local TD reported on their visit to Castlepollard. The report which was read to the council stated: ‘We inspected the institution on the invitation of the Reverend Mother…We were agreeably surprised to find such a well-run and up-to-date institution in the County and was a credit to the Sisters’. The committee stated that they saw and interviewed the mothers there and found them to be ‘happy and contented’ and that the children were ‘clean, well-dressed and healthy’. The committee concluded that they were satisfied that the institution was administered in ‘a highly creditable and efficient manner’ and that ‘there were no grounds whatsoever for complaint’. The councillor who had instigated the visit reluctantly agreed with the committee’s findings but protested that the council should have the power to undertake surprise visits to the institution. The visiting committee concluded that there was no truth in the allegations made against the institution and that ‘the unfortunate unmarried mothers of the county and their babies were well catered for’.

20.49 A DLGPH memorandum on Miss Litster’s inquiries noted that ‘the lady [Sister Leontia] requires watching. What is the infant mortality rate in this place’. Miss Litster provided data on infant mortality in Castlepollard for the years ended March 1941 to March 1944 which showed that the infant mortality rate had decreased from 30% to 10% over this period. Although the department acknowledged that infant mortality had been greatly reduced, the rate was still too high. The department told Sister Leontia that it would not be satisfied until infant mortality was reduced to a rate of 2%. Sister Leontia replied that the congregation had

---

23 Westmeath Examiner, 10 February 1945.
24 Westmeath Examiner, 17 March 1945.
made every effort to reduce infant mortality and that the rate had decreased further in the year ended March 1945. However, she said:

I would point out that we are dealing with a class of mothers who in the vast majority of cases, does not want the baby to survive and we get little cooperation from them.

20.50 The department also asked if Wassermann tests were being used to identify venereal disease in Castlepollard. Sister Leontia said that the local authority maintenance rates applicable at that time would not justify the cost of undertaking routine blood tests. She stated that the maintenance allowance was ‘hardly sufficient’ to maintain women and children and reminded the department that the congregation was paying off a large overdraft having built the maternity hospital. She further said that patients who tested positive for venereal disease required treatment which would incur further outlay of monies which the congregation did not have. The congregation had no objection to carrying out Wasserman tests or to providing treatment for those who tested positive but asked for any suggestions as to where they could get the extra funding this would involve.

20.51 In July 1945, the department told Sister Leontia that it would not object to an increase in local authority maintenance rates and approved the following rates:

- Expectant mothers 15s each
- Children 15s each
- Mother and child 27s 6d
- Post-partum mothers 12s 6d each.

20.52 The department stipulated that the increased rates should result in extra nourishment for expectant mothers and should cover the costs associated with Wasserman tests and childhood immunisation.

20.53 In January 1946, the *Meath Chronicle* reported on a case where a 23-year-old man was charged with having ‘carnal knowledge’ of a ‘feeble-minded’ 29-year-old woman. The woman had given birth in Castlepollard in August 1945. The medical officer, Dr Cullen, gave evidence that the woman was ‘of low mentality’ and that anyone in frequent contact with her should have been able to judge that she was feeble-minded. The accused denied being the father of the child but admitted having ‘carnal knowledge’ of the woman whom he did not consider to be ‘feeble-
minded’. The jury returned a guilty verdict and he was sentenced to twelve months hard labour.\textsuperscript{25}

**Financial problems**

20.54 In February 1948, the Mother Superior in Castlepollard, Sister Helena, told the Department of Health that the congregation would not be in a position to keep Castlepollard operational unless something was done to help them offset their accumulating annual deficit. The department acknowledged that the institution had accumulated substantial deficits from at least 1945 and, following a consideration of the applicable capitation rates, one departmental source wrote:

I am not at all surprised that there is a deficit in the working of the institution as it must be quite impossible to maintain mothers and children at any proper standard for these rates. At the time they were fixed the rates for patients in voluntary hospitals were £2.12.6 per week for adults and 35/- per week for children. It has since been recognised that it costs just as much to maintain a child as an adult and that they are in fact more troublesome and need more attention. It is likely that much of the work in this institution is done by mothers thereby enabling the costs to be reduced. Nevertheless, the capitation charges are in my view, too small.

20.55 In May 1948, Miss Litster again inspected Castlepollard. One hundred and thirty one women and 135 children were living there at the time of her visit. There were eight babies in the maternity hospital and all but one were being breastfed. The infants were normal and healthy except for one whom she described as ‘a Mongol, marasmic’ with a bad hernia from birth. There were 32 infants in the infants section; all but two were being breastfed and they appeared healthy on the whole. She noted that the infants were outside in cots, that most were ‘already tanned’, and that a shade protected them from direct sunlight. There were 40 older children whom she said appeared normal and healthy except one described as a ‘marasmic infant’. There were 55 toddlers playing outside and all seemed to be healthy and contented. Three toddlers, whom Miss Litster described as ‘mentally defective’, were also living in the home. Two of these were aged three and five years respectively. The Department of Health had previously instructed Cavan county council to make alternative arrangements for these children but was told that no suitable alternatives could be found. The third child, a two-year-old girl described

\textsuperscript{25} *Meath Chronicle*, 26 January 1946.
as ‘an imbecile’, was born to a private patient who had left the home without her child. The congregation received no maintenance payments for this child and her mother had refused to consent to admit her to a specialist institution.

20.56 In the period 1 April 1947 to the date of inspection, 21 May 1948, 104 children were either born in, or admitted to, the institution. Fourteen infant deaths were notified during the same period. Miss Litster calculated that this was a 13% infant mortality rate. The causes of death were given as gastroenteritis (six); marasmus/congenital debility (three); cerebral haemorrhage; cerebral tumour; haemolytic jaundice; cardiac failure and bronco-pneumonia. One woman died of eclampsia during this period. Miss Litster noted that many women admitted during the year were admitted ‘practically in labour’ and that some were ‘verminous and suffering from scabies’. She concluded:

On the whole the health of the inmates of the Manor House continues good. The food is plentiful and excellent. Beds and cots are comfortable.

20.57 The structural problems had continued. There were large cracks down the walls.

20.58 Miss Litster inspected again in January 1949. At the time of her visit, 131 women were living in the institution along with 160 children aged from new-born to three and a half years. The problem of older children remaining in the institution was again raised; a quarter of the children were over two years old. Again, Miss Litster urged that the local authorities make better efforts to find foster homes. She also raised concerns about a three-year-old boy whom she described as ‘a mental defective, noisy, ill-tempered and unable to walk or talk’ who could not be properly cared for in Castlepollard. In the year ending 21 January 1949, there were 123 live births (there were also six stillbirths) and a further five infants were admitted after birth. Four infant deaths were notified; the causes were given as gastroenteritis (two); congenital debility and haemolytic jaundice. Miss Litster noted that this represented an infant mortality rate of 3% and was a significant reduction from the previous year:

This is the lowest death rate yet in our special homes for mothers and babies and I think some recognition should be conveyed to the community and the doctor. The health of the children is on the whole, excellent, and they are well cared for.
Policy on mother and baby homes

20.59 In January 1949, the medical officer to Castlepollard, Dr Cullen, told the Department of Health that the continued failure of local authorities to board out children had led to serious overcrowding which he warned could result in epidemics of serious proportions. He said that the councils involved received a list of children maintained by them at the end of every quarter but failed to make any serious efforts to secure foster homes for them. He cautioned that local authorities must take a large share of the responsibility if children succumbed to infectious disease while resident in the home. Dr Cullen expressed his belief that all institutions catering for unmarried mothers were overcrowded with children who should have been boarded out and suggested that the department set up separate orphanages to cater for children aged between two and six years. He reasoned that women could then take their leave from mother and baby homes to take up employment and avoid the ‘discontentment’ attendant on ‘detaining’ women for two or more years while they waited for their children to be placed in foster homes.

20.60 Following Dr Cullen’s letter, the department gave some consideration to the system in operation in the three Sacred Heart mother and baby homes. Miss Litster pointed out that the retention of mothers for two years had been decided by the congregation in consultation with the Department of Local Government and Public Health and that all parties considered that this was the shortest period ‘within which any reformatory effect might be expected’. She further stated:

The attitude of society in this country towards the unmarried mother is at the root of the idea of retention for a long period. Unmarried mothers here are persons to be punished. In the Homes a great deal of emphasis is placed upon penance and it is small wonder that girls come to look upon them as places of punishment. Any girl in these Homes speaks quite casually of ‘doing my term’. The result is that once the two year period has passed, continued detention is a cause of discontent. I suggest that mothers should be kept not longer than nine months after confinement. A more willing spirit amongst the inmates may be expected as a result.

20.61 Miss Litster pointed out other advantages to earlier discharges.

Most of the mothers were domestic servants before admission and during their stay in the home have had opportunity of further training. There is at present a dearth of domestic servants and good wages are procurable. It is short-sighted policy to saddle a P.A. Authority longer than need be with the
upkeep of a woman who is capable of maintaining herself and of contributing to the maintenance of her child. It would be good public policy to insist that the employment found for a discharged mother should be in this country for several reasons; to stem emigration; to help solve the problem of domestic labour; to keep her within reach. Another advantage which might accrue from earlier discharge would be greater readiness on the part of expectant mothers to seek admission to the maternity home at an earlier stage in pregnancy. There is a growing tendency to delay application for admission until confinement is almost due. The lack of pre-natal care can have nothing but bad results.

20.62 Miss Litster said that the Reverend Mothers of the three Sacred Heart homes were willing to agree on the shorter stay suggested but all emphasised the resultant problem of dealing with the children of discharged mothers. She then addressed Dr Cullen’s suggestion about establishing homes where children could be maintained to the age of six or seven years. On many occasions I have drawn attention to our need for homes for motherless babies. We have no such homes, except that now owned and conducted by the Irish Sisters of Charity at Temple Hill, Blackrock. To that home, of course, our “Public Assistance” babies have no right of admission. An orphanage for children up to 6 or 7 years old would not agree with our policy of keeping children as far as possible out of institutions. For this reason, homes to which babies might be transferred from the “mother & baby” homes at the age of 9 months, or earlier, should not be designed to keep children beyond an age when they might be boarded-out. To build and staff such nursery homes would prove a costly undertaking.

20.63 Instead she suggested that changes could be made to the arrangements in the three homes to allow for the establishment of a separate nursery for babies from nine months upwards. She pointed out that the space and equipment were already there. The consequences of such a change would include the employment of household staff as ‘mothers left behind are found unwilling to care for the babies of discharged mothers’. She said that mothers who should have been discharged and who were willing to remain as domestic workers and nursery attendants should he paid. A higher capitation rate would have to be paid for children who were resident without their mothers. However, there would be savings to the local health authorities in that there would be no payments for the discharged mothers.
and employed mothers could contribute to the cost of their children’s maintenance.  

20.64 Miss Litster said that she was unsure if the Congregation of the Sacred Hearts was willing to care for unaccompanied children who were in their care from birth but expressed her doubt that they would be willing to admit ‘orphaned babies from outside’ and considered it unwise to do so. She noted that the Sacred Heart Homes were already ‘unwieldy’ and that smaller units designed to house unaccompanied children were more desirable. There remained a problem of finding accommodation for ‘illegitimate’ children who were not born in mother and baby homes - children born in hospitals, county homes, maternity homes or at home. These children were being kept at home ‘where they are not wanted’ or placed at nurse for reward, or ‘adopted’ for a lump sum or brought to the Regina Coeli hostel. ‘These are the babies whose deaths swell our infant mortality rate.’

20.65 She suggested that one or two of the ‘better Convent Industrial Schools’ might be asked to equip a nursery and provide staff trained in the care of infants and children. Miss Litster did not agree with Dr Cullen’s suggestion that the department should set up standalone orphanages to house unaccompanied ‘illegitimate’ children. She cautioned against the move on the basis of the costs involved and the danger that such orphanages would become ‘waiting rooms’ for children destined for transfer to industrial schools, a move which she regarded as being against the departmental policy of keeping children out of institutions.

20.66 Miss Litster was strongly committed to keeping children out of institutional care which, in the case of older children in mother and baby homes, meant industrial schools. However, she thought that industrial schools were better than county homes. In November 1949, following requests to have 13 children aged between two and four years removed from Castlepollard, Westmeath county council sought permission from the Department of Health to transfer some children to an industrial school. The department refused the request and instructed the Westmeath council to re-double their efforts to secure foster homes for them. The Westmeath council replied stating that they were unable to secure suitable foster homes and that

---

26 Miss Litster noted that her observations referred only to the three Sacred Heart homes. The other two homes in existence at the time – Pelletstown and Tuam - were directly controlled by the public assistance authorities. Mothers left these homes earlier than mothers in the extern homes and they were allowed leave their children in the homes. See Chapters 13 and 15.
Mullingar county home was also overcrowded with unaccompanied children. In further correspondence the Westmeath council sought permission from the department to transfer five boys aged between three and four years from Mullingar county home to St Joseph’s Industrial School, Tralee. When asked for her opinion, Miss Litster stated that she was reluctant to agree but conceded that, in the absence of suitable foster homes, the only way to get children out of Castlepollard was to make room for them in Mullingar county home. The department reluctantly agreed to the move on the proviso that the Westmeath council would continue to seek foster homes for all institutional children maintained by them.

The 1950s

The congregational council minutes for 1950 suggest that the Department of Health, through Miss Litster, had asked the congregation to consider setting up a home for ‘unwanted children’: presumably a reference to older children for whom it was proving difficult to find foster homes. It appears that the congregation could not come to a decision and the matter was left in abeyance. This was not the first time that the congregation refused an offer to set up a home in Ireland. In previous years the health authorities had lobbied the congregation to open mother and baby homes in Sligo and Wexford. On both occasions the congregation reluctantly agreed to the proposals and made efforts to source properties in both counties. On another occasion Miss Cruice, St Patrick’s Guild, was anxious that the congregation would take over the work of an unidentified mother and baby home in Dublin (this was almost certainly St Gerard’s - see Chapter 27). In this instance, the Archbishop of Dublin, Dr McQuaid, refused to allow the congregation to operate in his diocese. However, it seems clear from the congregational council minutes that the Congregation of the Sacred Hearts had no real interest in expanding its operations in Ireland and did not follow up on the proposals with any vigour.

During her inspection of Castlepollard in May 1950, Miss Litster noted that 28 children aged between two and four years were living there. Miss Litster commented that Meath county council was especially slow in finding foster homes. She also reported that all local authorities found it more difficult to procure foster

homes for boys than for girls. The Castlepollard institutional records confirm this: 20 of the 28 older children living in Castlepollard were boys.

20.69 In 1943, the departmental engineering inspector, Mr Humphreys, had reported that Castlepollard was suitable for the accommodation of 122 women and their babies. However, in May 1950 Miss Litster recorded that 142 women and 143 babies were living there. She noted that the Reverend Mother in Castlepollard had not been told about the assessment of maximum capacity and there was nothing in the agreement between the department and the congregation about maximum capacity. The issue was addressed immediately; a month later the department inspected Castlepollard again to establish occupancy and reported that adult occupancy was in line with its recommendations. However, the number of children living there exceeded the maximum occupancy number by 13; the problem, as always, was that alternative arrangements had not been made for the older children, some of whom were ‘mentally defective’.

20.70 Miss Litster’s 1950 inspection report stated that, in the period 21 January 1949 to 22 May 1950, 140 infants were born in Castlepollard and a further 40 were admitted after birth. Six infant deaths, and one child death, were recorded during this period; Miss Litster calculated that this was an infant mortality rate of 3%. Despite the concerns about overcrowding, she acknowledged that the mortality rates there were far lower than in other institutions.

20.71 The institution reported to the Department of Health that, on 31 March 1951, 122 women were living in Castlepollard. During the previous year 149 women had been admitted: 75% were maintained by local health authorities and 25% were private patients. Of the 162 women discharged during the year, 44 were discharged to employment. All but one of these women were public patients. Three women left the institution to marry, four were transferred to other unnamed institutions and a further seven were discharged to unspecified destinations. Most women were recorded as being discharged to parents or relatives.

20.72 When Miss Litster next inspected in November 1951, 113 women and 95 children were living in the home. She noted that six children aged three years and upwards should not have been there; five were accompanied by their mothers. Some women had lived in the institution for almost four years because alternative arrangements had not been made for their children. Miss Litster noted that four of
the older children were ‘mentally defective’ and the prospect of procuring foster homes for them was poor. One child, an unaccompanied five-year-old ‘mentally defective’ girl, whom Miss Litster had recorded in her previous four reports, had reportedly developed ‘a violent temper and vicious disposition’ and was deemed ‘a danger to younger children’. This child was born in Castlepollard to a private patient who had left the home and who repeatedly refused calls to have the child admitted to St Vincent’s Home, Cabra. The child’s mother was a native of County Laois and was paying £3 a month for the maintenance of her child. Laois council would not accept liability for the child’s maintenance in St Vincent’s Home. Miss Litster advised the Mother Superior that, failing successful negotiations between the child’s mother and Laois county council, the child should be transferred to the county home. In another instance, Miss Litster discovered that the NSPCC inspector for the area had proposed to bring a three-year-old boy, resident with his mother in Castlepollard, before the courts for committal to an industrial school. Miss Litster strongly opposed the move and demanded an explanation from Offaly county council as to why they were not utilising their powers under the Public Assistance Act 1939 to provide for the child rather than bringing him before a court for committal to an institution.

20.73 In the period 1 April 1950 to 21 November 1951, ten infant deaths were notified in Castlepollard. All ten had been born in the home and were aged from new-born to seven months at the time of death. Causes of death were given as gastroenteritis (four); congenital heart disease/heart failure (four); prematurity/spina bifida and convulsions/cerebral haemorrhage. Miss Litster calculated that these deaths represented an infant mortality rate of around 5%. While acknowledging that this was relatively low, she noted that it represented the second increase in infant mortality in the home in two years.

20.74 In 1952 the Superior General of the congregation contacted the Department of Health proposing that unmarried women with more than one child should be allowed admittance to their homes. Traditionally, institutional care for unmarried women with more than one child was restricted to county homes. Sister Rosemonde had suggested that women and children already living in the Sacred Heart homes would be placed in Bessborough and Sean Ross and that single mothers and their children living in county homes could be transferred to Castlepollard. The department objected to the proposal for a number of reasons. The primary reason was that this would result in overcrowding in Bessborough and
Sean Ross. Another departmental objection to the proposal was concern that the removal of women from Westmeath to institutions in other districts would isolate them and would ensure that ‘family contacts would fail’. The third objection was that the fall in the numbers seeking admission would continue: the department was sceptical that the fall in admissions recorded in the 1950s represented ‘a sudden excess of virtue’.

20.75 The Department of Health made a different proposal to Sister Rosemonde, asking her, in consultation with the Superior General, to consider setting up a separate home to cater for unmarried women on their second or subsequent pregnancy in County Meath. Sister Rosemonde met a departmental delegation and the Meath county secretary\(^{28}\) to discuss the proposal but decided against the move on a number of grounds; the initial cost of a new home would fall on the congregation ‘as they would not accept the running of an institution under the direct control of a local authority’; there would be difficulties getting suitable staff; and many single women on their second or subsequent pregnancy would be former residents of one of the Sacred Heart homes and might be reluctant to face re-admission to a home in the care of the same nuns ‘due to embarrassment’ or ‘fear of another lengthy stay’. Congregational council minutes for 1952 show that, at this juncture, the congregation was not prepared to undertake work with ‘second offenders’ even though it was in discussions with the Irish authorities about doing so. Due to increased pressure from the Department of Health, and some county managers, regarding the ‘pressing need’ to provide suitable institutional care for single women on their second or subsequent pregnancy the congregation approached Cardinal D’Alton, Archbishop of Armagh, to discuss the possibility of opening a home in Dundalk. However, following correspondence between Cardinal D’Alton and Louth County Council, the congregation withdrew the suggestion.

20.76 In May 1954, a Department of Health memorandum on services available to ‘unmarried mothers and illegitimate children’ gave an overview of Castlepollard. The memorandum stated that the institution had accommodation for 130 women and 130 children (which was more than the 122 deemed to be appropriate in 1943 - see above). It noted that Castlepollard had previously experienced severe overcrowding but produced figures for the years 1950-52 suggesting that average occupancy had declined considerably. The memorandum stated that, in 1953,

\(^{28}\) Meath County Council was looking at establishing a mother and baby home at this time and did later set up Dunboyne – see Chapter 24.
average occupancy was 112 women and 96 children. In 1953, Castlepollard received £16,622 in local authority capitation payments and a further £305 from the Maternity and Child Welfare scheme. Total receipts for the year totalled £23,454: total expenditure was £23,539.

20.77 The memorandum noted that weekly capitation rates at Castlepollard in 1953 were £2 for mothers and £1 for children and were intended to cover the cost of all medicines, drugs and medical services provided by the institution. Dr Cullen remained as the visiting medical officer and emergency deliveries and caesarean sections were not undertaken in the institution, but transferred to the National Maternity Hospital, Dublin (Holles Street). Dr Cullen had asked local authorities to consider covering the cost of ‘special drugs’ such as aureomycin, streptomycin and procaine-penicillin outside of the ordinary maintenance charge. However, Miss Litster urged Dr Cullen not to press the matter and the suggestion was subsequently dropped. The Department of Health agreed that local authorities could pay for the use of drugs such as penicillin ‘in certain instances’.

20.78 In April 1955 Miss Litster inspected Castlepollard. At the time of her visit, 111 women and 89 children were living there. She noted:

The general health of the occupants is excellent. The children especially are well cared for, well clothed, comfortable and well-fed. Good and plentiful play material is provided.

20.79 Miss Litster noted that the women had been admitted from almost every county in Ireland. She acknowledged that the original intention was that the Sacred Heart homes would be regional institutions but recognised that the admission of a large number of women from a small number of counties to any one institution was not conducive to residents seeking to maintain their anonymity. Miss Litster noted that nine children aged two years and over were also living there and described each of their circumstances:

- A two and a half year old girl. Mental defective. She is incapable of walking or talking, has no control over bodily functions, cannot feed herself. Arrangements have been put in train for her admission to St Vincent’s Hospital, Cabra. The Health Authority might be asked to make an effort to expedite admission.
- A two year old boy. This boy may not prove suitable for boarding out. It is feared that he has an epileptic tendency.
• A three year old boy. This boy is a fine healthy child. Legal adoption was proposed for him but cannot be arranged because his mother is a patient in [...] mental hospital and her consent, even if procurable, would be invalid. I am informed that arrangements are being made for his admission to St Vincent’s Junior Industrial School, Drogheda, and I suggest that the Health Authority might be asked to make efforts to obtain a good foster home for him at once instead of sending him to an industrial school.

• A two year old boy. A fine child of healthy appearance. However, he is making no effort to walk. It is possible he may prove to be sub-normal in mentality.

• A two year old girl. A lovely and healthy little girl. Arrangements have been made for her adoption in America and only the passport is being awaited.

• A two year old girl. This child is mentally defective. Arrangements are being made for her admission to the Home for mentally defectives in Lisnagry, Co Limerick. The Health Authority might be asked to make an effort to hasten her admission.

• A two year old boy. Awaiting passport for adoption in America.

• A two year old girl. A healthy and lovely little girl. Arrangements have been made for her adoption in America and the passport is being awaited.

• A two year old boy. A healthy little boy. Arrangements have been made for his adoption in America.

20.80 Miss Litster commented that children from Castlepollard were not sent to the USA for adoption until they reached the age of two; other institutions were sending them when they reached one.

20.81 She noted that a new dining room had been completed. It was ‘admirably designed’, airy, bright and attractive with tables seating four. The structural problems were continuing - there were patches of damp on the outer walls even though she was visiting after a prolonged period of dry weather.

20.82 In August 1956 the Minister for Health wrote to Bishop Kyne of Meath asking his advice on matters relating to the institutional treatment of unmarried mothers in Castlepollard. The minister was trying to reduce expenditure and was concerned about the length of time women and children were remaining in Castlepollard. The minister said that average annual cost of maintaining a woman and her child in
Castlepollard was £230 and £100, respectively. In his reply, Bishop Kyne said that he had no say in the administration of Castlepollard.

20.83 In July 1957, Miss Litster reported that 101 women and 81 children were living in Castlepollard. Because occupancy in Castlepollard was comparatively low at that point, she urged the department to contact health authorities in Wexford, Kilkenny and Limerick, where county homes had a number of mothers and children, with a view to transferring expectant women and single women and their children from those county homes to Castlepollard. Miss Litster stipulated that the health authorities should be asked to consider transferring women with one child and women with multiple children to Castlepollard.

20.84 In June 1958, the Department of Health inspector, Miss Reidy, inspected Castlepollard. At the time of her visit 103 women and 81 children were living there. She reported that accommodation for women was ‘clean, well-kept and adequately comfortable’ and was as follows: six seven-bed units and two six-bed units in the main building; the hospital had five six-bed units and one two-bed unit; the isolation unit had four two-bed units.

20.85 Miss Reidy reported that the children’s nurseries were ‘large, bright and airy’ and that the welfare and the wellbeing of both mothers and children was ‘excellent’. She noted that the children had a plentiful supply of ‘toys and playthings’ and a television had been installed.

20.86 Between Miss Litster’s 1955 inspection and Miss Reidy’s inspection, 332 women were admitted to Castlepollard: four were private patients and the remaining 328 were maintained by local authorities. Almost all the local authorities had residents there. Miss Reidy noted the recorded discharge pathways of 241 children in this period as follows: home with mother/relative (124); USA adoption (13); Irish adoption (seven); Scottish adoption (two); other adoption societies (72); boarded out (three); various children’s homes (eight); hospital (seven) industrial schools (five). Nine infant deaths were reported in this period; Miss Reidy noted that this was half the Sean Ross infant mortality rate.

20.87 In 1958, the Department of Health was reviewing the occupancy rates in the three Sacred Heart Homes - see Chapters 18 and 19. The conclusion was that two, rather than three, institutions would be sufficient to meet demand. The department
wrote to Bishop Kyne of Meath pointing out that Castlepollard was the smallest of the three and had the highest cost per patient. The proposal was to transfer women and children from Castlepollard to Sean Ross and Bessborough. Castlepollard would then be available to cater for ‘mentally defective children’. In reply, Bishop Kyne said that his diocese was not directly involved in the administration of Castlepollard and that the diocesan council of Meath would not object to the repurposing of the institution.

20.88 As the department gave further consideration to the future of the three Sacred Heart homes, the question of the unmarried mothers who were still using county homes arose. A memorandum, dated May 1958, noted that decreased occupancy in St Patrick’s Home, Navan Road (Pelletstown - see Chapter 13) could absorb some women who were using county homes. However, the memorandum concluded that in the event of Castlepollard’s closure, the only available accommodation for single women on their second or subsequent pregnancy would be in county homes. (This, of course, was incorrect because Dunboyne had been established for this purpose - see Chapter 24).

20.89 In March 1959, the Department of Health issued a circular letter and questionnaire to every health authority seeking up to date information on unmarried mothers and their children accommodated in county homes and similar health authority institutions. The returns showed that 204 unmarried mothers had been admitted to county homes in the year ending March 1959. On 30 September 1958 there were 94 unmarried mothers and 236 children in county homes. The children were not necessarily ‘illegitimate’; many were there because they had disabilities and no suitable institutional place was available; others were homeless. Information about the length of stay of mothers in county homes does not seem to have been collected but the department seemed to think that many stayed only for a month and the majority stayed for less than six months. The department’s commentary on the situation is revealing:

it appears that some health authorities do not endeavour to send unmarried mothers to the Special Homes; they only send them if requested to do so by or on behalf of the mothers. Most health authorities do, however, endeavour to send mothers to the Special Homes, generally first pregnancy cases, but it appears that quite a number of these refuse to go to the Special Homes because they believe they would be compelled to work very hard while there. This type of mother, often of the vagrant class, generally stays only a month
or so in the County Home and then leaves, taking her child with her; she is apparently not concerned very much about keeping her mishap secret. Health authorities generally have not been aware that second and subsequent pregnancy cases are being taken into the Special Homes so these cases are still accommodated in the County Homes as a rule. It appears that health authorities tend to keep subnormal unmarried mothers in the Homes for long periods - up to 3, 4 or 5 years - as they know that these girls would only get into trouble again as soon as they leave. The mothers of subnormal or handicapped children tend also to be kept in the Homes for long periods - the children are not suitable for adoption, boarding out or sending to industrial schools and health authorities tend to keep the mothers in the County Homes to look after the children until they can be admitted to suitable institutions.

20.90 A memorandum dated September 1959 shows that the department had begun to consider using Castlepollard as a home for women on their second or subsequent pregnancies. At this stage, it is clear that the homes were all accepting some women on their second or subsequent pregnancies but they would not accept the woman’s other older child or children. It is also clear that the congregation did not favour establishing a home exclusively for these women.

20.91 This memorandum also dealt with the question of capitation rates. On 1 April 1956 capitation rates for all three homes had been fixed at £2 5s a week for mothers and £1 2s 6d for children. The department had anticipated that these rates would result in a revenue loss at Castlepollard but would result in a £1,500 surplus across all three homes. The department acknowledged that their expectation of a surplus was not realised, that a deficit totalling £7,000 was recorded in 1957 and that the congregation’s financial situation had further deteriorated during 1958. The memorandum recognised that lower occupancy was the cause of the financial problems. Sister Rosemonde had called to the department to discuss the financial situation and had intimated that a plan to change Bessborough to a home for ‘mental defectives’ would be welcomed.

The 1960s

20.92 The Department of Health considered the capitation rates in January 1961. A briefing note at this time shows that the deficit of £7,000 in 1957 had increased to £25,000. The department considered that this accumulated deficit was largely the
fault of the authorities of the homes or their accountants as they had failed to present their annual accounts promptly and failed to draw the department’s attention to any serious losses in running the homes. The department accepted that the revised capitation rates would have to cover the costs of running the homes and also deal with the deficit. The expected transfer of women and children from the Children’s Home, Tuam (which was due to close - see Chapter 15) to Castlepollard and Sean Ross was a further consideration as this move was expected to increase income for both homes; the department expected that 17 women and 117 children would be re-located from Tuam.

20.93 In March 1961, the Department of Health notified authorities at the Sacred Heart homes that the capitation rates were being increased to £3 for each woman and £1 10s for each child and the increased rates would apply from 1 January 1961. The department also decided to discontinue the grants paid to the homes under the Maternity and Child Welfare scheme as they were not paid to other institutions; the three homes had been receiving a total of about £1,500 a year from this scheme. The revised capitation rates were to be considered ‘all-inclusive’ and would represent the total contribution to the homes from public funds. This meant that no extra payments would be made by health authorities for any medical services, blood-grouping or any similar tests provided for residents.

20.94 In June 1960, Miss Reidy inspected Castlepollard. There were 78 women and 79 children living there. She reported that the accommodation for women and children was ‘clean and well-kept’ and that the wellbeing of both was ‘excellent’. In the period since her last inspection in June 1958, 337 women had been admitted: 302 were maintained by local health authorities and 35 were private patients. The children’s exit pathways were recorded as follows: parent/relative (75); USA adoption (43); Irish adoption (16); other adoption societies (65); boarded out (nine); St Clare’s Stamullen (12); industrial schools (two); and Crumlin Children’s Hospital (four). There were two infant deaths in the period; the causes were congenital deformity and debility.

20.95 When Miss Reidy visited Castlepollard in March 1962, she recorded that, since her previous visit, 229 women had been admitted; 14 were private patients. Adoption was now the major exit pathway for children. A number of children continued to be described as going home with their mother or a relative but many of these children are very likely to have been subsequently placed for adoption.
20.96 There were six children in the institution aged between three and four; five of these had been transferred from the Children’s Home, Tuam. There were 13 children without their mothers; nine of these had been transferred from Tuam; two were ‘legitimate’ children being maintained by Mayo county council and two were the children of mothers who were in ‘special institutions’.29

20.97 Miss Reidy concluded her report by stating that no infant deaths had occurred in Castlepollard during this two year period. However, the institutional records show that two infants born in Castlepollard during this period subsequently died in Our Lady’s Children’s Hospital, Crumlin.

20.98 Miss Reidy next inspected Castlepollard in August 1963. Her report shows that, in the period since her previous inspection, 100 women had been admitted and 77 women were living there on the date of her visit. Adoption continued to be the major exit pathway for children; two children were admitted to Nazareth House, Fahan at the request of their mothers. Two infant deaths were notified during this period representing an infant mortality rate of about 2%. Causes of death were given as congenital heart disease and congenital deformity.

20.99 In May 1964, the Department of Health examined the audited accounts of the Sacred Heart Homes and queried the increased running costs associated with Castlepollard. The congregation’s auditors told the department that the annual salaries of nursing staff who were members of the congregation had increased from £50 to £200 during 1963. The auditors stated that there were 14 congregational nursing staff working at Castlepollard at that time. The auditors also advised that renewals and repairs at Castlepollard increased from £1,647 to £3,405 during 1963 and other increased expenditures were attributable to the erection of a new shed (£1,700) and the purchase of a new washing machine at a cost of £757.

20.100 Miss Reidy inspected Castlepollard again in April 1967. In the period since her previous inspection, in August 1963, 684 women had been admitted. There were 72 women and 41 children living there on the day of her visit. Adoption continued to be the most significant exit pathway for children and the problem of older children remaining in the institution was ending. When Miss Reidy inspected in

29 It is not clear what is meant by this; it is most likely to be either mental hospitals or Magdalen laundries.
August 1968, there were 29 children in the home and all were less than six months old.

20.101 Miss Reidy’s last inspection was in December 1969. At the time of her visit 43 mothers and 15 infants were living there. In the period since her previous inspection, 135 women had been admitted. All infant residents were less than six months old. Four women were living in the home without their children. Their children had been placed for adoption and the women were seeking employment. She noted that due to reduced occupancy, all residents were accommodated in the hospital block and the ‘old Manor House’ was unoccupied.

20.102 During her December 1969 inspection, Miss Reidy was told by Sister Rosemonde that talks had been going on with the Department of Health about the future of Castlepollard. Miss Reidy was clearly not impressed by the fact that she had not been informed by the Department of Health about the closure of Sean Ross as a mother and baby home - she found out only when she sent a client there after it had closed.

As you are aware, the inspection of Homes for Unmarried Mothers was assigned to me officially in August 1957. The reasons that it is administratively requisite that I should be kept informed regarding any proposed changes under consideration effecting either the running of the Homes or the reception of cases to them, are patently obvious.

20.103 She had not been informed of the talks about Castlepollard either: ‘my first intimation also that the closing of the Home is almost imminent came from the Home Authority accidentally, and not, as logically one would expect, through the administrative channel’.

**Closure of Castlepollard**

20.104 In August 1969, the Superior General of the congregation, Sister Etheldreda, had told the Department of Health that the congregation would be discontinuing services for unmarried mothers at Castlepollard and it planned to dispose of the property. Sister Etheldreda said that she had informed the Bishop of Meath of the decision and, while he expressed his regret that such a decision had to be made, he was most understanding. She said that the property at Castlepollard was in excellent condition and asked if the department had an interest in buying the
Ch. 20 Castlepollard

She said that any new work at Castlepollard would have to be undertaken by another congregation or lay group as she did not have Sisters available to continue the work there. In November 1969, Sister Rosemonde was asked to meet departmental officials to discuss the matter.

20.105 On 13 November 1969, Sister Rosemonde, Sister Assumpta, Castlepollard, and Sister Hildegard, Bessborough, met Department of Health officials to discuss the proposed closure of Castlepollard. Sister Rosemonde told the meeting that Castlepollard had accommodation for 130 women but was ‘too big and too expensive to run’. She said that the capitation rate paid by health authorities ‘was not generous’ and that the home had incurred a substantial loss as a result. Sister Rosemonde also stated that the congregation had insufficient staff to run the home and found it impossible to employ nurses because of its remote location. She stated that ‘under the old system’ women stayed in the home for longer periods and undertook work while living there but that the average stay was now six to eight weeks. She told the meeting that there was no major hospital close to Castlepollard and that emergency cases were taken 60 miles to Dublin by road. This had been undertaken by a local man who was no longer available and she found it difficult to get emergency cases transferred to hospital, particularly at night. She said that the congregation did not want to ‘drop out’ of their work with unmarried mothers and intimated that they were considering opening a smaller home near an urban centre. However, efforts to establish such a home near Dublin had not met with Archbishop McQuaid’s approval because he considered that Pelletstown catered for Dublin’s needs. She said that women living in Castlepollard would be transferred to Bessborough.

20.106 A department official said that the decision to close Castlepollard was a matter for the congregation but thought it unwise to close it so soon after the closure of Sean Ross. He calculated that women living in both institutions could be accommodated in Bessborough with four beds to spare. However, it was brought to his attention that in March 1959, 188 women were living in both homes and that Bessborough had capacity to accommodate just 130 women. He expressed his concern that Bessborough did not have capacity to deal with every woman who sought admission to a Sacred Heart home and cautioned that the closure of Castlepollard ‘might create serious difficulties’ for the department. He also expressed concern that the closure of Castlepollard would leave the midlands and the west of Ireland without institutional services for unmarried mothers and their children. He asked
Sister Rosemonde if the Superior General would consider postponing the closure of Castlepollard for at least six months to give the department time to assess the ‘fall out’ from the closure of Sean Ross. He concluded by stating that the service provided by the Congregation of the Sacred Hearts at Castlepollard was essential to the midlands and the west and urged the congregation to consider opening a smaller home near Galway or Sligo if plans to close Castlepollard were to proceed. The department wrote to the Superior General to tell her that the department was examining the possibility of using Castlepollard as a home for ‘mental defectives’ and thanked her for not pressing for the immediate discontinuance of services for unmarried mothers at the home.

20.107 In January 1971, Sister Rosemonde informed the Department of Health that the Superior General had decided to close Castlepollard and that the congregation would no longer admit maternity patients to the home. Sister Rosemonde advised the department that she hoped to have all resident children placed and all resident women discharged before the end of that month. The Longford/Meath/Westmeath Mental Hospital Board bought Castlepollard for £100,000. The Department of Health discussed the use of the £100,000 due to the Congregation of the Sacred Hearts of Jesus and Mary from the sale of Castlepollard and considered that, as a registered charity, the congregation had two options: to transfer the proceeds to the Department of Health for deposit to the Hospitals Trust Fund or to allow the congregation to use the proceeds to pay off their bills until the £100,000 was exhausted. Sister Etheldreda informed the department that the congregation would not object to the monies being spent on the provision of a new 50-bed unit to cater for ‘mentally handicapped’ girls at Sean Ross. The congregation has told the Commission that it paid £80,000 of the proceeds towards the unit in Sean Ross.

20.108 Concerns were expressed by the county medical officer for Westmeath about the closure and its effects on the availability of services for unmarried mothers in Westmeath. Bishop McCormack of Meath initially objected to the sale of Castlepollard as he considered that the Congregation of the Sacred Hearts should have, under canon law, sought permission from him to do so and protested that he had not been involved in discussions about the closure. (His predecessor had not objected - see above.) Furthermore, he told Sister Etheldreda that he had received representations expressing concerns about the consequences for the care of single expectant women. He said this continued to be an urgent pastoral problem
that could not be dealt with adequately by social services. Bishop McCormack subsequently agreed to the sale on condition that the purchasers would care for the ‘nun’s cemetery’ at Castlepollard. The matter of the ‘children’s cemetery’ did not arise during discussions.\(^\text{30}\)

Evidence of former residents

The experiences described by the former residents who gave evidence to the Commission are largely set out in their own words. In some cases, particular information which might identify the witnesses has not been included.

Resident A: Mother, mid 1960s

20.109 Resident A became pregnant at age 18 after being raped by her then boyfriend. When she was six months pregnant she told her parents. She said that the parish priest arranged for her to be admitted to Castlepollard and her parents drove her to Dublin and put her on a bus to Castlepollard. Her parents did not discuss any other options with her and ‘sent her away’. She went to the Catholic Protection and Rescue Society before she went to Castlepollard to make arrangements to have her baby adopted. Her mother wanted to keep the baby but her father would not allow it. Her father was afraid of what the neighbours would say and her pregnancy would have brought shame on the family.

20.110 She remembered entering Castlepollard for the first time:

There was a girl waiting at the gate for me, and took me up to the - and then when I went up to the office I got a pet name, my whole identity was taken away and I got a pet name. Then when any post came in for me it was opened before I got it, and when I was sending out letters they were read before I could seal the envelope. Then I was given a job, you were given jobs like I had to sluice the nappies and I had to take them down to the laundry and I had to collect the bread down there for to bring up for the supper. Some of the days I went down the nuns were carrying the little shoe boxes down, to bury the babies.

\(^{30}\) Meath Diocesan Archives
20.111 Resident A told the Commission that she saw ‘about ten’ deceased babies being sent for burial in what appeared to be shoe boxes. The deceased infants were buried on site at Castlepollard.

I would like to see justice done like where the little babies were buried, you know why? Were they starved, why? I couldn't say they were really cruel or anything like, but I didn't like them burying the babies. I suppose they had to do something with them, but I didn't like that.

20.112 She told the Commission that there was a building on site at Castlepollard known as the ‘mattress room’ and the women were sent there to give birth if they were ‘screaming and shouting’. She had not seen this herself but was told about it by other women at recent meetings held at Castlepollard. She said that she was examined by a doctor and nurse about once a month. The doctor was in attendance when she went into labour and her baby was delivered by forceps. She said that the nuns forced her to breastfeed her baby for six weeks and she had a bad experience with it.

It was probably a good thing for the baby, but it wasn't good for me...I was made breast feed her and she was really and truly eating me. So, I said it to them, and they got me a shield and that didn't work, and they made me express then. They got me a pump and made me express. That turned me off breast feeding my children.

Resident B, Mother, mid 1960s

20.113 Resident B became pregnant at the age of 17. Her mother took her to her family doctor who suggested that she might move in with a couple in Cork until she had her baby. Her mother then brought her to see their parish priest who recommended that she would be admitted to Castlepollard. Her parents did not consult her or her partner on the decision: ‘It was Castlepollard or nowhere’. Her mother drove her to Castlepollard. Her parents signed all the paperwork at Castlepollard. She said that her mother signed her into Castlepollard under a different name to maintain her anonymity. Her mother was determined to conceal her pregnancy and was ‘in total denial’. She did not know if her parents paid for her maintenance in Castlepollard. She recalled:

So, I go to Castlepollard with my parents. I am brought in, introduced to one of the nuns, I can't remember her name. My parents - I was taken out of the

---

31 The institutional records show that no infant deaths occurred in Castlepollard during Resident A’s time there.
room and my parents had a chat with her. Then I was brought over to what they called the hospital. It was a separate building from the convent.

20.114 Resident B said that the ground floor of the maternity hospital housed about ten Down Syndrome women and their babies.\(^{32}\) She was put in an eight-bed ward for two months and then transferred to a two-bed ward for the duration of her stay. She was not allowed to use her real name and was given a house name. She said that women did not discuss their personal life with each other as they were ‘too afraid’. She wore her own clothes but was given a brown nylon shop coat to wear over them. The women woke at 6am each morning for mass followed by breakfast. She recalled the daily routine as follows:

Get up, go to mass, have your breakfast, and then basically wash floors, clean windows, change beds; houseworky type things. Some of the girls worked in the laundry…It was more boring than hard… In the evening we would just sit around and read or talk or, you know, talk about nothing basically because we were all afraid to say ‘my name is …’ type of thing, and you know, ‘the guy that is the father of the baby is my boyfriend’. You know, you just didn't talk about your personal life.

20.115 She said that all the beds in Castlepollard were occupied during her time there and stated that some women were from Australia and England. She recalled:

Well they had English accents, so I presumed they were English. There were girls there that were from the country, but their parents didn't know that they were pregnant. They thought that they were working in England and say it is me, well I would write to my mum and give the letter to the nun not sealed, right. She would read it and if she didn't like anything in it they got a black marker and put a line through what they didn't like, and it was the same when we got post in, if they didn't like something they would censor it… The point I was going to make about the girls that their parents didn't know, that they thought they were working in England, they would write a normal letter home to their parents and say how well they are getting on and all this type of thing and they would send them to England to be posted back to Ireland.

20.116 Resident B did not remember if there was a television in Castlepollard but remembered hearing the radio in the dormitories during the day. The gates to the

\(^{32}\) The Commission has found no evidence of this.
institution were locked at all times and she had to seek permission to walk the grounds. She recalled that some of the nuns ‘were quite pleasant and some of them weren’t’. She said that she received no medical attention and ‘never saw a doctor’ during her time in Castlepollard. She told the Commission that a Down Syndrome girl delivered her baby and that there was no nun in attendance: ‘Just as I say this Down Syndrome girl standing beside me holding my hands and me screaming my lungs out’.

20.117 She said that the food served to women in Castlepollard was ‘horrendous’:

Breakfast would be a cereal and a cup of tea. Lunch would be a sandwich and dinner was normal dinner…You got what was on the plate and that was it. If you had a big appetite, then you were hungry… It was a harrowing experience. It was like being in jail basically; your freedom, your identity, the whole lot was taken away from you.

20.118 Resident B said that women were free to receive visitors and that her parents and her partner’s parents visited her. She said that, although there was no conversation with her parents about it, her child was going to be adopted and that was it. Her mother never spoke to her about her child. She subsequently married the father of her child and he refused to talk about their child.

20.119 Resident B told the Commission that she was in Castlepollard for nine months. She said that her mother would have left her in Castlepollard ‘if she had her way’.

20.120 Three weeks after giving birth she was collected by her partner and they handed over the baby for adoption. She and her partner went to England and they subsequently married. The adoption papers were sent to her in England about two years later. She said:

I knew that she was, you know, that she was going to be adopted and I didn't really have the courage or the conviction to not sign them because at that stage I think I was about 20 living in a foreign country, two children, you know, and I didn't have the means to do anything about it either.

20.121 Resident B subsequently made contact with her daughter.

33 The Castlepollard register records that Resident B was in Castlepollard for 18 weeks
Resident C, Mother, late 1960s

20.122 Resident C told the Commission that she came from a family of 12 children where there was ‘a lot of religion’. She became pregnant aged 18 years in 1968. She did not tell her mother but her mother subsequently found out and was glad that Resident C was gone out of their neighbourhood so that she ‘didn’t bring shame on the family’. Resident C was put in contact with Fr Colleran, Catholic Protection and Rescue Society, who told her about Castlepollard. She told her friends that she got a job in the midlands and went to Castlepollard in November 1968:

I went in there. I remember the open armed statue at the door, it was facing the door, and I remember the girl who answered the door… So, she said, ‘Mother is expecting you’ and I was sitting down, and Mother came in. Again, in my head she was a very large presence. I stood up when she came in and she sat down, I remained standing, which was a very odd thing in a way… She told me that basically, I nearly have the words in my head because I never, I have vivid memories of certain aspects but not others, but she said how I’d been a really bad person and that I was there to make amends, and that I was lucky that they were taking me in, and that the only way I could get God to forgive me was by giving a good Christian family the child that I couldn't rear myself. So that was it… How my mind was, to be honest. I couldn’t keep this baby.

20.123 Resident C said that she went into Castlepollard with the idea of having her baby adopted but that she did not know what that entailed.

20.124 She was brought upstairs in Castlepollard and was examined by ‘a very nice nun’, Sister Justine. She said that, because she did not have ‘a huge bump’, she was put on night duty and allowed to go into the local town on Sundays to attend mass. Her duties included feeding babies, making bottles and cleaning. When she became obviously pregnant she was put working in the home by day. She remembered:

I just have in my head this vision of very busy people; stairs being polished and you know all of that sort of stuff, but I don't have any memories of being so tired that I couldn't speak or anything like that, you know? I didn't find it, I mean I come from a family where we all helped out, we had a small little farm and we worked pretty hard tilling turnips and all that sort of thing, so I didn't mind work.
20.125 She had a bed in a dormitory. The women did not have much privacy. She recalled:

Again I used to share, well when I was younger I shared a bed with two sisters, a double bed, so having your own bed was actually not the worst thing that could happen to you, but it was all very strange and new... So again, personal hygiene was really important and not everybody realised that so you could sometimes be sharing with somebody whose personal hygiene was pretty awful.

20.126 She wore her own clothes in Castlepollard and a house coat. She remembered that women brought their clothes to the laundry and washed them themselves. They could watch television and she remembered watching ‘Top of the Pops’. She said that she learned lots chatting to women who came from various parts of the country. She remembered that quite a few of the women were civil servants. They were not encouraged to talk to each other while working but that they had leisure time in the evening and the nuns operated a small shop on the premises:

And so, they sold, top of the list guess what? Cigarettes, cigarettes and matches top of the list. Toiletries, you could buy your toiletries and baby clothes. There was a lot of sort of almost competition about who would have the nicest clothes for their babies and things like that. What else? Obviously, it sold biscuits... So that, that was the shop. Like we would all be puffing our heads off in the whatever, it was some sort of a sitting room, you know, day room or whatever it was called. That would be an hour or something and then a bell would ring.

20.127 She said that her days in Castlepollard were ‘very regimented’ and, while food was not ample, the women were fed sufficiently. She remembered:

It was the very first time that I ever had potato salad. Like, it wasn't something that the farmer's wife made usually. I remember having potato salad, beetroot and tinned corned beef and it was a real novelty. Yes, it was, I was looking at it thinking it was very strange but, you know? So, yeah, you got things like that. So, no, I was never, I was never hungry.

20.128 Resident C told the Commission that her waters broke around six weeks before her baby was due and the nuns were convinced that she had done something to herself to bring on labour. This was the worst part of her time in Castlepollard when she was not believed. She was brought to the hospital and she had a long
and difficult labour. She was attended by a lay midwife and two helpers. A nun brought her son to her but told her that he would have to be transferred to hospital. Her baby remained in a children’s hospital for almost two months. She did not have the opportunity to visit him there. When she recovered, she was put on night duty feeding babies:

Then I was put back on night duty because I was free, I was the one who was free, I didn't have a baby of my own to mind and I was, I think I was probably very good because I took an interest in all of the babies. My interest in babies has never waned. I love babies. Every baby I see I speak to. I fed all of the babies and I would have girls bribing me to feed their baby first, not quite bribing me, but you know what I mean?

20.129 She said that it was difficult to get updates about her baby and she found this very frustrating:

So, I didn't get weekly updates, or whatever, but when I would ask, she would say no he is not ready to come back yet, or whatever. So I continued almost like, like why am I here, I am a prisoner in my head, you know, and sort of thinking I might escape and go to Dublin and take him out of this hospital, you know I had all sorts of thoughts but obviously there was a number of things that were confining me and one of them was a lack of money. My mother never wrote to me or anything while I was there… the father of the child came once… But he didn't come again, and he didn't want a baby either. Like I didn't want him, and he didn't want either of us. So anyway, loads of times I really just wanted to run away but, in those days, you didn't get mother and payment, you know that? So that was, you know, I couldn't bring the baby home, end of story, and I didn't have any, anybody who said look I'll help you to mind your baby.

20.130 Resident C told the Commission that women stayed with their babies in Castlepollard until they were adopted:

If it took a year then you stayed a year. For some girls it took longer. There was a girl who had twins and they were finding it difficult to place twins, I think.

20.131 She remembered seeing some older children in Castlepollard during her time there. She also remembered some women who worked in the home and were known as ‘lifers’. She thinks that these women had had children in Castlepollard
but were mentally incapacitated to some degree. She also remembered that some women in Castlepollard were there on their second pregnancies and that they ‘got a terrible hard time’:

Then there was also a girl arrived one day and I remember it so well. She was slim, beautiful; her hair was beautifully done, etc... She came in, she was there two days, her baby was born and three days later her baby was adopted, and she had her own room. I wondered afterwards, you know, whose daughter was she because obviously she was somebody that the nuns knew? She could have been a politician’s daughter, who knows but there was that special treatment.

20.132 She remembered that the priest was treated very well when he came to say mass at Castlepollard on Sundays. She stated that everything had to be perfect for his visit and that he was given his breakfast after mass:

He got rashers and sausages and the whole lot. We didn’t get any of those but if you happened to be in the kitchen when you were cooking them you might have got a little bit. So, it was probably of its time that era when everybody bowed down to the clergy and people had disdain. Like you know you were lower than, it is a very hard thing when you are made to feel that. You know people say you can only be made to feel it if you allow it but I certainly wasn’t self-aware or well developed in those days; I didn’t have any skills really so I felt myself like a really bad person.

20.133 She said that babies in Castlepollard were ‘stuffed with porridge and thick rice and rusks so that they would fatten up’ and look healthy for prospective foster parents. She remembered well-dressed couples visiting Castlepollard and presumed that they were prospective adoptive parents:

I kept thinking maybe they are going to take my baby. I would be looking at people. Then I was told, I was told one, I think it was a Wednesday that you are going to Dublin tomorrow, your baby is being adopted tomorrow. Now I am sure I signed papers, but I have no recollection of signing papers. It is possibly something that I did but it doesn’t stand out for me. I don’t have this memory of signing away my baby... But I obviously did, I'm sure I did otherwise it wouldn't have happened. I don't know if I knew the full implication of it, but I did, I knew that I had no choice I think, so that was it.
20.134 The witness told the Commission that that she was driven by car to the Catholic Protection and Rescue Society with her baby and accompanied by a nun from Castlepollard. She stated that she had all her belongings with her in the car. She remembered:

I was put in a room up the top of the house with him and then they brought me in, well it was a nun brought me in a hot bottle and told me to feed him for the last time, so I did. Then she just came in and took him. So I had to stay in the room, I was trying to look out the window to see would I see people going out with him or would I follow them, you know, all this sort of thoughts? Anyway I had to stay for 30 minutes and then no talk, nothing, just ‘you may go now’... So I had to put on the brave face and smile and look like life was very good and I’d just come from my job. So, I did that, I suppose I did that, and I did it for years, I was able to, you push it all down there somewhere... So, I didn't ever discuss him. I didn't forget him.

20.135 She met her son 30 years later in the room in which she had given him up for adoption. She said that she had a happy reunion with him and he was now part of her family. Reflecting on her time in Castlepollard, she said:

I wouldn't, like I would never sort of condemn Castlepollard. I feel that at the time I was what was considered ‘in trouble’, that was what was on offer. It was a penance, you know? They weren't enlightened about people's feelings... They were God's people and, you know we had, we did have respect for them, there is no doubt about it, and you had fear, you know you did have fear. Probably all of us down there our biggest fear was that somebody would find out about us. Like that was probably one of the biggest fears.

Resident D, Child, born mid 1940s

20.136 Resident D believes that his mother was admitted to Castlepollard in 1944. He has a photograph of her in Castlepollard and she was ‘smiling and seemed quite happy’. She stayed with him in Castlepollard for two years and then he spent a further four years there. His mother told him that she was working to contribute towards his maintenance in the home. He suspects that his mother was trying to prevent him from being boarded out but he was subsequently discharged to Tullamore County Home. He told the Commission about his own research into mother and baby homes but said that he had no memory of his time in Castlepollard and that his mother had not spoken much about her time there.
Resident E, Child, born mid 1960s

20.137 Resident E told the Commission that he suspects that his mother was admitted to Castlepollard as a private patient as she came from a wealthy family. His mother was driven to Castlepollard by her father who ‘left her there’. He was taken from his mother as soon as he was born and sent to a nursery. His mother did not see him for 13 days. He was then transferred to another mother and baby home with his mother. His mother was collected from there by her father and he was left unaccompanied. He was collected by his adoptive parents three days later. He has never met his birth mother but spoke to her on the phone once for 50 minutes. He stated that his mother had no memory of the time between giving birth and leaving him in the second mother and baby home. Not surprisingly, he has no memory of either institution.

Affidavits received by the Commission

The Commission received a number of affidavits from former residents. These are sworn statements and are reported largely in the words used by the former residents. Unlike those who gave direct evidence, the Commission did not ask any questions of these former residents.

Resident F, Mother, early 1960s

20.138 Resident F was collected from her home by a priest who drove her to Castlepollard when she was 14 years old. She said that she did not know that she was pregnant. She was given a ‘house name’ but she refused to acknowledge it:

I was told ‘from now on you answer to the name [...]’. I did not respond to being called [...] because my name is [...]. I got my ear pulled or a thump on the back or my hair pulled by the nuns when I did not respond to being called [...] …Their behaviour and aggression towards me was vicious and spiteful…They would give me a vicious knock, hit or dig. The nuns were unkind, hostile, spiteful and mean.

20.139 She said that she was subjected to beatings by the nuns:

I was beaten by the nuns with a stick. They would beat me all over, on my head, my arms, my legs, anywhere. I don’t recall what I did to get beaten so badly. I had massive welts and bruises all over me. I saw other girls get
beaten with sticks and saw their welts and bruises. No one visited so no one knew what they did to us. You got beaten by sticks or by their hands; across your face, your head, hands, arms, legs or torso.

20.140 She said that the nuns made her unblock toilets with her bare hands. This used to make her physically sick and she could not get rid of the putrid smell. She stated that ‘sometimes a nun was kind’ and would give her a bar of scented soap after unblocking the toilets.

20.141 She said that the sanitary towels given to women in Castlepollard were made from towelling:

We were given six towels each and they had to last for the whole of your period. They were made of towelling, but they were like gold dust. They would be stolen by the other girls if you did not hide them well. The towels were hard and smelly. You had to wash them by hand before they were taken away and boil washed in the laundry. You washed what you had out to use again but they were awful things to use...We had to deal with periods every month...I dreaded my periods and I think every girl did.

20.142 She said that the ‘older girls’ in Castlepollard were ‘malicious and nasty’ and physically assaulted and threatened her. She said that she was hit and smacked across the face by the older girls and that the nuns did nothing about it. She stated that some of the girls would take her clothes and underwear and if she complained to the nuns, they would physically assault her.

20.143 She said that she had a difficult pregnancy and was put on bed rest for six months. She was transferred to a hospital in Dublin to give birth and then returned to Castlepollard with her baby. She stated that she was not allowed enough time to recover and was made to go back to work in the home even though she could not walk on her own. She said that the nuns had no concern about her and did not care about her welfare.

20.144 She said that the nuns were unsympathetic to women if they were sick or ill:

I had in-growing toenails and never had treatment for them while I was at Castlepollard. No one did anything if you were ill, the nuns did nothing, you were left to deal with pain...Some girls would get hurt by doing their jobs, some would get hurt in the laundry room by machinery or down on the farm.
The nuns would bandage the girls; no one was sent to the hospital or seen by doctors. The same could be said about the girls in labour, the nuns delivered the babies…

20.145 She said that she was put in charge of one of the dormitories:
Working in the dormitories was a better job than most. I think there were 12 beds and one chest of drawers for all of us in our room. Our clothes were laid out every two days or so. Everyone had their names on their clothes. Our underwear had to last two to three days before they were changed. There was no storage in the room for clothes…When important people came to Castlepollard I had to change the beds and put these new bedspreads on beds and put the old ones in the chest of drawers. Once they were gone the old canopies came out.

20.146 She said that each bed had a pillow, blanket and sheets. The bedspreads were taken off the beds at night and women were not allowed to use them to stay warm. The dormitories had radiators but that they were not left on long enough to heat the rooms: ‘You went to bed cold and you stayed cold all night and you woke up cold’.

20.147 She said that the daily routine in Castlepollard began at 5am when women went to mass and then had breakfast. They then went to work in the laundry, ironing, cleaning, tending to the dormitories and working on the farm. The women did all the work while the nuns supervised:
They would beat you or wallop you if they thought you did not work hard enough or do it right. They would make you do it again. They were very cruel and blamed us for them being in the convent. They are the cruelllest people under the sun and the harshest on the planet.

20.148 Breakfast at 7am was porridge with milk and sugar on top. Lunch was between 1-2 pm and consisted of bread with jam or cheese, with ham every so often. She said that dinner was at 5pm and that it was ‘a proper dinner’ with meat and vegetables:
We had to line up and our food was served by other girls. You wouldn’t and couldn’t line up for seconds. We would have a pudding, normally rice or semolina and every so often apple pie and custard. We were always hungry.
20.149 The women were allowed to watch television in the evenings and that they were in bed by 9 pm. The women washed every day in a sink and they had toothbrushes and toothpaste. She said that she hid her toiletries because other women would try to steal them.

20.150 She said that the nurseries in Castlepollard were well-run and the children were treated well. Sister Angelina was in charge of the babies and she was a lovely lady:

The children had plenty of clothes, nappies and plenty of food. The children were immaculate. You could pick out outfits for your child to wear. The children had plenty of food. Not many babies were breast fed, mostly bottle fed, I think because the children were moved on and adopted. There were children there as old as 5-6 who were never adopted.

20.151 She said that she was upset when her baby was taken for adoption and the nuns showed her no sympathy. She said that at some stage she had signed her name on a document but she did not know what it was. She believes that these were documents relating to the adoption. She remained in Castlepollard for six weeks after the adoption and was then taken to a hospital in Dublin where she worked in the kitchen and lived onsite.

**Resident G, Mother, early 1960s**

20.152 Resident G became pregnant at the age of 19. Her mother discovered that she was pregnant and sent her to Castlepollard. She had no say in this decision. When she entered Castlepollard, she was given a ‘house name’ and a uniform. She was not made to work in the home as she was heavily pregnant and had swollen ankles. Her labour was uncomplicated and one of the nuns helped to deliver her baby. She was not given any pain medication. She found the birth to be a traumatic experience as she was alone and did not have any family member with her and she was not shown any compassion by the nun.

20.153 She was sent to work in the laundry at Castlepollard a few days after giving birth:

I worked six or seven days a week from early morning until evening. The working conditions were very difficult due to the long hours and the heat and I felt constantly exhausted…The nuns told us that we had to work to pay for the cost of our upkeep in the home.
20.154 She bathed and fed her baby every day but she was not allowed to spend any great amount of time with her child. She feels that this was a conscious effort by the nuns to prevent mothers and children from bonding. She said her baby was kept in a play pen all day and that had impeded his physical development. She said that the mothers were only given limited information about their babies.

20.155 She said that, while she was not afraid of physical abuse at Castlepollard, the nuns subjected her to emotional abuse. She said that she felt she was not able to complain of her treatment as the nuns would not have listened. She said that this contributed to ‘the culture of fear’ in the institution.

20.156 She said that living conditions in Castlepollard were ‘basic’ and that the nuns enjoyed a ‘better lifestyle’. Women had little freedom and there were no opportunities for recreation, education and exercise. The nuns read all her incoming and outgoing letters and this prevented her from forming meaningful relationships with anyone outside Castlepollard:

> It was very lonely and depressing living in Castlepollard. I felt that I was locked away for all that time, despite the fact that I had not committed a crime.

20.157 She said that she signed documents relating to her baby’s adoption under duress. She said that she was never informed of her rights and was not offered any advice. She said that the nuns reduced the amount of time that she got to spend with her baby after signing the adoption papers. She felt that this was to reduce any chance of bonding. Her baby was adopted by an American couple when three months old:

> The night before [my baby’s] adoption, I was given clothes to dress him in and the nuns had given him a teddy bear and a prayer book. The next morning, I woke up early to bathe and dress him. As I was trying to say goodbye, a nun entered the room and removed him from my arms stating that he had to go now…I later learned that he was taken to Shannon airport with a nurse and flew to America.

20.158 She said that she subsequently learned that the adoptive parents handed money over to the nuns at Castlepollard and that ‘payments continued for a number of years’.34

---

34 The witness did not provide any evidence to substantiate this statement.
I was never informed of this fact by the nuns and I was shocked by the reality. I felt as if my son had been sold.

20.159 She remained in Castlepollard for a month after her baby was adopted.

**Resident H, Mother, late 1960s**

20.160 Resident H became pregnant, aged 20, as a result of rape. She subsequently contacted the man who promised to support her but then disappeared. She then went to see this man’s parish priest and told him her story. She said that the priest sexually assaulted her in his car. Her parish priest arranged for her to be admitted to Castlepollard. She said that going to Castlepollard was initially a relief for her as she was having so much trouble at home. She was given a ‘house name’ and ‘a big floral smock’ to wear. Her days in Castlepollard were ‘long and boring’ and the women were not allowed to speak to each other. She said that the medical officer examined her every week:

I hated him; he was so rough with really big hands. He used to examine me internally from the back passage and I was sore for ages after. I went into labour … and was still there two days later. I was given nothing to eat in case I was sick…Eventually, [three days later] I was put in the main labour ward and they sent for [the medical officer]. He had a face like thunder as he was so annoyed that he had to come in. He and Sister Aiden put me to sleep and I had to have a forceps delivery. He woke me up and stitched me in cold blood with not even a local anaesthetic. I will never forget the pain. I later found out that he had cut right through my rectum and I had six stitches. I couldn’t go to the toilet properly for years after that.

20.161 She said that she was unable to walk after her labour as ‘they had damaged a nerve in my right leg’. She said that no one was allowed to breastfeed in Castlepollard and that women had to express their milk and feed their babies with a spoon:

I really wanted to feed my baby myself but instead I couldn’t see her. The other girls kept saying how beautiful she was. I wasn’t allowed out of the bed and didn’t see her until after Christmas. All the time I was expressing, and she was being fed off a spoon. I had engorged breasts with milk lumps in my shoulders and upper arms. I was in so much pain… I was in agony… They wrapped me in tight bandages to relieve me…I was forced to stay in bed for 21 days.
20.162 She said that when she held her baby for the first time, she was determined to keep her. She was sent to work in the laundry when her baby was six weeks old:

It was a horrible place and the smell hit you each morning. Filthy nappies and sanitary towels called ‘rabbits’ were washed in huge washing machines. We could only see the babies at feeding time when you expressed your milk and fed them with a spoon. All the time we were feeding we had to recite the rosary out loud and so couldn’t talk to our babies. Once they were fed, we changed their nappies and went back to work.

20.163 Her foster mother told her that she could bring her baby home and keep her. The witness ‘jumped at the idea’ as she did not want to put her baby up for adoption. She said that the nuns did not approve of the move as she did not have the means to support herself and her child. Life with her foster mother was difficult and she struggled with being a first time mother. She said that she used to get ‘incredibly upset’ and had no one to turn to for help or advice. After six months, she and her baby were re-admitted to Castlepollard. She said that the nuns were very persuasive, and she agreed to put her baby up for adoption. She realised that she could not work and look after her baby at the same time and realised that she had very little to offer her baby:

The nuns painted a wonderful picture of the life she would have in the USA and how could I deny her that…I don’t know where I got the strength to make the decision as they suggested but I did so and I agreed to return to Castlepollard…I dreaded going back there and I didn’t know how I would be received.

20.164 She said that she and her baby were put in isolation for two weeks and were brought food by one of the women. When they were released from isolation she saw her baby only for short periods each day and although she never saw any evidence of it, she wondered if her baby was given ‘any injections’.

20.165 She said that she worked in the front hall of the home during this period. On one occasion she was physically attacked by one of the nuns which left her with ‘scratches on her arms and covered in flour’. This nun also verbally abused her and told her that all she was good for was ‘lying under men’. Another nun asked her not to tell the Reverend Mother about this:

Living in Castlepollard was like living in a prison. I couldn’t leave while I was there but, even if I could have done, I had nowhere to go…We had to work all
the time…There was the odd argument or fight when one of the girls didn’t follow the rules but I didn’t get involved in any of that and tried to stay out of trouble. A lot of it I don’t remember.

20.166 The witness said that the women lived in the convent. There was no heating, although she was allowed a hot water bottle, and the building was freezing in the winter. She slept in a ten-bed dormitory and was allowed to bathe once a week for 20 minutes. She said that ‘there was no medical care or attention, not even an aspirin’. She described the food in Castlepollard as ‘adequate’ with porridge for breakfast; soup and bread for lunch; and stew with vegetables followed by pudding for dinner. She did not know if the nuns ate the same food as the women. There were no opportunities for education at Castlepollard but they had recreation time for an hour every evening when they watched television.

20.167 Her child was adopted by an American couple when she was two years old. She was then free to leave Castlepollard but had nowhere to go. She contacted her birth mother who arranged for her to live with her aunt in the UK. She was subsequently contacted by her daughter and that they now have a wonderful relationship.

**Children born in Castlepollard in the 1960s**

20.168 Seven people born in Castlepollard provided affidavits. They had no recollection of their time there. One described his time in an industrial school. A number described their experiences of adoption.

20.169 Some provided anecdotal evidence about their mothers’ experiences. One man who was born in the mid-1960s said that his mother told him that the treatment was terrible and inhumane:

She said she was made feel like a criminal for having a baby and was constantly made to feel guilty…She said she would never be able to publicly acknowledge my existence because of the shame she felt and she was terrified that anyone would ever find out about it…My birth mother said that she did not suffer any beatings at the hands of the nuns, but she spent the majority of the day on her hands and knees scrubbing stone floors. She told me it was a very emotionally traumatic time and that it impacted her mental health severely.
Evidence of former staff heard before the Commission of Investigation

**Sister Sheila Buckley, Castlepollard, 1968-71.**

20.170 Sister Sheila told the Commission that she worked as a midwife in Castlepollard from 1968 to 1971. Two other midwives assisted her. Dr Cullen, an obstetrician, was medical officer to the home at that time. He visited every Tuesday to examine the women living there. He did not attend at normal deliveries but did so if there was a complication, if there was foetal distress or if the mother was unable to deliver. Sister Rosemonde was Mother Superior at Castlepollard during her time there.

20.171 The nearest maternity hospital to Castlepollard was the Coombe Hospital, Dublin, which was a two hour drive away. The home did not have an ambulance to transport emergency cases. She said that there was ‘great cooperation’ between Castlepollard and the Coombe who were always willing to take women from Castlepollard when necessary. Sister Sheila stated that societal attitudes to single motherhood were changing at that time:

> They were inclined to go more into the hospitals to have their babies and then they would be transferred from the hospital to us until such time as the mother made up her mind whether she wanted the adoption or whether she would keep the baby, so they were given that time.

20.172 Sister Sheila said that it was still policy that women would take a ‘house name’ in Castlepollard in the late 1960s:

> Well the girls were offered this name and they all wanted to take names when they came in and it was just because of confidentiality really, you know. If anybody didn't know that they were there and they rang up phoning, well if they didn't know the house name you knew you could decline and not always give out the information.

20.173 Sister Sheila stated that the maternity hospital at Castlepollard was a modern well-equipped unit and that it was ‘quite a nice place to work’. With regard to the general atmosphere in the institution she stated:
It was quite pleasant. There was the odd disagreement I suppose between them but that's always, they were all right the next day, an odd grumble here and there.

20.174 Sister Sheila stated that Sister Rosemonde interviewed every woman on her admission to the maternity hospital at Castlepollard. She stated that the purpose of the interviews was to find out who they were, whether they intended to keep their babies and to ascertain if any family members were aware that they were in the home.

20.175 She said that there were typically ten to twelve babies to be cared for in the neonatal nursery at any one time. She and a nurse looked after the babies and were helped by some of the young mothers waiting to have their babies. She said that it was a popular job for some of the women. She said that mothers went to the nursery to feed their own children. With regard to breastfeeding, Sister Sheila stated:

Well they would feed if they wanted to but very few of them did want to breastfeed so they used to express the milk and then that was boiled and given to the..., put in the bottles and given to the babies...some of them went home a bit early, you know, if they didn't make a decision about the baby and they wanted the time to think, they didn't want to be breastfeeding and then going home. So, it was to keep their breasts from getting engorged and all that kind of thing.

20.176 Sister Sheila explained that if a woman was undecided on whether to put her child up for adoption, she would leave the baby in Castlepollard while making her decision. She said that, while some may have decided to take the baby home, most women were advised by their families to have their babies adopted. She said that adoptions from Castlepollard were managed by Fr Regan of St Clare’s Adoption Society, Stamullen, in conjunction with Sister Rosemonde. Sister Sheila said that she sometimes brought infants from Castlepollard to Bessborough to be adopted through the Sacred Heart Adoption Society. She stated that on some occasions, but not always, foster parents waiting at Bessborough would give her a donation of £10 to be given to Sister Rosemonde:

If I took a baby to the parlour and if somebody would put a note in my hand, that's the only thing that I am aware of a donation. They might say, to help
you with the petrol, Sister, or something they might say, something like that, you know.

20.177 Sister Sheila said that no infant deaths occurred in her nursery during her time at Castlepollard. However, she said that infants who died in the home were buried in an onsite burial ground. She moved to Bessborough when Castlepollard closed in 1971.
Chapter 20 A: Castlepollard Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

![Graph showing Castlepollard Total Mothers Admitted per Year](image-url)
The Castlepollard institutional records show that 4,972 women were admitted to the home in the years 1935-71. Information relating to date of admission was available for 4,961 women (99.8% of admissions). On opening, Castlepollard had accommodation for 37 women. However, in its first full year in operation 72 women were admitted. Throughout the 1930s admissions were routinely double the capacity of the home. In 1940, 132 women were admitted to the home causing acute overcrowding. Following DLGPH advice, Castlepollard closed to new admissions for much of 1941; 34 women were admitted that year. Admissions increased steadily during the remainder of the war years and peaked in 1946 when 194 women were admitted. From 1947 to 1957, 146 women on average were admitted annually. Admissions began to increase again from 1959 and peaked in 1970, the home's final year in operation, when 233 women were admitted.

Analysis by decade shows that most admissions to Castlepollard were recorded in the 1960s (34.2%) followed by the 1950s (27.8%); 1940s (26.5%); 1930s (6.7%) and the 1970s (4.7%).
Private patients accounted for around 10% of admissions to Castlepollard. Most private patients were admitted between 1948 and 1955. They accounted for one in four of admissions in 1948 and 1950.
Information relating to occupancy was available for 4,846 women (97.3% of admissions). The institutional records show that occupancy, in relation to the number of admissions, was relatively high throughout the 1930s and was higher than the number of admissions in 1938. High occupancy rates generally related to periods where women stayed for longer durations in the institution and correspond with periods of overcrowding as identified in the historical records. Increased admissions to the home in 1940 caused acute overcrowding to the extent that restricted admissions during 1941 did little to reduce the occupancy rate that year. Occupancy rates increased again in 1943 and remained relatively high until the mid-1950s. Although admissions began to increase significantly in the 1960s occupancy rates declined steadily. This mirrored trends in other mother and baby homes and reflected shorter stays because of the availability of legal adoption.
Occupancy comparison

A set of annual statistical returns sent by Castlepollard to the Department of Health for the years 1950-69 inclusive allowed for a comparison of occupancy rates notified by the Congregation of the Sacred Hearts against occupancy rates independently calculated by the Commission. Temporary absences from the home, such as cases where women were temporarily in another hospital, are excluded from the Commission’s calculations and may inflate the Commission’s numbers slightly. Notwithstanding this, it is clear that the occupation rates notified by Castlepollard are broadly in line with the Commission’s calculations.
Analysis by decade shows that there was little variation in average occupancy in Castlepollard in the 1940s and 1950s. A similar number of women were admitted to Castlepollard in both decades (1,317 in the 1940s and 1,381 in the 1950s) and average occupancy was 103 and 112 respectively. A significant change, however, can be identified in the 1960s. Although admissions increased significantly during the decade (1,697 women were admitted) average occupancy had decreased to 84. Although less admissions were recorded in the 1940s and 1950s a woman admitted to Castlepollard in that period could expect to be living with another 106 women on average. Although admissions increased in the 1960s a woman admitted in that decade could expect to be living with another 83 women on average.
Information relating to birth details was available for 4,913 women (98.8% of births and admissions). The institutional records show that 83% of women admitted to Castlepollard were admitted pregnant, gave birth and stayed; 7% were admitted pregnant, left before giving birth and did not return and 10% were admitted to the institution for the first time accompanied by their baby having given birth elsewhere. Of the women admitted pregnant, who gave birth and stayed, 92% gave birth in Castlepollard, 6% gave birth in the Coombe and 2% gave birth elsewhere.
Length of stay

Information relating to length of stay was available for 4,836 women (97.3% of admissions). Length of stay was longest for women admitted during 1938.\(^1\) Women admitted that year spent 456 days on average in the home: one woman spent just eight days in the home while others remained there for over three years. Average length of stay decreased gradually until 1946 but increased significantly for women admitted in 1947. In the period 1947 to 1959 length of stay remained relatively high at 304 days on average. Length of stay decreased dramatically during the 1960s and for women admitted in 1970, the home's last full year in operation, women spent 103 days on average in the home.

Analysis by decade shows that the average length of stay in Castlepollard was highest during the 1930s. Although the average length of stay decreased somewhat in the 1940s there was no great reduction until the 1960s. A woman admitted to Castlepollard in the 1960s could expect to spent around half as long in the home as a woman admitted in the 1940s.

---

\(^1\) 1935 is discounted here as it was not a full year.
Comparative analysis of average length of stay between public and private patients shows that while private patients spent slightly less time in the institution in the 1930s, they spent significantly less time there from the 1940s through to the 1970s. For instance, in the 1940s the average stay for a private patient was 40 days; approximately one eighth of the 310 days on average which public patients spent in the home. Although this margin reduced somewhat in the 1960s and 1970s public patients remained in Castlepollard around three times longer than their private counterparts in those decades.
Analysis of length of stay in the institution after giving birth shows that, in the 1930s, 24.4% of women left Castlepollard within 50 days of giving birth and 53.2% left within six months of giving birth. However, 24.7% of women, or one in four remained in the home for over 700 days. In the 1940s, 39.3% of women left within 50 days of giving birth and over 60% left within six months. The number of women who spent over two years in the home had decreased slightly to 22%. By the 1960s, 37.4% of women had left the home within 50 days of giving birth and over 83% had left within six months. The number of women who spent over two years in the home had decreased dramatically to 2.6%. By the 1970s, almost 53% of women left within 50 days of giving birth and 97% had left within six months. By this time only a small number of women spent over six months in the home.
Information relating to age on admission was available for 4,936 women (99.3% of admissions). Age on admission ranged from 12 to 45 years. The average age on admission was 22 years and the mode of age was 20 years. 79% of women were aged between 18 and 29 years on admission; 8% were 30 years or over and 13% were under 18 years. Around 5.6% of all admissions were aged between 12 and 16 years.
Address prior to admission

Information relating to address prior to admission was available for 4,929 women (99% of admissions). The institutional records show that all 32 counties featured as an address prior to admission. Westmeath was the most cited address and accounted for 11.26% of admissions. Over 36% of women were recorded as having a previous address in either Westmeath, Meath, Cavan or Offaly.
Previous pregnancy
Information relating to previous pregnancies was available for 179 women (3.6% of admissions). The Commission considered this sample too small to enable it to draw any conclusions.

Occupations
Information relating to occupation was available for 172 women (3.5% of admissions). Again, this sample too small from which to draw any conclusions.

Referral pathways
Information relating to referral pathways was available for 91 women (1.8% of admissions). The Commission considered this sample too small from which to draw any conclusions.
Exit to place

Information relating to exit to place was available for 2,237 women (45% of admissions). The institutional records show that over 75% of women left Castlepollard and returned to the family home or other private address; 12.78% left to take up employment; 8.54% transferred to hospital; 0.89% were placed in employment in a Congregation of the Sacred Hearts run institution; 0.8% transferred to one of the other institutions under the Commission’s remit; 0.36% were discharged to a convent, nun or priest; 0.36% to a Magdalen Laundry; 0.3% transferred to private mother and baby homes and small numbers were discharged to social workers, nurses and doctors. One woman ‘absconded’ without her baby. These exit pathways altered very little from the 1930s to the 1970s. All transfers to Magdalen Laundries were recorded between 1936 and 1950.

Annual statistical returns furnished by Castlepollard to the Department of Health for the years 1951-69 inclusive confirm trends relating to exit pathways established by the Commission’s analysis of the institutional records. The annual returns show that, in this period, most women were discharged to the family home (64%) or directly to employment.
In the 1950s, 30% of women were discharged directly to employment; by the 1960s close to 50% of women were discharged via this route. The annual returns also show that 2% of women left the home to marry in this period and 1% were transferred to unnamed institutions.

Maternal mortality

Through the institutional records, the Commission identified nine deaths among women admitted to Castlepollard: representing a mortality rate of 0.18%. All but one death occurred in Castlepollard. One death was not associated with pregnancy or childbirth and was due to tubercular meningitis. Three deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy - all three were notified as syncope. Five deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were mainly due to puerperal septicaemia/sepsis, eclampsia and atrophy of the liver. Adhering to WHO guidelines the maternal mortality rate in Castlepollard was 0.16%.

Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. [https://www.who.int/healthinfo/statistics/indmaternalmortality/en/](https://www.who.int/healthinfo/statistics/indmaternalmortality/en/)
Children: Admissions

The institutional records show that 4,559 children were admitted to Castlepollard. Information relating to date of admission was available for 4,550 children (99.8% of births/admissions). On opening in 1935, Castlepollard had capacity for 37 women and their children. However, from 1936-39 almost double that number were admitted each year. In 1940, 109 children were born/admitted to Castlepollard which led to acute overcrowding. Admissions were restricted during 1941, but increased steadily from 1942 and peaked in 1946 when 186 children were born/admitted. Child births and admissions remained relatively high in the period 1947-63 when 129 births/admissions on average were recorded annually. Births and Admissions increased substantially in 1964 and remained high throughout the 1960s. In 1970, the last full year of Castlepollard's operation, 214 children were born in or admitted to the home.
Analysis by decade shows that most births/admissions to Castlepollard (34.4%) were recorded in the 1960s followed by 27.5% in the 1950s and 26% in the 1940s. Numbers recorded in the years 1935-39 accounted for 7.2% of all births/admissions and 4.9% were recorded in 1970-71.

Information relating to accompanied/unaccompanied children on entry was available for 4,477 children (98.2% of admissions). The institutional records show that 99.4% were admitted accompanied by their mother and 0.6% were admitted unaccompanied. Three children were admitted as accompanying siblings.
Information relating to child occupancy in Castlepollard was available for 4,335 children (95.1% of admissions). From 1935 to 1940 average occupancy increased in line with increased admissions. In 1941, average occupancy was substantially higher than average admissions and was most likely caused by the temporary restriction on admissions that year. However, in the years 1947-50 average occupancy was often higher or on par with average admissions. As was the case with other mother and baby homes, occupancy rates decreased in the 1960s as more women were opting for adoption.
Further analysis of occupancy rates in the late 1940s shows that child occupancy rates were greater than mothers’ occupancy rates from 1946-49. This suggests that, in those years, more women left Castlepollard without their babies. Conversely, from 1951 to 1970, mothers’ occupancy rates were substantially greater than child occupancy rates; the discrepancy was most pronounced in the mid to late 1960s. This suggests that women remained in Castlepollard for a period after their children had been discharged.
Analysis of child occupancy by decade shows that a child admitted to Castlepollard in the 1940s could expect to be living with another 98 children on average. Although child admissions had increased in the 1960s, a child admitted in that decade could expect to be living with another 56 children on average.
The Commission compared data relating to occupancy derived from institutional records with annual returns sent by Castlepollard to the Department of Health for the years 1950-69. Temporary absences from the institution, such as instances where children were being treated in external hospitals, are not recorded in the Commission’s occupancy numbers. No date of admission and/or discharge was available for 4.9% of children and these were excluded from the Commission's calculations. These factors caused the Commission’s calculations to fluctuate slightly. Notwithstanding this, the Commission is satisfied that the occupancy rates forwarded by Castlepollard to the Department of Health were broadly in line with rates which the Commissions independently arrived at.
Information relating to length of stay was available for 4,335 children (95.1% of admissions) The institutional records show that children stayed in Castlepollard longest in the 1930s when the average stay was 369 days. This decreased steadily to 353 days in the 1940s; 266 days in the 1950s; to 122 days in the 1960s and to 51 days in the 1970s. Children admitted to Castlepollard in the 1930s spent three times longer in the home than those admitted in the 1960s and seven times longer than those admitted in the 1970s.
Comparative analysis of public and private patients shows that children born to private patients experienced significantly shorter stays in Castlepollard than their public counterparts. In the 1930s, the discrepancy was around 20%. However, in the 1940s and 1950s the discrepancy had increased to around 90%. Although the gap reduced significantly in the 1960s a public patient still spent around four times longer in the home. The gap reduced further in 1970, but public patients still spent over twice as long in the home as their private counterparts.
Information on child discharge relative to the mother was available for 4,072 children (89.3% of admissions). The institutional records show that 58.7% of children discharged from Castlepollard left the home on the same day as their mother; 32.2% were discharged while their mothers remained in the home and 9.1% were discharged after their mothers had left the home.
Child exit pathways

Information relating to exit pathways was available for 2,892 children (63.43% of admissions). The institutional records show that legal adoption (49.65%) was the most frequent exit pathway for children; 23.55% went home with their mother; 9.09% transferred to another institution; 4.67% were nursed out; 4.05% were boarded out and 1.3% were informally adopted (pre 1953).

Annual statistical returns furnished by Castlepollard to the Department of Health for the years 1951-69 inclusive show that the main child exit pathways from Castlepollard during this period were with the mother, through adoption, placement with an adoption society with a view to adoption and through local authority boarding out schemes. In 1951 around 1 in 3 children were discharged from Castlepollard with their mothers; by 1969 around 1 in 6 were discharged in this manner. In 1961 a noticeable increase in the number of children discharged to the care of an adoption society can be observed. While the statistical returns record such children under the heading ‘Placed at nurse through a Society’ in these cases ‘at nurse’ refers to temporary foster arrangements while the child awaited placement for adoption. Similarly, in 1964 there is a discernible increase in the number of children placed for adoption directly from Castlepollard. By 1969 almost 80% of children discharged from
Castlepollard were adopted directly from the home or through an adoption society. In 1951 around 1 in 5 children were discharged under a local authority boarding out scheme. As legal adoption became a more frequent exit pathway the number of children placed in boarding out schemes fell dramatically and by 1969 just two children were discharged from Castlepollard in this manner. During this period around 3.5% of children were discharged from Castlepollard to other unidentified institutions. These discharges are likely to relate to children who were transferred to specialist hospitals, or to the placement of older children in industrial schools. However, the records show that seven discharges to ‘other institutions’ notified in 1967 and 1968 were transfers to Nazareth Home, Fahan, Co. Donegal.

**Foreign adoptions**

The institutional and official external records show that 435 children admitted to or associated with Castlepollard were placed for foreign adoption. The Commission identified passport office records for 314 of these children. Most foreign adoptions (84.36%) relate to children adopted in the USA; 8.27% in Great Britain and 6.6% in Northern Ireland. Three children were adopted in the Philippines, Guernsey and Singapore respectively.
Child deaths

The Commission established 247 deaths among children associated with Castlepollard. Information relating to date of death was available for 246 children (99.6% of deaths). The Commission identified death records relating to 230 children which are held by the GRO. Most infant and child deaths in Castlepollard (67.5%) were recorded between 1935 and 1947 and peaked in 1940 when 34 deaths were notified. Infant and child mortality was also high in the years 1944-47; 80 deaths were recorded in that period. The number of deaths fell from 24 in 1947 to five in 1948, and apart from a slight spike in 1950 (10 deaths were recorded that year) mortality remained relatively low for the remaining years of the home’s operation.

Analysis by decade shows that most infant and child deaths (60.2%) were recorded in the 1940s; 21.1% in the 1950s; 11.4% in the 1930s; 6.1% in the 1960s and 1.2% in the 1970s. The institutional records show that in 93% of cases the child’s mother was resident in Castlepollard at the time of the child’s death. The remaining 7% died unaccompanied by their mothers.
Although children born to private patients accounted for around 10% of admissions, they accounted for just 3.7% of infant and child deaths; 96.3% of deaths occurred among children born to public patients.
Information relating to place of death was available for 247 infants and children (100% of deaths). Most deaths (89.5%) occurred in Castlepollard/St Peter's Hospital; 8.9% occurred following transfer to other hospitals. One death was recorded in St Kevin's Hospital, a county home, a children's home and a private mother and baby home respectively.
Most deaths (96.15%) occurred among infants as follows: perinatal: 0-7 days (19.23%); neonatal: 8-28 days (19.23%) and infancy: 29-365 days (57.69%). The remaining 3.85% of deaths occurred among children aged between one and three years old.
Cause of death

Information relating to cause of death was available for 230 children (93.1% of deaths). The most frequently notified cause of death (26.1%) was congenital debility and prematurity; 22.2% were notified as respiratory infections - mainly bronchopneumonia; 13% as gastroenteritis and gastritis; 9.1% as whooping cough and one off causes; 6.9% as congenital heart disease; 6.5% as haemorrhage - mainly cerebral haemorrhage; 5.2% as malabsorption - mainly marasmus; 3% as influenza; 2.2% as convulsions; 1.7% as meningitis or encephalitis; 1.7% as spina bifida; 0.9% as generalised infections; 0.9% as tuberculosis and 0.4% as congenital syphilis.
Infant mortality rates in Castlepollard were by far the lowest recorded across all three homes run by the Congregation of the Sacred Hearts of Jesus and Mary. Infant mortality peaked in the home in 1940 when a rate of 26% was recorded. This was approximately half the peak mortality rate recorded in Sean Ross (50%) and approximately one third of the peak infant mortality rate recorded in Bessborough (75%).

In its first full year in operation, 1936, Castlepollard recorded an infant mortality rate of 17.65%. Unusually for an institution of this type, infant mortality decreased dramatically to just 1.52% in 1937 and remained relatively low at 6.25% in 1938. In the years 1939-41, Castlepollard experienced acute overcrowding. Infant mortality increased to 26% in 1940 and remained relatively high at 25.58% in 1941. However, following restrictions on admission to the home in 1941 and an easing of overcrowded living conditions infant mortality decreased to 5.56% in 1942. The infant mortality rate remained relatively steady in the years 1943-47 when an annual average of 12.5% pertained. From 1948 to its closure in 1971, infant mortality rates in Castlepollard remained relatively low; it was above 5% on just two occasions (6.2% in 1950 and 5.3% in 1951) and remained below 1% most years after 1960.

Infant mortality rate is calculated as follows: Living infants born in a given year who died before the age of 1 year as a percentage of all infants born in the same year.
Chapter 21: Regina Coeli

Introduction

21.1 Regina Coeli was not a conventional mother and baby home. The Regina Coeli Hostel opened on 5 October (Rosary Sunday) 1930. It was run by the Legion of Mary, a lay Catholic organisation, founded in 1921 by Frank Duff, who was a senior civil servant in the Department of Finance. A report covering the first nineteen months from 5 October 1930 to 11 May 1932 indicated that it catered for two distinct categories:

- Unmarried mothers and
- General, which the report subdivided into ‘young and elderly and good, bad, indifferent, criminal, proselytized and Protestant’.¹

21.2 This hostel admitted homeless women, separated women, alcoholics, women with mental health problems and other destitute women; some returned on many occasions. This Commission is concerned only with the unmarried mothers and other women who entered the hostel with their children. Regina Coeli provided both short-term and long-term accommodation for many pregnant single women and for mothers and children. A total of 5,631 women and 5,434 children who come within the Commission’s Terms of Reference were in Regina Coeli between 1930 and 1998, (the end date for the Commission’s investigation). Regina Coeli was the only institution in Ireland prior to the 1970s that supported unmarried mothers who wished to raise their child(ren). It offers insights into an alternative to the other mother and baby homes. Unlike the other institutions that have been examined by the Commission, Regina Coeli never received direct state support for maintaining mothers and children.

Sources

Institutional records

21.3 The records of women admitted to Regina Coeli are held by the Legion of Mary. They consist of entry cards that are filed alphabetically. Records of the mothers and children that come within the Commission’s Terms of Reference are therefore mixed with the records of other women who entered Regina Coeli. This meant that the relevant records had to be extracted manually. The Legion of Mary facilitated

¹The Regina Coeli Hostel, Report 5 October 1930-11 May 1932; Dublin Diocesan Archives/AB7/b/Lay organisations.
the Commission's staff who photocopied all the cards on site. The Commission then identified and recorded all pregnant single women and unmarried mothers; separated and widowed pregnant women and women in these categories who entered the hostel with one or more children. Married women with an extra-marital pregnancy or an extra-marital child are also included.

21.4 These cards record the woman's name, address and date of admission, and departure, her age, marital status, name and address of near relatives, and where she was living before she came to Regina Coeli. Other information recorded includes whether she was working and, if so, the name of her employer. Many women were working as domestic servants and in these cases the name and address of the employer is recorded. If the woman had been referred to Regina Coeli, the name of the person, oftentimes a priest or a voluntary organisation, is recorded. The cards also record when the woman was last at the sacraments and they include a question as to whether the woman has been confirmed (the sacrament of confirmation) but that is rarely recorded. The woman's religion is recorded. The religion of the birth father, if known, is usually only recorded if he is not a Catholic.

21.5 It is also generally recorded whether a woman spent time in another institution, such as another institution being investigated by the Commission or an industrial school or orphanage; whether she had a previous pregnancy and where that baby was born.

21.6 The card was updated if the woman left the hostel and returned. Most details of daily life for residents that are given in this report are taken from these records. Some cards span decades and sometimes include an update about the child: adopted, fostered, or sent to an industrial school. If the child was boarded out or settled directly from the maternity hospital, the records often give details of the child’s birth taken from the register of births. Some cards include information about the mother or child that was recorded many years later. For example, the record of a woman who entered the hostel in 1939 contains an additional entry in 1966 to say that she had died. The record of a woman who entered the hostel in 1942 contains an entry from 1954 saying that she had lived in England but had returned to Ireland, had just got keys to a house and 'seems wonderfully happy and quite settled down'. Other cards record queries or contact made by children looking for information about their mothers.
21.7 Some cards record whether or not a woman had ‘confessed’ to the events leading to the pregnancy. They record whether the woman arrived pregnant or accompanied by her child or children, and whether she had other children who were not in the hostel. The cards use the term ‘second offender’. They generally record whether the woman’s family is aware of her pregnancy, and whether the woman is using an alias, rather than her own name.²

21.8 Information as to the ‘putative father’ is included in as much detail as was available; for example, an entry from 1933 states that ‘a T.D. is responsible for her trouble. She had been going to Leinster House and creating scenes there, trying to see him’. She had been sent to Regina Coeli ‘by the porter from Leinster House’ The cards often record cases where a pregnancy resulted from rape or incest, though these words are generally not used; rather reference is made to the putative father being a family member or the woman having been ‘assaulted’. Whether or not the father of the child was supportive and whether he acknowledged the pregnancy or child was also recorded, if known.

21.9 The cards sometimes also give background information about the new resident, including physical descriptions and comments on her presentation, her background or general demeanour. They often record an initial observation: ‘seems like a good girl’; ‘seems very untruthful’; ‘very indifferent about everything’, ‘is a strange person’, ‘seems wanting in sense’. The health of the mothers and babies is noted, including references to any hospital stays by the mothers or babies while in Regina Coeli and the name of the hospital. There are references to mothers undergoing tests at the Lock Hospital - the hospital that treated sexual diseases - and the outcome of these tests is recorded: whether she has ‘the all clear’ or needs treatment.

21.10 Comments are also recorded about the woman’s prospects of marriage. One card stated that the putative father would be willing to marry the woman if she produced a clear blood test result (free from venereal disease). The record on a woman who was admitted in 1951 states that ‘marriage [is] improbable’. A 1958 entry states that the woman ‘knew the man about a year - no question of marriage’.

² This only appears to have happened in very rare cases – fewer than ten.
21.11 The information on these cards was entered by a Legion of Mary voluntary worker. The Legion of Mary has told the Commission that at any time the hostel might have had 140 volunteers working on a weekly basis.\(^3\) ‘Different volunteers wrote up the cards at different times’. These case records provide an unrivalled source of information about unmarried mothers and children. Because of their unique nature, they are quoted extensively in this report.

Other Sources

21.12 The mothers and children in Regina Coeli were not maintained by central or local government. Some limited evidence relating to Regina Coeli exists in a number of Department of Local Government and Public Health (DLGPH) and later Department of Health files that are available in the National Archives; the most important of these are HLTH M 60, and H10/70/1. Regina Coeli is mentioned intermittently in the Clandillon Papers, which were supplied by the Department of Health to the Commission. These papers include records of pregnant women who contacted the Custom House (the headquarters of the Department of Health) seeking assistance during the 1940s and 1950s; many of these women had been sent back from Britain. (These women are discussed in Chapter 7). The other files relating to Regina Coeli in the various Department of Health discoveries were concerned with the threatened closure and reconstruction of the hostel - these contain extensive details of costs and architectural plans, but very limited information about life in the hostel. There is also some information about Regina Coeli in the files of the Dublin Diocesan Archives.

Origins

21.13 The hostel opened in North Great Brunswick Street, in part of the former North Dublin Union, next door to the Morning Star hostel for homeless men, also run by the Legion of Mary, that opened in 1927. In 1918 the North and South Dublin Unions merged to become the Dublin Union. Thereafter all in-house admissions were to the former South Dublin Union (in James's Street). The former North Dublin Union was occupied by the British military authorities during the war of independence, but by the mid-1920s it was vacant. When Dublin Corporation was dissolved in 1924, local administration was controlled by three government-appointed commissioners. They offered the former North Dublin Union buildings to

\(^3\) A member of the Legion of Mary is sometimes described as a ‘legionary’ and the female members are sometimes described as ‘Sisters’. As far as possible, the Commission is using the term ‘member of the Legion of Mary’ but the other terms are frequently used in quotations.
the Catholic charity, the St. Vincent de Paul Society, for use as a hostel for homeless men, but the Archbishop of Dublin, Dr Byrne did not wish the SVP to undertake this work, and the premises were given to Frank Duff who was a personal friend of one commissioner, subject to certain conditions. A Department of Health file, dating from 1951/2 states that there were no records of the agreement to give these buildings to the Legion of Mary; the arrangement was purely informal and the buildings were apparently taken over piecemeal by the Legion as the need arose. Although the Dublin Board of Assistance complained from time to time about “encroachment” by the Legion of Mary they took no positive action in the matter.

21.14 Planning for a women’s hostel began in 1929. There is no indication that Regina Coeli was originally planned as a mother and baby home. In a long memorandum written in 1950, Frank Duff stated that

Primarily it was the derelict type of woman that was in view, but from the very first moment the unmarried mother presented herself for admission and was accepted in her capacity of destitute. They did not admit ‘girls possessing means’ because it was believed that they could make other arrangements. Finola Kennedy notes that, shortly after Regina Coeli opened, a pregnant woman applied for admission, and this resulted in ‘the inauguration of the “Mater Dei” aspect of the hostel, a type of hostel specifically organised on the basis of units for mothers and children’. By Christmas 1930, less than two months after the hostel had opened, women from Regina Coeli were giving birth in the Coombe Hospital. The August 1932 report gives the capacity of Regina Coeli as 78; it is unclear how this was divided between the two groups.

Religion

21.15 Regina Coeli was run by the Legion of Mary and their religious mission was central to its operation. In this respect Regina Coeli was similar to many rescue homes established in Britain and the United States by religious communities both Protestant and Catholic, who believed that spiritual and material rehabilitation were inextricably linked. In the 1932 report on Regina Coeli, Frank Duff emphasised that ‘Every entrant is made the subject of a special and individual attention,

---

5 Mother of God.
6 Kennedy, Frank Duff, p. 91
directed in the first place to the creation of moral fibre through the frequentation of the Sacraments’. Before Regina Coeli opened, he suggested that many of these women would have ‘enjoyed free lodging in a Protestant shelter, at the expense of attendance at Proselytising institutions’; the only option for destitute unmarried mothers from outside Dublin who fled to the city was to seek admittance to ‘the Protestant home’ - a reference to the Bethany Home. He claimed that most women who entered the hostel were ‘found to be neglecting the Sacraments’, and while ‘no pressure is brought to bear on them in the Hostel but an early return to regular practise is the unvariable [sic] result of some period of residence’. Between October 1930 and May 1932 he claimed that eight Protestants who had stayed in the hostel were received into the Catholic church.

21.16 Religion played an important role in the life of Regina Coeli. In the first 18 months two retreats7 were held in the hostel. There was a chapel/oratory, but it is unclear when it opened. A member of the Legion of Mary who worked in Regina Coeli said that

When our oratory opened then there would have been weekly mass, and occasionally mass during the week. But very few of our residents would attend it, they would always be welcome but no one was ever forced to attend.

21.17 Daily prayers were part of the routine, but she claimed that no one was obliged to take part.8 In 1942 Frank Duff wrote to Archbishop McQuaid, thanking him for the restoration of the Blessed Sacrament in the Regina Coeli and Morning Star Hostels,9 which seems to suggest that the hostels had that privilege at some earlier time, but then lost it. Retreats were held in Regina Coeli on 10-12 May and again on 13-15 December 1947. In 1948 Frank Duff thanked the Archbishop for granting the status of a semi-public oratory in Regina Coeli. Retreats appear to have been a regular feature of life in the hostel; there is reference to the regular Easter retreat. In 1961 and again in 1969 there is evidence that the hostel was granted permission to hold Easter religious ceremonies in the hostel.

21.18 The individual records of women in the hostel indicate that much emphasis was placed on confession, including a note of when a resident was last ‘at the

---

7 A period of intensive prayer and religious ceremonies lasting one or more days.  
9 Dublin Diocesan Archives/AB8/b/XXI/79/12/3.
sacraments’. Some cards record whether the woman had made a ‘good’ or ‘bad’ confession. All the children were baptised and subsequently consecrated to Our Lady and all the mothers were churched. At this time children were baptised within days of their birth, when the mothers were still in a maternity hospital; children baptised while resident in the home were baptised in St Paul’s Church, Arran Quay. The records of children who were long-term residents in the hostel give the dates of their first communion and confirmation.

The Women

Admission Pathways

21.19 A total of 5,631 women who come within the Commission’s terms of reference are recorded in the institution’s admission records. There are records of 5,434 children; 809 women were accompanied by more than one child. Of the 1,426 women who were in the hostel without a child, 999 left prior to birth; 222 left to give birth and did not return; 141 stayed in the hostel after the birth of a child, but without a child; 14 arrived after the birth and without a child and there is no information on 50 women.

21.20 In the 1932 report Regina Coeli claimed that the hostel assisted women who were in grave difficulties ‘for whom no alternative existed’. The only facilities for unmarried mothers in Dublin were the Dublin Union (which included Pelletstown, see Chapter 13) or Protestant homes. (St Patrick’s Guild operated a small maternity home, but it only accepted women who could pay). It was alleged that some women were reluctant ‘to face the Union’; furthermore the Union would only admit ‘Dublin girls’, which meant that for the ‘the large number of those flying from the country,’ the Protestant homes were the only option. Between October 1930 and May 1932, 101 women were admitted to Regina Coeli; 26 were described as ‘waiting mothers’ - pregnant; 45 gave birth after admission and 30 arrived with their baby. The outcomes for these mothers were: two went back to previous employment; 19 settled in indoor situations (live-in service); six settled in outdoor situations; 12 married; 23 returned home; 39 were in Regina Coeli or in the Coombe Hospital.

21.21 Women were referred to Regina Coeli by a variety of individuals and agencies. Some women were brought or referred by their employer, particularly those in

---

domestic employment. One woman met Frank Duff on the street and he brought her to the hostel. Another common referral pathway was through the almoner (social worker) of a Dublin hospital. In 1930 for example, ‘An unmarried mother with fifteen day old baby entered the hostel. B went to City of Dublin hospital (Baggot Street) on 17th April, 1931 and was referred to us. She tells me that the baby has been adopted by the Catholic Protection and Rescue Society’. Women and children were referred by inspectors of boarded out children. The almoners of the Dublin maternity hospitals referred women who had recently given birth and had nowhere to go. The records of two women, in 1944 and 1949, state that they were referred by the almoner in the Coombe Hospital and the almoner in Dr Steeven’s Hospital (a general hospital) respectively. Many women were referred by members of the Legion of Mary: a woman in 1945 was admitted following a phone call by a member in Sancta Maria; another woman was sent by a member in Raglan Road; other women were referred by priests.

21.22 Regina Coeli features regularly in the records of pregnant women who contacted the inspectors in the Department of Local Government and Public Health/Department of Health seeking assistance in the 1940s and 1950s. In the years 1944-48, 73 of the 680 women who contacted the department were sent to Regina Coeli and large numbers were referred to the hostel during the Emergency years, though it was often full and they had to be sent elsewhere. Many of these women had been returned from Britain while others came to Dublin from other parts of Ireland, often destitute and not knowing where to go. The department used Regina Coeli as short-term emergency accommodation while inspectors tried to secure the agreement of a local authority to pay for the woman’s maintenance in a mother and baby home and a place was being sought for her in one of those homes. Many of the 999 women who were in the hostel and left before giving birth went to mother and baby homes. The number of women referred by the Department of Health fell during the 1950s because arrangements with local authorities and with the mother and baby homes had become more streamlined, and there was less pressure on places.

21.23 Some women who could not afford to stay in a private nursing home came to Regina Coeli seeking accommodation. A woman in 1943: ‘Came to hostel pregnant nine months. Has been with [Nurse who ran a nursing home on Dublin’s North Circular Road], for past 3 weeks. Came here as she cannot afford to pay’. In a small number of cases the referral came from a politician as in the case of a
Some women wrote seeking admission, for example a woman in 1951 ‘Applied for permission by letter and was accepted’. A woman in 1953 ‘Was housekeeper to priest one month before entry. No mention of family at all. Is not in touch with father of baby’. A woman in 1958, ‘was living in a flat with children. Put two other children for adoption’. Regina Coeli tried to find her accommodation but was unsuccessful. A woman in 1975 was referred by her family. She was ‘separated from coloured man for some years’. A woman in 1983 had been ‘Deserted by husband who is an Algerian Muslim [sic]. Parents have disowned her’. A woman in 1970 was ‘Referred by two nuns. She had been here before making tentative inquiries. She was very anxious to keep the baby but refused the nuns’ request to take her home’. An interview with two voluntary members of staff from Regina Coeli, recorded in an academic thesis, described the referrals they received:

A lot of our, em...we didn't have any referrals as such but a lot of our girls would have been recommended by their priests. You know if they were in trouble they may have gone to their priest for assistance and they would have sent them over. The hospitals also recommended girls to come to us, but mostly it was word of mouth.\textsuperscript{11}

On occasion a mother would be referred to Regina Coeli whilst attempting to have her children returned from an industrial school. A separated woman who entered

\textsuperscript{11} Graham, \textit{Unmarried Mothers}
the hostel in 1956 with one of her two children, and pregnant with a third, had another child in Goldenbridge Industrial School. The record stated that ‘the Department of Education notified us about 21/1/1957 that [the child] would be sent here from Goldenbridge School on a supervision certificate - that is, we must notify the school authorities if [the mother] leaves here’. In 1952 a separated woman was ordered to stay in Regina Coeli for three weeks on probation from the court. The Commission is not aware of any statutory basis for this court order.

She remained for five years with her child.

**Circumstances of Pregnancy**

21.26 The institutional records usually contain some information about the circumstances of the woman’s pregnancy, such as whether she became pregnant by her boyfriend, through a casual sexual encounter, or as a result of rape. One entry from 1931 makes it clear that the woman in question was totally ignorant about sexual reproduction: ‘the father of the child is a man called [...] whom she knew for four months, frequent intercourse, never knew that it was that way children were brought into the world’. Most often it simply stated whether the putative father was her boy-friend; it sometimes recorded whether he was willing to marry her. In most cases, whilst the putative father was named, no further mention is made of him. Some records gave additional details. For example, a woman ‘Is five months pregnant, does not know who is responsible, has been carrying on with men since she was seventeen years of age but is adamant she never took any money from them’. Another woman in 1946: ‘Got pregnant while she was in the British Forces stationed in Palestine’. Some descriptions are colourful: a woman in 1941 ‘Came to hostel pregnant’. It notes that the father of her child ‘respected her all along ‘til one night they both took cocktails to which they were not accustomed with result - she does not remember the occurrence’.

**Rape**

21.27 The cards also recorded instances of possible rape or incest. Rape is often recorded as assault or an attack. A woman who entered Regina Coeli was employed at St Patrick’s Hospital (a psychiatric hospital). ‘She was assaulted on her way into the hospital. Reported the matter to the Guards’. A woman who was admitted in 1942 ‘was attacked while going for a message. Does not think she has any sin’. A woman, who was admitted in 1945 from the Coombe Hospital with her baby boy ‘States that a man assaulted her when returning home late one night’. 

The Commission is not aware of any statutory basis for this court order.
The record card on a woman in 1941 stated ‘Expecting a baby. Father - a neighbour - assaulted the girl when he was in drink’. A woman came to the hostel in 1955, four months pregnant. She did not know the identity of the father; she got a lift from him and was assaulted. In the case of another woman, ‘The man responsible is […], a neighbour who returned to England a few days after he assaulted her’. A woman admitted in 1950 ‘was working in a mental hospital and was assaulted by two men whom she knew when coming from work’. In relation to a woman in 1939, a doctor ‘called and said […] should take action against father of child when baby is born. He said […] was a very nice girl’. Any blood relationship between the mother and the putative father was recorded, for example, in the case of a woman admitted in 1951, ‘her uncle is responsible’.

Attempted Abortion

21.28 A number of women appear to have attempted to terminate their pregnancy. There are references to women drinking substances that were sent to them from England or going to doctors to have the baby removed. In 1943, a separated woman arrived at Regina Coeli; she was a domestic servant who had been assaulted by a lodger in the house where she worked. He sent her to a doctor in Merrion Square and she paid him £3 but his intervention failed to terminate the pregnancy. The report states that the doctor refused to take further action unless she paid him more money. A woman had a miscarriage in the hostel in 1943 and was removed to the Rotunda; she returned to Regina Coeli when she was discharged. Her records state that ‘Doctor had said it was a complete abortion. Suspected […] brought in drugs to […]’. The records of a woman who came to Regina Coeli in 1938 stated that the doctor had been called as a result of statement she made about taking a dose to destroy the baby. The doctor ordered her to bed and said he would call again. He also advised that the Gardaí be notified. A detective called to the hostel and took a statement. This statement was signed by the woman and a member of the hostel staff. The file on another woman who arrived in 1948 noted that ‘she has been taking stuff to settle her condition’.

Pregnant from Ireland

21.29 The hostel often provided short-term accommodation for women who were described as Pregnant from Ireland (PFIs). These were pregnant Irish women or new mothers who were sent back from England by local authorities or Catholic

---

13 This section should be read in conjunction with Chapter 7 which describes the wider story of PFI cases. The focus here is primarily on evidence from Regina Coeli records.
charities. This role reflected the fact that the Legion of Mary was very involved in welfare services for emigrants - speaking to young women who were taking the boat to England, and through that work Legionaries would have come into contact with pregnant women who were travelling to Britain. They were also in regular contact with English Catholic charities and members of the legion worked with Irish emigrants in Britain.

21.30 Regina Coeli’s involvement with PFI cases began shortly after the hostel opened. The report covering the years 1930-32 tells the story of a woman who was sent to Regina Coeli by Father Craven of the Crusade of Rescue, Westminster Archdiocese. The report claimed that ‘cases from England are not ordinarily taken, but Fr. Craven certified as to his conviction that mother and baby would not be saved if they stayed in England. She was indescribably hardened and had already disposed of her baby to Protestant hands’; after some months in Regina Coeli ‘she is frequenting the Sacraments, and manifests a great love for her child with which she vows she will never part’.

21.31 There are many references in admission records to women being returned to Ireland when it became evident that they were pregnant. A woman in 1935 ‘Went to England, arrived in Liverpool last Tuesday. Stayed in a Catholic hostel. Was met at the boat by Girls Protection Society who discovered her condition and warned her to return to Ireland at once. She arrived back in Dublin this morning’. Another woman, admitted in 1932, spent nine months in London and was ‘sent back pregnant last October’. In 1934 a woman was ‘Sent home by the CPS and met in Dublin by member of CPS who took her to the Union’.

21.32 Some women who planned to travel to England were stopped before they left Ireland. In a case in 1936:

Legion prevented her from going to Scotland with her two sisters, who had asked her to come over and made arrangements for her when they found out she was pregnant. Protestant Ladies Maid had asked [...] to tell her when baby was born she would take it and pay her compensation for having given it over.

15 Regina Coeli report October 1930-August 1932
16 Catholic Protection and Rescue Society of Ireland
21.33 The number of PFIs who were repatriated rose during the years of the Emergency, as English mother and baby homes and other welfare agencies came under increasing pressure; some had to relocate from the large cities. Despite an agreement that women would not be sent back to Ireland without advance notice, giving either a charity or the department inspectors the time to arrange for their maintenance in a mother and baby home, many women ended up in Dublin, with no arrangements for their future. Many of these women were given temporary accommodation in Regina Coeli but Miss Litster complained that after a few days in the hostel they were often ‘unwilling to go to an institution under the care of nuns’, because they preferred ‘a certain free and easy’ atmosphere in Regina Coeli, including permission to smoke.

21.34 Some of the cases below highlight the way in which women who went to England, either pregnant or who became pregnant in England, returned to Ireland.

21.35 In the case of a woman in 1958 there is no reference to her coming back from England but she was put on a train for Limerick with her baby, where she would be met, at the train, by Miss Harris of the London Welfare Office. Another woman in 1945 ‘was sent by Southwark CPRS’. A woman in 1953 ‘Came with baby aged 7 months born in England’. She had been transferred to the hospital from a home in Surrey and returned there for about six weeks after the birth with the baby. A doctor recommended that both should be sent to Ireland and the Southwark branch of the CPRS arranged for her repatriation. A woman who was three and a-half months pregnant when she went to England in 1935 ‘was met at the boat by the Girls Protection Society, who discovered her condition and warned her to return to Ireland at once’. One woman was returned from the United States in 1955 when it was discovered that she was pregnant. Her records state that she ‘was in America since she became pregnant. States Legionnaires there had her sent back. Had three more children while resident in the hostel’.

21.36 Some women returned from England because they were unable to work. A woman, five months pregnant, admitted in 1945, ‘arrived back from England last night with a letter addressed to Legion of Mary, Dun Laoghaire. Has all arrangements made by Welfare Association in Leeds to stay in England but

---

17 Information about Miss Harris can be found in Chapter 7.
18 This may be a reference to the International Catholic Girl’s Protection Society. For details see Jennifer Redmond, _Moving histories. Irish women’s emigration form independence to Republic_ (Liverpool University Press, 2018) pp 88-93.
Ministry of Labour insisted on her returning when she could not work’. A woman in 1932 went to a job in England but when she realised she was pregnant her employer sent her home. In the case of a woman, admitted in 1943, ‘the factory where she worked paid for her fare home and will take her back’. In 1944, a woman ‘arrived from Reading tonight and was brought by sisters [members of the Legion of Mary] from the Bureau, Westland Row’.19 ‘Was seven months in England. Was pregnant when she went and was deported’. Another woman, ‘a V.D case’ was deported from England in 1943. Another woman was sent to Regina Coeli as a ‘refugee’ from Leeds in 1941.

**Women who were admitted and those who were refused entry**

21.37 Regina Coeli did not distinguish between ‘first offenders’ and ‘second offenders’. A woman who entered the hostel in 1948 with her three-week-old baby ‘is a second offender. Had another baby three years previously in Castlepollard. Tried to gain admission to Castlepollard again; was refused, and the Rev Mother told her to come here’. A woman in 1944 ‘Came to the hostel eight months pregnant. Refused to go to Roscrea’ [Sean Ross]. In 1943 a woman ‘entered hostel nearly nine months pregnant. Was in Tuam Maternity Home for 5 weeks. Left there and is adamant that she would not return there’.

21.38 Regina Coeli refused to admit, or re-admit, women who were classified as a ‘street case’, that is, women who were, or had been, engaged in prostitution. They were generally referred to the Legion’s Sancta Maria Hostel.

21.39 Some women were described as ‘not the type for here’; one woman was sent to St Rita’s nursing home on Sandford Road (see Chapter 2). It is probable that she was not admitted to Regina Coeli because she had sufficient means to pay for accommodation in a private nursing home. A file on a woman who had been in Regina Coeli in 1949 records that she called in October 1954 seeking re-admission, ‘is in trouble again. Meeting decided not to accept her in view of the way she had placed last child after signing a statement about NSPCC’. Her child had been placed in an industrial school. ‘Meeting decided that she could not come here ‘til M. has been returned to her. Returned with children’.

---

19 The Emigrants Section of the Dublin Archdiocese’s Catholic Social Welfare Bureau was based at 18 Westland Row, opposite the railway station (now known as Pearse Station). This station was the terminus for trains from the west of Ireland and passengers taking the boat from Dun Laoghaire to Holyhead (a major route for people travelling to and from England) travelled by train from Westland Row to the boat. Members of the Bureau and the Legion of Mary, met and interviewed intending emigrants at the railway station, and on the train to Dun Laoghaire, Daly, *Slow failure*, pp 278-9.
Some women were refused admission because they were married or were known to have accommodation. A woman who first entered the hostel in 1941 with her baby subsequently married and returned with her husband, but was refused admission as they had accommodation. In 1984 a woman who arrived at the hostel with two of her children, including a son aged fourteen, was refused entry to the hostel as he was too old.

**Overlap with other scheduled institutions**

The Regina Coeli files record extensive references to other institutions which are being investigated by the Commission (scheduled institutions). Roughly 1% of the women admitted (a total of 72) gave a mother and baby home or the Dublin Union as their previous address. A woman who was admitted in 1944 had given birth to a baby in Pelletstown, went from there to Sancta Maria, who sent her to Regina Coeli. A woman admitted in 1957 had been in Castlepoddard. ‘She did not like Castlepoddard so left and came back to Dublin’. A woman in 1944 ‘came from Pelletstown for one night with baby and returned to Pelletstown the next day.’ Some women only stayed for one or two nights in Regina Coeli, while on the way to another institution. A woman returned from England in 1962 with her baby; her record noted: ‘is wavering about keeping the child, but with a bit of encouragement might.’ The CPRSI, (who had probably organised her return from England) arranged for her to be admitted to Pelletstown. In 1942 a woman went to Pelletstown from the hostel; another woman travelled by bus to Bessborough in 1946. She wrote shortly afterwards to Regina Coel asking to return with her baby but ‘was advised to stay there’. In 1945, a woman arrived in Dublin by bus and was admitted to Regina Coeli for one night before travelling to Castlepoddard. One common pathway was for women who came to Regina Coeli to go to the Dublin Union and from there to Pelletstown. A woman in 1943 was ‘anxious to go to Castlepoddard but cannot afford to pay’. A woman came with her baby in 1942 from the county home in Castleblayney.

Some women had spent time in industrial schools or other institutions. A woman who arrived in 1943 ‘Was eight years in Booterstown Convent - Sisters of Mercy and then two years in Sisters of Mercy Baggot St training for laundry work. Left Regina Coeli 24/9/1943. Returned on 30/8/1944 with baby born in Pelletstown. Went back to Pelletstown with baby on 31/8/1944’
21.43 The mother of a young woman who arrived in 1940 had died when she was only two weeks old. She spent two years with a nurse mother in Kent and was then transferred to a Barnardo’s Home in England where she remained until she was seventeen. She then went to an institution in Belfast, remaining for three months before being sent to the Bethany Home where she remained for three years. In 1937 she broke a window and was sent to the Dublin Union, where she remained until she came to Regina Coeli in 1940.

21.44 Some women who were refused entry to other institutions came to Regina Coeli. In 1946 a woman stated: ‘Tried for admission in several places today. Went to St Kevin’s but would not be taken in without a doctor’s note. Went to Pelletstown next day’. The record on a woman in 1943 states that ‘Dr […] sent her to Pelletstown today but she was refused admission and sent here.’ She left Regina Coeli to go to Bessborough after a stay of less than a month. In the same year a woman came to Regina Coeli from Holles Street Hospital after trying Basin Lane (a night refuge) and St Patrick’s Guild. A woman arrived in 1945 with her fourteen-month-old child who was born at a private address and baptised in the Roscommon county home. The record stated she ‘left Roscommon on 6/1/1945 with child to go to Summerhill Convent, Athlone. Baby could not be accepted by Sr. […] who said the child was deformed and would never walk. Came to Dublin. Went to Sisters of Charity and the Bureau (presumably the Catholic Social Welfare Bureau) and was sent here.’

21.45 Women also sought the services of Regina Coeli when they had tried and failed to get baby ‘settled’ or ‘fixed’ elsewhere. A woman in 1933: ‘Came from South Dublin Union- a cousin claimed her out this morning and took her to Eccles St (probably St Brigid’s orphanage) to see if she could get the baby fixed up, was refused there, tried Dunleary also refused. […] told her to come here if she failed to get her baby fixed’. A woman went to Regina Coeli in 1937 with her baby. She was recorded as having gone ‘to Henrietta St and St. Patrick’s Guild - neither would take her. Has no money.’

**Long stays and multiple entries**

21.46 A unique feature of Regina Coeli was the fact that many women entered the hostel on multiple occasions and others stayed, sometimes intermittently, over the course of many years. Some of these long-stay women gave birth to a number of children during their years in the hostel. Many women kept in contact with the staff in the
hostel after they had left and sometimes returned for a further stay (not pregnant). One woman, who entered the hostel in 1953 pregnant, wrote in 1970 seeking admission for herself, her husband and children. On more than one occasion women who subsequently married, informed the hostel of this and sent some wedding cake. These examples indicate the nature of the relationship between the residents and Regina Coeli.

21.47 A woman who arrived in 1954 stayed for nine years. Her daughter is recorded as being ‘placed’; she was sent to Booterstown Convent.²⁰ It seems that this girl returned to Regina Coeli for holidays. A woman who arrived in 1953 stayed for ten years with her two children. A woman who first entered in 1940 was resident intermittently for ten years. In 1950 it is recorded that she was pregnant; she left in 1961.

21.48 A woman, who came in 1955, gave birth to six children during the course of her fifteen-year stay. A woman, who is first recorded in 1943, stayed in Regina Coeli for 14 years and gave birth to three children during that time. Another woman stayed with her child in Regina Coeli for eight years from 1945. A woman was admitted in 1952 and left in 1966. A woman entered the hostel in 1957 pregnant. Her first child was born that year, a second was born in 1960 and a third in 1962. It would appear that they had been placed with a foster mother but retained a relationship with the hostel. There are references to them returning on occasional weekends. One of the children is recorded as pregnant and leaving the hostel in 1986 to live with the father of her child. A second child was reported to have given trouble in the hostel, and a meeting decided that she could no longer remain there. She was placed in High Park special section in May 1971.²¹

21.49 A woman spent fourteen years on and off in the hostel with her son, from 1946. Another woman also arrived in 1946 with her three-month old baby. The baby was placed in Cavan Industrial School in 1948. The woman was readmitted to Regina Coeli in 1965, brought by a member of the legion. A woman lived in the hostel intermittently over a period of twenty-six years, between 1939 and 1965. She married while resident there. A woman arrived pregnant in 1950 and gave birth that year. She died in 1963; her son left the hostel in 1965, having apparently been resident there for the first 15 years of his life. He was taken by a female

²⁰ This is probably a reference to St Anne’s Industrial School.
²¹ There was an industrial school and a Magdalen laundry at High Park.
member of the Legion of Mary and apprenticed to clock making. A pregnant
woman entered the hostel in October 1952; she returned with her son from the
maternity hospital and gave birth to a second child in 1958 while living in the
hostel. Mother and children moved to accommodation in the north inner city in
1969; she had spent 17 years in Regina Coeli.

21.50 A woman arrived in 1952, seven months pregnant. She gave birth to a boy in the
Rotunda and returned to Regina Coeli with her infant. Her eldest child was
brought to Regina Coeli to join her. She gave birth to additional children in 1954,
1957, 1960 and 1962. There is evidence that she gave birth to another child, but
no date is recorded. Mother and children moved to a flat in the Liberties, 18 years
after coming to Regina Coeli.

21.51 A separated woman with a son, who was boarded out, entered the hostel
pregnant. A daughter was born in 1955. She gave birth to four additional children
between then and 1969. The family moved to a house in 1978, 23 years after she
had entered the hostel. A woman arrived in 1931 pregnant and gave birth to a
child; she gave birth to twins in 1941. She entered and left the hostel on many
occasions; she was last admitted in 1952, 21 years after her first stay in Regina
Coeli. Another woman arrived in 1940 with a two-week-old baby. She remained
there for 28 years, leaving occasionally and returning.

21.52 Another distinct feature of the Regina Coeli hostel was the fact that many residents
maintained contact following their departure. A woman who came to the hostel in
1943 with her child, who was almost three years old, left to go to a room in the
south inner city but returned occasionally, as she ‘finds the room lonely’. When
former volunteer workers were asked about women who returned to the hostel,
they replied that ‘that has always been a feature and still is a feature’.  

21.53 A woman entered the hostel for the second time in 1941 with her twelve-month-old
baby who was born in Pelletstown. She had been a ‘nurse child’ and had been in
the Dublin Union for six weeks. The records indicate that she left the hostel and
returned with four children in November 1950, leaving and returning again with
another child in 1952; another child joined her from hospital the following year.

---

22 Graham, ‘Unmarried mothers’,
A woman entered the hostel in 1948 with a one-year-old child; she gave birth to a baby over a year later. In 1951 she suffered a serious stroke and was described as unsuitable to undertake the care of the children. Her son remained in the hostel until approximately 1963; her daughter remained until she married in the late 1960s.

**Regina Coeli and Protestant institutions**

The records of mothers who were in Regina Coeli often express a fear that she would bring her child to the Bethany Home\(^23\), or that she would give her child to a Protestant social worker or a Protestant foster mother. They describe attempts by members of the Legion of Mary to ‘rescue’ mothers and/or their children from the Bethany Home. If a mother had been resident in the Bethany Home before coming to Regina Coeli she would be instructed to attend confession immediately and apparently asked to give a full account of her time in Bethany, including whether she had allowed her child to be baptised while there, or had denied her own faith. The records relating to a woman, admitted in 1932, state that the baby went to Bethany Home and then to Pelletstown.

In 1936, the mother of a young baby who was living in Regina Coeli assisted another mother to travel by train to Belfast with her infant. This second mother placed her baby in a Barnardo’s Home. When this became known, the mother who helped was reprimanded by two voluntary workers.

> The terrible responsibility of the baby’s soul was pointed out to her and after a severe talking to she was told that she must leave the hostel on 20th inst. As an act such as she had done made her subject to such drastic action. She admitted doing it. Left the next day. Went to […] who had already arranged to settle baby in Athlone School\(^24\) on 24/7/1936. [the mother] went to friends in Fairview.’

A woman returned to Regina Coeli in 1937. Her entry card states ‘a previous child (one and a half years old) was rescued from Bethany Home last week and placed by CPRS’. The son of a woman, admitted in 1937, was ‘rescued’ from the Bethany Home and baptised in Arran Quay Church. The mother explained that ‘Priest would not allow her to tell her long-term boyfriend she was pregnant as he was a Protestant. Baby was later taken from Bethany Home … and out into Gloucester

---

\(^{23}\) See Chapter 22.

\(^{24}\) Almost certainly the industrial school which was sometimes known as Summerhill.
Street, and was then taken by the CPRSI’. A woman admitted pregnant in 1937 was reported to have two ‘other’ babies in the Bethany Home; the CPRSI arranged to ‘rescue successfully’. Another woman was ‘rescued from Bethany Home by CPRSI with baby’ in 1939. A woman was brought to Regina Coeli that year by a Catholic priest from Kilcullen ‘who rescued her from Bethany Home’.

21.58 A woman came to Regina Coeli in 1937; her baby died shortly after birth. In 1939 she was recorded as pregnant and in the Bethany Home. Her record states that the ‘CPS had written to her mother and Canon F to claim her out. Bethany authorities are arranging a marriage’. The woman’s mother travelled to Dublin, removed the baby from the Bethany Home and the CPRSI placed the baby with a foster mother. The infant’s mother was reported to be working and returning to Bethany every night.

21.59 In 1934 a mother came to Regina Coeli and returned to the hostel having given birth in the Rotunda. In November 1935 it was recorded that mother and baby had been taken to the Bethany Home by members of the Protestant Friendly Society, who had been put in contact with her by the minister (it is not stated which Protestant denomination) in her home town. She had written requesting her baptismal certificate, and ‘says now she is a Protestant’.

21.60 A case recorded in the Archbishop Byrne papers in the Dublin Diocesan Archives stated that a man who would appear to have been a Protestant clergyman had written to Bethany in relation to a Catholic girl who had gone to him and I took up the case…girl back from England where she had been for previous two years. Very threatening and troublesome brought to her senses at last and was admitted to the Regina Coeli hostel on the 4th. She has an offer of marriage in Ireland and is likely to be married if she can be relieved of the child. Mother took daughter and infant home.  

21.61 In 1944 a woman came to Regina Coeli with her baby from Belfast. Her record states that she had initially gone to the Bethany Home before going to Miss Cruice (St Patrick’s Guild). By 1944 Bethany had given a commitment not to admit Catholic women and it would appear that they had referred this woman to St Patrick’s Guild. A woman and her baby were admitted to Regina Coeli in 1951

25 Dublin Diocesan Archives. AB8 Items 22/7/1/15.
from the Bethany Home when it became known that she was a Catholic. Her record states, ‘The CPS have the case in hand’. Her child was baptised in Arran Quay Church. A woman came to Regina Coeli in 1948 seven months pregnant. She was referred by Miss Cruice. ‘She had called to Bethany Home who had sent her to Miss Cruice. The mother and baby went to Bessborough soon after the birth. A woman who arrived pregnant in 1948 had spent two months in Sean Ross ‘representing herself as a Protestant. She later went to Bethany Home where they got very suspicious as she did not know the hymns or prayers. On being questioned she went away.’

21.62 The records relating to a woman in 1955 state that her child was in The Children’s Fold, Boley, Monkstown (a Protestant children’s home). ‘She said Catholics would do nothing for them. Wrote to Fr H Parish Priest Blanchardstown telling him about the child in the Protestant home and asking him to take action with the girl in the matter’. A woman who was admitted to Regina Coeli in 1944 and subsequently left the hostel with her child was reported to have given her baby to a Protestant woman in Wicklow. The Legion of Mary contacted the Gardaí who notified her parish priest and the Rathdown Board of Assistance. The CPRSI suggested that Regina Coeli should bring the mother back to the hostel and encourage her to retrieve her baby. A member of the Legion of Mary collected the mother, secured a letter from a solicitor and went to the Irish Church Missions. They collected the baby the next day and brought the child to the county home in Rathdrum, where Miss Litster had arranged admission.

21.63 In 1944, a woman is reported to have gone to the Irish Church Missions (ICM), Townsend Street (a Protestant charity) to try and get the child ‘fixed’ and was told she would have to pay 40s a month until the baby was two years old. In 1945, a resident in Regina Coeli asked the ICM to take her child, but the ICM officer told her that ‘he could not help her as he had eleven children to fix before he would touch Catholic children. [the woman] was warned that her action meant expulsion from the hostel but she went that evening to the Rotunda’. Mother and baby were immediately sent to Pelletstown from the Rotunda. A woman who was admitted to Regina Coeli in 1952, six months pregnant, was described as a Protestant. While she was in the Coombe, having given birth, the almoner of the hospital informed Regina Coeli that Protestants, who were interested in her, had asked to be notified when she arrived into the hospital. They visited the new mother and arranged for her baby to be placed in the Children’s Fold. A woman came to the hostel in 1959
with a six month old baby, having been referred by the CPRS. It is recorded that the woman had

given the child to the Protestant Adoption Society but when her mother found out she wrote to [the woman] telling her to get the child back from the Protestants. She had to go the courts to get it back. Rev Fr. Harvey of the Crusade of Rescue helped her in the case.\(^\text{26}\)

**Race and Ethnicity**

21.64 A small number of children in Regina Coeli were the offspring of Irish mothers and African, Asian or West Indian fathers. An entry card in 1955 states: ‘Child’s father was Indian. Child is slightly coloured’. The child of a resident in 1966 was described as ‘coloured. Father is West Indian’; another child in 1979 was ‘coloured’. A woman is recorded as having two children, a son and a daughter. The entry card states that her son, ‘is quite African. Unclear whether L is the daughter of same father’. A woman was admitted in 1963 with five children: ‘Putative father is a Pakistani. The children are coloured’. Another woman ‘came with coloured baby’. The entry for a woman in 1980 states, that her son, ‘is slightly coloured-[the woman] reported to have contact with coloured man.’ One mother who was in the hostel in 1973, who had been born in an Irish provincial town, was described as ‘coloured’. A woman, who was resident in 1958: ‘Married a Nigerian Muslim. Joined him in Nigeria last year and found he had 4 native wives. Says he was very cruel to her’. A resident in 1953, ‘Has not seen the man responsible - an African’. Her child was described as ‘very clearly half-negro’. A woman who came to Regina Coeli in 1964 ‘was living with a coloured man...has a girl - this child is also coloured’. ‘Evidently her parents had a shock when they saw the child was coloured and refused to keep her there’.

21.65 A number of women were noted as being members of the Traveller community, but there is no further comment concerning this. One woman is described as ‘a travelling person’; and ‘Is a strange type’. Two other files state: ‘They are travelling people’. A woman: ‘Travels around. Parents were caravan people’. In 1975, a woman was described as ‘an itinerant’. A 1974 resident ‘Lived with her parents; travelling people’.

---

\(^{26}\) This obviously happened in England; Fr Harvey was based in the archdiocese of Westminster.
**Mental Illness and intellectual disability**

21.66 A number of women were reported as experiencing mental illness. In 1952, a woman was described as speaking and acting peculiarly. Guard and doctor summoned and on a later date [the woman] was committed to Grangegorman mental hospital. Later released back to RC and again re-admitted various times, including under Garda escort to Grangegorman...on Christmas Day 1959 after having attempted again to strangle [her son].

21.67 There are repeated references to this mother attacking her son and being admitted and re-admitted to Grangegorman. In 1960 a woman was described as ‘a mental case and has cancer of the throat’. A woman who arrived in 1940 was ‘very strange and had to be isolated in the Cedar room. Is mentally affected. Dr W saw her but would not commit her to Grangegorman, says she has a wild fever.’ She was sent to Cork Street fever hospital but was transferred to Grangegorman. Another woman was described as ‘very strange’. She was admitted to Grangegorman as a voluntary patient in 1950. The entry card concerning a woman who arrived with three children in 1964 stated that she was raised in a county home and later adopted. She married but separated from her husband and was described as having had a nervous breakdown. Her records noted many suicide attempts. One report described her as a ‘pleasure seeking psychopath with an addiction for alcohol' but no sign of mental illness. She was committed to Grangegorman and spent time in other hospitals. The last line stated that she ‘had been found, dead in England, murdered?’ The records on one widow who entered Regina Coeli in 1964 with three children, following the death of her husband in an accident, recorded that the priest who had assessed her ‘could not make up his mind whether she was mental or sheer devilment. We have his permission to have her treated in St. Brendan’s [Grangegorman] if we decide she needs it’ She was admitted by ambulance and under escort shortly afterwards. In 1974 a woman who had arrived the previous year was committed to St. Loman’s, a mental hospital in Mullingar, by her family doctor.

**Criminal behaviour and prostitution**

21.68 Regina Coeli was unusual in that it admitted women who had been, or were currently, involved in crime. There are references in the records to residents who had some contact with the Gardaí in relation to theft or violence. There are also some references to women stealing from each other or having violent altercations. A woman came to Regina Coeli in 1933 from Mountjoy prison ‘where she had been
Women who were engaged in prostitution were generally sent to the Legion’s Sancta Maria Hostel. The two hostels were in close communication, and regularly cross-referred. However some ‘street cases’ were admitted to Regina Coeli, particularly those who were seeking to give up soliciting. A separated woman who worked as a prostitute on the quays came to Regina Coeli in 1965. Her estranged husband had been committed to prison for 21 months for living on her criminal earnings and she had been in prison for two periods of two months for soliciting. The record states ‘Is anxious to give up the street life and get her children back.’

The Children

A total of 5,434 children were admitted to Regina Coeli and there is information about the date of admission for over 99% of the children. Children came to Regina Coeli with their mother, and remained with their mother; in a small number of cases a child might remain in Regina Coeli, while their mother was in hospital, prison or otherwise temporarily absent. Admissions peaked in the 1940s when over 30 per cent of the children were admitted; 225 children were admitted in 1942 and 233 in 1943 – statistics that mirror the peaks experienced by other mother and baby homes during these years. The numbers admitted in the 1950s were just over half the figure for the 1940s; in the 1960s less than one-fifth of the 1940s number were admitted. (The small number may reflect the need to rebuild the hostel). The number admitted rose sharply in the 1980s, reflecting the increase in the number of mothers who were keeping their child
Mothers who kept their children

21.71 Before the 1970s, Regina Coeli was the only institution that assisted unmarried mothers to keep their infant. The following are the percentages of mothers who are known to have kept their babies within Regina Coeli. It is possible that other mothers left with their babies and raised them outside the hostel. Although the mothers who kept their babies were a minority until the 1970s, the proportion was undoubtedly much higher than for any other institution catering for unmarried mothers.

21.72 In the early years it appears that the outcomes for children from Regina Coeli were not very different to other mother and baby homes. In the period from October 1930 to August 1932, eight children were placed by the CPRSI; seven by St Patrick’s Guild; 26 by the Legion of Mary; 13 had died; eight were with their mothers in their own homes; 13 were in Regina Coeli and 26 had not yet been born. The increasing proportion of mothers who kept their child is evident in the data for length of stay. By the 1950s the average length of stay for children was significantly longer than in previous decades.

21.73 In a lengthy memorandum written in 1950 and submitted to the Department of Health, Frank Duff stated that

From a very early moment it became a principal idea of the Hostel that mothers should be encouraged to keep their children permanently. Such a course was not hitherto possible to girls in their circumstances. The best that could be aimed at was that they would retain them for a period of a year, so as to give the child its chance of life. After that everything operated to bring about separation. A job was found for the mother and the child went off to fosterage or into an industrial school. But in the case of the Regina Coeli there was no date at which the mother had to make up her mind. Each new day brought growth of affection for the child and the natural mother to keep it and be responsible for it. From first to last the hostel has urged this latter
consideration on the girls. The cry too commonly heard is that these girls should be ‘given their chance’ as if no responsibility whatever lay on the mother in respect of the child.

21.74 Duff believed that as the fathers had failed in their duty to the children, there was a greater responsibility on the mother. He claimed that ‘As a result of the interaction of proper natural affection and the encouragement and facilities provided….a great proportion of the girls are not only prepared but determined to keep their child’. The hostel grew rapidly and soon expanded into adjacent buildings - all of the buildings were part of the former workhouse. The expansion in numbers was concentrated ‘on the unmarried mother’s side’. The arrival of babies ‘rendered necessary a complete reordering of the system of the Hostel’. The original plan, as in the Morning Star Hostel, was that the residents would leave the hostel in search of work every morning, and have their dinner in one of the various charitable institutions around the city or at their place of work. The presence of mothers and babies made it necessary to provide food and care throughout the day. The Legion of Mary took over additional premises and instituted a day system that involved feeding babies and older children. He claimed that the babies’ diet was ‘as directed by the Child Welfare Department of Dublin Corporation’, whose nurses and doctors gave ‘constant and invaluable aid to the Hostel’. At a later date, probably in the 1940s, the Catholic Social Welfare Conference began to subsidise the dinners, which enabled the hostel to improve the quality. The older children attended neighbouring schools.

21.75 One of the core principles behind all Legion of Mary hostels was that no services should be provided free of charge. The basic charge in Regina Coeli was 6d a day, including supper. Dinner, which was served in the middle of the day, cost an additional 1s 3d depending on a person’s means. There was no charge for babies under 6 months of age; older babies were charged 1s a week. Mothers were expected to find outside work, or undertake work in the hostel to earn this money. However most work in the hostel was carried out by members of the Legion of Mary.

21.76 The dormitories and other provision for unmarried mothers and their children were separate from the other residents. In the early years the mothers and children

---

27 Duff probably means the Catholic Social Service Conference, which was established in 1941 to co-ordinate social services provided by the Catholic church in Dublin. Lindsey Earner-Byrne, *Mother and Child*, pp 90-3.
were accommodated together in dormitories, but when it was realised that the residents included ‘six rather big boys of ages 8 to 10’, Frank Duff states that a decision was taken to renovate ‘old accommodation at the back of the premises’ and six mothers and their sons moved there. Duff conceded that the accommodation was ‘rather defective from many points of view, notably in regard to the congestion caused. Observers remarked that we now had our own little slum’. He claimed that these family units resulted in ‘the establishment of the happiest sort of home-life and the growth of the domestic virtues’.

21.77 Frank Duff was opposed to children being committed to industrial schools. In his 1950 memorandum he stated that

One of the very grievous aspects of our work has been the fact that by reason of some legal technicality it is possible for any woman to apply to the district courts and automatically to have herself relieved of the care of her child, the latter being sent to one of the orphanages. A certain society has constituted itself a port of easy call for any woman who has this idea in regard to her child. The girl has but to present herself to them and the remainder of the thing works out almost as a mechanical transaction. It is not necessary to point out that this state of affairs constitutes a standing incitement to women, and a certain proportion of them prove too weak to stand that incitement. The result of this breaking up the little family unit is not for the good either of mother or child. A formidable proportion of the women thus relieved of their children get into trouble again… Based upon Regina Coeli experience of such cases, it can be confidently asserted that over sixty per cent of such girls thus come to disaster, and it is at least likely that the proportion is very much higher. Then what happened to the children who are thus taken away? The number of children who emerge from industrial schools at the age of sixteen and then come to grief is so considerable that a number of years ago the government set up a commission of enquiry to investigate the question.

21.78 He claimed that one-third of the ‘street girls’ in Sancta Maria Hostel had been in industrial schools, likewise ‘a formidable proportion of the men resident in the Morning Star’. In a short hand-written letter which accompanied this report, which was addressed to a senior official in the Department of Health, he highlighted the ‘operations of the Society for the Prevention of Cruelty to Children, which are obviously countering our work’.
21.79 There is evidence that Regina Coeli encouraged mothers to reclaim their children from industrial schools. A woman first entered the hostel in 1953 with her seven-month-old baby. She gave birth to twins the following year and the record states that the twins were committed from St Ultan’s Children’s Hospital to Goldenbridge Convent, 28 placed through the courts for one year in-the newly opened section for children of sick mothers. When the mother returned to Regina Coeli without the twins, she was told she could not be re-admitted without them. She telephoned Goldenbridge Convent and arranged to take them that evening which she did. She was then transferred with twins to St Eithne’s, Rosary House, within Regina Coeli.

21.80 In 1942, Helen Murtagh, a Catholic social worker in Birmingham, travelled to Dublin to examine facilities for unmarried mothers. She was concerned about the number of pregnant Irish women in Birmingham and sought to understand the reasons why they left Ireland. She met Dr McQuaid and officials from the Department of External Affairs and the DLGPH including Miss Litster. Before she left Ireland she wrote to Dr McQuaid contrasting provisions in Birmingham and in Dublin. In the course of her report she stated that ‘It grieved me very much to see the babies needing so much at Regina C. It is merciful work, but I could not help comparing them with our eight nurseries where every mother can stay with her baby, all because the Ministry of Health pays again & again to build future citizens’. 29

21.81 In 1943 the Joint Committee of Women Societies and Social Workers submitted a report on boarded-out children and children in institutions to the DLGPH. They had visited a number of children’s homes and other institutions, but they did not visit Regina Coeli. In her commentary on that report, Miss Litster stated that ‘a great change in public opinion will have to take place’ before Irish unmarried mothers could keep their children. ‘The experiment has been tried in Regina Coeli of helping mothers to go into rooms and maintain their own babies’. She had also assisted a number of mothers who wished to keep their child, but she claimed that ‘No permanent success attended these efforts. As soon as the children were at an age to be admitted in an Industrial School steps were taken by their mothers to have them admitted’. (It is unclear whether this comment applies to Regina Coeli mothers or only to those who had been assisted by Miss Litster).

---

29 DDA/AB8/b/XIX.
21.82 A report by Miss Litster in 1947 noted that the hostel is crowded with unmarried mothers from every part of Ireland. A nominal sum is charged for board and lodging and when the girl is destitute nothing is demanded. Generally the girls go to the Rotunda Hospital for confinement returning to the Hostel, from which after a period they go out to daily work, their babies being looked after in the Hostel during their absence. No solution to the baby's future offers from the Hostel. Despite the poor living conditions, some mothers preferred Regina Coeli to the more conventional mother and baby homes because they could smoke, make tea for themselves, and go out to pictures.

21.83 The reference to making tea is highly suggestive of the institutional regime in mother and baby homes. But the real difficulties that the mothers in Regina Coeli faced in keeping their children should not be discounted. When she reviewed data on younger children committed to industrial schools in the years 1953-55, Miss Litster discovered that a large number of those committed came from Regina Coeli and Sancta Maria hostels, though she noted that the authorities in these hostels tried to dissuade mothers from doing so.

**Children left in Regina Coeli without their mother**

21.84 It was quite common for women in Regina Coeli to go home and leave their child in the hostel, and on occasion the hostel staff had to contact them and ask that they return. A woman left in October 1934, leaving her baby in the hostel. She ‘was written to twice requesting her to return from her home. A nun went to her home place to look for her and found that the woman was getting married (not to the man responsible). Her mother came to RC to look after the baby. Baby died in hostel on December 1’. He was described as ‘abnormal and delicate’. A woman went home in 1938 ‘promising to return to look after baby’ but later efforts to find her failed. The district nurse said that the child could not be kept in Regina Coeli, ‘but must go to the Union’ and the dispensary doctor issued an admission ticket. The Gardaí located the mother in her home, where she had been for some time. The Legion of Mary determined that two of their members should go there and ask her to return to the hostel; if she refused they would hand her the baby. This mother returned reluctantly to Regina Coeli; her child was placed in Newtownforbes Industrial School 30 shortly after her return.

In 1936 a mother left the hostel and ‘did not say where she was going’. She left her baby, who had curvature of the spine, in Regina Coeli. A voluntary worker took the child to the local dispensary doctor, who supplied a ticket enabling the child to be admitted to the Dublin Union. A woman arrived in 1957 with her child who was almost three-years old and left shortly after without her child. The Gardaí were notified and members of the legion visited a number of places where they thought she might be. They eventually wrote to St Kevin’s (the Dublin Union), asking them to take the child, who was sent to Pelletstown. A woman was recorded in 1954 as ‘going to London and husband’s sister will take the baby’, which happened shortly after the mother left. In 1952 an infant ‘was minded by other mothers for a period of 5 months while her mother was away/staying out all night/in hospital’.

Women might leave their babies in the hostel while they went home to visit family or attend funerals. It is not known whether this was done for convenience or because their families were unaware they had had a child. In 1939 a woman went home for ten days; during that time her baby was in Regina Coeli and also spent some time in hospital. A woman returned home in 1952 for her mother’s funeral. She wrote to Regina Coeli on a number of occasions asking to extend her time at home, which eventually lasted over three months. Her baby died while she was away. Some mothers left their children to go on a holiday. In 1954 a woman entered Regina Coeli pregnant and returned to the hostel following the birth. She then got married and left her baby in the hostel while she went on honeymoon. In 1942 a woman left her son to be ‘minded here for a month as his mother went on holidays with her employer.’ Women also left their babies while they went to hospital. In 1976, a two-year-old child was minded in Regina Coeli while the mother was in St. Brendan’s. Another mother left her child in Regina Coeli for a period of six weeks while she went to the Rotunda for ‘a serious operation’ in 1944.

Women were permitted to leave their children in Regina Coeli when they were in prison. In 1939, a mother ‘was arrested for stealing £4 in wallet from lodger in mistress’ house. She was put on remand. Baby minded here.’ A woman who entered the hostel in 1939 four months pregnant struck another resident in 1945, and was sentenced to a month’s hard labour. Her baby stayed in Regina Coeli. In 1953 a woman arrived with her two-week-old son, who was later admitted to hospital. The mother went home eight weeks later - her son was still in hospital - following a letter from her mother that the father had had a stroke. A meeting of the hostel staff decided to withhold permission to leave, ‘til girl’s mother had
promised to send girl back within specified time’. Her baby was reported as ready for discharge in January 1954, eight months after admission to hospital, and the hostel sent a telegram to her home asking her to return immediately. This was followed by a letter in March threatening to bring the child to her home if she failed to return; they also wrote to the woman’s mother warning of the consequences. Her son was brought to her home in June. The legion members did not meet his mother, but the grandmother took charge of the child.

21.88 Some children who were resident in Regina Coeli were admitted to hospital and did not return. The records show that they were placed or settled from the hospital. A woman arrived in 1946 with her three-month-old son, who was born in Castlepollard. He was admitted to St Clare’s hospital; his mother left Regina Coeli two weeks later and was suspected of going to England. When her son was ready for discharge from St Clare’s there was no trace of the mother. The Gardaí were notified. Miss Litster arranged for his transfer to St Kevin’s hospital pending her return. A baby was admitted to St Clare’s in 1953. The maternal grandfather signed an undertaking to claim him on discharge, but later records indicate that the Gardaí were contacted because his mother could not be located.

21.89 A woman left in 1954 with her baby. The sister in charge in Pelletstown contacted the hostel to say that the woman, who was known to her, had been seen in Phoenix Park with the baby and later a baby that appeared to resemble her baby was found on the doorstep of Pelletstown. A Garda sergeant called with clothes and wrappers which were easily identified as from Regina Coeli. A member of the hostel staff confirmed the baby’s identity. The mother was arrested and remanded in custody. Her cousin bailed her out and she was sent to St. Patricks, Crofton Road, Dun Laoghaire - a Magdalen Laundry - for two years.

Children with special needs

21.90 One baby was described as ‘a cripple and simple’. The child’s mother was given notice to leave the hostel in December 1946. She returned with a letter from the NSPCC requesting that she be kept in Regina Coeli with her child until the child was admitted to a Sunshine Home. However this mother again went out without the child and was told to leave immediately. She went to a rented room with the baby. The daughter of a resident in 1953 was described as a ‘spastic’; she was brought to ‘school for spastics in Finglas’. She had had an epileptic fit while being taken by her mother to an orthopaedic hospital.
Fostering and Adoption

21.91 Some children born to mothers who were in Regina Coeli were fostered (or placed at nurse). In the 1930s the names of several women who were described as involved in boarding out children are mentioned. The records relating to a woman in 1938 stated that ‘Baby taken from Mrs […] foster home as she was not following Mrs C’s rules and Mrs C will have no more to do with her’. One named woman is described as ‘settling children’. There are also references to Miss Plater, and Nurse F, who ran a nursing home on the North Circular Road. Women were often sent to Nurse F for a period after they had left Regina Coeli, which would suggest that they were not keeping their baby. A woman in 1933 was ‘referred here by Miss Cruice, who then took her baby’. Another baby was taken by Miss Cruice in 1940. In 1947 a mother and her baby went to Nurse H in Upper Leeson Street, who placed many children at nurse in the Dublin area. In 1949 a mother went home and her child remained in Regina Coeli ‘pending settlement by Miss Litster’, who presumably arranged for him to be boarded out or placed at nurse.

21.92 In order to have a child placed at nurse by a charitable organisation, or by an individual such as Nurse F or Nurse H it was necessary for the mother to pay money to cover the cost of keeping the child. The individual case records give some information about payments to have a child placed, including payment to a priest to have the baby ‘settled’. A resident in 1936 arranged for a woman in Liverpool Street to foster her child ‘straight from hospital. Fr […] said she had got woman’s name from an advertisement and intends to pay £25 down for settlement’. The entry card for a resident in 1941 states ‘E called to Miss Cruice about settling the baby but Miss Cruice will not settle it without a written promise of payment. E went home as mother was very ill. She left baby here having signed a guarantee for Miss Cruice to pay 7/6 weekly for the baby’s keep here until Miss Cruice settles it in a few weeks’ time’. In 1943 it was reported that a mother ‘had £30 or so for settlement of baby and had given £15 of it to Miss […]’. An entry about a mother in 1949 reports that a named doctor is interested in the case as is Father Barrett (Director of the Catholic Social Services Council). There was £100 for settlement of the baby.

21.93 There are infrequent references to seeking money from the putative father of the child. One woman appears to have taken a legal case; she ‘reported that baby

---

31 This is discussed in greater detail in chapter 11.
was to be adopted by order of the court, £80 was awarded her, £15 for herself and £65 for Fr. Kenny\textsuperscript{32} for the child'. A resident in 1941 ‘Took out affiliation order against man and on 19/6/1942 he was ordered to pay her 5/ weekly.’ When a woman was admitted in 1944, her entry card recorded that ‘The priest in Tipperary saw the man responsible and when he refused to marry her got sufficient money to pay expenses and £50 for adoption of the child.’ The record of another woman, admitted in 1943, states that the ‘Man responsible promised to pay for fixing of baby’. The father of a child, born in 1943, ‘did not answer her letters but promised her sister to pay for baby’s adoption.’\textsuperscript{33} A woman successfully took the father of her baby to court for maintenance in 1945. A resident in 1948 ‘Reported . . . that man agreed through solicitor to pay £120 for complete adoption’. A child lived in Regina Coeli for two years after his mother had left the hostel; the boy’s father paid for his maintenance until a member of the Legion of Mary took the child ‘for adoption’. In other cases contact was made but the putative father refused to take financial responsibility for the child. In the case of a resident in 1947 the ‘Man responsible knows of her condition but refuses to accept any responsibility’. With respect to another woman ‘Man responsible knows of her condition but can do nothing for her as he married another woman in a Registry office’. In 1970 the file notes that Garda C ‘is getting after the man to support N’.

21.94 Some babies were ‘settled’ directly from the hospital and the mother went home. A woman who was in Regina Coeli in 1938 ‘went to Rotunda, baby girl had been settled by Fr Kenny’. The woman went home. A woman in 1935, ‘Had baby fixed by Holles St. Matron’; she and her baby were sent to the Dublin Union from the maternity hospital. Another woman’s record in 1943 states that ‘baby taken direct from hospital by Fr Kenny on 24/4/1943 and [the woman] taken home the same day by her mother.’ In a small number of cases the baby was taken by a family member. The record for a woman in 1942 states that ‘her married sister is taking the baby to Glasgow with her’. Another woman was taken home by her sister-in-law in 1939, ‘who is taking the baby’. In 1933 a child went to the mother’s sister.

21.95 In 1935 a resident in Regina Coeli brought her baby to a foster mother who had agreed to take her child for a sum of 30s a month, and Mrs Clancy (an inspector of boarded out children) certified the foster mother as suitable. However in the same year another baby who had been placed with a foster mother was ‘taken to the

\textsuperscript{32} Of the Rotunda Girls Aid Society.

\textsuperscript{33} These were all informal adoptions.
Union by the foster mother as Mrs Clancy would not let her keep it. Baby admitted to South Dublin Union on 27/1/1933 as there was no one paying for it here'.

21.96 In some cases the voluntary staff in Regina Coeli assessed the mother’s fitness to care for her children. A mother arrived with a week-old baby in 1963. She was described as a ‘case for Sancta Maria’ but she could not be admitted there with her child. ‘Decided at a meeting of 15/11/1963 that she was unfit to look after the child, arrangements to be made to have the child settled’. This child is recorded as going to Pelletstown for a week but there is no information as to the ultimate destination. There are also instances where a mother left with her baby to go to a foster placement; a woman came to hostel pregnant in 1944; ‘Baby taken by foster mother Mrs […]’. In two cases members of religious orders, one a priest, one a nun, took children from Regina Coeli in person; it is not clear where they brought the babies.

21.97 Women in the hostel were told to give 48 hours’ notice of a baby being fostered to the Inspector of Boarded Out Children. A woman arrived pregnant in 1935. She gave birth to a baby in the Rotunda and returned to the hostel. The baby was taken by a foster mother when approximately three months old. ‘Was warned by sisters that she should give 48 hours’ notice to Inspector of Boarded Out Children but did not’. ³⁴ The records show that another mother in 1952 referred to the father of her child arranging a foster home through a newspaper advertisement. In 1934, a baby was ‘taken by a foster mother…but taken back the same evening as foster mother feared interference by Mrs Clancy, the local inspector of boarded out children. The baby was then taken to another foster mother, who visited Regina Coeli with the baby some months later. The baby was ‘doing well’. The baby’s mother also visited the hostel.

21.98 After the commencement of the Adoption Act 1952 on 1 January 1953, there are references to foster parents formally seeking to adopt the child in their custody. A woman was in Regina Coeli with her child in 1939. ‘Mrs […] of NCR is “placing” the baby’. (NCR refers to the North Circular Road in Dublin’s inner city.) In 1954 the foster parents applied to Regina Coeli seeking details of the mother’s address so that they could adopt this child. In 1958 a mother left Regina Coeli and was located in Gloucester St Convent - a Magdalen laundry. However the sisters ‘agreed that she should be with the baby’. Arrangements were made for a member

³⁴ The Children Act required the foster mother to give notice – see Chapter 1.
of the legion to collect her, but her child ‘was taken for adoption…by arrangement of nuns’. A woman entered the hostel in 1964 eight months pregnant and she was admitted to St Kevin’s hospital by ambulance. Her record shows that ‘she is not coming back here, all arrangements are made for the adoption of the baby’. There is evidence that Regina Coeli continued to place some children in foster care after the introduction of legal adoption. A report on a boarded-out child, born in 1959, stated that she had been placed by Regina Coeli hostel.

21.99 **Industrial schools**

In some cases where mother and child were separated, it is clear that a mother wished to remain with her child(ren) but was unable to do so. The file relating to a child in 1938 recorded that he was being taken to a foster mother for the night and that an NSPCC inspector was sending him to Pelletstown. However the medical officer at the Dublin Union refused to admit this child to Pelletstown and he was returned to his foster mother. This mother, who had given birth to more than one child was ‘indoor to Mrs […]’ - presumably working as a domestic servant, and her employer ‘insisted on getting a note from us to the effect that the babies had been settled up. We sent it’. Some days later this mother returned to Regina Coeli; ‘she could not bear to be separated from her children’. However mother and children were refused entry ‘because she would barely make payments and elder child too old.’ Two of her sons were sent to the industrial school in Drogheda, a third son went to Carriglea - an industrial school in Dun Laoghaire,\(^{35}\) and a daughter went to Sligo (presumably to the industrial school).

21.100 There are frequent references to children being placed in industrial schools by court orders. Some mothers sought a court order because they were unable, too poor, or unwilling to care for their child. In a number of cases it would appear that Regina Coeli petitioned the courts to make an order in respect of the child. In some cases, Regina Coeli would not allow a woman to remain with her children if she could not afford to pay. It would appear from the records that many mothers were unable to pay for their upkeep, but while some remained there long-term, others were not permitted to do so. A woman came to the hostel in 1937 with three children (one is described as having been ‘rescued’ from Bethany Home). ‘[the child] was committed to Drogheda School. Srs. M and R and Bro. Duff (presumably Frank Duff) were present in court’. A woman who came to the hostel

\(^{35}\) Ryan Report: [http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL1-10.PDF](http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL1-10.PDF)
in 1955 had her son ‘placed through the courts on 19/10/1961 in St Patrick’s pending a vacancy in Stillorgan’. Another child was committed to Artane Industrial School in 1964. The record relating to a woman in 1937 states: ‘child was to be placed in an industrial school and Mrs C [NSPCC inspector] asked that mother and child be admitted until then. They stayed for 10 days when child went to an Industrial School, Kilkenny and the mother went to indoor work’. In 1958 a two-month old baby was placed in an industrial school in Kilkenny through the courts. A woman admitted in 1942 applied to the NSPCC inspector in 1944 ‘to put child in school. . . We consented as [mother] is away all day at work from it’. The baby was admitted to St Kevin’s without the mother and was subsequently sent to an industrial school in Sligo. The file notes that the mother ‘had not informed us of this’. A woman arrived in 1953 with her baby. She applied to the NSPCC the following year ‘to have baby settled…but officer would not help without letter of consent from the Hostel’. This child was placed in Goldenbridge industrial school through the courts. The NSPCC was involved in placing many Regina Coeli children in industrial schools. The record for a woman in 1941 states that ‘[…] is staying indoor with Mrs O’C, NSPCC and that society is getting baby into school, we will have no further responsibility of baby’.

**Health Care: Disease and Mortality**

21.101 Regina Coeli was located in the centre of Dublin in a disused former workhouse which was a nineteenth century building with primitive sanitary and washing facilities. The hostel admitted unmarried mothers and children, and destitute women, some who would have been sleeping on the street or staying in other homeless shelters, so it is not surprising that there were numerous outbreaks of infectious disease. The hostel was staffed by volunteers, who were members of the Legion of Mary. It did not employ a nurse(s), midwives or a visiting medical officer. Frank Duff was committed to the principle that care should be provided by volunteers, not paid professionals.

21.102 There is no evidence that Regina Coeli applied for funding under the Maternity and Child Scheme in its early years. In December 1934 the hostel applied for exemption from the provisions of the *Registration of Maternity Homes Act 1934* which applied not just to an institution where women gave birth but to an institution,
‘wholly or partly used or intended to be used for the reception of pregnant women or of women immediately after child birth’ (see Chapter 1). The request for exemption was approved and signed by Gerald Boland (Minister for Posts and Telegraphs), who was acting on behalf of the Minister for Local Government and Public Health. It stated that the ‘Institution is not carried on for private profit’. However a handwritten note dated 30 January 1947 stated that the exemption order did not issue - it appears that this was confirmed by the Secretary of the Department of Health.

21.103 It was never envisaged that women would give birth in Regina Coeli and the hostel never had a designated resident or visiting midwife on its staff or a visiting obstetrician. The admission record for one woman in 1941 states that ‘I explained to her that this was not a maternity home.’ By December 1930, shortly after the hostel opened, women were being sent to give birth in the Coombe Hospital. At some later date the Rotunda Hospital - which was closer - became the hospital where women in Regina Coeli gave birth and attended ante-natal clinics. At this time most Dublin mothers gave birth at home and the city’s maternity hospitals sent medical teams into the community to perform deliveries. There is no indication that Regina Coeli considered using this service. Regina Coeli also admitted women with their new-born infants, who had been discharged from all the Dublin maternity hospitals - women who had not been in the hostel before giving birth.

21.104 The annual clinical report of the Rotunda hospital for 1945 includes information on unmarried mothers who gave birth in the Rotunda in the years 1940-44, which shows that the largest cohort were discharged to Regina Coeli. The report stated, in reference to unmarried mothers, that ‘approximately half of the mothers were anxious to have their babies adopted or boarded out or looked after by relatives and only about 2% were planning to marry the putative father or to look after the baby permanently themselves’. It noted that the hospital almoners were unable to remain in contact with these mothers and children.

21.105 This study suggested that both mothers and children often required ‘a prolonged period of convalescent treatment under skilled nursing and medical supervision’ following their discharge from the maternity hospital but ‘Unfortunately the existing homes have not all got medical and nurses facilities’; and they were also
overcrowded - ‘conditions which are detrimental to the health of both mother and child’.

21.106 A DLGPH file in 1943 that examined provisions for ante-natal care for unmarried mothers in various institutions noted that expectant mothers in Regina Coeli were sent to the Rotunda for a medical examination on the first suitable day following their admission. It claimed that women attended ante-natal clinics regularly until the birth of their child. Expectant mothers received a special diet in the hostel, which consisted of an additional pint of milk daily in addition to ‘a good midday meal of meat, vegetables and milk pudding’.

21.107 Infant mortality in Dublin was substantially worse than in comparable cities in Britain and it proved difficult to reduce it. Mortality in the city’s tenements and city-centre cottages was extremely high, yet the mortality among illegitimate children was a multiple of that figure. Overcrowding, which facilitated the spread of infectious diseases, was a major factor; likewise the relatively low rate of breastfeeding (which was a reflection of poverty and poor nourishment of mothers). The poor quality of milk used to feed infants, which was often watered down, from tubercular cows, or riddled with infection was another contributory cause. The city of Dublin implemented a variety of schemes to reduce infant mortality, including the feeding of malnourished mothers, and providing depots to supply clean milk.

21.108 Regina Coeli experienced outbreaks of infectious diseases almost from the beginning. In 1931 there is a record of a child being admitted to hospital with diphtheria: ‘Corporation sent the following day and took away the bed clothes for

39 Annual reports of the Dublin medical officer of health, 1929-54
disinfecting’. In April 1933 the Dublin city manager informed the DLGPH that the medical officer of health had notified him about a measles outbreak in Regina Coeli; he described the hostel as ‘an institution founded for giving lodging to women of very poor class and their babies’. He reported that ‘as many cases as possible’ were sent to Cork Street Hospital, but as there was insufficient space to remove all the sick children, the public health section of Dublin Corporation had appointed a temporary nurse to look after these children in the hostel.

21.109 Appointments of temporary nurses for periods lasting weeks, and sometimes one to two months to tackle epidemics in Regina Coeli, were a regular feature throughout the 1930s and 1940s. The nurse who was appointed during the 1933 epidemic returned in 1935 to deal with another measles epidemic. There were further measles epidemics again requiring temporary nurses in August and December 1936; epidemics of gastro-enteritis, also requiring temporary nurses, were reported in the autumn of 1936, February - March 1937, April 1937 and May 1938. The records of individual mothers record details of deaths during these outbreaks. In 1935 a baby died in the hostel during an epidemic of measles. The record on another woman who had lived in the hostel since 1932 stated: ‘Baby very ill on 7/2/1934 - refused to take it to hospital. Sent it to Clonskeagh Fever Hospital on 19/3/1934 but it was sent back- no room for it anywhere. Baby died in hostel on 22/3/1934’

21.110 The reports of the Dublin City medical officer of health record regular visits by the city’s public health officials to the hostel and the Sláinte Welfare clinic in nearby Blackhall Place was available to mothers and babies in the hostel. Nurses weighed infants in the clinics and referred children that needed attention to a doctor. They gave weekly lectures on hygiene and mother craft but it is not known if any Regina Coeli mothers were present. The 1939 report on public health in Dublin city stated that unmarried mothers were visited ‘in the ordinary way’ by district health visitors; their records were kept in a similar manner to married women and they were addressed as married women in the clinics.\textsuperscript{40} A later note on a Department of Health file indicates that the local dispensary doctor was responsible for medical care at Regina Coeli, but he found it difficult to visit the hostel ‘except occasionally’.

\textsuperscript{40} These reports are an invaluable source of information about maternal and child health in Dublin. Unfortunately many of these annual reports, including reports for most of the war years, are not available.
21.111 There is no indication of any response by the DLGPH to frequent requests by Dublin Corporation to approve the appointment of temporary nurses in Regina Coeli. In 1940 the Dublin city manager applied for approval to appoint both a day and night nurse because of an outbreak of German measles; the file noted that there was no suitable sleeping accommodation for the night nurse in the hostel. On this occasion however an official in the department noted that

There is an outbreak of some sort (including typhoid) about once a year at this institution. There is no official information re medical attendance. I understand that the M.C.W. M O\textsuperscript{41} or the local disp[ensary] doctor may have managed to look after the babies on previous occasions.

21.112 He noted that some of the babies might have been transferred to St. Kevin’s hospital. The department’s attention was prompted on this occasion because the Dublin city manager applied for approval to appoint a doctor to attend at the hostel. Another official noted that ‘The medical arrgts [arrangements] at this home are not satisfactory and it seems that if the Corporation do not bear the cost in this instance, proper medical attention is not likely to be provided otherwise, should the necessity arise in the future’. Dublin Corporation explained that in the past it had not claimed money from the department for these temporary appointments at Regina Coeli but would do so in future. The department was insistent that these claims should not be made under the Maternity and Child Welfare Grant scheme.

21.113 Temporary nurses were appointed on several occasions in the early 1940s to nurse epidemics of flu, enteritis and other infectious diseases. In the autumn of 1940 Regina Coeli suffered an outbreak of typhoid, which obviously affected adult women, because cases were sent to the nearby Hardwick Hospital.\textsuperscript{42} In 1942 the department expressed concern that cases of gastro-enteritis were being nursed in Regina Coeli, as opposed to sick patients being transferred to a fever hospital. The department had received complaints from two named doctors who were attached to Dublin hospitals ‘that cases are often moribund before transfer to their institutions’. The Dublin medical officer of health, Dr Russell, was asked to investigate why the hostel was not sending children with infectious diseases to hospital. He reported that temporary nurses were appointed in May 1940 following reports that there were eight cases of diarrhoea among children in the hostel. Because there was a qualified nurse in charge of the children, and a doctor had

\textsuperscript{41} Maternity and child welfare medical officer.
\textsuperscript{42} St Laurence’s Hospital incorporated The Richmond, Whitworth and Hardwick Hospitals.
reported that the cases were not severe, it was decided to nurse them in the
hostel. It was believed that these cases might be due to ‘faulty feeding methods,
and would clear up on proper adjustment of diet’. The fact that accommodation in
the city’s fever hospitals was limited was also a factor. He wished to keep hospital
beds for children from the slums, where there was no possibility of them being
nursed at home.

21.114 A baby was admitted to the infirmary in Regina Coeli with enteritis and died there
in February 1942. A baby was removed to the infirmary with green diarrhoea and
died there on New Year’s Day 1942. There are frequent allegations that children in
Regina Coeli were not transferred to hospital in time. In 1946 a baby was admitted
to St Kevin’s hospital and then transferred to St Clare’s. The Regina Coeli records
state that ‘St. Clare’s phoned here next day to say baby had been admitted the
previous evening in a dying condition and asked why it was left so long.’ A baby in
1942, ‘died here in infirmary on 14/1/1943. Had not been seen by Dr […] who
refused to give a death certificate. Rotunda doctor had not seen it for three days
so also refused a cert’. Some babies died in the hostel because they were refused
admission to hospital. A mother ‘says she took the child to Temple St on
19/6/1941, doctor admitted child, nun refused it when it arrived in ward because it
came from Regina Coeli. She took it to St Ultan’s Hospital but they had no bed’.
Another baby was admitted to Cork St Hospital with measles, however three days
later it was reported to have scarlet fever and was returned to the hostel where it
died shortly afterwards. Dr Russell claimed that there were advantages in sending
nurses into the hostel because ‘there was no qualified person available in the
home to effect prompt isolation of and so prevent the spread of infection among
the healthy children’. The nurses isolated 18 children with enteritis in one ‘ward’ in
the hostel; two more serious cases were transferred to fever hospitals. No children
died. The hostel was being visited by the medical officer in charge of maternity
and child welfare.

21.115 A report on Dr Russell’s handling of the Regina Coeli epidemic was compiled by Dr
Lysaght a medical inspector in the DLGPH. At the conclusion he commented: ‘My
own personal view is that the retention of unmarried mothers and children in this
Hostel is altogether wrong. St. Patrick’s Home, Pelletstown appears to me the
proper place for all such cases where they are under the care of nurses; beter [sic]
are available’, though he acknowledged that Pelletstown was overcrowded. He
also noted that one of the doctors who had referred to ‘moribund’ cases stated that
this comment applied more widely to ‘neglected ones from poor surroundings retained too long at home without medical and nursing attention’.

21.116 In 1942 Regina Coeli applied to a Dublin medical officer for funding to buy an electric water heater and Dublin Corporation duly applied for departmental approval for £19 to cover the cost of the heater, and £14 for installation. In response to that application the DLGPH noted that the hostel ‘does not appear to have been approved under the Maternity and Child Welfare Scheme’. There were further epidemics and more temporary nursing appointments. The number of deaths in Regina Coeli peaked in 1943, which coincided with a spike in admissions. In 1944 yet another outbreak of measles resulted in Dublin Corporation appointing a doctor to attend the hostel for six weeks. When departmental approval was sought, an official noted that some arrangement should be made whereby the authorities of Regina Coeli would always have the services of a doctor available. I have previously recommended that a resident MO should be appointed. The death rate amongst infants in this Institution is excessive. The arrangement made does not appear to be satisfactory.

21.117 Dublin Corporation had proposed appointing a doctor who was attached to the nearby St Laurence’s Hospital, as medical officer to Regina Coeli. The department suggested that this appointment should be permanent; the medical officer should pay daily visits to the hostel. However a colleague cautioned that the hostel was not under the control of the Public Assistance Authority and, while the appointment of a medical officer seemed necessary, the cost could not be charged to the poor rate. Dr Conn Ward, the Parliamentary Secretary at the DLGPH, sanctioned this appointment but reiterated that the cost could not be recouped under the Maternity and Child Welfare Grant.

21.118 1946 appears to have been a crisis year. Deaths were lower than in the years 1942-44 but admissions had fallen. Twenty-two infants died between 2 February and 26 August, three in St Clare’s hospital. Regina Coeli recorded several cases of gastro-enteritis among children who had recently been discharged from the Rotunda, Holles Street and St Kevin’s hospitals. This particular epidemic prompted Dr Deeny, the chief medical officer of the DLGPH to ask whether the department had ‘any relation to the Hostel’, and whether it was possible to carry out an inspection. An official expressed the opinion that the Regina Coeli Hostel
came within the definition of maternity home and suggested that an authorised inspector could 'enter and inspect the Hostel at all reasonable times'.

21.119 Ten of the children who died in 1944 died in Regina Coeli, the remainder died in various hospitals. The largest number, 26 died in St Kevin's hospital; two died in St Clare's Hospital, which had opened in October 1944 as an infectious diseases hospital for children (see Chapter 2). In 1945, 13 deaths took place in the hostel, 23 in St Clare's. [A number of children born to Regina Coeli mothers died in Dublin maternity hospitals shortly after birth and were never resident in the hostel.] St Clare's accounted for 17 of the 33 deaths that took place in Regina Coeli between January and 12 August 1946; two children died in the hostel.

21.120 In August 1946 a department medical inspector and another doctor visited Regina Coeli 'with a view to suggesting measures to reduce infant mortality'. They recommended the appointment of a visiting medical officer and a day and night nurse, who should ideally have training and experience in children's diseases. They also recommended establishing an isolation ward where new arrivals and suspected cases could be isolated until cleared by the medical officer. Although the arrangements for preparing infant feeds were 'fairly satisfactory', they suggested that it would be desirable to provide a separate kitchen with adequate sterilising equipment. There were only seven permanent members of staff, no qualified nurse or doctor to care for the babies and mothers in the hostel. The permanent staff consisted of members of the Legion of Mary. The Legion of Mary has told the Commission that up to 120 volunteers would have contributed two hours work every week. At the time there were 220 residents. The medical inspector noted that the policy of the Legion of Mary was to encourage mothers to go out to work, leaving their baby in the hostel in the hope that this would enable the mothers to keep their children. He reported that 'a considerable amount of money would need to be spent in repair, decoration, furnishing and suitable equipment before it could be considered suitable. The voluntary effort, beyond doubt laudable, in my opinion is unable to cope with the situation in a satisfactory manner'. He described the state of hygiene in the hostel as 'fairly satisfactory'; each baby had its own bottle. However it was not possible to encourage breast feeding if mothers went out to work.

21.121 Following this inspection, the department wrote to Regina Coeli asking it to arrange for 'a small deputation of the authorities' of the hostel to meet the department's
medical advisors to discuss measures to prevent infant deaths. In November, Dr Deeny reported that he had met representatives of the hostel and efforts were continuing to ensure that there was adequate medical and nursing care. In December a representative of the Legion of Mary informed him that the hostel had recently refused to admit three babies from the Rotunda because they believed that they were suffering from enteritis. These babies had died in St Clare’s hospital; a fourth child admitted with her mother at the request of the almoner in the Rotunda, had been removed to St Clare’s the day following her arrival and had died. At this time it would appear that discussions were underway about ‘the Medical Missionaries’ - presumably a reference to the Medical Missionaries of Mary\textsuperscript{43} - taking on nursing duties in the hostel. However Frank Duff claimed to ‘have a prospect of a team from the Richmond Hospital’ - he suggested that this arrangement ‘would be preferable as obviating two controls working in the same place, and also the question of accommodation’. In January 1947 Dr Deeny instructed a colleague to ‘Pl[ease] keep after this place’; he wanted a report within ten days. His colleague reported that Mr Duff claimed to have secured the services of a medical officer, who was a member of the Legion of Mary and a full-time voluntary worker. From the summer of 1946 the legion was sending reports to the department about babies admitted to St Clare’s from the hostel; they highlighted the number of these children who had recently arrived in Regina Coeli from Dublin maternity hospitals; these reports continued during 1947.

21.122 The department arranged to meet Frank Duff in July 1947 and again later that year; the primary concern was to confirm the appointment of a medical officer. Notes on children who were suffering from gastroenteritis indicate that the named doctor, who was a member of the Legion of Mary, was working at the hostel in the spring of 1947; however it is unclear how long he remained. In December it is recorded that Frank Duff had promised to appoint him as medical officer to the hostel. However there is a short note from Dr Deeny headed, ‘Regina Coeli Medical Appointment’, stating that he had discussed ‘this matter’ with the Archbishop of Dublin. ‘He himself felt that little could be done to improve this place’.

21.123 The department carried out an inspection on 30 July 1948. The inspector, who was shown over the building by Frank Duff, reiterated that there should be proper

\textsuperscript{43} A religious order founded in Drogheda in 1937.
medical and nursing supervision; there was none at that time. The doctor who had been expected to take up the position had left and was not expected to return. One of the ‘lady supervisors’ was being trained at Fairy Hill, which was described as an ‘open-air hospital’;\(^{44}\) following her time there she was planning to attend a course at the Rotunda; this had apparently been arranged by Dublin paediatrician Dr Robert Collis. The department’s medical inspector recommended that an architect should inspect the buildings and determine what repairs and reconstruction was needed. He indicated that the interior needed cleaning and painting and adequate heating, bathrooms and lavatories and a properly-equipped nursery needed to be installed. He also recommended the appointment of a visiting paediatrician; adequately trained nursing staff to supervise infants and infant feeding; proper beds, bedding and bed linen; adequate laundry arrangements and arrangements for the care of sick adults.

21.124 In his memoirs, Dr Deeny records that ‘At some medical meeting or other, possibly in the Royal Academy of Medicine’, Bob Collis said that the Regina Coeli Hostel was in a terrible state, that babies were dying there and that conditions were abominable’. Dr Deeny stated that he went to visit Regina Coeli to see whether these allegations were correct and he determined that enteritis was prevalent in the hostel. He commented that

‘Frank Duff resented any interference from anybody, was bound by the rules and regulations of the Legion which he had written himself, was a living saint, having devoted his life to this extraordinary mission. He turned off his hearing aid at meetings if he did not wish to agree to something...It was very difficult to come to any conclusion on what he was doing, but he did have babies with enteritis there. After my shouting at him, he agreed to allow me to help.

21.125 Dr Deeny’s secretary in the department organised ‘a whip-around’ and collected £25, which he used to persuade Frank Duff to set aside ‘a little room, which we furnished as a kind of quarantine station’. He arranged that every woman arriving with her baby would be placed in that room for five days. If the baby was healthy, mother and infant would be admitted into the hostel. He claimed that this isolation process ‘gradually cleaned up the place’. He also claimed that many of the infants

\(^{44}\) It was established by the paediatrician Dr Collis to provide care for refugees arriving in Ireland.
who were arriving into Regina Coeli with enteritis had been discharged from the Rotunda.  

21.126 When Dr Deeny informed the Minister of Health, Dr James Ryan, about Regina Coeli, the minister decided to pay a visit. Deeny described the hostel as pretty grim...Here and there, through those great empty workhouse wards, the women had made little private areas. An old bed, a cradle made from an orange box, a couple of other such boxes for a bedside table or a stool, a rag of a floor rug, pin-ups and holy pictures and a clothes line and this was their home.

21.127 He claimed that Dr Ryan promised Frank Duff £30,000 ‘Sweep money’ asking that each woman should be given ‘a decent cubicle, fix up the sanitation and the heating and so on’.  

21.128 A report of the consultative health council dated 3 August 1948 included details about infant mortality and facilities in Regina Coeli.  
For the year ending 31 March 1948  
Admissions (presumably of children) totalled 74  
Requiring hospitalisation 21  
Admitted to St Clare’s 10  
Deaths in hospital 16 (21.6% of total admissions)

21.129 Nine children died in St Clare’s, three in fever hospitals, three in St Kevin’s hospital and one in Regina Coeli. The cause of death listed for those who died in St Kevin’s was marasmus in two cases and malnutrition in one case. The report stated that they had failed to ‘trace’ the cause of death of the infant who died in the hostel. It noted that ‘A “Nursery” is available into which illegitimate infants are received, their mothers being accommodated in a special department. All babies under six months are isolated before admission’.

---

45 Deeny To Cure and to care (Dublin: Glendale Press, 1989) pp 96-7. The Commission cannot determine whether this is true.
46 Deeny pp160-161  If Dr Ryan visited Regina Coeli, he would have visited before February 1948 when the Fianna Fáil government was defeated in a general election. Deeny’s memoir was written many years later; he may be confusing some events; the promise of funding from the Hospitals Trust is recorded at a meeting in December 1948.
47 The consultative child health council was established in May 1948 by Minister of Health, Dr Noel Browne, to advise him on measures that would improve children’s health, and particularly measures that would bring about a reduction in infant mortality. These figures cannot be compared with the data in the statistical appendix which has been presented by calendar year.
21.130 A sub-committee of the consultative health council that focused on infant and child health in Dublin was chaired by the paediatrician, Dr Robert Collis. Most of their recommendations related to the general population. They emphasised the importance of breastfeeding, regular weighing of infants, artificial feeding when necessary and isolating infected infants. They noted that the death rate of children born to single mothers was more than three times the rate for ‘legitimate’ babies; this was a problem ‘to be faced resolutely if the general infant mortality rate is to be reduced’. The report examined conditions in institutions that accommodated unmarried mothers and their children. They described Regina Coeli as unsatisfactory; infant mortality was three times the rate in Pelletstown. The hostel was ‘lack(ing) almost every proper facility in regard to both nursing and structure’; it was utterly unsuitable for new-born infants. They claimed that infants in Regina Coeli were ‘not being properly cared for or adequately nourished at present. For instance from reports received we understand that babies have no suitable nursery; and that often tiny newborn babies are kept with their mothers in improvised cots and in crowded cold dormitories and are only fed 4 times in 24 hours’.

21.131 In 1947 Regina Coeli applied again for exemption from the requirements of the Registration of Maternity Homes Act 1934. The hostel had been sent a registration form but a woman, described by the department as ‘the nominal head of the Institution (I think)’ said that they were unable to comply with the requirements of this Act. The department referred her to the Dublin Corporation health department. Dr Deeny described the requirement that Regina Coeli should register as a maternity home, as ‘an excellent opportunity to enable us to achieve some of the improvements - very necessary - specified by Dr OS’.

21.132 Shortly after this Miss Litster noted that Frank Duff had agreed to apply to Dublin Corporation to register the hostel under the 1934 Act. She indicated that, if the hostel was to comply with the legislation, the essential requirements were the appointment of a visiting children’s doctor and trained nursing staff and the provision of equipment in the institution. She reported that Frank Duff hoped to secure the services of a second nurse who was a member of the Legion of Mary. Miss Litster suggested that it was important ‘that the proper conduct of the hostel should be secured within the constitution of the Legion of Mary, that is, by voluntary workers attached to the Legion’. She acknowledged that the hostel was ‘not an ideal home for mothers & babies. It has however since its inception,
``filled a want, and it does something which no other home in Eire succeeds in doing. It `\`keeps mother & child together'. The children in the hostel appeared to be healthy and contented. Their mothers clothe & care for them as best they can and were it not for the existence of the hostel these children would be for the most part in industrial schools. Separation of mother and child would be in most cases complete. The hostel has kept mother & child together and has saved the State the cost of maintenance of the children in Industrial Schools …The spirit of self-sacrifice and devotion which activate the Legionaries who work in the Hostel is to my mind the fine flowering of a selfless humanity.

21.133 Miss Litster was adamant that this was ‘not something which may readily be replaced by paid labour’. She advocated finding a compromise between the government’s requirements for professional staff and the Legion’s culture of voluntary service.

21.134 In December 1948 officials in the Department of Health discussed the registration of the hostel as a maternity home with representatives of the Legion of Mary. The department assured Frank Duff and his colleagues that the Minister (Dr Noel Browne) ‘appreciated the very important work’ and wished to ‘do everything possible’ to assist. However they reiterated that the hostel must have adequate medical and nursing staff. Frank Duff replied that all the work was done by voluntary staff and employing nurses or a doctor ‘would give rise to very considerable difficulties’. He would welcome an arrangement where nurses on the staff of Dublin Corporation would visit the hostel daily and ‘on request’. He gave a commitment that he and his fellow-workers would co-operate ‘in every possible way’ with nurses and doctors. Dr Harbison, Dublin Corporation superintendent medical officer of health promised that if that was done, he would recommend that the Dublin city manager would make an annual grant to the hostel, and the department gave a commitment that the Legion of Mary could apply to the Hospitals Trust for a grant to meet capital expenditure. They also suggested that Mr Duff apply to the Public Assistance Authority for a grant towards the running costs of the section of the hostel that accommodated destitute women. Frank Duff claimed that he had made many unsuccessful applications to the PAA but ‘it appears to him that the Board of Assistance was very much opposed to his efforts to help these women and children’.
21.135 Frank Duff wrote to the Archbishop of Dublin immediately after this meeting. Dr McQuaid appears to have been much more supportive of the Legion of Mary than his predecessor Archbishop Byrne. In 1942 he donated linen (no further details available) to Regina Coeli and the president of Regina Coeli thanked him: ‘it would have been beyond our power to secure such superb material, of which we stood in greatest need’. She also thanked him for his interest in the hostel. In December 1948 Frank Duff thanked him for the cheque that he had sent as a contribution to the cost of ‘re-conditioning’ Regina Coeli. On 16 December, shortly before the meeting with the department, the Archbishop had reported that ‘Dr Collis again insisted that Dr Spain and he were the only medical upholders of the Regina Coeli at that Council meeting and that he only drew attention to the defects of the place in order to get help for the hostel’. He suggested that Frank Duff should meet Dr Spain.

21.136 Frank Duff informed the Archbishop that ‘astonishing things took place at the meeting with the governmental deputation’. The officials all professed ‘their intensive favour for Regina Coeli and the work it does’. They suggested that it was the only institution of its kind in the world, making ‘an invaluable contribution towards the particular problem’, and it should be given financial aid. However they highlighted the hostel’s weak spot, the absence of staff with professional qualifications, and suggested that this adversely affected the attitude of the medical profession towards the hostel. The department recommended that the nurse who visited weekly should make a daily visit, and this would satisfy the medical professionals. Mr Duff told the Archbishop that these visits would not constitute an assumption of authority over the work carried out in the hostel, adding, ‘They (presumably the department officials) would also seek to provide adequate medical assistance’. He reported that the department had suggested that he apply for £10,000 towards the cost of improvements, and promised him that it would be granted. He also reported that ‘they would recognise us as qualifying for a grant under the welfare code of 50% of our annual expenditure’. This is not minuted in the department’s records; it would appear to be a reference to the proposal by the Dublin Corporation medical officer that he would recommend that the city manager should pay an annual grant to the hostel, but no amount or

49 Holles Street.
50 The consultative health council meeting.
51 DDA/AB8/b/XXI/79/12/13.
percentage as mentioned. Mr Duff told the archbishop that ‘the attitude of the four of them was delightful. It was not like a conference of officials but of very earnest Catholics’. He claimed that the officials insisted that Dr Collis did not represent them and he reassured the archbishop that ‘we are not abandoning our idea of getting regular nurses on the Regina Coeli staff, and we will take energetic measures in that direction’. He thanked the archbishop for permission to use his name ‘in the event of the going being bad’, though the need did not arise.

21.137 When the department approved capital expenditure for Regina Coeli some months later (see below starting paragraph 164), an official suggested that they should insist on Frank Duff agreeing to the appointment of a resident doctor and nurse, but that did not happen. In December 1949 Dr Deeny noted that a public health nurse visited Regina Coeli at least one a week ‘and oftener if she thinks necessary, so that there is some more care being given’.

21.138 In February 1949 the department contacted Dublin Corporation to inquire ‘on what grounds it was decided by the City Medical Officer’ that Regina Coeli was not to be regarded as a maternity home for the purposes of the 1934 Act. The Commission has not seen any record of a reply to this letter. A file headed ‘Hospital Statistics: List of Voluntary and Local Authority Institutions and Private Maternity Homes’, compiled by the Department of Health in approximately 1960 (it is not dated) lists Regina Coeli under the heading of ‘Voluntary Institutions’; it is listed together with voluntary homes for the elderly and on another list in the same file with the heading ‘Private Voluntary Institutions for the Elderly’. It is not listed among the maternity homes. There is no evidence that Regina Coeli was ever registered or inspected under the 1934 Act.

21.139 There is no indication that Regina Coeli appointed trained nurses from the ranks of its members. The Legion of Mary member who was being trained in nursing abandoned the effort, and Miss Litster reported that Frank Duff had decided ‘not to follow up this idea’; he hoped to identify one or more trained nurses who were members of the Legion of Mary. She reported that some attempts had been made towards re-organisation in the hostel; the dining and recreation rooms were being combined and the current dining room was being equipped as a nursery.

---

52 Institutions approved under the Maternity and Child Welfare Scheme could recoup 50% of approved costs, but they had to submit records of expenditure.

53 DDA/AB8/b/XXII/79/12/14.
21.140 The battle over medical appointments continued. In 1951 the department considered a report given to the Dublin medical officer, which has not been seen by the Commission. In reply, an official told the Dublin city manager that ‘in my opinion it was wrong that Mr Duff should dictate to the local authority as to the person who would provide their much needed service to the people under his charge’. It emphasised that the secretary of the Department of Health had agreed that the service should be provided by the Corporation’s Maternity and Child Welfare Section, by staff of that section ‘and not under any special arrangement as regards the appointment of a special doctor to meet Mr Duff’s convenience’. A subsequent minute indicated that the city manager ‘does not wish to pursue the matter any further in view of the difficulties raised by Mr Duff’.

21.141 By 1952 the Dublin public health department was arranging to hold a clinic in Regina Coeli under the maternity and child welfare scheme. An additional medical officer was appointed later that year; the duties included a weekly clinic at Regina Coeli. By March 1953, a total of 25 clinics had been held in Regina Coeli; they were attended by 2,091 women, infants and children. Women and children underwent medical examinations; and baby formula (for example, Cow and Gate, Farex, Bengers Food) and various vitamins and dietary supplements were distributed. The Dublin chief medical officer for maternity and child services told the department that ‘a very high degree of delicacy has to be observed in questioning mothers in this clinic, more particularly at the onset of our operations there, as any incautious handling would only negative our efforts at Child Welfare’. All staff were instructed ‘to tread very warily’. As some mothers were at work their children were brought to the clinic by other mothers. By this time, the children were being immunised against diphtheria and whooping cough. Some women in the hostel contracted TB and there are also references to women receiving a TB allowance.\(^{54}\)

21.142 When two members of the Legion of Mary who had worked in Regina Coeli were asked whether doctors and nurse ‘came in’ to the hostel, one replied that they didn’t; the second said that a doctor and nurse came on Wednesday; that was the practice when this woman began working in the hostel in 1962 or 1963. One woman noted that there were many children ‘with problems’ such as measles, anything contagious’. One suggested that the children of unmarried mothers had

---

\(^{54}\) This was almost certainly the Infectious Diseases Maintenance Allowance which was introduced by the Health Act 1947.
more medical problems than other women; she blamed this on poor nutrition during pregnancy, before they came to the hostel.\footnote{Graham ‘Unmarried Mothers’}

Deaths
21.143 There is no separate death register for Regina Coeli. Most deaths of mothers or children who were resident in the hostel took place in hospitals. The Commission has compiled a list of deaths, based on the paper records of a woman’s entry to the hostel. It records a total of 734 child deaths and 13 deaths of mothers. These records note the date of death, often the place of death, and the cause of death, although the latter is only available in approximately 40% of child deaths and a lower proportion of maternal deaths.

21.144 The records show the majority of deaths of women occurred before 1950. The cause of death is not recorded in most of these cases however most do not seem to be related to the pregnancy or birth. Three mothers died in the Rialto Hospital, a TB hospital, and one mother died in the Pigeon House – another TB hospital. One mother gave birth to stillborn twins in the Rotunda in 1942; she died there a few weeks later. In 1944, a mother who had been a resident of Regina Coeli since 1932 ‘got ill suddenly in dormitory and was anointed’. She was removed to St Kevin’s hospital and died there. A woman who was five months pregnant when she arrived in 1935 went to the Dublin Union some time later and died there. A woman was admitted in 1944, her child was placed with a foster mother by the CPRSI later that year. She went home but returned to Regina Coeli as she could not stay at home because the neighbours were suspicious. She left the hostel in December 1944 to take up indoor work. A later note recorded that the hostel was informed that she committed suicide by drinking a bottle of Lysol; her mother and father were told she died from natural causes and were not told about the baby. A woman entered the hostel pregnant in 1987 but there is no reference to the birth of the baby. She was found dead in a nearby street in 1992; her remains were buried in the ‘Alone’ plot in Glasnevin following her funeral mass in Church Street.

Deaths of children
21.145 734 children who were associated with Regina Coeli died. 68% of the deaths occurred in the 1940s; 335 children died in the years 1941-45. The number of deaths fell sharply in the late 1940s, in line with national trends and trends in other
mother and baby homes. 1949 was the last year when the number of child deaths was greater than ten. The last child death was recorded in 1983.

21.146 Most children died in Dublin hospitals; 19% died in Regina Coeli. St Ulan’s children’s hospital and St Clare’s a children’s hospital for infectious diseases that opened in October 1944 accounted for 30% of the total deaths. Almost one-quarter of the children – 23% died in either St Kevin’s hospital or in Pelletstown; 8% died in Cork St. or Clonskeagh fever hospitals. The high proportion of deaths in hospitals that treated infectious diseases shows that they were a major cause of child deaths in Regina Coeli

21.147 There are a number of instances of stillbirths and infants dying suddenly in the hostel. In 1953, an infant was ‘found dead in cot…No inquest necessary as it had heart trouble. Remains removed to the morgue’. In 1934 a woman ‘stayed in bed ill. When another resident brought her dinner in bed she said that her baby had been born. It was dead in the bed with her. Baby removed to Union. Mother attended by two doctors from Rotunda hospital. No inquest necessary as baby had been still born’. An infant whose mother came from England in 1945 having ‘got into trouble with an American soldier’, died in the hostel; the infant was reported to have had a bad heart. A child died in the dormitory in March 1945; the record stated that the infant ‘had been delicate from birth’. Gardaí were called when a baby was found dead in a cot but ‘after examination were satisfied baby died from natural causes, was delicate and wasted’. A baby was found dead in bed beside her mother in 1942: ‘though she had a cot, she did not use it, no inquest’. A three-month old baby was found dead in 1945 as the mother was carrying it to hospital. ‘Baby taken by Guards to morgue on 4/12/1945 for post-mortem. No inquest.’ When a child was found dead in his cot in Cedar Room in 1951 the Gardaí were notified and his body was removed to the morgue. However no inquest was needed. Another child of this mother was taken to Clonskeagh fever hospital in 1956 suffering from whooping cough and died of bronchial pneumonia. A three-month old baby died, in 1942, in a ‘weaning fit’. The mother gave her infant an elaborate funeral with white plumes and a mourning coach. One of the last children’s deaths in 1964 was the eleven-year old grandson of a widow, who had come to Regina Coeli two years earlier from England, with him. He died in the hostel, and his remains were taken to St Kevin’s hospital; no cause of death is recorded on the hostel records.
Accidents and Abuse of Children

21.148 The cases cited above indicate that the hostel called the Gardaí in cases of possible infanticide. The record relating to a mother in 1939 state:

Baby was found dead in bed beside [mother] next morning…though [mother] said it was alright at 7.30pm, there was to be an inquest, coroner satisfied with his report. Doctor advised that mothers should not keep babies in bed with them. Guards did not attach importance to tightness of baby's clothing. [mother] was quite unperturbed and sisters were not satisfied that she was entirely innocent.

21.149 The fact that children lived in this hostel for long periods, in a large building that was never designed to reduce the risks of accidents, and the large numbers of active children in the hostel undoubtedly led to an increased risk of accidental injury. There are references to burns and scalding by boiling water. In 1936 one girl ‘Got a very bad fall in the yard behind the big house’; a boy ‘crushed his finger under a heavy rock in the garden. Had to get his top finger amputated’. In 1940, a small boy ‘had head stitched about…after blow of stone thrown deliberately’ in 1945. In 1955 a two-year-old boy was admitted to St Kevin's hospital with severe burns on his back. Another fell off the ‘Big House staircase’ in 1955 and was removed to the Richmond hospital. A child with a head injury was admitted to Richmond hospital after a fall in 1958. A boy who had been in the hostel since he was four years old injured himself when he was eleven; he ‘fell over bannisters in Rosary House and fell from top to ground’. He was detained in the Richmond hospital. A boy who arrived in 1942 suffered from scarlet fever and measles; he received stiches to his head when another boy threw stones at him, and he broke his arm.

21.150 In 1943, a baby boy ‘fell into a pot of boiling water and died from his injuries’. Another baby was ‘scalded by hot water on legs while mother was working in kitchen’ in 1949. Yet another baby ‘burnt his hands on fire’. A baby who was 22 months old in 1945, ‘fell into a pot of boiling water left on floor in cottage’. He was removed to the Richmond Hospital and died as a result of his burns. In 1953 a one-year old girl ‘was scalded by falling tea pot’. She was admitted to the Richmond Hospital and died four days later; an inquest was held into her death. In 1960 a press fell on a girl; she was admitted to the Richmond hospital with a broken leg and required stitches to her head. This child was readmitted to the Richmond the following year with burnt hands.
21.151 There are also reports of children having been abused or neglected. Some reports refer to the mental health of the mother when the incident occurred. A mother was reported in 1957 to be ill-treating her child: ‘was beating it and not giving it the bottle properly’. A mother came to Regina Coeli in 1943 with her child. Her record states ‘[…] and baby to hospital. […] called without baby on 8/12/1943. Said she had been to indoor work. Women suspect she had abandoned the child’. A mother arrived with her baby girl in 1939; her baby became ill and was admitted to Temple St hospital. A nurse later phoned for details of the case as the child was very neglected. It was decided to contact the NSPCC about the case. The mother was suspected of not feeding the baby properly:

- Returned to hospital and then returned to hostel. Has bronchial trouble and developed whooping cough. Sisters noticed [mother] acting rather peculiar. [Mother] refused to take baby to St Ultans. Dr [the dispensary doctor] saw it three times but [mother] would not do what he ordered. [Mother] created a scene in GPO. Guards got in touch with Catholic Girls Society who had her sent back here. Baby taken from her that night lest she should harm it. Both went to the Union. Dr […] of the Union said she was very troublesome and he was thinking of committing her to Grangegorman

21.152 A woman who first entered Regina Coeli in 1939 and later married was summoned in December 1956 for neglecting her children. A woman came to Regina Coeli in 1933 with her eight-day old baby. ‘Attempted to strangle her baby on 13/6/1933 so the sister sent for her mother who took her home. Mrs C took charge of the case. Did not get imprisonment through her influence.’ A woman came to Regina Coeli, seven months pregnant in 1939. Her baby was reported as seriously ill in the infirmary with measles the following year and died. She returned pregnant and was re-admitted in 1947. She left with her baby a week after giving birth. A detective contacted the hostel because a baby had been abandoned in Temple Bar that evening, and the baby’s blanket had the initials RCH (Regina Coeli Hostel). A woman came to the hostel in 1943 eight months pregnant. She returned following the birth with her baby. Her record stated ‘Is neglectful of him. Baby sent back to Rotunda and then transferred to Clonskeagh Hospital’; he died there. A woman who had arrived in 1942, four months pregnant, was reported to be ‘neglecting baby. She is a bit mental’. Mother and baby were admitted to the Dublin Union; the baby died the following day.
21.153 The records relating to a woman in 1947 state that a baby who was taken out of the hostel in 1947 to return to Kilkenny. ‘Notified by Garda had been abandoned by mother in Temple Bar previous evening at 6.20pm. Identified by laundry mark on our blanket. [Mother] Taken to St Kevin’s by Garda.’ A baby daughter of a mother who came to Regina Coeli in 1936 was reported to have died in the Adelaide hospital later that year. An inquest was held as it had just been brought to Hospital. Mother and father are street singers. Baby died of pneumonia. Coroner remarked on loss of weight as checked with feeding list here and its sudden development of pneumonia. Sr. O appeared for the Hostel. Verdict: death due to malnutrition through no fault of mother.

21.154 In 1946 a woman came to Regina Coeli with a seven-week old baby who had been born prematurely in Pelletstown. She was brought by an official from St Kevin’s. Dr Coffey\textsuperscript{56} phoned - admits baby is in very bad condition and has notified NSPCC and Bridewell that [...] insisted on taking child out, and she has undertaken to relieve us of all responsibility in event of baby dying. Baby admitted to St Clare’s on 5/4/1946. It died on 9/4/1946. Inquest held in St Clare’s 18/4/1946. [member of Legion of Mary] attended. Coroner gave verdict that baby died from natural causes but police later informed [...] there might be proceedings taken against the girl. She was interviewed at Bridewell the next day and told not to leave Dublin pending decision of Attorney General.

21.155 Another case records that: Guard called 3/2/1941 as baby found at [...]. From the description given it is surmised it is [woman who had been in Regina Coeli’s]. Child was in a pram with a brown blanket and quilt on it. There was a hot water bottle and feeding bottle in pram. Reported next day child had been placed in Union…Was charged on 21/2/1941 and committed to Pelletstown on a year’s probation.\textsuperscript{57}

21.156 In December 1944 it was reported that a woman who arrived in Regina Coeli some months earlier with her baby, ‘had beaten the child very severely on previous days - possibly due to her own ill health. Baby admitted to St Ultans on 25/10/1945 -

\textsuperscript{56} A paediatrician attached to the Dublin Union.

\textsuperscript{57} The Commission is not aware of any legal basis for a committal to Pelletstown. It is possible that the woman agreed to go there.
both lungs affected. [baby] died 6/12/1945 - both lungs had been collapsed.' There is no reference to a Garda investigation or an inquest. The mother was described as being in ‘better frame of mind now. More reconciled about baby’s death.’

21.157 There are also allegations that Regina Coeli neglected children who were in the hostel’s care, particularly with respect to infant feeding. A baby was admitted from Regina Coeli to St Kevin’s and then sent to St Clare’s in 1946: ‘St. Clare’s phoned here next day to say baby had been admitted the previous evening in a dying condition and asked why it was left so long.’ In 1937 it was, ‘Reported by Mrs Clarke, NSPCC that […] had complained at the office that the baby was neglected here. Mrs Clarke was shown the weight chart for the feeding kitchen which showed it gained weight until the week before it went to hospital. Mrs Clarke settled the baby in High Park on 11/6/1938.’

21.158 There are further references to foster mothers being neglectful of babies in their care. A woman came to the hostel with an eight-day-old baby in 1946: ‘Reported as giving child to […] around June, 1946. Child described as being ‘badly neglected…as baby was very ill decided to take it to hospital before admitting her here…baby looks very neglected and very poorly clad’. The mother was readmitted to Regina Coeli, her baby was admitted to St Clare’s.

21.159 The records on a woman who came to Regina Coeli five months pregnant reported that in January 1942 ‘she had got baby settled with foster mother in Wicklow…Reported 23/4/1943 baby was very bad in Union…Reported 23/7/1943 baby was blind from neglect by foster mother. Baby had died on 7/4/1944’. A mother came to the hostel in 1945 with an eleven-month-old baby. ‘Had been living with her uncle. Says the aunt ill-treated the baby…The child’s body is bruised from the uncle beating it’.

Feeding/Nutrition

21.160 The institutional records mention a ‘feeding kitchen’ in Regina Coeli. A mother in 1934 ‘was spoken to for having a bottle of cold milk which she proposed to heat under the tap and give the baby during the night. Left as a result with baby’. There are some references to breastfeeding: in 1932: ‘As it was found out that she was breastfeeding [a child aged almost three years] at night it was arranged to leave the child in […] at night. [Mother] objected at first but gave in’. [This was
presumably in order to wean the child off breastfeeding]. The various health reports and inspections during the 1940s contain references to inappropriate feeding, and this also features on some of the individual records. A woman entered the hostel in 1935 eight months pregnant. She returned with her baby having given birth in the Rotunda. The baby, described as ‘very delicate’, was admitted to St Ultan’s children’s hospital at four months, and returned to the hostel shortly afterwards. The file noted ‘Baby very ill due to faulty feeding at night. Found on 17/7/1935 that she had equipment in a case to feed the baby at night. […] was notified as Dr […] had forbidden such feeding. [Mother] was offered choice of Union or courts. Refused to go to either. Taken to Union’. A later report noted that the mother was in the Dublin Union; her child was in Pelletstown and died there. A woman came to the hostel in 1941 with her 11-day old baby, who died. The record noted that ‘[…] had been feeding the child in hospital but denied that here and had him on a bottle. Was only 4 lbs weight’. A woman was admitted when pregnant, and returned having given birth in Holles Street in June 1942. A report five days later noted that ‘she was very troublesome in hospital, refused to nurse the baby and it had to be put on a bottle.’

Restructuring the hostel - creating family units

In 1949, the Department of Health forwarded an application to the Hospitals Commission for funding to carry out improvements at Regina Coeli Hostel. The application proposed to segregate mothers and children by the age of the children, providing accommodation that was ‘appropriate to each age group’. It proposed to convert a ground-floor refectory to accommodate mothers and babies from birth to six months. When the Hospitals Commission inspected Regina Coeli there were 19 mothers and babies in this category. They noted that ‘the mothers and infants using it will both sleep and spend most of their day’ in that room. A first floor dormitory would be converted to provide sleeping accommodation for mothers and babies aged from six months to two years, and the second floor would provide similar accommodation for mothers and children aged from two to four years. At this time there were 30 mothers with children aged from six months to two years, and 26 mothers with children aged from two to four years. The work in these dormitories involved painting and decorating and the installation of a central pot-stove in each dormitory. Work had already been completed on the ground-floor dormitory, but the other dormitories were described as ‘very dilapidated looking and depressing in contrast’.
21.162 The most ambitious improvements planned were in the accommodation provided for mothers with children who were over four years of age, who were described as ‘a growing problem owing to the age of the children and the fact that some of the mothers go out to daily work’. The legion had settled some of these ‘small family units’ in cottages at the rear of the hostel. Frank Duff’s 1950 memorandum indicated that these early units were ‘defective from many points of view, notably in regard to the congestion caused’. The application to the Hospitals Commission proposed to reconstruct the dormitories in a vacant building, dividing each dormitory into ‘six cubicles and a common room…with an open fireplace for cooking proposed and an adjoining sanitary annexe’, with a washroom, toilets and bath. The plan was to reconstruct nine dormitories to provide 54 units for mothers and children. These units were to be organised on the basis that most women went out to work, but at least one woman in a unit of six acted as housekeeper and looked after the children.

21.163 The Hospitals Commission reported in favour of these proposals. They noted that the family unit would be ‘comparatively inexpensive and…very necessary’. Much of the work was being carried out by members of the legion; the remainder was being carried out by direct labour, ‘on a day-to-day basis’, so the main cost related to materials. However they highlighted the need for repairs to the roof, gutter, stone stairs and the main fabric of the building, and absence of a fire escape. Given these costs they recommended that the work should be limited to five dormitories, creating thirty family units, which would meet current needs. There were 26 mothers in Regina Coeli with children aged four years and older.

21.164 When the Hospitals Commission submitted their report to the Department of Health the department carried out its own inspection. The medical inspector endorsed the recommendations of the Hospitals Commission. He described the proposed improvements as a very serious approach to the “unmarried mother and child problem” However he described the overall condition of the building as ‘far from satisfactory’ because of lack of funds. The bed clothing was ‘dirty’; the hostel had sufficient blankets but sheets and bedspreads were in short supply; beds were in need of replacement and there was also a need for new cots. The department inspector was informed that the laundry was carried out in St Kevin’s - the Dublin Union - but he claimed that ‘the bed clothes appeared not to been washed for quite a long time’, and some of the sheets and pillow cases were made from disused
He suggested that the laundry facilities should be improved, perhaps there should be an electric washing machine for babies’ nappies. The ‘Grey Building’ which was being converted into family units had been vacant for some time; the floors were in need of repair and ‘appeared to me to be dangerous’. He noticed water coming through the roof. A later departmental memorandum commented that ‘There does not appear to be much point in giving a Grant for the rehabilitation of a building if the leaking roof of the building is not also repaired’.

By the end of 1949 the department reported that the chimney and roof were being repaired, and work was advancing on the family units. The inspector commented that ‘it looks very neat and clean and comfortable. The residents have a common sitting room which is also very comfortable’. He inspected the beds and he reported that the beds and bed linen were ‘not very clean or in good condition, mattresses are also short’. Some of the Legion of Mary volunteers informed him that they needed ‘½ ton coir and 1000 yards of ticking, 500 sheets and 500 blankets’. This purpose of the department’s visit appears to have been to determine the final cost of the work.

A report by the Hospitals Trust records a grant to Regina Coeli for capital expenditure, amounting to £10,830; the only description given is ‘improvements’. The amount was greater than the £10,000 that was originally approved; the additional money was provided to complete the work on the western block. However the legal advisor in the Department of Health had queried whether Regina Coeli was eligible for this funding, because, under the Public Hospitals Act 1933, eligibility of mother and baby homes for funding was confined to institutions for mothers and children who were under five years of age. The department decided that a request for additional funding, to reconstruct another disused wing which would cost approximately £12,000, should be rejected. The officials recommended that any further work of this nature should be supported by the local authority, not by the Hospitals Trust. The Regina Coeli records suggest that each of these ‘blocks’ (Frank Duff’s word) had a name: St Fidelma’s Unit; St Ita’s Unit; Cedar Room; St Leila’s; St. Mellas; St. Aideen’s; St. Dympna’s; St. Brona’s; St. Nessa’s, St Eithne’s. It is not clear from the description of these units whether the

60 Hospitals Trust, Irish Hospitals 1930-1955 (Dublin 1956)
mothers and children ate in these units or whether they ate in a larger communal
dining-room.

21.167 In 1950 the county manager of Tipperary South Riding contacted the Department
of Health to inquire about Regina Coeli because he was considering sending some
mothers there. A senior official in the department informed him that the Committee
on County Homes recently visited Regina Coeli and they were ‘very much
impressed by it’. He stated that
The Department is not officially sponsoring Regina Coeli. We are however
watching the experiment very very carefully and it may transpire that the
Regina Coeli are on the right lines in their handling of this very difficult
problem. We do not openly send girls to Regina Coeli but if one or two are
sent from different counties we could watch the position and see whether it
should be encouraged.

21.168 There is no indication that South Tipperary or any other local authorities sent
women to Regina Coeli and it appears that the department’s enthusiasm for the
Regina Coeli approach did not persist. A memorandum in December 1951 noted
that the members of the inter-departmental committee on the reconstruction of
county homes who visited Regina Coeli
were favourably impressed by the excellent spirit of the members of the
Legion of Mary and by the pleasant relationship which exists between the
voluntary workers and the residents. The atmosphere of the Hostel was
considered to be in many ways superior to that of the usual institution, from
the point of view of the happiness of the residents, but the members of the
Committee were unanimously apprehensive of the changes that must take
place as the children grow older. This aspect of the scheme was mentioned
by the Committee members to Mr. Duff, but, while expressing himself as
having no fears for the future, he did not explain how the difficulties referred to
would be overcome.

21.169 The hostel had a close, if informal, relationship with Dublin Corporation, and it was
routinely supplied with equipment that was being discarded by St Kevin’s hospital
and replaced with new items, including used sheets, towels, kitchen equipment
and furniture. This suggests very minimum standards for such items applied in the
hostel. The Department of Health paid the ESB bill.
21.170 In 1955 the Dublin Board of Assistance contacted the Department of Health in relation to a proposal by Regina Coeli to rebuild large sections of the former North Dublin Union workhouse, at an estimated cost of £200,000; £70,000 would be spent rebuilding the Morning Star Hostel (for men), the balance would be spent on Regina Coeli. It was anticipated that the money would be provided from the funds for improving county homes. In November 1956 a staircase collapsed in the hostel (it is unclear whether this was in the section that accommodated unmarried mothers and their children), and some of the voluntary workers, members of the Legion of Mary, were injured. The following year an architect’s report concluded that although measures might be taken to make the building less dangerous for some time, ultimately it would be necessary to demolish most of the building.

21.171 By 1963 the survival of Regina Coeli was in jeopardy. The Minister for Health (Seán MacEntee) stated that it would be ‘a grave misfortune’ if the hostel could not survive, noting, correctly, that it was ‘a feature of the Social Services of Dublin which would be irreplaceable by other methods’. During the summer of 1963 two city-centre tenements collapsed with the loss of a number of lives. Dublin Corporation carried out emergency inspections of city tenements, and other vulnerable buildings, including Regina Coeli. The Dublin Health Authority condemned the building as unsafe, and ordered the evacuation of the 250 residents. They offered the Legion of Mary the former Crooksling sanatorium in north Dublin as an alternative hostel. Frank Duff resisted the proposal to close the hostel, and a compromise was reached. This involved demolishing part of the building, the east block, and the erection of chalets to provide temporary housing. At the time there were 54 single mothers and 90 children in the hostel.

21.172 This was only an interim solution. In May 1965 the secretary of the Department of Health contacted the Dublin Health Authority about the need to rehouse the families in Rosary House (West Block). ‘It is understood that your authority had been in touch in recent months with the Legion of Mary concerning the number of such “families” for which the health authority should make provision in the proposed new accommodation’. The letter emphasised that ‘in view of the structural condition of Rosary House, the Minister is most anxious that this building should be evacuated at the very earliest opportunity’. It suggested that the residents should also be rehoused in temporary chalet accommodation because the department was uncertain as to the future requirements for the facilities.

61 Cork Examiner, 5 August 1963
provided in Regina Coeli. It indicated that plans for the building of new units at Regina Coeli should be drawn up having taken account of the demolition of Rosary House.

21.173 In 1966, the Dublin Health Authority outlined proposals for the accommodation to be provided in the renovated Regina Coeli for ‘elderly ladies and unmarried mothers’. It would comprise 79 bedrooms and ancillaries for elderly ladies and units for unmarried mothers comprising of 44 beds in total. The proposed ‘family units’, designed for the mothers and children, would consist of 11 double units, with 11 bedrooms, a toilet, kitchen and living quarters and one washroom per unit. The estimated cost was £71,000, including fees for architects and surveyors. A note to the Dublin Health Authority from the Department of Health stated that built-in wardrobes ‘though considered desirable, may have to be reconsidered on the grounds of economy’ and ‘wash-hand basins may not be deemed necessary in bathrooms as they are being provided in each bedroom.’

21.174 The 1960s was a time of high price inflation. In February 1967 a Department of Health file noted that the plans submitted for the family units, old ladies units, kitchen and dining hall had been examined:

In the Family Units a mother and child have been allocated a bedroom of 120 square feet. A cubicle of 60 square feet has been allocated for each of the Old Ladies. A new Dining Room to serve 120 people (children will be catered for at a separate setting) is based on 12 square feet per person. This is a reasonable figure. The new Units provide accommodation for 167 people and the estimated cost of £156,000 gives a cost per person of £939 which is not unreasonable in present day figures.

21.175 The plans submitted had suggested that the grounds should be landscaped by patients and staff of Grangegorman hospital (St Brendan’s mental hospital), presumably as a means of reducing the cost. However the author of this report wanted to include an estimate for lawns etc:

At present the site is in an appalling condition and it would be a mistake to erect new buildings without allowing sufficient site work to show the buildings off in a proper setting. I think this is very important at Regina Coeli which has visitors from all over the world due to the widespread work of the Legion of Mary.
21.176 The rebuilding took two years longer than the time stipulated in the contract. Part of the delay was attributed to a prolonged cement strike. In 1973 the total costs were estimated at £362,000; all but £10,000 was covered by a loan taken out by the Eastern Health Board. In 1977 the final cost was estimated to be £365,000. It would appear that work started in 1979; half the cost was borne by the Hospital Trust Fund; the other half was borne by the Eastern Health Board, but financed through the state's Local Loans Fund.

Alternative housing

21.177 One recurring issue for Regina Coeli was the difficulty of finding alternative housing for mothers and children who had been in the hostel for some time and should leave. In 1950 Frank Duff noted an imperative need for this, especially in cases where the mother had married. He noted that, ‘thanks to the good offices of Mr […] of Dublin Corporation’, they had secured housing for one of the two women who had recently married and was setting up home with her child and her husband (not the father of this child). He also wanted some form of hostel that would accommodate the boys raised in Regina Coeli when they became older. He returned to this request in the 1960s, when the hostel was threatened with closure, asking that the mothers and children should be housed by Dublin Corporation but there was an acute housing crisis. Homeless families were living in squalid accommodation in the former Richmond Barracks and Dublin Corporation was giving priority to families with four or more children, so that request was unlikely to be met.

Marriages

21.178 In 1950 Frank Duff highlighted the fact that many women who were in Regina Coeli with their child later married. He claimed that marriage had eased ‘the accumulation of babies’ in the hostel. Some mothers married the father of their child, which he claimed had ‘a surprising angle’ as the marriage was not in prospect when the woman had entered the hostel. He claimed that ‘normally the father would have evaded responsibility’ but in a considerable number of cases the man is subject to second thoughts. He claimed that a very large number of marriages had taken place from the hostel and that many women had married men who were not the father of their child.

The men in question have shown an almost universal readiness to accept the child which was not their own - some took on more than 1 child - not in a
single case known to the Hostel has the child been under disparity as compared with children subsequently occurring in that family. He claimed that in several cases the adopted child was ‘the man’s favourite’. Other women had returned to their family home with the child.

21.179 The case records confirm that marriages did take place. A woman was admitted to Regina Coeli with a baby who died. She returned in December 1952 and her daughter was born two months later. In 1956 she married ‘a legionary with his own home to whom she had been introduced by the Hostel’. She collected her daughter and they moved to her new home in Drumcondra. A woman arrived to the hostel, pregnant in 1950. She went on to have three children while resident there. ‘Arrangements were set on foot to bring about a marriage between […] and a Limerick man,...who applied for a wife in August, 1954. There was some correspondence and interchange of photograph.’ A woman became resident in the hostel with her son in 1932. ‘About September 1940 a man called - was anxious to re-marry as his wife was dead. Had good home in […].’ He was introduced to a woman in the hostel. They married and she and her child went to live in his house. Another record noted that ‘Efforts are being made to bring about a marriage between […] and [an ex Morning Star resident].’ They married in 1956. A woman married a man who was deaf and non-verbal (described in the records as a deaf mute) who was resident in the Morning Star hostel in 1948. In 1939 a resident married a widower who had called looking for a suitable wife. He had three children the eldest of whom wrote to the hostel to say thanks ‘for sending them their new mammy’. The records show two marriages between residents of Regina Coeli and Morning Star Hostel in the 1950s and one in the 1960s.

**Work**

21.180 Much of the work in Regina Coeli was done by volunteers. The Legion of Mary informed the Commission that up to 120 workers would have carried out two hours a week of voluntary work in Regina Coeli. There are references to women leaving Regina Coeli (sometimes for a number of months) to work while other women in RC minded children. The records examined by the Commission show that the staff and other residents facilitated women going out to work and this was aided by other women often minding the women’s children while they worked. However, if the mother was seen not to be playing her part in looking after her own child this would be noted and the arrangements permitting the woman to go out to work and leave her child would be reviewed and perhaps changed. Some mothers worked
in the hostel, though much of the work was carried out by voluntary workers who were members of the Legion of Mary. There are references in the files to women going ‘on sticks’ - if she had not secured outside employment. Finola Kennedy, Frank Duff’s biographer, in her evidence to the Commission stated that he (Frank Duff)...could see women... paying their way, you know. None of you probably remember, but you could get these little bundles of sticks. The men might chop them if it was a big piece of wood and the women might bundle them’. These bundles of sticks were sold by neighbourhood shops; they were used as kindling for fires.

21.181 Most of the women who worked outside the hostel were employed in service jobs, in hospitals and other welfare or commercial institutions, though some women worked as servants in private homes. In 1951 Frank Duff mentioned that a number of women were working in the Chest Hospital (St Mary’s) in the Phoenix Park. He also noted that the employers of women who worked as domestic servants in private homes did not always know that they resided in Regina Coeli. In 1932 a woman was hired as a domestic servant, ‘was there for a short time, her baby was minded by one of our women’. A woman in 1952 ‘went by permission to work for two weeks to former mistress’. In 1934 a woman 'went back to indoor work, baby minded here'.

21.182 Two former volunteers said that women worked in ‘the Richmond hospital across the road, Jervis Hospital, there were several restaurants...And they could get like domestic work or like waitressing work, a lot of them were maids in the hospitals and stuff like that and some of them would be servants in big houses and stuff like that. One of the mothers would, they would arrange between them you know between the five or six mothers, that one of the mothers would stay at home and look after the children of all the mothers and all those mothers would pay that mother and that’s how they all made their contributions, they were equal'.

21.183 These child-minding arrangements did not always work smoothly. One woman who got a job as a live-in domestic servant left her child in Regina Coeli. The record shows that ‘it became difficult to get girls here to mind the baby as [...] does not visit the child, get clothes for it or pay for its minding.’ In 1937 a woman was recorded as bringing her baby with her to work. ‘She said that she did not intend to

---

62 DDA/A88/b/XXI/79/12/19 (1951).
63 Graham, 'Unmarried Mothers'.
do anything with baby but could not get it minded here while she works’. In 1935 a woman who got a job as a caretaker left and took her son with her.

**Finances**

21.184 Regina Coeli was heavily reliant on voluntary contributions and the voluntary work of Legion of Mary members. Finola Kennedy refers to ‘bazaars, flag days, Rosetta Days, when paper flowers were sold, Beetle Drives, and even a special night of greyhound racing at Shelbourne Park stadium’, plus financial contributions from W. T. Cosgrave, his sister and Dr McQuaid.\(^6^4\) The hostel also benefited, as has been described, from various forms of support given by Dublin Corporation. Frank Duff expected all men and women who lived in Legion of Mary hostels to make some financial contribution. In 1950 he stated that

None of the services of the Hostel were supposed to be provided free. In fact it has always been a cardinal point...that as far as possible our residents should be given the impression that they are more or less paying their way. This is a point of importance when there is question of morale. But at the same time the charges which are made are very small, bearing no relation whatever to the things that they receive. Nevertheless they work in the desired way. The basic charge in the Regina Coeli is sixpence a day, which includes breakfast and supper and all the general amenities. The charge for the mid-day meal I have already specified. For a baby up to six months of age there is no extra charge. After that age the sum of one shilling per week is levied in respect of each child.

As to the manner of meeting the foregoing charges: some of the girls have petty resources which are sufficient to cover what they have to pay. Then it is more than easy to secure outdoor work for any girl capable of performing it. In fact our problem is that we are not able to meet the demand for it. In general this sort of work is highly paid. In third place for those who are for one reason or another incapable of providing for themselves in the manner aforesaid, we have a work system in the Hostel which meets the gap between what they have and what they have to pay.

It is hardly necessary to mention that the receipts from all the foregoing avenues fall far short of the expense of maintaining the Hostels, in spite of the fact that all our labour is voluntary. There is not in the entire system even one paid worker. The balance of the expenditure is provided by all sorts of

\(^{64}\) Kennedy *Frank Duff*, p. 93
expedients - an annual Flag Day, a system of penny a week collections, whist drives, etc. And nowadays an occasional legacy is beginning to trickle in to us.

21.185 Although Regina Coeli was designed to care for destitute women, some of the women paid for their upkeep. There are references to 'has money', 'can pay, 'mother will be responsible for payments'. In some instances the exact amount that a woman paid on entry is recorded, though it is not stated how long she would be staying. It is noted that a woman who arrived in 1939 recorded 'will pay £5 now'. In 1942 a woman 'has £30 which she is to hand in'. In 1942 a woman came to Regina Coeli and gave £2. In 1943 the entry notes that the Red Cross would pay for a woman and her daughter. In the same year the CPRS took responsibility for paying for a mother. In 1944 a woman was admitted to the hostel seven months pregnant. The record of entry stated that the manager of a bank would guarantee payments. In 1945 a woman who had employed a resident in Belfast as a domestic servant said that she would send payment for her in Regina Coeli. In 1953, a resident was warned about irregular payments. She tendered 7s 6d, which was not accepted, and she was told to leave two days later. She 'went on that date with baby to St Kevin’s as casuals'. In 1953, a woman who had previously been in Sancta Maria hostel came with a baby girl; the records state that Sancta Maria would pay for her. In 1957, the entry card for a woman says that the ‘County Council will be responsible for her payments'. One entry also states that, if a resident has sufficient funds to stay elsewhere, she must leave. A woman entered the hostel in 1990. She paid £6 for a one week stay and was given provisions. As has been described above, in some cases the father of the child paid towards the cost of maintaining mother and child in the hostel.

The Later Years

21.186 In the early decades of the hostel (1930s-1960s) the majority of entrants were unmarried mothers who were coming to the hostel either pregnant or with their small babies, often because they had no-where else to go. From the 1960s onwards the circumstances of the women entering the hostel changed and some women sought entry because of domestic violence, homelessness or drug addiction. In 1978 the Federation of Services for Unmarried Parents and their Children sent a questionnaire on housing to member agencies. The eighteen agencies that replied recorded that 184 clients sought assistance with housing over a four-week period. The majority were pregnant women; 63% were leaving
home; 24% were leaving privately-rented accommodation. The Federation commented on the low instance of forward planning by mothers. Most agencies helping with housing were in Dublin, but more than half of their clients came from outside Dublin - so the pattern of pregnant single women coming to Dublin, which was identified in the 1920s, continued. The Federation concluded that there was 'a high incidence of housing breakdown' when a single woman became pregnant.

21.187 Regina Coeli continued to house significant numbers of mothers and children although the quality of accommodation was poor. There was a second spike in the numbers of children in the hostel in the early 1980s. By this time many single mothers and their children went to Regina Coeli in the belief that this would help them to secure local authority housing. In 1980 the Federation of Services for Unmarried Parents and their Children reported that housing was the primary concern of 53% of first-time callers to the Federation; 7% of these callers were then living in Regina Coeli. In 1983 a woman was referred by Brú Chaoimhín (Cork Street Night Shelter) where she had been staying for seven weeks; she was waiting for council housing. A woman who arrived in 1980 with two daughters, aged 13 and 11, had been living in England for 18 years. She returned to live with her sister in Dublin in 1979 while her brother-in-law was in prison. When he was released, 'He threw [...] and the girls out'. She and her daughters were in Regina Coeli for nine months; she then moved to a Dublin Corporation flat in Ballymun.

21.188 Although public attitudes towards unmarried mothers had changed, some single mothers continued to encounter opposition from their families, and family tensions inevitably escalated in cases when a mother and her child(ren) were living with family members, often in small and potentially overcrowded homes. One mother of three who arrived with her children in 1982 had been staying in the homes of her mother and her sister. A mother of one had been living with her parents but they had had a row and she could no longer live in the family home. Another woman was asked to leave the family home at short notice in 1987; she moved into a Corporation flat some days later. These family tensions persisted until the end of the century. In 1993 a woman who had planned to place her child for adoption, but had changed her mind, came to Regina Coeli, while waiting for local authority housing. ‘Parents put her out and do not want to know anything about the baby. Nuns who were looking after her are trying to get her a flat in Dublin where she is doing a FÁS course’. The parents of one woman who arrived with her child in
1998 were separated. She had tried to live with her mother but they did not get along. She moved into her father's flat when he was away but 'no room now'.

21.189 Regina Coeli also provided emergency housing for women who were separated or had been deserted by a husband or partner. One woman arrived from England with her son because her partner was in prison. A pregnant woman arrived in 1981 with two children, having apparently been deserted by her partner, a professionally-qualified man of African birth. Her older children were born while she was in Pelletstown. An eighteen year old who had eloped to England at the age of sixteen was brought to the hostel with her child by a Dublin priest. It was reported that her husband had been beating her since their marriage.

21.190 The profiles of the mothers and children who were in Regina Coeli from 1930 to 1998 reflect the elements of continuity and change in the history of single mothers and their children, in twentieth-century Ireland.
From the institutional records, the Commission identified 5,631 women who were admitted to Regina Coeli in the years 1930 to 1998 and are within the Commission’s Terms of Reference. Information relating to date of admission was available for 5,616 women (99.7% of admissions). The majority of women (71%) were admitted prior to 1960. Admissions increased from 16 women in 1930 to 136 in 1933; from 1933 to 1939, 129 women on average were admitted annually. Admissions began to increase again in 1940 and peaked in 1942 when 290 women entered the hostel. The years 1940 to 1948 were the busiest period; 1,926 women, over one in three of all admissions, were admitted in those nine years. Numbers began a staggered decline from 1948; by 1969 just 14 women were admitted. Numbers began to increase again from 1970. In the 1970s, 36 women on average were admitted annually; admissions almost doubled in the 1980s when an average of 71 annual admissions were recorded.
admissions was recorded but decreased to an average of 31 admission per year in the 1990s.

Analysis by decade shows that more women (36.3%) were admitted to Regina Coeli in the 1940s than any other decade followed by the 1930s (19.2%); 1950s (15.5%); 1980s (12.7%); 1970s (6.4%); 1960s (5%) and the 1990s (4.9%).

**Status on entry**

Information relating to status on entry was available for 5,627 women (99.9% of admissions). The institutional records show that most women (53.3%) were admitted pregnant and unaccompanied; 34.4% were not pregnant but accompanied by one child; 9.6% were not pregnant but accompanied by a number of children; 1.7% were pregnant and accompanied...
by one child; 0.7% were pregnant and accompanied by a number of children; 14 women were not pregnant and were unaccompanied on admission.

**Age on admission**

![Mother’s Age on Admission](image)

Information relating to age on admission was available for 4,844 women (86.5% of admissions). Age on admission ranged from 15 to 59 years. The mode of age on admission was 21 years. Most women (79.8%) were aged between 18 and 29 years on admission; 17% were aged between 30 and 59 years and 3.1% were aged between 15 and 17 years.

**Marital status**

Information relating to marital status was available for all women. The institutional records show that the majority (87.32%) were single women; 10.94% were separated; 1.58% were widowed and nine were recorded as married women.
Length of stay

Information relating to length of stay was available for 5,144 women (91.4% of admissions). The institutional records show that average length of stay decreased from 411 days in the 1930s to 296 days in the 1940s. However, in line with many mother and baby homes, length of stay increased substantially in the 1950s when a stay of 579 days was the norm. This had more than halved by the 1970s (286 days) and by the 1990s women spent just 54 days on average in the hostel.

Maternal deaths

Through the institutional records, the Commission identified 13 deaths among women associated with Regina Coeli. All 13 women died in external hospitals following transfer from Regina Coeli; the majority occurred before 1950. Three deaths were associated either directly or indirectly with pregnancy and childbirth. Most deaths, however, were due to infectious disease such as tuberculosis (eight deaths) and bronchitis.
Children: Admissions

Through the institutional records, the Commission identified 5,434 children who were admitted to Regina Coeli in the years 1930 to 1998. Information relating to date of admission was available for 5,415 children (99.7% of admissions). The institutional records show that child admissions increased from seven in 1930 to 127 in 1933. Child admissions were highest in the years 1933 to 1957; 54.2% of children were admitted to Regina Coeli in that period. Admission peaked in 1943 when 233 children were admitted. Admissions began a staggered decrease from 1957; by 1968 just 15 children were admitted to the hostel. Child admissions began to increase from 1971 rising from 20 admissions that year to 142 in 1981 and 202 in 1984. Admissions began a staggered decrease thereafter; 42 children on average were admitted annually in the 1990s.
Analysis by decade shows that more children (27.6%) were admitted to Regina Coeli in the 1940s than any other decade followed by the 1980s (21.3%); 1930s (15.5%); 1950s (14.8%); 1970s (8.6%); 1990s (7%) and the 1960s (5.2%).
Length of stay

Information relating to length of stay was available for 4,952 children (91.1% of admissions). In the years 1930 to 1948 length of stay varied from 101 days on average for children admitted in 1930 to 413 days for those admitted in 1947; the average stay for children admitted in this period was 283 days. However, length of stay increased dramatically from 387 days on average for children admitted in 1948 to 861 days for those admitted in 1949. Length of stay remained relatively high in the years 1949 to 1969 and peaked in 1963; children admitted that year spent 1,111 days on average in the hostel. Length of stay decreased sharply from 752 days on average for children admitted in 1969 to just 49 days for those admitted in 1971. Children admitted in the 1970s spent 183 days on average in the home - this decreased to 98 days on average in the 1980s and to 80 days in the 1990s.
Child deaths

From the institutional records, the Commission identified 734 child deaths associated with Regina Coeli. Information relating to date of death was available for 718 children (97.8% of child deaths). Six hundred and fifty one child deaths (90.7%) occurred prior to 1950. The worst period for child deaths was in the years 1941 to 1946; 54.2% of child deaths associated with Regina Coeli were recorded in those six years. As was the case with other homes, 1943 was the worst year for child deaths; 95 child deaths occurred that year.

Place of death

There was no place of death recorded for 176 children and a further 75 died in unnamed external hospitals. Where a place of death was recorded 133 occurred in Dublin Union/Pelletstown/St Kevin’s Hospital; 107 occurred in Regina Coeli; 77 in St Ultan’s Hospital; 73 in St Clare’s Hospital; 36 in Temple St Hospital; 24 in Cork St, Hospital and 22 in Clonskeagh Hospital. A small number of deaths occurred in the Richmond, Rotunda, Locke and Holles St Hospitals. Child deaths associated with Regina Coeli occurred in at least 13 different hospitals and institutions and information relating to place of death was not available for over one in three children. An attempt to locate GRO death records for children
recorded as having died in the Regina Coeli Hostel itself proved difficult; the Commission considered that efforts to establish cause of death through engagement with GRO death records was not feasible.

**Age on death**

![Regina Coeli Child Deaths Age on Death](image)

Information relating to age at death was available for 626 children (85.3% of child deaths). Most children (90.4%) died in infancy as follows: perinatal (0-7 days) 1.1%; neonatal (8-28 days) 12.3% and infant (29-365 days) 77%. 9.6% of deaths occurred in children aged one year and older - three of whom were over 5 years old.
Chapter 22: Bethany Home

Origins

22.1 Bethany Home opened on 4 May 1922 and continued in operation until 1971. It was an amalgamation of two previous charities: the Dublin Midnight Mission and Female Refuge, founded in 1862, based at 31 Marlborough St Dublin, and the Dublin Prison Gate Mission, established in 1876, with an address at 40 Blackhall Place. Both charities aimed to provide a safe shelter for women, predominately from the poorest classes, who had nowhere else to turn and who had entered, or may have been tempted to enter, a life of prostitution. In addition, the Prison Gate Mission sought to rehabilitate former female prisoners and, by training them in domestic service, to integrate the women back into mainstream society. Their mission of rescue and rehabilitation was broadly similar to the Magdalen Asylums that were established in Ireland and elsewhere. Both charities were associated with the Church of Ireland, but their services were open to any women without distinction of religion.

22.2 A lack of funds forced the closure of both charities in 1921 with the trustees deciding to transfer their rights and properties to a new board that consolidated the charities into the Bethany Home, an institution that would focus on providing shelter and support for unmarried mothers and their children. The property in Marlborough St was sold to clear off debts. The new home was located in the premises of the former Dublin Prison Gate Mission. The address was 23 Blackhall Place, while the address of the Dublin Prison Gate Mission was 40 Blackhall Place. This suggests that the street numbers were revised. By the early twentieth century many rescue homes in Britain had become homes for unmarried mothers, as had some rescue homes in Belfast (both Catholic and Protestant), and the Magdalen Asylum in Leeson Street. The decision by these two Protestant charities to re-focus their philanthropic efforts on unmarried mothers and their children suggests

that the concern about ‘illegitimacy’ in post-World War I Ireland was not confined to the Catholic community.

Sources

Institutional records

22.3 The institutional records of the Bethany Home are held by PACT, which was formerly known as the Protestant Adoption Society. These were digitally copied by the Commission. There are four registers:

- The Admission/Discharge Register from 29 March 1922 to 3 May 1946: This register is the continuation of the admissions register of the Dublin Midnight Mission (which is not relevant to this inquiry). It lists the woman’s name; age, religion, birth-place; her most recent address; how long she had been in Dublin - though this is generally blank; her occupation; dates of admission and discharge, and her destination when discharged. A column headed ‘description’ gives some details about her appearance or some judgements about character or personality - as for example ‘[maternity] case fair complexion, blue eyes curly hair’, or ‘drink’; ‘fair complexion wearing glasses’. The early entries reflect an institution in transition; only five of the first twelve entries in the register were identified as maternity cases. One woman was sent from the courts where she had been charged with concealment of birth - she left eight weeks later to a ‘situation’. A farm worker whose file states ‘railway station’ under the heading ‘where from’ was brought to Bethany by ‘patrol’ and sent home to Cavan. She was described as ‘dark, good colour vacant looking’. The patrol was almost certainly carried out by the Midnight Mission. A twenty-four year old woman from Dublin, who was admitted in March 1927, was described as ‘untidy, fair, fat, quick temper’. This column was rarely filled in after the early 1930s. An ‘observations’ column was usually used to record details of the woman in relation to her child, i.e. whether she was pregnant, or accompanied by a child; the child’s date and place of birth, and whether it was her first or second child.

- The Bethany Baby Records covering the period 7 May 1922 to 25 August 1970; This lists babies’ names; date of birth; whether they were born in the home or admitted after the birth; date of christening, vaccination details; date of leaving the home; where they went and if they were readmitted to Bethany. After the move to Rathgar all children, born in Bethany or
admitted to Bethany, whose mothers were members of the Church of Ireland, were baptised in the nearby Zion Parish Church. These ceremonies usually involved multiple infants; 13 children born in Bethany between June and November 1935 were baptised in a ceremony held in the church on 13 December 1935. The children of mothers who belonged to the Presbyterian Church were baptised in Rathgar Presbyterian Church.

- Records and Particulars Book of Maternity Home (or Hospital) known as Bethany Home 1936-1956 and Records and Particulars Book of Maternity Home (or Hospital) known as Bethany Home 1956-1971: This was the standard official register that all maternity homes and hospitals were required to keep under the Registration of Maternity Homes Act 1934. It gives the woman’s name, age, date of admission, condition (not always completed), date of discharge, state of health, removal of child, particulars of the person removing a child and particulars of person to whose care a child was removed, plus a general column for observations. It appears that Bethany completed this official record and also continued to maintain its individual admission book until 1946, when it began to rely solely on the official register and the Bethany Baby Book.

### Representative Church Body Library

22.4 The minutes of monthly meetings of the management committee of the Bethany Home from 8 January 1924 to 8 January 1937, and from 12 May 1944 to 14 January 1966, are held in the Representative Church Body (RCB) Library in Braemor Park. The library also holds copies of some annual reports of the Bethany Home; these give some details about the mothers and babies, records of donations, subscriptions and an annual financial statement. The RCB Library also holds a register from Zion Church of Ireland Parish, which includes separate pages with entries for the baptisms of babies born in Bethany Home, c.1935-1949. These give the dates of baptism, the child’s Christian name, parent’s (mother’s) name; they give no entry under ‘abode’, or ‘quality, trade or profession’.

### Irish Church Missions

22.5 The Commission has also consulted the records of the Irish Church Missions (ICM) to the Roman Catholics held by the ICM in Bachelor’s Walk.

6 Zion Church of Ireland Parish Baptismal Register, Bethany Home, December 1935.
Department of Health files

22.6 This report also draws on Department of Health files. Some are available in the National Archives; others were supplied under a discovery order to the Department of Health. The main files used in this chapter are:

- NATARCH/ARC/0/402710
- NATARCH/ARC/0/413869
- NATARCH/ARC/0/493747
- CCP/INA/0/483137
- INACT/INA/0/474129
- NAI M34/58 Volumes 1 and 2

22.7 These contain, among other things, the various inspection reports and the correspondence in relation to finances which are outlined below.

Published material

22.8 Miss Lily Pilgrim, a matron of Bethany Home, published a short booklet, *Far Above Rubies - A memoir of Miss Hettie Walker of Bethany Home*. This is undated but was obviously written after Miss Walker’s death in 1955. Other material is referenced in the footnotes.

Governance and Management

22.9 The Bethany Home was a charity with a board of trustees that was formed in 1922 following the merger of the Dublin Midnight Mission and Female Refuge and the Dublin Prison Gate Mission charities. In practice, the governance of the institution was overseen by a voluntary management committee that generally met monthly. The minute books of those meetings, covering the period from January 1924 to January 1937 and from May 1944 to January 1966, have survived. The minutes of the first meeting recorded in the surviving Bethany Home minute book, on 8 January 1924, show that the management committee consisted of three men and seven women; one appears to have been the wife of a trustee. The most important member of the management committee was Miss Hester Ann ‘Hettie’ Walker, who served as Bethany’s Residential Secretary from November 1924 until her death in May 1955. She was succeeded by George Godden who continued in that role until his unexpected death in May 1961. He was succeeded by William M. Taylor.
22.10 The management committee included members from several Protestant churches: Church of Ireland, Presbyterians, Methodists and Plymouth Brethren, (a conservative, nonconformist, evangelical Christian movement, originating in Dublin, which split from the Church of Ireland in the late 1820s). The committee generally included a number of Protestant clergymen, their wives and lay evangelists. Miss Pilgrim, Bethany’s long serving Matron, described Miss Walker as ‘born again’. She had been an itinerant evangelical preacher before taking up her role in Bethany and in this capacity she had been acquainted with evangelical clergy, and it would appear that she continued the rescue work of the Dublin Midnight Mission. In 1932, the minutes contain a report by Miss Walker on preventative work among girls frequenting public houses late at night; she was given approval to accept one or two urgent Midnight Mission cases.

22.11 Bethany operated as a predominantly Protestant mother and baby home. At the official opening, the Church of Ireland Archbishop of Dublin, John Gregg, expressed the hope that the people of Dublin ‘would support this vitally good work, which was a very real door of hope to those who had fallen, and for whom that home was specially intended’. Like its predecessors, Bethany was open ‘for all classes and creeds’ and ‘down-trodden woman’ from ‘all parts of Ireland’. During its first 17 years of operation, it regularly admitted Catholic unmarried mothers and illegitimate children. The board and staff of Bethany saw their mission as helping the young women admitted to Bethany ‘to lead good Christian lives’ on their departure. It noted that ‘the appreciation shown by the girls…testified to the spirit in which the work was carried out that girls went out determined to live better lives.’ In 1933, Bethany stated that, in the past year, five girls who were former inmates had married and ‘many heartbroken parents had found relief through the open door in Bethany for their daughters’. Meetings of the management committee opened with a ‘season of prayer’, and closed with a prayer. A dominant influence on the management committee and, consequently, on the ethos of Bethany (particularly in its first decades of existence), were those members who were associated with the Church of Ireland’s Society of Irish Church Missions to the Roman Catholics (ICM). Founded in 1846, the ICM’s aim was to convert the

9 *Irish Times*, 8 May 1922/2 February 1928.
10 *Irish Times*, 6 February 1925;13 February 1930.
11 *Irish Times*, 16 February 1933.
Roman Catholics of Ireland to the Protestant Faith. From 1922 until his departure to Australia in 1935, Rev Thomas Chatterton Hammond, the ICM’s Superintendent, was a prominent member of the Bethany management committee. In a pamphlet produced in 1936 on the dangers of Protestant inter-faith marriages to Catholics, Rev Hammond described those who chose to marry Catholics as ‘betray[er[s] of an age-old heritage [who] must forever feel ashamed’. A significant number of Bethany babies were placed by the ICM, either in a children’s home or with ‘adoptive’ parents.

22.12 The influence of Plymouth Brethren doctrine was evident in the management of Bethany. One of their main beliefs was *sola scriptura*, the view that the Bible was the supreme authority for church doctrine and central to their way of life, morality and code of conduct. In February 1935 the Bethany Committee unanimously resolved that ‘the following doctrinal basis should be subscribed by each and every new member of the Managing Committee, namely belief in:

The supreme and sole authority and sufficiency of the Scriptures of the old and new Testaments as the rule of faith and practice: the unity of the Father, the Son and the Holy Spirit in the Godhead, the utter depravity of human nature in consequence of the fall: the forgiveness of sins only through faith in Christ’s obedience unto death even the death of the cross; the necessity of the direct influence of the Holy Spirit to impart and sustain spiritual life; the immorality of the soul; the eternal blessedness of the righteous and the eternal punishment of the wicked.

22.13 The report of the annual meeting published in the *Irish Times* in February 1933 quoted a statement by the chairman that ‘the work of the home was very much misunderstood in many circles. There were many who looked upon it as proselytising work – that their aim was to entice people from one church to another - whereas the fact was that its great aim, and the only aim, of the home was to bring sinners back to Jesus’.

22.14 It seems clear that despite frequent protests to the contrary, those in charge of Bethany sought to indoctrinate residents in their own religious beliefs. In August

---

14 *Irish Times*, 18 February 1933.
1924 a decision was taken to form a special sub-committee of ladies connected with Bethany to discuss with the Matron how best its ‘spiritual work’ could be continued. Vacancies for staff were generally advertised in British religious periodicals. In 1928 Miss Pilgrim, then a nurse in Bethany, resigned to take up a position with the Dublin Medical Mission; she returned to Bethany as Matron four years later. In 1928 a nurse gave notice that she intended returning to China (presumably to undertake missionary work). In 1926 the management committee minutes record that a nurse employed in the home was ‘firm’ in her engagement to a Roman Catholic. It was subsequently recorded that she had acknowledged the wishes of the committee that she should seek another position and would give them ample time to find a successor. In 1957, an advertisement seeking the services of a qualified nurse to work in Bethany asked that applicants be ‘evangelical missionary-minded’.

The Registration of Maternity Homes Act 1934

22.15 In the early years the only contact between Bethany and the State or local authorities was in relation to women who were sent to Bethany by the courts. Bethany was a charity, funded by private sources, and as such it was not subject to oversight by either the local authority or the Department of Local Government and Public Health (DLGPH). The only aspect of Bethany’s work that involved local or national government related to the children that Bethany placed at nurse. The children and nurse mothers should have been registered and subject to inspection by the local authority; however the obligation rested with the foster mothers, not with Bethany - see Chapter 1. The Registration of Maternity Homes Act 1934 transformed this picture because all maternity homes were required to register and became subject to inspection. Bethany registered as a maternity home under the 1934 Act in November 1935.

The Premises

22.16 From 1922 until 1934 the Bethany home was located at 40 Blackhall Place in the north inner city. Census returns from 1911 state that the property at 40 Blackhall Place was officially designated as a ‘laundry’; this suggests that the Prison Gate Mission was similar to a Magdalen laundry. There were eight outbuildings, consisting of two stables, two coach houses, a harness room, a boiling room, a shed and a laundry. The premises had stone/brick/concrete walls, a slate/iron/tiled roof and consisted of twenty rooms. The front of the building had fifteen windows
and was classed as a ‘first class of house’. On census night there were 32 resident women: 20 Catholics, nine Church of Ireland, one Methodist and two described as ‘others’.\textsuperscript{15} The report by the \textit{Irish Times} on the opening of the new Bethany home in May 1922, stated that the main building, facing Blackhall Place, would accommodate 25 girls. The centre building had been set apart for such cases as were formerly dealt with by the Dublin Midnight Mission and would hold from 20-25 girls, while the building known as the Crawford Memorial would be specially used for maternity cases.\textsuperscript{16}

22.17 Within three years of the Bethany home opening, it appears that the management committee wanted to move. Minutes of the meeting on 18 March noted the ‘desirability of selling and buying a place in some healthy neighbourhood’. The meeting in May that year referred to the possible sale of the home. In 1928 the management committee discussed an approach from the Female Orphan House in Harold’s Cross Road, a Protestant charity, who asked whether Bethany would accept the premises and assets if offered to them. A barrister, who was asked for advice on this proposal, determined that the orphanage could not be legally transferred to Bethany. In 1929 the management committee decided to write to the Trustees of King’s Hospital, which at the time was located nearby in Blackhall Place, inquiring whether they would buy the Bethany premises for £3,000 or a reasonable offer. The next meeting reported that the Bethany Trustees had agreed to sell the property and buy more suitable premises. By January 1930 the prospect of selling the property to King’s Hospital had disappeared. Bethany then tried to sell it to the Institution for the Blind. The May 1930 meeting reported that the premises could not be disposed of by public auction and it was suggested that it be converted into rented flats. The next attempt was to sell off vacant parts of the premises. There were several further abortive attempts to dispose of the premises to various organisations until it was finally sold to Dublin Corporation under a compulsory purchase order in March 1934.\textsuperscript{17}

22.18 Bethany had not yet identified an alternative premises but Miss Walker informed the management committee that Rathgar House ‘could be obtained on terms’. This was a former private boarding school located on Orwell Road, Rathgar, which

\textsuperscript{15} See 1911 Census Returns for 40 Blackhall Place, West Side (Arran Quay, Dublin) http://www.census.nationalarchives.ie/pages/1911/Dublin/Arran_Quay/Blackhall_Place_West_Side/55032/

\textsuperscript{16} \textit{Irish Times}, 8 May 1922.

\textsuperscript{17} \textit{Irish Times}, 28 February 1934.
was owned by a member of the Bethany Board of Management. The three-storey detached building with a floor area of circa 6,000 square feet stood on grounds of about one acre. At the time of the Bethany home’s closure in early 1972, the premise was described as having twenty rooms. The hall floor and return consisted of eight rooms and a toilet annexe; the first floor had seven rooms, two bathrooms and water-closets while the lower floor had a large kitchen, a gas-fired water-heating boiler suitable for central heating, a laundry, drying-room and two additional rooms. After Bethany acquired the property, £284 was spent adapting it; in later years various improvements were carried out but it underwent no major extension.

22.19 An independent valuation commissioned by the management committee valued the property at £2,000; however the owner sought £3,000. The committee discussed the price in his absence; they asked him to reduce the price, but the minutes state that he was ‘perfectly satisfied’ that it was worth £3,000. They also noted that no other premises were available – however it was also probable that he had no alternative purchaser. They eventually compromised on a price of £2,750 - which was 37.5% higher than the independent valuation. They assigned £180 for alterations.

22.20 The wish to leave Blackhall Place appears to have been prompted by several considerations - the unhealthy air in the inner city may have been one factor (there is a reference to getting sick children away to the countryside). There may also have been concerns about the women living in premises that appear to have been on the side of the street. Miss Pilgrim recounts how ‘one inmate in Blackhall Place was found receiving a match-box full of cigarette butts, tied with a piece of string and drawn up through a window from the street’. However the determining factors were probably problems with the premises and financial pressures. In 1929 the minutes noted that accommodation in the Crawford would be inadequate for the number of children who would be in the home over the winter months and it was agreed that the adjoining Gospel Hall would be used to house the children if one or two anthracite stoves were purchased and some renovations were carried out. However Dr Mackay, who was for many years Bethany’s unpaid medical officer, reported that the Gospel Hall would not be suitable as a nursery unless fireplaces

were provided so that plan was dropped. Finances were probably the major motivation.

22.21 The former stables at Orwell Road were converted and used temporarily by Emmanuel Home, a children’s home (see below). When the Emmanuel Home moved out in 1938 this space became an annexe to the main house and a dormitory for mothers. The move to Rathgar eased Bethany’s financial difficulties. The overdraft was reduced; it would have been obliterated if the new property had been bought for £2,000, the price set by a professional valuation. By December 1939, however, the overdraft had risen to almost £1,000 and securities were sold to clear it.\footnote{Irish Times, 18 April 1940.}

22.22 Orwell Road was more suitable as a mother and baby home than Blackhall Place. When it was inspected in November 1937 under the \textit{Registration of Maternity Homes Act}, it had two baths and three toilets; this was significantly better than any other mother and baby home at that time. There were 4 wards and a total of 25 beds. It is evident that these statistics include all the accommodation for mothers in Bethany, because the next inspection report in November 1938 stated that there was accommodation for 4 patients, in one four-bed ward; this was obviously where mothers gave birth and women requiring ante-or post-natal care were accommodated. This report stated that there were 5 baths and 6 toilets. However an inspection in December 1945 records that there was ‘1 bath in main house’. In 1950 the Department of Health noted that the mothers’ dormitory was ‘in a building apart from the Home proper’; the infants slept in a nursery in the main home. In 1951 it was proposed to install washing facilities in this annexe which would appear to have been devoid of any, however it was then decided to supply a basin, jug and stand instead of washbasins. Following an inspection by a Dublin Corporation official in May 1949, Bethany was advised to erect a proper fire-escape; construction commenced in May 1950.

22.23 Economy prevailed throughout Bethany. There is evidence of insufficient household items, and a shortage of heat and hot water. In 1924 the matron reported that there was a shortage of sheets for inmates; she was instructed to buy some. In 1928 the ladies committee expressed concern that several babies were
being bathed in the same water - an economy that risked transmitting infections. In 1934 however the same committee remarked on ‘huge fires’ in the kitchen and the management committee decided that the coal should be locked up.

22.24 Lack of facilities for drying clothes for mothers, babies and staff remained a constant complaint, both in Blackhall Place and Orwell Road. Consideration was given to installing ‘laundry dryers’ in 1936 on the recommendation of the DLGPH inspectors, but that does not appear to have happened. In 1948 it was noted that staff had nowhere to air their personal clothing - it was suggested that a fire might be kept burning in the living room at night for that purpose. In 1946 a meeting of the management committee noted the ‘great inconvenience of inadequate water heating owing to the insufficiency of supply of suitable fuel’. This problem was common to all mother and baby homes during the war and the immediate post-war years. In May 1946 they reported that a water heater had been installed - paid for by a ‘friend’. But the new heater supplied only half the quantity of hot water required. The committee dismissed the proposal that they should buy a second heater, and decided to fully use the existing heater. A legacy of £1,500 in 1946 was used to rewire the house, install a children’s toilet and replace linoleum. This money also funded the purchase of new blankets. When blankets or other household goods were purchased the committee used their connections with the major Dublin stores to secure ‘seconds’ at special prices. In a letter to the Irish Times in February 1938, the rector of the Zion Church, Rathgar appealed to the public for ‘beds, bedding, furniture, delph, clothing or anything that may prove of use in the works of Bethany Home’.

20 In 1954 it was estimated that 24 mattresses needed repair, but the Matron, Miss Walker, and the secretary reduced this number to 12 and decided that this could be done using cheaper materials than originally specified.

22.25 Bethany frequently relied on voluntary labour. An inspection report under the Registration of Maternity Homes Act 1934, carried out in 1938, listed the staff, in addition to the Matron as ‘4 & voluntary worker’. There was an active ladies’ committee. A shelter for infants was erected on the lawn at Orwell Road in 1935 by a ‘Christian’ friend of the home. However, it does not appear to have been long-lasting because another shelter was erected in 1946 - this was funded by

---

20 Irish Times, 16 February 1938.
charitable donations. In 1960 three men decorated the bedrooms and toilets without charge and some months later they were asked to tackle the ‘squalid condition’ of the kitchen and girls’ sitting room. In 1965, two ‘3 K.W.’ storage heaters were installed in the nursery.

22.26 The fall in the number of women admitted during the 1950s meant that everybody could be accommodated in the main house. With this in mind it was decided to rearrange the rooms. The front nursery was turned into a prayer room. A room next to the kitchen was converted into a sitting room for the women - apparently the first provision made for any form of leisure or relaxation. The Matron was asked to seek public donations of chairs, cushions and other suitable articles. It was decided to sell the annexe in 1956; however later that year there were proposals that it should be used to house Protestant refugees fleeing the Hungarian uprising. The Irish Red Cross assumed responsibility for the heating and furniture. In 1957 Bethany agreed to a request to house a Catholic Hungarian family in the annexe. When the refugees had moved to alternative accommodation the Red Cross agreed to buy the annexe at a price of £1,200. The sale was completed in September 1958. Bethany continued to function as a mother and baby home until 1972 when a decision was taken to close the home because of falling admissions.

Staffing and Inspections

22.27 When Bethany opened it was staffed by one qualified nurse and the Matron. However, given the high level of sickness among children, in March 1926 the management committee determined that ‘the children needed more care than they could get with the present staff’. They recommended appointing an assistant to the matron. This assistant (qualifications unstated) was dismissed within months because her work was deemed ‘unsatisfactory’. The number of children had increased from 14 in the previous year to 23 and staff found it difficult to provide adequate care. In 1928 the visiting committee noted that the ‘girls’ in the nursery - presumably these were either expectant mothers or mothers of children who were in Bethany - were ‘not doing what they could for the comfort of the babies’. It was decided to hire a fourth member of staff to work in the kitchen to enable the new matron’s assistant to help in the nursery as required. In 1929 a nurse who was
due to take up appointment failed her CMB\textsuperscript{21} examination. Having failed to secure a qualified nurse (Bethany tended to advertise in British religious periodicals), the committee agreed to appoint a woman who was known to the Matron, but was presumably unqualified, as a ‘suitable assistant to the staff’. An ‘inmate…who had proved to be of great assistance in the Nursery’ was taken on as a servant.

22.28 Despite a significant increase in the numbers of infants, particularly following the move to Orwell Road, there was no corresponding increase in staff numbers. In June 1936 the management committee determined that additional staff would be required and approval was given to hire an ‘honorary helper’. When Bethany was inspected by Mrs Crofts, apparently in September 1936 under the \textit{Registration of Maternity Homes Act}, she determined that the bedrooms were overcrowded: there appear to have been three bedrooms in addition to a room that was used as the delivery unit. At this time there were 25 women in the home. Mrs Crofts also described the medical staff as inadequate. One member of the board of management suggested that they apply for exemption from the Act and the committee decided to consult their solicitor. At the next meeting of the management committee in October, Miss Walker reported on visits by Dr Sterling Berry, a medical inspector in the DLGPH, and Mrs Crofts and their recommendations ‘re Staff, number of girls, worker for night duty and laundry’. The management committee decided to recruit a nurse who had the CMB, and to give one month’s notice to another staff member, who presumably lacked this qualification. They also unanimously agreed that the number of ‘girls’ in the home should not exceed 20 except in urgent cases. Another member of staff was hired as a night worker. The Commission has not seen any reports on these inspections in the records of the Department of Health.

22.29 An inspection carried out in November 1937 by Dr Dillon under the \textit{Registration of Maternity Homes Act} listed the staff as a Matron, who was SRN and CMB; one qualified nurse who was not a qualified midwife; a housekeeper; and a night worker. This was deemed sufficient. When Dr Berry visited Bethany on 25 January 1939, a little over a month after the home had been inspected by his colleague, Dr Dillon (the Commission has not seen any record of this inspection), he reported that conditions were much improved since the last inspection. He described it as

\textsuperscript{21} The Central Midwives Board was responsible for registering and regulating midwives.
‘kept very well...clean & comfortable. The mothers and infants are well looked after & appear happy & contented’. There were 22 expectant or nursing mothers in the home - two more than the permitted number - and 42 children. The Matron was SRN and CMB. Under the heading ‘staff employed’, in the standard inspection returns, there was one midwife and one qualified nurse, plus four other staff and voluntary workers. The staffing was deemed adequate for the home. When Miss Pilgrim retired as Matron in 1944 and was succeeded by Mrs Glover, she served on the management committee. By September 1944, Bethany was employing three additional staff to support the matron, a nurse on a £75 per year salary, the housekeeper, on a salary of £52 and a third worker whose duties and salary were not stated. (All would have lived in the home.) Another maternity home inspection in December 1945 recorded the staff as the Matron, Mrs Glover, who was SRN and CMB and a nurse with similar qualifications plus a housekeeper and ‘girl in charge of older children’. The staff was deemed adequate and the inspector wrote that they ‘appeared’ to be efficient and capable.

22.30 Bethany often found it difficult to recruit nurses when a nurse resigned. In 1945 the Matron and the two other staff had to care for 19 women and 31 babies. Bethany was again without a qualified nurse from December 1947 to April 1949, and the nurse who was appointed left within three months. It was also without a housekeeper for much of this time. In December 1949 the staff consisted of the Matron, a housekeeper and an ‘honorary worker’. Staff shortages persisted throughout the 1950s. Between December 1947 and September 1953 Bethany had a qualified nurse on the staff for only a total of three/four months. In January 1957 when the home was yet again without a qualified nurse, the Matron told the committee that it was ‘not yet absolutely necessary’ to find a replacement. Some months later she reported that a qualified Scottish nurse had agreed to fill the vacancy and ‘was anxious to engage in their Christian service’, the ‘smallness of the salary (£150 p.a.) being no deterrent’. This nurse left within a year. Bethany’s difficulties in attracting and retaining staff suggest that the salaries were too low, and the fact that recruitment was limited to Protestant women, preferably with strong missionary impulses, was a further handicap. Staff shortages probably meant that mothers had to carry out more work and the quality of care for mothers and infants may have suffered at times.
CHAPTER 22 BETHANY

22.31 Medical care was provided free of charge by a visiting doctor, who was voted an annual honorarium of £10; it is unclear how often he visited Bethany. The maternity homes inspection carried out in 1945 stated that ‘most of the girls appear to be sent to city hospitals for confinement’. In 1957, the committee expressed its thanks to him for carrying out inoculations of the children and mothers, along with other services, free of charge. In 1950 it was reported that free dental treatment had been provided to several women in the home.

Finances

22.32 The Bethany home was a charity and in 1922 its funding came from a variety of sources: legacies and donations, the proceedings of sales of work and church collections and payments made by the mothers or on their behalf. When the Bethany home opened, a debt of £1,000 had been incurred in modifying and preparing the premises in Blackhall Place for its new purpose. In March 1924, the Management Committee held a lengthy discussion about the serious financial situation. Since 1922 the debts had risen from £1,500 to over £2,078. Subscriptions had fallen from £129 in 1921, to £35 in 1923. The chairman decided to write a letter appealing for funds to all would-be subscribers. At the annual meeting the following February the financial difficulties were attributed to the growing number of women, mostly from the country, who were seeking admission.

22.33 The 1920s was a difficult period for charities. In 1930, the Irish Hospitals Sweepstake was established to provide an alternative source of income for the Dublin voluntary hospitals that could no longer rely on charitable donations or legacies. Irish Protestant charities lost donors because of Protestant emigration after independence. War-time inflation, punitive income tax and death-duties had eroded traditional sources of income for charities such as legacies, and dividends from stocks and shares in railways and other safe investments. In 1928, the chairman of the management committee agreed to write to all clergymen who referred women to Bethany, asking them to make a contribution towards its costs. There were annual sales of work and pound days when the home was open to the public, the premises were decorated with ‘flowers and foliage’ and stalls were

---

22 Irish Times, 8 May 1922.
23 Irish Times, 6 February 1925.
erected selling ‘a great variety of needlework and fancy goods, cakes and home-
made bread, jam and vegetables’. Church of Ireland clergy connected to the home
oversaw the proceedings, explained its purpose and promoted its work. From the
late 1930s, these events were replaced by an annual Gift Day, where ‘friends and
sympathisers’ and members of the public could visit, attend an opening prayer
meeting and bring donations or money or gifts such as ‘articles of food, household
utensils, soap, mats, ink, medicines, etc.’ Bethany also benefited from numerous
public collections organised by religiously affiliated groups such as the Young
Men’s Christian Association (YMCA), but the revenue from these activities was
modest and uncertain.

In 1927 Miss Walker (who was described as assistant to the matron) noted that
‘some Friends of the Home had much sympathy for the children, which was not
extended to the mothers’. The management committee determined to create a
special fund for the children - which they presumably hoped would attract more
donations. A special public appeal was made to support this new fund ‘to enable
suitable homes to be got for the children when they leave the Home - surroundings
in which they could be visited by the workers and where Christian influences
prevailed’. The notice for the Bethany Home Gift Day in 1950 - which would have
been widely circulated - stated that ‘Babies may be seen from 3 to 5 pm. Tea will
be provided in the afternoon’.

The minutes of the Bethany board of management convey a picture of chronic
financial insecurity, which might be temporarily relieved by a windfall donation or a
legacy, followed by another financial crisis within months. In December 1925 the
board received a letter from their bank drawing attention to the large overdraft. It
appears that the permitted figure was £2,000. The committee minuted that ‘care
should be taken in relation to admitting girls so as not to add to expenses
unnecessarily’. Yet by the following August the overdraft had climbed to £2,210
and the home appears to have made efforts to discharge mothers and babies. It
sold an unspecified quantity of War Loans to reduce the overdraft. The organ was
out of order but repairs were deferred. The minutes for February 1927 noted that
income in the previous month was £18 and expenditure was £110. The committee

26 Irish Times, 17 March 1934/27 September 1941.
determined that only emergency cases would be admitted and efforts made to reduce the numbers in the home. The ladies committee was asked to review the diet and articles in the nursery and beds ‘with a view to curtailing expenditure as far as possible’. Five ‘girls’ were admitted in April; when asked to explain this, Miss Walker produced a letter from an anonymous donor who had given £200 to prevent admissions being refused. Despite these efforts to reduce expenditure, the overdraft remained close to the maximum permitted, so the committee determined to hold a special meeting in September to discuss ‘how best to make the work done by the Mission known to the churches’. They ordered 150 copies of a circular letter and 1,000 copies of a pamphlet outlining Bethany’s work, for distribution among the ‘ministerial brethren’ of the members of the management committee. Friends of Bethany organised ‘drawing room meetings’. These efforts made a minimal dent in the overdraft.

22.36 In September 1930, with the overdraft within £20 of the limit, the meeting discussed stopping admissions, selling stock, discharging ‘inmates’ and deferring the payment of most bills. They placed the premises on the books of an estate agent for sale if they could identify alternative premises costing £500 less than the sale price. This was a time of international recession. In September 1931 Bethany was informed that owing to the depreciation of the securities lodged in the bank as security for the overdraft, the overdraft was not covered; the bank demanded that further securities should be lodged immediately. The committee contacted Lord Iveagh and Lord Plunkett (bishop of Meath 1919-25), who was also a member of the Guinness family, seeking assistance, but there is no indication of a response. A special meeting of the management committee about the finances was preceded by a one-hour prayer meeting. The committee determined that no women should be admitted until the overdraft was below £2000, other than exceptional cases. They decided to cap admissions at 20 and redoubled efforts to sell the Blackhall Place premises. The financial statement presented at the 1933 annual meeting reported that over the previous twelve months, Bethany had received £408 10s from legacies and wills, £306 in public subscriptions, £152 from the Sale of Work and Pound Day, £75 in donations and £63 from public collections. However running costs consistently outstripped income. In 1938 it was reported that Bethany operated at a loss of £625; £711 was spent on ‘dietary costs’, £259 on

salaries and wages of staff, £140 on coal and gas and £58 on drapery and household expenses.  

Financial support from the state:

22.37 There is no evidence in the minutes of the management committee for the years 1924-37 that Bethany sought public funding. In 1922 when Bethany was founded the only funding for mother and baby homes provided by central government was the Maternity and Child Welfare grants that were introduced in 1916. The Magdalen Asylum in Leeson St (later Denny House - see Chapter 23) and St Patrick’s Guild (which had a small home in Mountjoy Square - see Chapter 27) benefited from these grants, as did organisations that placed children in foster homes, such as the Society for the Protection of Destitute Catholic Children and the Nursery Rescue and Protestant Children Aid Society. Bessborough, which opened in 1922, was funded through capitation payments for mothers and children who were sent to the institution by South Cork Board of Assistance and over time by a growing number of other local authorities, see Chapter 18. Each local authority had to secure ministerial approval permitting them to pay for unmarried mothers and their children in the designated mother and baby home: see Chapter 1.

22.38 It is not clear when Bethany first tried to secure state funding. In 1925 an official from the DLGPH gave evidence to the Commission on the Sick and Destitute Poor about the funding provided to the Magdalen Asylum (later Denny House) under the Maternity and Child Welfare scheme. When he was asked whether the Bethany Home had claimed funding under this scheme, he replied ‘We don’t touch it’.

22.39 The minutes of the board of management from 27 January 1937 to 12 May 1944 do not survive. On 28 January 1944 the DLGPH approved an application by Monaghan County Council to send a pregnant woman to Bethany. Monaghan appears to have been the only local authority to seek approval to admit women to Bethany at this time, and rather than concentrate on securing funding under the Public Assistance Act 1939 for the women and children in the home, it would appear that Bethany preferred to emulate the Magdalen Asylum by securing funding under the Maternity and Child Welfare Scheme. The first letter on file from

29 Oireachtas Library, Minutes, Commission on the Relief of the Sick and Destitute Poor, 10 June 1925.
Bethany to the DLGPH requesting a grant from the National Maternity and Child Welfare scheme is dated December 1942. The department replied seeking information about the women and children who were in the home during 1942. It is unclear what happened next - the file does not contain a response by Bethany. However, in March 1943, the department noted that ‘the financial position of the Home as disclosed in the accounts does not appear to warrant State Subvention’.

In subsequent correspondence Bethany pointed out that, in 1940, it had cashed in investments amounting to almost £1,000 to clear its overdraft.

22.40 When the Bethany representatives met an official in the DLGPH in 1944 to pursue their claim for assistance under the Maternity and Child Welfare scheme, they were informed that it was ‘now a matter for the Dublin Corporation’. Bethany replied that they had been trying for two years without success to secure financial assistance from the Corporation; (the Commission has seen no information about this). Bethany appears to have pinned its hopes for public funding on Dr Sterling Berry, a medical inspector of the DLGPH, who was undoubtedly sympathetic towards its campaign, probably for religious reasons. In 1945 he promised to contact the Dublin city manager on their behalf. However, the Dublin city manager refused Bethany’s application for a grant, noting that Bethany had not been approved under the Maternity and Child Welfare scheme. Dr Berry suggested that they apply for approval. Later that year however, Dr Berry, having consulted the Dublin city manager and Dr Russell, the Dublin medical officer of health, advised that Bethany should apply ‘for a grant’ under the public assistance scheme. The board decided to do this ‘while expressing fears that few of the girls referred to it would be willing to make applications through the City Manager’. When the Bethany representatives met members of the commission that was running Dublin City, they told the Bethany delegation that they had no authority to award a grant to the home. Bethany again wrote to the Secretary of the DLGPH seeking financial support in the summer of 1946. The letter mentioned that Bethany was running an overdraft of £800; they did not understand ‘why financial assistance cannot also be given to an institution which performs such useful public service’. The department reiterated that the ‘appropriate procedure’ was to approach the public assistance authorities asking that Bethany be recognised under the 1939 Act. They suggested that Bethany should contact ‘those from whose districts inmates are admitted to the Home in circumstances which would appear to suggest that they could be

30 Dublin Corporation was dissolved 1942 and replaced by three appointed commissioners – see Chapter 1.
deemed eligible for public assistance’. Dr Berry, who had now retired from the department, advised Bethany ‘that this would involve considerable correspondence’; they tried to short-circuit this by writing to the department for approval. Dr Berry promised to intervene on Bethany’s behalf but the department informed Bethany that ‘The Minister does not give his consent in this connection without application for consent having first been received from local authorities’. Dr Berry then confirmed that the procedures outlined by the department were correct.

22.41 The minutes of the Bethany management committee for 1944 and 1945 do not mention that Monaghan county council had secured departmental approval in 1943 to maintain mothers and babies in Bethany. However, in June 1946, Bethany notified Monaghan county council that it had increased the weekly charge ‘for each girl’ to 15s ‘in view of the increased cost of living in Dublin’. It was claimed that this would cover approximately half of the maintenance cost of each mother. Some months later Cavan county council applied to the department for approval to maintain mothers and children, who were members of the Church of Ireland, in Bethany. The county council pointed out that ‘the girl in question’, who was a member of the Church of Ireland, could not be sent to Sean Ross or Castlepollard, the two homes approved for Cavan public assistance cases. It then emerged that this ‘girl’ had left the Bethany Home, but Cavan asked the department to advise as to ‘what arrangements should be made for such cases in future’. The department replied that ‘the home, if necessary’ could be approved under Section 35 of the Public Assistance Act 1939. The department approved the maintenance of unmarried mothers who were members of the Church of Ireland in Bethany under the Act. In 1948 Longford public assistance authority agreed to pay for the maintenance of a mother and her child in Bethany with effect from August 1947. In 1950 the Department of Health noted that Bethany had been approved for admissions from Cavan, Monaghan and Longford; Donegal sought approval to maintain a woman in Bethany in 1956; Kilkenny did likewise the following year; Tipperary North Riding and Wicklow were approved in 1959, but the number of public assistance authority admissions from the various counties appear to have been so infrequent that the counties tended to seek approval on a case by case basis.

22.42 The Commission does not have any details about the number of women and infants maintained by the public assistance authorities. In the mid-late 1950,
Bethany was receiving £2 a week for each mother in the home from the public assistance authorities. This was the same as the amount paid for women in the Sacred Heart homes. On several occasions the minutes of the management committee note that payments by local authorities were in arrears. Nevertheless, at the 1965 annual meeting the Matron expressed thanks for the ‘great help’ Bethany had received from ‘County Councils of the areas from which the girls came’.

22.43 In October 1948 Bethany wrote to the Department of Health, on the advice of Miss Litster, requesting reimbursement under the Maternity and Child Welfare scheme. At this time the Department of Health was expanding services for mothers and children. Total payments from the National Maternity and Child Welfare Grant increased from £34,149 in 1945/6 to £58,752 in 1947/8. In the years 1945-1948, just over £50,000 of the £134,000 expended under this scheme went to voluntary agencies; the balance went to local health authorities. In March 1948 this grant was merged into the Health Services Grant. These changes and the Department's evident willingness to increase spending under this heading would have made it easier to include Bethany. In January 1949 the Department of Health informed Bethany that it would be eligible for maternity and child welfare grants from the beginning of the year. This meant that Bethany would be reimbursed for 50% of approved expenditure on mothers and infants - excluding mothers and babies maintained by the public assistance authorities. The financial benefits were significant. In April 1949 the treasurer reported that income since the previous meeting had amounted to £801, of which £697 came in a grant from the Department of Health. Bethany recorded a credit balance in its accounts, apparently for the first time.

22.44 This comfortable position was short-lived; by 1953 Bethany was again running an overdraft. By the 1950s, it was heavily dependent on support from local authorities and the Department of Health. There were few references to bequests, although in January 1955 with the overdraft standing at £599, an American gentleman who had adopted two children some years previously arranged to transfer shares worth $3,000 to Bethany which could be sold for the benefit of the home. Bethany suffered the same experience as other mother and baby homes. Falling numbers and shorter stays reduced revenue; the twice-yearly payments under the maternity and child welfare grants reported in the management committee minutes become
smaller. By early 1958 the overdraft had risen to £1,192; it was £250 at the end of 1956. The management committee decided to have a ‘form of request’ included in the Home’s Annual Report Booklet, and members of the committee were asked to identify potential donors. Bethany determined to apply to the national radio station, Radio Éireann for inclusion in the station’s weekly charity appeal.31

22.45 Economies were necessary. The high cost of heating and fuel was highlighted; there was a view that the cooker and water heater were too large and inefficient for their needs. It was decided to repair and use the stove instead of the cooker. A second hand gas cooker, financed by a private subscription, was installed some time later. The completion of the sale of the former Emmanuel Home ‘annexe’ on the site of the Bethany Home reduced the debt to £205. The management committee continued to seek charitable donations, distributing 1,000 handbills advertising its annual Gift Day along with copies of the annual report to subscribers. Bethany asked clergymen to make an announcement to their congregations about the annual Bethany Gift Day and the need for increased financial support. Such efforts were evidently successful. The accounts for 1962 showed a surplus of income over expenditure of £194; total income was £2,111, expenses amounted to £1,917 10s 3d. When the 1964 accounts showed a surplus of income over expenditure of £175, the management committee ‘voiced thanks to God’. In 1964 Bethany received a gift of £1,000 that they invested in shares. The favourable financial circumstances meant that in 1968 the committee reported that many improvements had been made in the past year and ‘much more’ were envisaged. When Bethany closed in 1972 the property was sold for £38,000. In 1974 a High Court judgement determined that the net proceeds of the sale - £37,232 and an additional £4,000-£4,500 in other securities should be allocated to the Magdalen Home, Eglington Road (later Denny House) and Miss Carr’s Children’s Home on Northbrook Road, with the Magdalen Home receiving 85% and the balance going to Miss Carr’s Home.32

The women

22.46 The institutional records which have been entered into a database and analysed by the Commission show that a total of 1,584 women entered the Bethany Home between 1922 and 1971. This number includes 113 who were neither pregnant,

---

31 An appeal for a charity was broadcast on Sundays before the main evening news.
nor recent mothers. (These women are discussed in a separate section). The records give very little detail about admission pathways. Some women and children were referred by local clergymen. In 1928 the management committee determined that the secretary should be advised as soon as possible of every case admitted temporarily by the Matron. They also determined that women should be inspected by the Bethany nurse before the secretary formally approved their admission and at the time of their admission every adult had to sign a formal document agreeing to the rules governing the Bethany Home.

22.47 There is some evidence that the number of women admitted was determined by the financial state of the home. For example, in November 1931 when the overdraft had reached its limit of £2,000, the management committee passed a resolution that the number of women in the home should not exceed 20. When finances improved in 1932, because of a legacy and an anonymous donation, the number of mothers increased from 26 to 50. Admissions peaked in the late 1930s. Between 1935 and 1939 the numbers admitted were 60, 62, 64, 51 and 57 respectively. In 1940 admissions fell to 32, and although they increased during the 1940s, the peak figure of 43 in 1946 was substantially below the numbers admitted in the late 1930s. The sharp fall in admissions in 1940 was undoubtedly due to the exclusion of Catholic women (see below). This meant that Bethany did not experience the same capacity pressures during the war as Catholic mother and baby homes.

22.48 When Bethany was first inspected in 1936 under the Registration of Maternity Homes Act 1934, the departmental inspector, Mrs Crofts, reported that the home was overcrowded and the management committee determined that the number of
mothers should be capped at 20 except in an emergency. This average figure had
been breached in every year from 1933 to 1939, with the exception of 1937, but it
was never again exceeded; in 1942 there was an average of 20 women in the
home. From the early 1950s, the number of women and babies fell steadily.
Average monthly occupancy was only in double figures twice after 1950, in 1953
and 1956. In May 1962, there were seven women and four resident babies; only
15 women were admitted in 1970 and two in 1971. The last child was admitted to
Bethany on 25 August 1970 and the last child was discharged on 18 December
that year. The last recorded admission for a woman was on 23 January 1971; the
last woman was discharged on 27 March that year.

Age of mothers

22.49 The mean age of mothers fell from 25 in the 1920s to 23 in the 1950s and 1960s.
Sixty-four women were under the age of 17, 41 of these were aged 16. In total
89% of mothers were 18 years and older. Information about the women’s
occupations is not available in 76.5% of cases; the best data is for the 1920s,
when it is no surprise that the overwhelming majority were either domestic
servants or engaged in home duties. In her memoir, Miss Pilgrim stated that the
women who entered Bethany were not simply ‘rough or low class…We have had
some of the most refined and cultured girls - typists, teachers, nurses, and even a
Minister’s wife and a missionary’.

22.50 The largest number of Bethany women gave a Dublin address (though many would
have been born elsewhere). The next most common addresses were counties
Cavan, Wicklow, Donegal and Monaghan, all with substantial Protestant
populations; 139 women gave addresses in Northern Ireland.

Length of stay

22.51 Women stayed in Bethany for a shorter period than in the Sacred Hearts Homes.
The longest average stay was in the 1950s. The increased duration of stay was the
result of women entering Bethany earlier in their pregnancy; the duration of post-
natal stay was falling - as happened in other homes. By 1961, the amount of time
allowed for a mother to remain in Bethany after the birth of her child was four
months. This was subsequently reduced to three months by a decision of the
management committee in December of that year. By this stage the average stay in all mother and baby homes was falling because children were being adopted.

22.52 Three-quarters of the women were admitted when pregnant and remained until after they had given birth; 17% arrived with their child having given birth. A small number (8%) left the home before the birth and others gave birth in hospital and did not return. Just over half, 54%, of the births took place in the Bethany home. Between November 1937 and December 1938 a total of 47 babies were born in the home. An inspection in December 1945 stated that ‘most of the girls appear to be sent to city hospitals for confinement’. Under the heading ‘Number of confinements in Home since date of last inspection’ it recorded 35 (22 in Rotunda). A report by the Department of Health in 1950 noted that Bethany mothers attended ante-natal clinics in the Rotunda hospital ‘the Home had a visiting physician and a qualified maternity trained nurse. The Home was described as clean and well kept; comfortable beds and the mothers appeared to be well-fed’. A Department of Health survey of accommodation for unmarried mothers provided under the Health Act 1953 stated that ‘Confinements do not as a rule take place in the Home except in an emergency or at the request of a patient’. The department regarded the move to hospital births as very desirable given the few staff in the home.

22.53 The three homes run by the Congregation of the Sacred Hearts of Jesus and Mary and the Magdalen Asylum would admit only first-time mothers. Bethany’s rule was somewhat different. Miss Pilgrim explained that ‘no girl was admitted the second time, having been in the Home and having had a chance to hear the Gospel previously but we often had girls admitted to have a second or third, or even fourth babies: but having been once in the Home they were not allowed back’. In 1956 the Department of Health noted that women who were ‘not eligible’ to be admitted
to the Magdalen Asylum or Bethany were sent to a home in Cork - Braemar House. Records of Braemar House, which was not included in the Commission’s remit, record women being transferred between Braemar and Bethany.

22.54 The institutional records show that almost 28% of Bethany mothers had one or more previous pregnancies, over 5% had multiple previous pregnancies; this information is not available for 28% of the women, so the actual percentage may have been higher. The highest proportion of women with previous pregnancies were admitted in the 1930s. During that decade many of the Catholic women admitted had already given birth to one or more children. In 1953 the Magdalen Asylum in Lesson Street contacted Bethany Home regarding its admission policy. Under the terms of its trust, the Asylum could only admit ‘first fail’ cases. Very few such women were now seeking admission; the number of ‘illegitimate’ births had fallen sharply and given that Bethany admitted women on their second or subsequent pregnancy, the Magdalen Asylum suggested that those ‘first fall’ cases coming to Bethany should be ‘diverted’ to the Asylum. Bethany’s management committee declined this request, noting that the ‘vast majority’ of women they admitted were ‘first falls’. If they excluded ‘first fall’ mothers the numbers admitted to Bethany ‘would be negligible’. In 1961 in a break with policy, the Matron was given permission to admit a woman who had been resident two years previously after she ‘had again got into trouble’. In 1956 a Westmeath clergyman asked that a woman be admitted to Bethany ‘to get a fresh start in life’. She had been resident there 18 years previously and was currently working in a mental hospital. But given that she was now in her fifties the committee decided that she was ineligible for admission.

22.55 There is evidence that Bethany sought financial support from the parents of Bethany mothers, and from the clergy that referred them. The women were expected to perform domestic work and chores in exchange for their care, and the Bethany authorities regarded such work as training for jobs in domestic service. However, it was frequently acknowledged that women admitted into the Home ‘could not usually pay anything towards their maintenance’ and securing financial assistance from parents and clergy proved difficult. By the 1950s a growing number of unmarried mothers were in insured employment and they qualified for maternity benefit (from 1953). The Matron reported that women were handing over their social insurance payments to support their residency. On occasion, women
who were viewed as being particularly useful while resident in the home were paid for their work. For example, in 1957, the Matron received approval from the management committee to pay one ‘girl who had been in the Home for the past year 10s a week due to her ‘helpfulness’. In 1964, the decision was made to increase the charge on women paying for their maintenance privately to £3 a week.

**Mothers’ exit pathways**

22.56 There is limited information available about the immediate destination of women who left Bethany. No details are recorded for 38% of the women. Where information is available, 56% were recorded as going home (i.e. their family home) or to a private address; 29% were recorded as going to a situation/employment, which may have been arranged by Bethany. The remainder scattered among a range of institutions. Bethany’s 1938 annual report stated that of the 87 women who had been resident over the previous year, 37 were sent to situations, seven went to friends, 13 returned home, six went on to other institutions, one left on her own accord, while 23 were still in the home at the end of that period. In 1956, the Matron reported that two girls were leaving the home to take up nursing overseas. Some former residents kept in touch with Bethany following their departure. In 1956, the matron reported that she had received a letter from a former ‘inmate’, who was now resident in California and happily married; this woman and her husband were ‘actively engaged in Christian service’.

22.57 A number of women were asked to leave Bethany. In 1945 Miss Walker reported to the management committee about the behaviour of a recently admitted woman. They issued an order requiring her to leave within six days. If she failed to comply they would be willing to ‘take such steps as they deem necessary in the circumstances’. In 1958 the Matron reported that one woman was causing considerable trouble and the management committee again ordered that she be told to leave within a week. This mother complied with the order; however she left her child, who was mixed-race, in the home. In 1963 a resident stole two coats from the Matron’s flat before leaving. The management committee awarded Matron £10 in compensation.
In 1944 the management committee discussed the problem of ‘feeble-minded girls’ in the home ‘some of whom were at present causing anxiety’. They acknowledged that they did not have the staff or facilities to cater for such cases and decided to approach the Salvation Army to explore the possibility of opening an institution to cater for such cases. A representative from the Salvation Army informed the committee that there was no prospect of anything being done just then, because of war-time pressures. Records indicate that a number of women with intellectual disabilities were admitted in later years. In 1959 a woman who had been in an institution in Co Meath (Drewstown House) was sent to Bethany ‘for a trial there’. She was described as having ‘limited mental facilities’; if Bethany did not prove suitable, it was proposed to transfer her to the Stewarts Institution. At almost the same time a twenty-year old woman, who was described as of ‘very low mental capacity’ was found wandering in Dublin. She was detained in St Joseph’s Convent, Drumcondra but was then transferred to Bethany with a view to her rehabilitation and finding her suitable employment. The Department of Health queried the decision to send this woman to Bethany; they did not believe that it had the facilities to rehabilitate her. Sligo County Council was planning to transfer a ‘girl’ from Stewarts to Bethany to determine whether she could be placed in employment. In 1963, the Matron told the committee that a recently admitted 17 year old ‘girl’ appeared to be ‘only 12 years old in intelligence’.

Roman Catholic Mothers

In the early years Bethany admitted women, irrespective of their religion; 419 of the 1,584 Bethany mothers were Catholics. In the 1920s and 1930s Catholics constituted over 45% of mothers admitted; in 1927, 1929, 1933, 1934 and 1937 over 50% of mothers admitted to Bethany were Catholic.

The ethos of Bethany was strongly evangelical. The staff and the management committee were determined to ‘save’ all the women who entered the home. In December 1957, the committee ‘heard with satisfaction’ how eight mothers ‘had professed conversion' having attended a recent ‘crusade’ meeting held by the British evangelist preacher Eric Hutchings. One ‘backslider had been restored’ (presumably to religious practice); in 1959, the Matron noted that two women had ‘come to Christ’ at the tent meeting held on Dublin’s South Circular Road.

Most likely in the Magdalen laundry on this site (High Park).
Mourning the death of their long serving Secretary, Miss Walker, in May 1955, the members of the management committee put on record, her selfless devotion to the spiritual and material welfare of the women and girls who in their time of need came under the influence and loving care of the Bethany Home. She continued to take a prayerful and practical interest in them after their discharge and this interest was greatly blessed by the Lord and rewarded by her seeing his transforming grace manifested in many lives. In caring for them she served her Saviour and has now entered into the fuller joy of his presence.

22.61 Bethany offered some attractions for Catholic women. Given the sectarian divisions in Irish society, it was unlikely that their presence in Bethany (and their pregnancy) would become known to family or neighbours. Women remained in Bethany for a shorter time than in the Sacred Heart homes, or a county home, and Bethany facilitated the placement/‘adoption’ of children, provided that the mothers consented to their being raised as Protestants. It may be significant that in the 1930s, the decade of peak Catholic admissions, 35% of the Catholic mothers admitted had given birth to one or more children. These women would not have been admitted to the Sacred Heart homes, though they would have been accepted in Regina Coeli or Pelletstown. Chapter 21 which deals with Regina Coeli, contains some details about Catholic mothers in Bethany and the efforts of the Legion of Mary to remove them.

22.62 In 1926 Miss Walker received a letter from Miss Cruice of St Patrick’s Guild requesting that all Roman Catholics applying for admission to Bethany should be referred to her. In return, she promised that Protestants applying to her organisation would be referred to the Bethany Home. The management committee informed Miss Cruice that they ‘could not comply with her request’. In 1934, during a sermon given to raise funds for the Catholic Sacred Heart Home in Drumcondra (an orphanage which was not connected to the Sacred Heart mother and baby homes), the preacher attacked the Irish Church Mission’s stated objective ‘to bring the gospel message of religious liberty to our Roman Catholic fellow-countrymen’. He referred to its ‘ally’ the Bethany home, and declared that the ICM’s aim was ‘to rob’ the Irish people of their Catholic faith. In April 1939, the annual report of the CPRSI described Bethany as ‘another active source of proselytising’ among

34 *Irish Independent*, 24 January 1934.
unmarried Catholic mothers in Dublin. It accused the Bethany authorities of trying to entice these women and their children to the Protestant faith. While Protestant women in Bethany had to pay a fee, the CPRSI alleged that Catholic women were accommodated free of charge on condition that they actively participated in Protestant religious services and their infants were reared in the home free of charge ‘on condition that they handed them over to be brought up as Protestants’.

Bethany was unapologetic about its missionary zeal. A.H. Gibson, who presided at Bethany’s 1933 annual meeting, stated that the work of the home ‘was very much misunderstood’ with many claiming ‘that their aim was to entice people from one Church to another – whereas...the only aim...was to bring sinners back to Jesus’.

Miss Pilgrim noted that some Roman Catholics admitted to Bethany ‘became new creatures in Christ Jesus’.

22.63 In January 1940 a barrister, representing the Bethany Home in a legal case, quoted a solicitor representing the Attorney General, who had opposed a draft scheme to give the funds of the Dublin Women’s Shelter (which had closed because the premises were subject to compulsory purchase) to Bethany because the manner that the trust deeds of the Bethany Home required it to adopt towards those who applied to it for shelter, would, if applied under the draft scheme to Catholic applicants, constitute an infringement of religious liberty under the Constitution; be a constant source of irritation to the Catholic community and thereby impair the good relations that ought to exist among all the citizens of the State.

22.64 In an affidavit Miss Walker denied that the religious liberty of any Roman Catholic applicant or inmate had been infringed. She alleged that the work of the home ‘had been seriously interfered with for a considerable time past by persistent, unfriendly, innumerable and unnecessary requirements of public officials’ and consequently with ‘great reluctance’ it was deemed advisable by the management committee to pass a resolution prohibiting the admission of Roman Catholics ‘notwithstanding that the home would be seriously prejudiced in this matter by adopting such a resolution’. She intimated that the passing of this resolution ‘was accelerated as the result of information which reached her Committee that, if it was not adopted, the recognition of this home as an approved institution was intended to be
The absence of management committee minutes for these years is a major handicap in trying to interpret this statement. At this time Bethany was not in receipt of any public funding; the only official recognition was as a place of detention for women and its registration under the *Registration of Maternity Homes Act 1934*, which makes no mention of religion.

In October 1940 the secretary of the Bethany management committee wrote to Dr Berry, a medical inspector in the DLGPH stating that the committee had unanimously adopted a resolution ‘That as suitable accommodation is available elsewhere in Dublin for Roman Catholic girls, such girls shall not in future be admitted to the Home’. The institutional records suggest that Bethany broadly complied with this resolution; only 23 of the 419 Catholic women were admitted after 1939; the last in 1964. In 1955 the Bethany management committee expressed concern that Catholic organisations in Dublin were ‘getting hold of babies born to Protestant mothers in hospitals’. They decided to ask the Church of Ireland Archbishop of Dublin to raise the matter when contacting the clergy members in the archdiocese. The Commission has not seen any evidence relating to this.

**Non mother and baby home admissions**

A total of 113 women who were admitted to Bethany were not pregnant and had not recently given birth. While mainly functioning as a mother and baby home, Bethany was also a place of detention for women accused of infanticide, ‘concealment of birth’ and petty crimes. Catholic women in such circumstances would have commonly been sent to a Magdalen Laundry. If they were under the age of 16 (this was raised to 17 in 1941), they would have been sent to a reformatory school, under the provisions of the 1908 and 1941 *Children Acts* (see Chapter 1). In 1945 the minutes of the management committee reported that Bethany had been registered as a place of detention for the purpose of part 5 of the *Children Act 1908* on the recommendation of Dr Barton, the Archbishop of Dublin.

---

37 *Irish Times*, 23 January 1940.

22.67 The Report of the Inter-Departmental Committee to establish the facts of State involvement with the Magdalen Laundries\textsuperscript{39} showed that 8\% of admissions to Magdalen Laundries were categorised under ‘criminal justice system’, which included cases ‘on remand, on probation, by the Courts from prison or by An Garda Síochána’. In 1940 the barrister who was appearing on behalf of the trustees of the Bethany Home told the High Court that the Gardai ‘were in the habit of sending any homeless Protestant girl to Bethany’.\textsuperscript{40} For example in September 1924, two sisters from England, aged 17 and 18 respectively, were charged with stealing a woman’s overcoat from a shop in Dublin and obtaining goods by ‘false pretence’ from two other establishments. They pleaded guilty and stated that they had been ‘left in Bray by their parents with £1, and had to do something to live’. The court ordered that they be sent to Bethany until such time as the probation officer ‘decided that they might leave, the period not to exceed 12 months’.\textsuperscript{41} In 1931, a young domestic servant from Wexford was ordered ‘to enter Bethany for six months’ having been arrested for leaving a hotel in Bray without paying a bill for a week’s worth of food and lodgings.\textsuperscript{42}

22.68 In 1926 a woman from Donegal pleaded guilty in the Central Criminal Court to the ‘concealment of birth’ of her child. In the majority of such cases, the initial charge of murder was reduced to one of ‘concealment of birth’ of an infant, in accordance with Section 60 of the Offences Against the Person Act 1861.\textsuperscript{43} Her solicitor urged the court to consider the extenuating circumstances, namely that she was underage and her parents ‘took no interest in her’. The court ordered her to be bound to the peace for a period of two years provided she remain in a suitable institution; she was ‘given to the care’ of the Bethany Home.\textsuperscript{44} Rattigan reports on an infanticide trial in the Central Criminal Court in 1930 where Miss Walker told the judge that if he took ‘a lenient course’ the defendant would be admitted to the Bethany Home and kept for at least twelve months.\textsuperscript{45}

22.69 From his examination of the Criminal Court Trial Record Books, covering the period 1926-64, Smith has uncovered four further cases of women being sent to Bethany on charges of concealment of birth or murder of an infant. One was a grandmother, who was sentenced to death for killing her daughter’s baby in 1938. The sentence was commuted to penal servitude for life; she was released on licence to Bethany two years after the date scheduled for her execution; she spent less than two months in Bethany, moving to live with a son in Northern Ireland. There is no evidence that Bethany received government funding for admitting these women. In 1947 Bethany asked Sligo county council to contribute to the cost of maintaining a woman, who was a native of the county and had been sent by the court, but they declined to do so. Bethany then contacted the Department of Justice. They replied that they had no funds available for this purpose. A request for funding to the Discharged Protestant Prisoners' Aid Society was also rejected. The Magdalen Laundries received no financial support for similar cases. Bethany continued to accept women committed by the courts or released from prison. In October 1962 a woman was admitted from Mountjoy Prison, as was a woman who had suffered a mental breakdown. In 1965 one woman was admitted on ‘prison remand’. This was the last such case before the home closed.

46 Table reproduced from James M. Smith, *Ireland’s Magdalen Laundries and the Nation’s Architecture of Containment* (Notre Dame: University of Notre Dame Press, 2007), p. 195. These records are held in the NAI.
Many of the women admitted to Bethany who were not pregnant or recent mothers were ‘Midnight Mission cases’. They were brought to Bethany by Miss Walker or her friends who patrolled public houses and the streets at night. Others were sent by charity workers and Gardaí. While Bethany refused to admit an unmarried mother for a second time ‘having had a chance to hear the Gospel previously’, this restriction did not apply to Midnight Mission cases. Miss Pilgrim claimed that many made repeat visits ‘and sometimes they stayed with us for months on end; and then the craving for drink and company would get so acute that they succumbed again’. In 1925 the management committee discussed the difficulties that arose in keeping the women as long-term residents in the Bethany Home. They decided to get in contact with a similar institution in either England or Belgium to which such cases could be referred, though there is no evidence that this happened. However, statistics suggest that some policy of reducing the number of these women was implemented, because 75 of the 113 women who were not maternity cases were admitted between 1922 and 1929.

**Health and mortality in the home**

Five mothers died while in the care of the Bethany Home; three in the 1920s and two in the 1930s. Three mothers died in Bethany itself and one each in the Rotunda and the Adelaide Hospital.

In November 1933 the Matron reported on the death of one woman, stating that the visiting doctor ‘was fully satisfied that everything possible was done for the girl who died’. In September 1957 a mother died in the Adelaide Hospital following an operation. The Matron subsequently outlined the particulars of her death and funeral to the management committee along with her attempts to get financial aid, from either her father or through church contributions, to help cover the £17 cost of the funeral arrangements.

**The Children**

**Infant mortality**

A very high rate of infant mortality was a common feature of all mother and baby homes until the late 1940s and Bethany was no exception. A total of 262 children who were born in Bethany, who were admitted to Bethany, or whose mother was in Bethany and left to give birth, and the child was not admitted to the home, died
between September 1922 and October 1964. In the case of 142 children, their mothers were in Bethany when they died.

22.74 The highest number of deaths was in the 1930s, when the numbers in the home were at their peak, but the highest mortality rate was in the early 1940s.

22.75 The death of any infant born in, or admitted into, Bethany was recorded in the Bethany Baby Book Register, which was kept and updated between the years 1922 and 1970. Two columns in the register, headed ‘where gone’ and ‘later news’, were used to record the death of a child, plus the date and place of death. Almost three-quarters of the total, 195 children, died in the Bethany home; 17.4% died in various hospitals, including 10 children who died in maternity hospitals; only three children are recorded as dying in a maternity hospital (the figures for deaths exclude stillbirths); seven children died in Emmanuel House. Nearly three-quarters, 73%, of the children who died were aged between one month and one year. This proportion was greatest in the 1920s, when 80% of deaths were in that category; it fell to 73% in the 1930s, 69% in the 1940s and 17% in the 1950 - by which time the overall death rate had fallen significantly.

22.76 There was a high incidence of infectious disease among children in Bethany until the 1950s. In February 1924 the secretary reported on a severe outbreak of influenza, resulting in the death of one of the 11 resident children. In December, the Matron reported that nine of the 27 children were suffering from bronchial pneumonia; she requested that they be transferred to hospital as soon as possible and that their mothers be notified - which would appear to suggest that these mothers had left Bethany. Following an outbreak of German measles in May 1925, the medical officer told a special meeting of the management committee that several babies were ‘suffering from septic infections’; he ‘strongly recommend that some building be set temporarily in the country and if possible near the sea so that the children and others can go there for a stay’. As it was not financially possible
to arrange this, the committee agreed that the mothers should be allowed ‘take babies out in prams with some dependable person in charge.’ It was decided at the next meeting to close the institution with a view to disinfecting the entire premises before reopening.

22.77 The Matron at this time subscribed to the not-uncommon belief that the children of unmarried mothers tended to be weak and prone to illness; in 1929 she attributed the deaths of six infants during the previous month as ‘mainly to the inherent illness of the infants in question’. However, she also reported that the visiting doctor had highlighted the risk of infection in the home. In May 1929 an amendment was made to Bethany’s standing orders requiring that ‘any child admitted must be put and kept in the isolation room until medically examined, and must be dealt with thereafter in strict accordance with doctor’s orders’. Following the death of a four-and-a-half month old baby in 1930, who had been admitted from the Waterford county home when six weeks old, the management committee decided that in future ‘no child shall be received unless accompanied by a medical certificate of health. If this is not forthcoming no child admitted shall be allowed out of the isolation ward, or to remain there longer than seven days without such a certificate’. The following month the medical advisor reported that there was inadequate space for infants in the nursery; more space was required. It is unclear whether the home had an isolation unit; the Commission has not seen any independent evidence that there was one.

22.78 The Matron reported to the monthly meetings of the management committee on the numbers of women and children in the home; the number that were admitted, or left since the last meeting, and, in the case of children, she gave the numbers who were born or had died. The minutes also contain brief comments on the health of the ‘inmates’, which was generally described as ‘good’ or ‘very good’. In the years when infant mortality was high it is doubtful that such observations were justified. In December 1935 the Matron reported that the ‘health of the girls’ was ‘good’; the deaths of six infants in the past month was due to ‘gastro-enteritis’. In April 1936 the visiting medical officer recommended that Bethany should purchase a sunlight lamp ‘owing to the larger number of babies now passing through the Home who needed ultra-violet ray treatment’ - presumably to prevent rickets. The medical officer contributed £5 towards the cost of £25.
22.79 In October 1936 the Matron reported that five infants had died in the previous month; four from heart failure. She went on to observe that the health ‘of all was good, except for one delicate baby’. Despite the recurring high infant mortality, the minutes of the management committee do not record any discussion of the causes of infant deaths, or what might be done (other than isolation) to reduce the number of deaths.

22.80 Because of the absence of minutes from 1937 to 1944 there are no contemporaneous comments on illness and deaths during this critical period. In January 1946, the Matron reported on an outbreak of measles; another measles epidemic was reported in October 1947, when 14 infants contracted the disease. When the Department of Health inspected the home in March 1948 (the Commission has not seen a copy of the inspection report), they highlighted the need to provide ‘a very comprehensive diet for the babies’. The committee claimed that it would be difficult to do this, because of the ever increasing cost of food. In September 1949, the Matron reported that 15 of the 33 children were suffering from whooping cough. By the date of the next monthly meeting all the children had been infected. Two children died. An outbreak of polio in September 1958 forced Bethany to cancel a planned ‘Bring and Buy’ sale. One mother was hospitalised. By the 1950s the number of infant deaths in Bethany and the other mother and baby homes had declined significantly due to immunisation programmes, the use of antibiotics and the reduction in infectious diseases in the community.

22.81 Overcrowding, which was particularly acute during the 1930s, inadequate facilities for the treatment of illnesses, the employment of under-qualified staff and the, frequently dire, financial pressures under which the Bethany Home operated were all contributory factors in the high incidence of infant mortality from the 1920s until the late 1940s. A further factor may have been the number of children who were in Bethany without their mother. It is also evident that heating and sanitary conditions were inadequate when the home was in Blackhall Place. They were much improved when Bethany moved to Rathgar, but there is sufficient evidence to suggest a lack of heating and facilities for drying clothes, and although the home was well-provided with bathrooms and washbasins, none of these was in the annexe where the mothers slept until the 1950s. There is no information available about the proportion of Bethany infants who were breastfed, but the fact that the mothers’ dormitory appears to have been in the annexe, whereas the nursery was
in the main house would have made it difficult for mothers to breast-feed their babies.

**Children’s exit pathways**

22.82 The institutional records have information about exit pathways for 1,072 children; this excludes 195 children who died in Bethany and 109 children where there is no information. The records show substantial changes in the children’s destinations over the decades. In the 1920s and the 1930s, for example, 31% of the children were recorded as nursed out; this fell to 24% in the 1940s and to less than 1% in the 1950s. In the 1930s, over 38% of children went to other institutions, compared to under 22% in the 1920s, 1940s and 1950s. This appears to suggest that families were more willing to take children in the early years: 42% of children who left in the 1920s were recorded as going with a parent or to family members, compared with 25% in the 1930s, 18% in the 1940s, 12% in the 1950s and 10% in the 1960s. The annual report for 1943 noted with satisfaction that, of the 84 children who passed through Bethany in the previous year, ‘an exceptionally large number of children had been taken home by their mothers, grandmothers or other relatives’. However it is possible that a mother or her family subsequently placed the child with a foster family or in an institution. A total of 216 Bethany children were placed for adoption (from 1953) and an additional 112 are recorded as ‘informal adoptions’.

22.83 Children left Bethany at an earlier age that the majority of children who were in the Sacred Heart mother and baby homes; the average stay was under a year and it fell following the introduction of legal adoption. The length of stay was greatest in the 1940s when it proved difficult to secure foster homes, because of the rising cost of food and clothing - a difficulty that was common to all charities and local authorities that placed children in foster care.

22.84 A significant number of children (49%) remained in Bethany after their mother had left. The Bethany authorities made arrangements to place these children either in foster homes, or Protestant charitable institutions; from the 1950s children might remain in the home pending the completion of adoption arrangements. Some

---

48 *Irish Times*, 15 April 1943.
children of Catholic mothers were transferred to the Catholic Protection and Rescue Society - a charity whose mission was to prevent Catholic children being lost to Protestantism. Most Bethany children who were adopted were adopted within the State and the adoptions were arranged through the Protestant Adoption Society. Unaccompanied children were also admitted to Bethany. Children who had been placed at nurse by Bethany were occasionally returned to the home, if the foster parent was either unwilling or incapable of keeping them, or the child became ill.

22.85 If a mother did not take her child when she left the home she was expected to contribute to the child’s maintenance in the home, or the cost of placing the child at nurse. Some mothers were able to provide this financial support though employment - usually as a domestic servant - which was arranged by Bethany. At the annual meeting in 1925, it was reported that £271 had been subscribed by the ‘girls’ or their relatives as ‘thank-offerings’. Yet a year later, it was noted that ‘most of the girls who are received into the Home cannot pay anything towards [their children’s] support … the mothers contribute as much as they can afford and visit them regularly’. Despite this the secretary, Miss Walker, stated that out of the 85 maternity cases dealt with in the past year, there had only been one case of a mother leaving the home and ‘disappearing’. The others ‘do not shirk their responsibility and contribute faithfully what they can to the upkeep of their children’.

22.86 The issue of mothers, who were unable to provide a pre-payment to cover the cost of the first monthly fee to the nurse-mother who was taking care of their children, was discussed by the management committee in 1927. The committee agreed in principle to provide financial help ‘in suitable cases’. In 1930, a concentrated effort appears to have been made to place as many children as possible with nurse mothers. By May, it was reported that 21 children were now so placed under the auspices of the home. In August, it was noted that all the children whose mothers had left were due to be nursed out over the coming days. As a result, the committee determined that they could dispense with an additional member of staff who had been hired in 1929. The 1933 annual report stated that 20 children from the home were at nurse; their mothers were contributing £137 18s towards the cost. Dr Barnardo’s charity made a donation to Bethany - amounting to £93 that

---

49 Irish Times, 6 February 1925.
year, towards the cost of foster care. In April 1939, it was reported that 29 children from Bethany had been nursed-out in the past year, with the mothers contributing over £229. The 1943 annual report highlighted with gratitude the grants from Barnardo’s towards the cost of boarding-out children.

22.87 Mothers were also expected to contribute to the cost of their children if they were placed in a children’s home. On occasion children were transferred from Bethany to homes run by Dr Barnardo’s, as happened with three children in June 1928. Barnardo’s also contributed to the cost of maintaining at least one Bethany child in a home run by the Irish Church Missions.

Children at Nurse

22.88 Local health authorities did not commonly place children in foster homes until they were at least two years old. None of the children who left Bethany were placed in foster homes by the local authorities when they left, although a number may have been placed in later years. The institutional records show that 207 children were placed ‘at nurse’, and this was the destination of 31% of Bethany children in the 1920s and 1930s. The proportion fell in the 1940s, when the number of ‘informal adoptions’ increased, and the practice of placing children ‘at nurse’ effectively ended following the introduction of legal adoption. In December 1955 only one child was being boarded-out from the home; his mother paid the entire cost.

22.89 Bethany was directly involved in identifying foster homes and placing children, and Bethany was responsible for ensuring that mothers contributed towards the cost of foster care, and for paying the foster mothers. Miss Pilgrim’s memoir of Miss Walker recalled the ‘great day’ when she acquired ‘her little Baby Austin. It was much used to hunt up Nurse mothers and visit adopted babies in many parts of the country’. Bethany used a network of Protestant nurse-mothers, some of whom were based as far away as Co Monaghan. In May 1930, it was reported that 21 children had been placed in foster homes. However, the quality of care in some foster homes gave cause for concern. The secretary attended a court case that month to give evidence on the condition of a Bethany child who was in the care of a nurse mother. Following this case Miss Walker stated that she was not ‘fully qualified’ to visit and inspect children at nurse in future. Following a discussion, it

50 A charity established by the Dublin-born Dr Thomas Barnardo in London in 1870 to care for destitute and homeless children. In addition to a network of children’s homes they supported some children in foster homes.
was decided that the lady members of the management committee should arrange for a suitable person to visit all nurse children from Bethany on a regular basis. The first of these visits occurred a month later, and the lady members remarked on the absence of proper clothes on children who were under the care of two nurse mothers. In October 1930, it was reported that children who had been at nurse with one identified nurse mother were to be removed from her ‘owing to unsatisfactory attention’. In 1933, Miss Walker noted that a number of ‘Christian girls’ had arranged to form a society to look after the interests of babies as they left Bethany Home; the Commission has no further details of this initiative. It is also unclear whether a ladies committee carried out regular inspections of foster homes; if they did, it is not reported in minutes of the management committee or the annual reports.

22.90 A report on boarded out children in Co Monaghan in December 1938 by the DLGPH inspector Miss Kennedy O’Byrne described details of a number of children placed at nurse by Bethany; she noted that one child was being returned to Bethany and would be ‘adopted’. The inspector reported that a nine-month old boy, who had been placed at nurse from Bethany two weeks previously, ‘appeared to me to be in a dying condition…It was dirty and neglected and sore and inflamed from a filthy napkin which cannot have been changed for a very long time’. The Gardaí had informed her that they had already ‘received unfavourable reports’ about this particular foster mother, who had fostered another infant from Bethany ‘some time ago [who]…wasted away and died within a month of being sent to her’. Miss Kennedy O’Byrne contacted the dispensary doctor and asked him to see the neglected child and order his removal to the county home. This foster mother had failed to register the child as required under the Children Acts. The inspector recommended that the local authority should ‘deal drastically with this woman and to prosecute’. She described the Bethany authorities as ‘very culpable to send a child in the condition of health of […] out to nurse. He should have been sent to a hospital’.

22.91 Her report prompted Dr Sterling Berry, a medical inspector in the DLGPH, to visit Bethany to investigate this case. Bethany informed him that the homes of all nurse mothers were either inspected by the Bethany authorities or a reference was sought from a reliable source. Nurse mothers were paid £1 10s a month and given an ‘outfit consisting of six napkins (nappies) & three of all other clothes’. At this
time Bethany had 19 children boarded out. Dr Berry claimed that the Monaghan woman had acted as a nurse mother for Bethany for some years and was ‘always regarded as satisfactory’ until this case. (Miss Kennedy O’Byrne suggests otherwise). Having checked the records of six children who had been placed with this nurse mother, he claimed that four ‘show very good results’. He described the child seen by Miss Kennedy O’Byrne as ‘delicate from birth and was put out to nurse on the recommendation of the Bethany Medical Officer who thought that country air might improve the child’s condition’. This child had been returned to Bethany. Dr Sterling Berry described him as ‘a delicate child but shows no signs of neglect or ill-usage’. He indicated that this foster mother would not be used by Bethany in future. Dr Berry ended his report by stating that ‘the Institution is kept very well is very clean and comfortable, no evidence of over-crowding. The mothers and infants are well looked after and appear happy and contented’. The Commission’s records show that this child died in Bethany two months later. The file suggests that the Monaghan county solicitor was examining whether to prosecute the foster mother.

22.92 Allegations that Bethany children were neglected became embroiled in a campaign, by the CPRSI, against Bethany’s proselytising activities. In July 1939 the assistant secretary of the CPRSI informed the clerk of Rathdown Board of Assistance that the CPRSI had removed seven Bethany infants to hospital since January; they were found to be sick or suffering from a range of medical conditions. In August, the Irish Independent carried a report of a meeting of the Rathdown Board of Assistance which discussed the case of one of these children, a four-month-old boy, who was suffering from whooping cough and purulent conjunctivitis of both eyes. He was admitted to Loughlinstown hospital. It is unclear where the CPRSI found this child; the file stated that ‘the child was in such bad condition that no foster mother would take him’. The infant ‘was rescued from the Bethany Home’ and admitted to Loughlinstown hospital. One of the children, an eighteen-month old girl, was taken by the CPRSI at the request of her mother who was in London; she was placed with a foster mother. The Bethany Matron informed the CPRSI that this child was ‘backward in walking’ - she was getting cod liver oil and exercises. This child was subsequently removed from the foster mother and placed in a Sunshine Home; the matron claimed that she had received sun-ray treatment at Bethany until she was a year old. The Rathdown Board’s chairman described these incidents as ‘becoming an epidemic’ and recommend that the
whole matter be reported to the department so as to ‘have an inquiry into the matter’.

22.93 Dr Berry again visited Bethany in October 1939, on foot of these reports. He stated that the children taken by the CPRSI ‘were delicate from birth…they were under constant medical care and received appropriate treatment. I am satisfied from my investigations that the children were not neglected while in Bethany’. He then went on to give his medical opinion that ‘it is well recognised that a large number of illegitimate children are delicate and marasmic from their birth, and if removed from constant medical supervision and nursing attention often quickly deteriorate’. He ended his report by again emphasising that the home was ‘clean and comfortable and not over-crowded. The children were well cared for and appeared to be happy and well fed. Several of the children were suffering from a mild form of impetigo; they were isolated and receiving adequate treatment’.

22.94 The final paragraph of this handwritten report is headed ‘Confidential: For Department use only’. Dr Berry outlined his belief that the complaints being made against Bethany ‘are largely due to the fact that they take in Roman Catholic girls for their confinements and keep them and their children subsequently. This practice is most undesirable as the Home and its environment are definitely Protestant. This being so the effects must be detrimental to these girls deprived as they are of the ministrations of their Church’. Dr Berry placed pressure on Bethany’s management committee to change its policy of admitting Catholic women and children into the institution. In an addendum to the above report, Berry stated that he again visited Bethany on 27 October to conduct an interview with the management committee on the matter and ‘to get them to consent to put an end to this most objectionable feature of their work’ and, as already noted, he was successful.

22.95 The CPRSI continued their policy of removing Catholic infants from Bethany. Their annual report from April 1940 stated that they had removed a total of 14 children from the institution in the previous year. A meeting of the Rathdown Board of Assistance in March reported on another case of an infant being taken out of

---

51 Irish Independent, 24 August 1939.
52 Irish Independent, 4 April 1940.
Bethany and sent to a foster home, who was suffering from ‘rickets and debility.’ They forwarded this information to the DLGPH medical inspector with a request the matter be investigated ‘as several children have been sent to nurse in the District, from time to time, from this Home, suffering from rickets’. In June 1940 the Rathdown Board of Assistance informed the department that four children from the Bethany Home had been sent to the Sunshine Home, suffering from rickets, (including the child taken by the CPRSI and mentioned above). The incidence of rickets rose sharply in Dublin during the war years, but the rise was concentrated in years after 1940. There appear to have been more references to rickets in relation to Bethany children, which may indicate a problem either with their diet (perhaps the milk formula used), or a lack of sunshine.

22.96 The proportion of Bethany children placed at nurse fell during the 1940s; the rise in ‘informal adoptions’ appears to parallel this decline, and as noted earlier few children were placed in foster care following the introduction of legal adoption.

Children’s Homes

22.97 A total of 303 Bethany children (the largest single cohort) were sent to various children’s homes and orphanages. Five institutions, Emmanuel Home, the Children’s Fold, which was originally located in the Coombe; the Cottage Home for Little Children in Dun Laoghaire, the Westbank Orphanage Greystones (previously the Protestant Home for Orphan and Destitute Girls/Harold’s Cross Orphanage) and Miss Carr’s Home in Ranelagh accounted for 190 children, just under two-thirds of the total. Bethany’s 1943 annual report specifically acknowledged ‘with gratitude’ the help of Miss Carr’s Home, and the Children’s Fold Home in taking children from Bethany over the past year. At least five children were recorded as being transferred to institutions outside the State, two were sent to the Ever Open Door (Barnardo Home) in Co Down, two went to the Manor House in Lisburn and one child was sent to a children’s home in Newcastle, England. Other Bethany children may have subsequently been transferred to institutions in Britain or Northern Ireland from children’s homes within the State.

53 For details of this, see Chapter 5.
54 Miss Carr’s Children’s Home; Miss Carr’s Flatlets was a different institution - see Chapter 25
CHAPTER 22 BETHANY

22.98 Emmanuel Home admitted the largest number of Bethany Children, 68 in total. When the Bethany Home moved to Orwell Road in October 1934, the decision appears to have been taken to open an orphanage/children’s home, in an adjacent premises on the site. This became the Emmanuel Home. When a £1,000 anonymous donation was received with instructions that it should be used to offset the running costs of Bethany and the Emmanuel Home, the management committee agreed to apportion £250 to Bethany and the remaining £750 towards the Emmanuel Home. It noted that Bethany ‘would be dependent upon Emmanuel Home for the acceptance of babies whose mothers had left Bethany’ and thus the Emmanuel Home ‘would have heavy financial responsibilities’.

22.99 On 12 January 1935, the Emmanuel Home was brought into use; a formal opening ceremony took place at the end of that month. For ease of access, the Bethany committee decided to grant a right of way alongside the boundary wall of their property to Emmanuel Home. At the first management committee meeting following its opening, it was reported that 21 babies had been transferred from Bethany to the Emmanuel Home. Between June and August 1935, 5 further infants were transferred to Emmanuel. In 1938 it was reported that 20 of the 87 children who passed through Bethany in the past year had been transferred to the Emmanuel Home; 29 other children had been taken by ‘the boarding-out auxiliary’.

In 1938 a decision was taken to move the Emmanuel Home to Portland Park House, Lorrha, Birr, Co. Offaly. It was reported that 37 children were taken back to Bethany when this happened. The move to Offaly was facilitated by Major Butler Stoney who had offered the use of the house as a home for Protestant children. However, at the Bethany AGM in May 1938 a member of management committee, who had been staying in Portland Park House described how a group of armed raiders broke through the front door. He and his wife were instructed to take their personal belongings and leave the house, as the raiders were about to set it on fire. The house was gutted by fire. Emmanuel House subsequently moved to Avoca, Co Wicklow. In 1939 the annual Bethany Home meeting reported that 13 children had since been transferred from Bethany to this premises. Emmanuel’s move to Avoca was possibly facilitated by a member of the Bethany management committee, who owned the Avoca Manor. In 1940 the Wicklow Board of Health noted that

55 *Irish Times*, 20 April 1939.
56 *Irish Times*, 19 May 1938.
57 *Irish Times*, 20 April 1939.
there appeared to be 25 children in Emmanuel Home; all were maintained by private subscriptions. Emmanuel Home claimed exemption under the Children’s Acts, because it was not run for private gain. When the local authority rejected this claim, Emmanuel Home took a successful court case. The judge accepted that the home was not operating for the purpose of private gain; he noted that all the children were illegitimate.56

22.100 At least 45 children were sent to homes that were run by the Irish Church Missions (ICM) - the Children’s Fold/Boley Nursery Home. The Children’s Fold, originally known as The Irish Door of Hope, opened in the Coombe in 1918. In 1922 it was described as ‘a new branch of the ICM work, in which a patient and loving effort is made to care for the homeless babies and to reclaim the erring girls who have taken a false step for whom the Church of Rome does little or nothing’. At this time it accommodated over fifty small children, 37 had been ‘rescued’ from Roman Catholicism.59 The Children’s Fold moved to Marlfield House, Co Wexford following the outbreak of World War II - allegedly following government orders to evacuate to the country. In 1943 the Gardaí in Gorey investigated a complaint of ill-treatment made against the matron by two girls who had recently left the Fold. She was convicted; her appeal was unsuccessful, but as a first offender she was given the Probation Act. A member of the ICM’s general committee in London visited Ireland as a result of this case. He reported that the home was too far from Dublin to make it possible to exercise ‘proper supervision’; ‘no official form [was] used’ when children were being admitted and ‘the law relating to adoptions needed careful decision’. The children were moved back to the Coombe. In 1945 the Fold proposed to relocate to Killiney Castle, however it was reported in the press that ‘Catholic members of the [Dun Laoghaire] Corporation would resent in the strongest possible manner the handing over of the premises to such a body’. Rev Coates of the ICM acknowledged ‘that it was obvious the real ground for refusing us the premises was that we were proselytisers’. The home then moved to Boley in Monkstown, where it remained for several decades, later moving to Shankill.

22.101 The ICM records show that some mothers contributed towards their child’s maintenance; others appear not to have done so. Mothers whose child was accepted into the Children’s Fold signed a declaration requesting the Children’s

58 Wicklow Board of Health Minutes 1 January 1940; 1 February 194024 June 1940; 6 July 1940
59 The Banner of Truth and Irish Missionary News, published by ICM, No 117 July 1922 and no 122 October 1923
Fold to ‘consent to her/him being brought up in the principles of the Church of Ireland’. Some children went directly from Bethany to the Children’s Fold - Miss Walker generally features as an intermediary and in a number of cases this was arranged before the birth of the child. A number of the declarations placing a child with the Children’s Fold were signed by Miss Walker, who described herself as the ‘lawful guardian of the child’. A number of Bethany children were admitted to the Fold, having previously been with a nurse mother. The medical report on one five-year old child, who had previously been with a nurse mother, noted that he had ‘sores on head, back of neck and feet Impetigo?’ He was placed in isolation, and given a medical examination two days later; this recorded that he had ‘signs of rickets, apparently healthy now’.

Adoptions

22.102 There were small numbers of informal ‘adoptions’ in the 1920s and 1930s directly from Bethany, they accounted for 4.5% of the children. This rose significantly in the 1940s when ‘informal adoption’ was the destination given for 29.5% of the children, and for 12% of children in the 1950s. In October 1925, a letter was received from a man offering to adopt one of the girls in the home. The management committee asked him to supply a character reference from a clergyman. This was duly provided, and the ‘adoption’ was arranged. In 1933, the Bethany annual report stated that though the home had not been able to arrange as many adoptions in the previous twelve months as they had in 1931, they still recorded their success in placing ‘some children in good names’. In 1940 Miss Litster, of the DLGPH, alerted the secretary of the department to cases where children were ‘taken out of this country in a haphazard manner without due regard for their safety and moral and physical welfare’. She had been contacted by the NSPCC. They reported that Miss Walker ‘constantly advertises in English Protestant religious papers, such as the Christian Herald and Church Times, for people to adopt children from Bethany Home’. A woman in St Alban’s had replied, forwarding a recommendation from a clergyman ‘which alone was required by Bethany Home’. An eight-month-old baby ‘was sent to her without further enquiry’. The police in St Alban’s alerted the local branch of the NSPCC to conditions in that home, and Miss Walker had to remove the baby, who was being adopted through an adoption society into ‘a suitable home’. Miss Litster claimed that in her letter to

---

60 This child was the son of a Catholic mother; he was born in an unnamed ‘Private Mother& Baby Home’, was placed at nurse before somehow coming to Miss Walker and Bethany.

61 Irish Times, 16 February 1933.
the woman who originally took this child, Miss Walker said ‘If you know of anyone else wanting to adopt a child, we would be so glad to get in touch with them. We have a good many needing homes’. Miss Litster also mentioned three other women who were also sending children in England (and one in America); these women had no connection with Bethany.

22.103 A number of Bethany children who were placed in the Children’s Fold were later adopted in Britain or in Northern Ireland, where legal adoption was possible from 1926. The ‘adopting’ parent(s) signed an undertaking to ‘accept responsibility for the control of […] under the direction of the Children’s Fold to provide for his Board and lodging and general maintenance and see that he is brought up in the Protestant faith and attends a protestant school and sent regularly to church on Sundays. In the event of it bring proved that I have not observed this undertaking I agree to return him to the Fold’. In 1937 A Church of Ireland clergyman in Co Armagh contacted the ICM concerning a childless widow in his parish, who had already adopted two boys; she was keen to adopt another boy. Miss Walker signed the papers permitting this adoption as the ‘legal guardian’ of a seven-year old boy who was in the Children’s Fold. There is some evidence that the ICM retained an interest in these children long after their adoption. One girl, born in Bethany, who was the daughter of a Catholic mother, went first to Emmanuel Home and then to the Children’s Fold. She was adopted by a couple in Northern Ireland at the age of seven. When she was seventeen years old a local clergyman wrote to the ICM informing them that ‘it is terrible the tramp she is turning out to be’. This file contains an anonymous letter from a ‘friend’ reporting that she was ‘running around with navy men and other bad men and girls that had children before’ and she had ‘never, done any work yet for her mother’.

22.104 Informal ‘adoptions’ from Bethany became much more common in the 1940s. The 1941 Bethany annual meeting reported that the past year ‘had been a record one from the adoption standpoint’, with 12 children being ‘adopted’ from the Home.\(^{62}\) Two years later, the annual report stressed that ‘the placing of children in good homes was the greatest problem with which the Bethany Home had to cope’. Nine children had been ‘adopted’ ‘into good homes’; Bethany made an appeal for

---

\(^{62}\) *Irish Times*, 13 March 1941.
‘further adoptions and continued support.’\textsuperscript{63} Eight ‘adoptions’ were recorded in the twelve months prior to March 1944.\textsuperscript{64} In May 1946, when there were 39 infants in the home, the management committee decided to send circulars to Dublin clergy in Dublin asking them ‘to be on the lookout for homes into which the children might be adopted’. This initiative met with little success and by the following January the Committee was told that the home was having a lot of difficulty finding adopters for male infants in particular. Miss Walker declared that ‘nobody seems to want the little boys’.\textsuperscript{65} From the late 1940s, the Bethany management committee became involved in campaigns to legalise adoption in Ireland. They also assisted the adoption of Bethany children in the USA. Meanwhile Bethany continued to facilitate informal ‘adoptions’. In September 1950, the Matron informed the management committee that she expected six more children to be adopted in the next month. In the 1950s, 54.4\% of Bethany children were placed for adoption, as were 56.6\% of children in the 1960s. When legal adoption was introduced, representatives of Bethany attended meetings of the Protestant Adoption Society; however they indicated that the management committee was in favour of Bethany being registered as a separate adoption society This did not happen; the Bethany Matron was elected as a member of the Protestant Adoption Society’s case committee and, while initially many of the babies were adopted from Bethany, in time a majority of Bethany babies who were legally adopted were placed by the Protestant Adoption Society.

22.105 The institutional records indicate that 50 children were adopted outside the State from the Bethany Home; the largest number, 29, went to Britain or Northern Ireland; 12 to the United States, four to Saudi Arabia; two to Italy, two to Canada and one to Norway (see Chapter 32). Other Bethany children may have been adopted overseas from children’s homes.

22.106 As adoptions became more common, Bethany’s main concern was to find suitable long-term care for children with intellectual or serious physical disabilities. In 1948 a child who was described as ‘mentally deficient’ was sent to Bethany from Miss Carr’s Home. The Bethany committee noted that the only institution which cared

\textsuperscript{63} Irish Times, 15 April 1943.
\textsuperscript{64} Irish Times, 30 March 1944.
\textsuperscript{65} Irish Times, 20 May 1948.
for such children was Cabra\textsuperscript{66} which was run by the Dublin Union under Roman Catholic management. It was decided to make enquiries ‘as to the possibility of making available provision for imbecilic children’. The Bethany authorities returned to this matter in early 1949. The child was by that stage boarded out to a foster mother. It was decided to consult the Rector of the Church of Ireland parish in which the Cabra institution was situated to arrange for her to be given the proper ‘instruction in Christian doctrine’ if she had to be transferred to Cabra. However, the Department of Health inspector of boarded out children reported ‘an improvement’ in the child, and indicated that the foster mother would be willing to care for her if she was given an increased maintenance grant. The Bethany authorities contacted Dr Barnardo’s who agreed to pay an additional sum to maintain this girl. In 1953 one of the children in Bethany was a 10-month-old baby who was described as ‘apparently a hopeless Mongol’. Bethany had advertised for a foster mother but there had been no response. The child’s mother, who was in service earning £5-6 a week, was said to be contributing ‘liberally towards its keep’. The committee determined that it would not be appropriate to send this child to the Catholic institution in Cabra, and it was reported that the mother did not approve of such an action. A ‘satisfactory nurse mother’ was eventually found. In 1956, the Matron was invited to join a committee being set up to establish a suitable home for Protestant children with mental deficiencies. She was said to be especially interested in this matter given that a couple of children with such issues were currently resident in Bethany. One a boy was being cared for by his mother in the home, however his condition was deteriorating. The management committee agreed to contact the clergyman who had sent the mother to Bethany, asking that the child be admitted instead to the Donegal County Home. In 1958 the committee discussed the case of another ‘mental defective’, a four-year-old boy. It was decided to transfer him to Stewarts Institution, and his local authority agreed to meet the cost of maintaining him.

**Witness statements**

22.107 The Commission heard witness statements from six women and men who were in Bethany when they were infants. All the witnesses left Bethany before their second birthday and the majority when they were less than a year old, though one man was readmitted from a foster home at the age of two years and three months. The institutional records do not give the date of his discharge on this occasion; he is not

\textsuperscript{66} St Vincent’s, Cabra – see Chapter 13
the only Bethany infant with no discharge date. Two witnesses, both born in the early 1940s, stated that they had rickets, and there is independent evidence presented earlier in this chapter, that other Bethany infants suffered from rickets at around this time. It is not possible to determine whether these two witnesses suffered from rickets as a consequence of conditions in Bethany or conditions in the foster home that they both shared. Most of the evidence given by former Bethany babies related to their experiences in foster homes, in children’s homes, or their adoption in Northern Ireland, which is beyond the Commission’s remit. The largest concentration of such evidence related to Mayil/Westbank, an orphanage in Greystones, which was a successor to the Protestant Home for Orphan and Destitute Girls; this home admitted boys following the move to Greystones in the late 1940s. There is no evidence of a direct link between Mayil/Westbank and Bethany though witnesses believed that there was a link; a total of 33 Bethany children were admitted to this institution - both in Harold’s Cross and Greystones. Witnesses gave evidence of children being moved from Westbank to Northern Ireland, for short periods or for adoption. One witness who gave evidence about this children’s home was born in Braemar, which is not among the scheduled institutions. Another witness, who was in Bethany with her mother in the early 1950s, immediately after her birth, gave evidence that she had two adoption documents; one drawn up by a firm of solicitors, the other from the Adoption Board. She claimed that there are serious questions about the legality of both. The Commission has determined that she was adopted informally at a time when legal adoption had not yet been introduced, and this adoption was later approved by the Adoption Board. Many of the early approvals by the Adoption Board related to similar cases. Several witnesses also complained about a lack of documentation, relating to their birth, date of discharge from Bethany - which is missing in some cases and adoption.

22.108 The Commission also heard evidence from a nephew of Miss Pilgrim, who was the Matron at Bethany from 1932-44 and was a member of the Bethany committee until 1955. This witness recalled visits to Bethany from the early 1940s. He said that the babies were reasonably well dressed; he never witnesses any unusual or unkind behaviour. He recalls playing with some of the children; the mothers ‘were less present in his memories’.
Chapter 22: A Bethany Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

![Bethany Total Mothers Admitted per Year](chart.png)
From the institutional records, the Commission identified 1,584 women who were admitted to the Bethany home in the years 1922-71.

Information relating to date of admission was available for 1,582 women (99.9% of admissions). Most admissions (77%) were recorded prior to 1950. Admissions were greatest in the periods 1925-29 (264) and 1932-39 (450) and peaked in 1937 - 64 women were admitted that year. There is some evidence that the number of admissions was determined by the financial state of the home (see main chapter). Admissions fell sharply in 1940 - most probably due to the exclusion of Catholic women from the home. In the period 1940-46, 40 women on average were admitted annually. Admissions appear to decline further in 1947; 1 29 women were admitted that year. By 1954 admissions had declined to just eight women. In the years 1955-64, 14 women on average were admitted annually.

Although 33 admissions were recorded in 1965, the annual average admission in the years 1966-70 was 20 women. In 1970, Bethany's last full year in operation, 15 women were admitted to the home.

Analysis by decade shows that most women (32.2%) were admitted to Bethany in the 1930s; followed by the 1940s (22.7%); 1920s (22.3%); 1960s (11.9%); 1950s (9.9%) and the 1970s (1%).

---

1 This apparent decline may have been due to a change in the method of record keeping mid-1946.
Religion
Information relating to religious denomination was available for 1,570 women (99.1% of admissions).

The institutional records show that most women (73.2%) were recorded as Protestant and 26.7% as Roman Catholic. The remaining 0.1% were recorded under ‘other religion’.

Referral pathways
Information relating to referral pathways was available for 42 women (2.7% of admissions). The Commission considers that this is an insufficient sample size from which to draw any conclusions.
Information relating to age on admission was available for 1,546 women (97.6% of admissions).

Age on admission ranged from 13 to 62 years. Most women (77.4%) were between 18 and 29 years; 13.9% were 30 years and older and 8.7% were 17 years and younger. The available records show that 4% of admissions were aged between 13 and 16 years. The mode of age on admission was 21 years; this fluctuated between 24 years in the 1920s to 17 years in the 1950s and 18 years in the 1970s.
Previous pregnancy

Information relating to previous pregnancy was available for 1,138 women (71.8% of admissions).

The institutional records show that most women (72.1%) were admitted on their first pregnancy; 22.6% on their second pregnancy and 5.3% on their third or subsequent pregnancy.

**Marital status**

Information relating to marital status was available for all women. The institutional records show that most women (95.7%) were single women; 3.4% were married; 0.8% were widowed and 0.1% were separated from their husbands.
Information relating to birth was available for 1,433 women (90.5% of admissions).

The institutional records show that most women (75%) admitted to Bethany pregnant, stayed and gave birth; 17% were admitted with their child and 8% left before the birth and did not return.

The available records show that 95.7% of women who gave birth after admission to Bethany delivered living infants; 2.9% delivered stillborn infants and 1.4% experienced a miscarriage. The available records relating to place of birth show that 54% of women gave birth in Bethany; 36.6% in the Rotunda Hospital and 9.4% gave birth in other hospitals - mainly the Coombe and Holles Street - or had a home birth.
Information relating to occupation was available for 373 women (23.5% of admissions).

The available institutional records show that most women (69.7%) were recorded as a domestic servant or other unskilled worker; 20.1% were working in the family home or on the family farm; 9.7% were recorded as teacher/civil servant/clerk or other skilled worker; one woman was unemployed and one was a primary school student.
Information relating to previous address by county was available for 1,460 women (92.2% of admissions).

The institutional records show that most women (26.9%) gave an address in Dublin followed by Cavan (6.7%); Wicklow (5.5%); Donegal (5.2%); Monaghan (4.7%); Kildare (3.5%); Tipperary (3.4%); Antrim (3.3%); Laois (3%); Cork (2.7%); Offaly (2.6%); Carlow (2.4%); Meath (2.3%); Sligo (2.1%); Kilkenny (2.1%); Louth (2%); Fermanagh (1.9%); Limerick (1.9%); Westmeath (1.9%); Tyrone (1.5%); Mayo (1.5%); Armagh (1.4%); Leitrim (1.4%) and Longford (1.2%). A small number of women gave Roscommon, Kerry, Down, Derry, Waterford and Clare as a previous address.
Information relating to occupancy was available for 1,551 women (97.9% of admissions).

The institutional records show that average occupancy in Bethany was largely determined by the number of admissions in any given year; occupancy levels were not inflated by long-stay residents. In 1936 a departmental inspector reported some overcrowding in the institution and recommended that maximum occupancy should be capped at 20 women. Occupancy was highest in the 1930s and mirrored increased admissions to the home in that decade - average occupancy ranged between 14 women in 1931 and 27 women in 1938. From 1940, average occupancy remained well below the 20 person cap and only reached maximum
capacity on one occasion, in 1942. Average occupancy decreased from 21 women in the 1930s to just six women in the 1960s.

Length of stay

Information relating to length of stay was available for 1,551 women (97.9% of admissions).

The institutional records show that the average length of stay in Bethany over the period of its operation was 154 days - this fluctuated between 300 days on average for women admitted in 1953 to 62 days on average for women admitted in 1969.

Women were typically admitted to Bethany 59 days on average before the birth of their child. This ranged from 66 days on average for women admitted in the 1960s to 51 days on average for women admitted in the 1970s.
Length of stay was longest for women admitted in the 1950s; they spent 212 days on average in the home. By the 1960s average length of stay had declined to 120 days.

The institutional records show that, in the 1920s, 32.1% of women left Bethany within 50 days of giving birth and a further 50.4% left within six months; 15% left between six and 12 months after the birth and 2.4% remained there for between 13 and 21 months.
In the 1930s, 21.5% left Bethany within 50 days of giving birth and a further 62.8% within six months; 12.8% remained there for between six and 12 months and 2.5% for between 13 and 24 months. Two women remained in the home for 25 and 28 months respectively.

In the 1940s the proportion of women who left within 50 days of giving birth declined to 20.4% and the number who left within six months declined to 54.6%; the number who remained in the home for between six and 12 months increased to 22%. A small number of women remained in the home for between 13 and 24 months and one woman remained there for 31 months.

In the 1950s the percentage of women who left the home within 50 days of giving birth declined substantially. In the 1920s, 32.1% of women had left the home within 50 days; by the 1950s this had declined to just 6.2%. Similarly, 62.8% of women left the home within six months in the 1930s; by the 1950s this had declined to 45.5%. Conversely, 12.8% of women remained in the home for between six and 12 months in the 1930s; this had increased to 44.1% in the 1950s. The proportion of women who spent over 12 months in the home increased in the 1950s, but no woman remained in the home for longer than 18 months after giving birth.

In the 1960s, all but three women left Bethany within six months of giving birth; one in five left within 50 days; two women remained for between six and 11 months and one woman remained there for 14 months.

**Maternal deaths**

Through the institutional records, the Commission identified five deaths among women admitted to Bethany: representing a mortality rate of 0.32%. Three occurred in Bethany and two in external hospitals. Two deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy - both cases resulted in cardiac failure. Three deaths were directly associated with pregnancy and childbirth - all three deaths were due to puerperal sepsis. Adhering to WHO guidelines the maternal mortality rate in Bethany was 0.31%.²

---

² Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. [https://www.who.int/healthinfo/statistics/indmaternalmortality/en/](https://www.who.int/healthinfo/statistics/indmaternalmortality/en/)
Information relating to exit pathways was available for 977 women (61.7% of admissions).

The institutional records show that most women (56.2%) were discharged to the family home or other private address; 28.7% were discharged directly to employment; 4.6% transferred to hospital; 3.1% transferred to one of the other institutions under the Commission’s remit; 2.8% were discharged in the care of voluntary organisations; 1.6% were discharged to hostels or other supported accommodation; 0.8% ‘absconded’ leaving the child in Bethany; 0.6% were discharged to the care of a nurse or doctor; 0.5% transferred to children’s homes or industrial schools and 0.5% were discharged to prison. Three women transferred to other mother and baby homes, two transferred to Magdalen laundries (both in the 1920s) and one was discharged in the care of a nun or priest. There were no major deviations in referral pathways over the timeframe of the home’s operation.
The Commission identified 1,376 children who were admitted to Bethany in the years 1922-70.

Information relating to date of birth/admission was available for 1,344 children (97.7% of births/admissions). Births and child admissions were greatest in the periods 1926-30 (197) and 1932-42 (497) and peaked in 1938 - 66 births/admissions were recorded that year. Births/admissions decreased from 42 in 1942 to 28 in 1943 and declined steadily until 1962 when eight births/admissions were recorded. In the final years of Bethany’s operation, 1963-70, 18 births/admissions on average were recorded annually. In 1970, the home’s last full year in operation, 12 births/admissions were recorded.
Analysis by decade shows that most children (32.4%) were born in or admitted to Bethany in the 1930s followed by the 1940s (24.2%); 1920s (18.2%); 1960s (12.5%); 1950s (11.9%) and the 1970s (0.9%). The majority of children (75%) born in or admitted to Bethany were there prior to 1950.

The institutional records show that 91.3% of children were either born in Bethany or admitted there with their mothers; 8.4% were admitted unaccompanied and 0.3% were older siblings admitted with their mothers.
Length of stay

Information relating to length of stay was available for 1,274 children (92.6% of births/admissions).

The institutional records show that the average length of stay for children in Bethany was 222 days. This ranged from 990 days on average for children admitted in 1922 to 48 days on average for children admitted in 1969. Child length of stay decreased substantially from 990 days for children admitted in 1922 to 317 days for those admitted in 1924 and 88 days for those admitted in 1926. In the years 1925-35, child length of stay was 178 days on average and exceed 200 days on just three occasions in 1927, 1931 and 1935. Length of stay increased significantly in the period 1936-48; average length of stay in those years was 314 days and ranged between 485 days on average for children admitted in 1940 to 225 days for children admitted in 1943. Although average length of stay for children admitted in 1951 had decreased to 131 days it had more than doubled to 277 days for those admitted in 1956. Length of stay began a steady decline from 235 days for children admitted in 1957 to 48 days for those admitted in 1969. Analysis by decade shows that average length of stay rose from 194 days for children admitted in the 1920s to 303 days for those admitted in the 1940s. By the 1960s, however, average length of stay had decreased to 72 days.

3 Only four children were admitted in 1922 and the length of stay could only be determined in two cases.
Information relating to occupancy was available for 1,264 children (91.9% of births/admissions).

The institutional records show that, in the years 1922-35, average occupancy was broadly in line with the number of admissions in any given year. In 1936, however, average occupancy began to increase proportionally and by 1937 average occupancy was almost on par with the number of admissions. Average occupancy remained relatively high from 1937 to 1949 and reflects the significant increase in the length of stay already identified in this period. Average occupancy exceeded admissions on two occasions, in 1940 and 1948 - this suggests that Bethany experienced the same difficulties in procuring foster homes for children as other mother and baby homes in this period. Average occupancy declined significantly from 1950 and, apart from peaks in 1954 and 1957 (years when length of stay had spiked), decreased steadily in the 1960s and 1970s.

A child born in or admitted to Bethany in 1938 could expect to be living with another 57 children on average; a child born or admitted in 1958 could expect to be living with another six children on average. By 1968, this had decreased to just two other children on average.
Comparative analysis of average occupancy of mothers and children shows that, in the years 1922-35, there were generally more women than children in Bethany. The years 1928, 1933 and 1934 were exceptions - however, the discrepancy between the number of women and children in those years was small. In 1936, however, the average number of children in Bethany began to exceed the average number of mothers to a much greater extent and by 1938 there were over twice as many children as mothers in the home at any one time. From 1937 to 1950 the average number of children living in Bethany remained far higher than the average number of mothers and reflects the fact that almost 50% children born in or admitted to Bethany spent time in the home unaccompanied and that almost 9% of admissions overall were unaccompanied children.
Information relating to children’s date of discharge in relation to their mothers was available for 1,178 children (85.6% of births/admissions).

The institutional records show that most children (49%) remained in Bethany unaccompanied for a period after their mother had been discharged; 29% left the home on the same day as their mother and 22% were discharged while their mother remained in Bethany.
Exit pathways

Information relating to exit pathways was available for 1,072 children (77.9% of births/admissions).

The institutional records show that 28.3% of children transferred from Bethany to other institutions - around one in three transferred to either the Emmanuel Home or Harold’s Cross Orphanage/Westbank; 21.7% were discharged with their mothers or other family member; 20.2% were legally adopted (from 1953); 19.3% were placed at nurse under private arrangement; 10.4% were informally adopted (pre 1953) and one child was boarded out under a local authority scheme.

In the case of unaccompanied children, 42.7% transferred to other institutions; 19.8% were placed at nurse; 18.7% were claimed by a parent or other family member; 11.5% were informally adopted (pre 1953) and 7.3% were placed for adoption (from 1953).
The primary exit pathways from Bethany altered over the timeframe of its operation. In the 1920s, 41.9% were recorded as leaving the home with their mothers; by the 1960s this had decreased to 10.1%. Nursed out was a major exit pathway in the 1920s and 1930s - just over 31% of children were discharged in this manner in both decades. By the 1950s, however, nursed out accounted for just 0.6% of exit pathways. Conversely, in the 1920s, informal adoption was an exit pathway for 4.5% of children; in the 1940s it was the most frequent exit pathway at 29.5%. From the 1950s, placed for adoption became the leading exit pathway and accounted for 54.4% of exit pathways in the 1950s; 56.6% in the 1960s and 46.2% in the 1970s.

![Bethany Foreign Adoptions](image)

The Commission identified 50 children who were placed for foreign adoption. Most children (58%) were placed for adoption in the UK; 24% in the USA; 8% in Saudi Arabia; 4% in Italy; 4% in Canada and one child was adopted in Norway.
The Commission identified 262 deaths among children associated with the Bethany home. This includes children who died in Bethany, children who were in Bethany and died elsewhere and children who were never admitted to Bethany but whose mothers had been living there prior to their birth. The Commission located GRO death records for 256 children (97.7% of child deaths).

The worst period for child deaths in Bethany was 1935-47; 61% of all child deaths occurred in those years and coincides with the high numbers of unaccompanied children living in the home at that time. Child deaths peaked in 1936; 25 deaths were notified that year. Over 95% of all child deaths occurred before 1950. Analysis by decade shows that most child deaths (40%) were notified in the 1930s followed by the 1940s (31%) and the 1920s (25%). The remaining 4% of deaths were notified between 1950 and 1960.
Information relating to place of death was available for 258 children (98.5% of child deaths).

Most child deaths (75.6%) occurred in the Bethany home; 17.4% occurred in other hospitals - mainly St Ultan's Children's Hospital and the Rotunda Hospital; 3.1% occurred in children's homes - mainly Emmanuel Home; 2.3% occurred in private residences; three children died in Pelletstown and one child died in Our Lady's Hospice, Harold's Cross.

**Burial records**

The Commission located burial records for 235 Bethany children; 231 children were buried in Mount Jerome Cemetery, Harold's Cross, and four children were buried in Glasnevin Cemetery.
Information relating to age on death was available for 259 children (98.9% of child deaths).

The available records show that most children (93.1%) died in infancy as follows: perinatal 0-7 days (8.1%); neonatal 8-28 days (12.4%) and infant 29-365 days (72.6%). The remaining children were aged between 368 days and four years at the time of death.

The institutional records show that 59% of children admitted to Bethany who died were accompanied by their mother at the time of death and 41% were unaccompanied.
Information relating to cause of death was available for 256 children (97.7% of child deaths). Most child deaths (32%) were notified as being due to malabsorption - mainly marasmus; 15.2% were notified as gastroenteritis; 13.7% as respiratory infections - mainly bronchopneumonia and bronchitis; 6.3% were notified as being due to non-specific causes - mainly congenital debility and prematurity; 5.9% as congenital heart disease; 5.1% as a range of other mostly one off causes such as asphyxia neonatorum and pertussis (whooping cough); 3.9% as being due to generalised infections - mainly toxaemia and scarlatina; 3.9% as convulsions; 3.9% as tuberculosis; 3.5% as meningitis/encephalitis; 2.7% as being due to haemorrhage - mainly intercranial and cerebral; 2.3% as congenital syphilis; 0.8% as spina bifida. One death was notified as being due to influenza and another as being due to measles.
It seems clear that infant mortality in Bethany was high from the beginning of its operation; a rate of 33.3% was recorded in 1922 which was its first year in operation. By 1931, the administrators of the home appear to have brought infant mortality under control and no child born in or admitted to Bethany that year subsequently died. However, by 1936 the infant mortality rate had increased to 34.6% and by 1943 had reached 62.1% - almost two in every three children born in or admitted to the home subsequently died in infancy. By 1945, the infant mortality rate had reduced substantially to 17.6% and further declined in 1948 when a rate of 3.6% pertained. No deaths occurred among children born in or admitted to the home in 1950 and 1951 and in the years 1956-62 inclusive. Peaks in infant mortality in 1952 (13.6%), 1953 (8.3%), 1955 (6.2%) and 1963 (10%) represented 3, 2, 1 and 2 infant deaths respectively.

Infant mortality rate is calculated as follows: Living infants born in a given year who died before the age of 1 year as a percentage of all infants born in the same year.
Chapter 23: Denny House, formerly the Magdalen Asylum

Introduction

23.1 The Magdalen Asylum/Denny House was Ireland’s longest-surviving mother and baby home. It was founded in 1765 in Lower Leeson Street, Dublin (close to the junction with St Stephen’s Green), by the philanthropist Lady Arabella Denny. It closed in 1994.

Origins

23.2 Lady Arabella Denny was closely involved with the Dublin Foundling Hospital which admitted deserted and abandoned children. J D Widdess, author of a history of the Magdalen Asylum, stated that, having received many letters from unmarried mothers who had been forced to place their children in the Foundling Hospital, Lady Denny decided to establish an institution to care for the mothers.¹ This became known as the Dublin Magdalen Asylum. A number of similar institutions opened in Britain and Ireland in the late eighteenth century. By the end of the nineteenth century there were over 300 Magdalen Homes in England and at least 41 in Ireland, including 19 in Dublin and Dun Laoghaire (then known as Kingstown), all run by religious denominations. The Magdalen Asylum in Leeson Street admitted former prostitutes and unmarried mothers who were expected to engage in various types of work, such as laundry, needlework, and domestic duties to support their care and provide them with training that would enable them to find employment when they left the institution. The asylum was established specifically to cater for women of the Protestant faith and, in contrast to other Magdalen institutions in Ireland, it admitted pregnant women, provided they were ‘first fall’ cases, that is, women experiencing their first pregnancy.²

23.3 The Handbook of Dublin Charities, published in 1903, stated that ‘The home is especially intended for Protestant young women after a first fall and for those who are about to become mothers’. The home was ‘in connection with the Episcopal Church’. The main income came from pew rents³ and collections in the adjoining Magdalen Chapel, which was opened in 1768, to provide revenue for the home.

² Report of the Inter-Departmental Committee to establish the facts of State involvement with the Magdalen Laundries: Chapter 3: History of the Magdalen Laundries and institutions within the scope of the Report, p. 41. This is based on a paper submitted by Maria Luddy.
³ Pew rents were payment made by prosperous individuals or families to reserve a pew in the Magdalen Chapel for their exclusive use.
1900 the total receipts for the chapel and asylum were £1,510 9s 5d; a laundry associated with the asylum contributed £135. Women in the Magdalen Asylum in Leeson Street were described as ‘penitents’. They were forbidden to use their own name or speak about their past; they were given a number when they were admitted, and they were known as ‘Mrs One’, ‘Mrs Two’.  

23.4 A total of 14 people were recorded as resident in the home in the 1911 census; 11 ‘inmates’ and three staff members, including a matron and portress (female porter). Twelve of the women were members of the Church of Ireland, one woman was a Baptist and one was Presbyterian. The youngest ‘inmate’ was 18 years of age; ten of the women were described as in ‘domestic training for domestic service’. The census described the institution as a ‘Magdalen Home’; the adjoining chapel was also recorded in the census. No babies were recorded in the 1911 Census. However, by 1921, the Magdalen Asylum had been transformed into a mother and baby home, exclusively for Protestant women experiencing a ‘first fall’. While the institution continued to be referred to as either the Dublin/Leeson Street Magdalen Asylum/Home, it no longer operated as a Magdalen Home style institution.

23.5 In 1910 the Nursery and Rescue Home and Rotunda Protestant Girls’ Aid Society was established at Little Fortfield, Templeogue, Dublin. This home was established as a shelter for Protestant ‘first fall’ women who had ‘fallen into sin’, with the intention of ‘restoring them to respectable life’. By 1922, it had admitted almost 200 women, many of whom were subsequently taken back by their families or relatives; some married; a majority were placed in domestic service by the home. Around 192 children were born in or admitted to the home. Many were either taken by the mother when she married or taken by relatives or placed with a network of nurse mothers used by the home. A majority were admitted into orphanages and 23 died while under the home’s care. By 1922 this home found it financially impossible to continue in operation, so it was decided to close and concentrate on the nursing out of children born to Protestant unmarried mothers. In 1922 the home had 26 children at nurse under its management. The renamed Nursery Rescue and Protestant Children’s Aid Society affiliated with the Magdalen

---

Asylum and would in future be responsible for placing children born to the women in that home at nurse.\(^7\)

23.6 The Magdalen Asylum moved to Eglinton Road in Donnybrook in 1959. On 4 June 1980 the High Court approved a proposal to vary the scheme under which the charity would operate in the future. The name was changed to Denny House; the restriction of admissions to Protestant women only was removed. Denny House would give priority to Protestant unmarried mothers and their children, but they could now admit separated, deserted or recently widowed women with their children and Catholics if accommodation was available.

**Sources**

**Institutional records of the Magdalen Asylum/Denny House**

23.7 Most of the institutional records relating to the Magdalen Asylum/Denny House are held by PACT - which was formerly known as the Protestant Orphans Society. These records were digitally copied by the Commission. They include:

- Magdalen Home case files, 1927-1994: These contain an admission form, medical certificates, correspondence and detailed notes on a woman's background, medical details, her activities and behaviour in the home, and discharge details for mother and baby. They include the woman's name, age, home address, religion, occupation, various questions regarding the pregnancy, and the amount she could pay per week to the home. These files become more detailed from the 1960s. Correspondence includes letters from local clergymen, mothers of the 'girls', and some of the women who were in the home. There are approximately 1,000 individual files; a small number are missing.
- Mother and Child Case Books, 1920-1961: These contain information about the mother's background; her admission and discharge; details of births; health details for mother and baby; and discharge details for mother and baby (seven volumes)
- Case Committee Books, 1955-1976: These contain background on mothers, admission/discharge, details of birth and discharge of baby (three volumes)
- Case Committee Notes, 1952-1973: These are loose notes with similar information to the Case Committee Books. (1 file)

\(^7\) The Nursery Rescue and Protestant Children's Aid Society, Thirteenth Annual Report, 1921-1922 (Dublin, 1922), p. 5.
Monthly Meeting Committee Books, 1973-1988: These have similar information to Case Committee Books plus details of the management of the home (2 volumes)

Matron’s Report Books, 1945-1957: These are monthly with the same details as above (2 volumes)

Baby Books, 1970-1994: These have details of babies’ birth, progress in home, and discharge details (4 volumes)

Interview Book, 1990-1994: These provide details of mothers seeking admission (1 volume)

Annual reports: 1958, 1962 and 1963

Discharge Books, 1980-1994: These note the background of mothers, updated accounts on their activities and behaviour in the home, and discharge details (4 volumes)

Records and Particulars Book of Maternity Home (or Hospital) known as Magdalen Home, 1961-1982: This contains details of admission/discharge of mother, birth of baby and discharge of baby (1 volume)

Church of Ireland Register of Baptisms solemnised in Magdalen Asylum Church, 1869-1983 (1 volume)

Correspondence concerning the transfer of Denny House records to PACT, 1994-2013.

The Nursery Rescue Society Archives

PACT also holds the records of the Nursery Rescue Society which was affiliated with Denny House. These records relate to fostering arrangements, placements in children’s homes and adoptions, and contact with the birth mothers. The records include

- Minute Books, 1909-1989 (18 volumes)
- Annual reports, 1914-1978 (61 items)
- Agenda Book, 1938-1943 (1 volume)
CHAPTER 23 DENNY HOUSE

- Little Fortfield Mother and Baby Home records, 1909-1921 - journal and ‘girls and babies’ register (2 volumes)
- Children’s case files, 1927-1965 - details of fostering, adoption (including to Canada, USA, Australia and UK), education and employment arrangements for children under care of society (c.200 files)
- Index cards relating to children’s case files (1 file)
- Children’s ledger listing all children under care of the society, 1945-1972 (1 volume)
- Surrender and Adoption Forms, c.1930-1965 - separate forms signed by mothers and adoptive parents (1 file)
- Nursery Rescue Society notebook on children giving details of child’s health, progress and where they were placed by the society, 1965-1975 (1 volume)
- Documents relating to history of society and regarding transfer of assets to PACT, 1989-1990 (1 file)

Department of Local Government and Public Health/Department of Health

23.9 There is information about Denny House in the evidence given to the Commission on Relief of the Sick and Indigent Poor and in the files of the Department of Local Government and Public Health/Department of Health: some of these files are in the National Archives, the remainder were supplied under a Discovery Order. There is very little information available about this home during the 1920s, 1930s and early 1940s; later files are rich in personal histories. The main Department of Health files used for this chapter are:
- CCP/INA/0/483137
- CCP/INA/0/482129
- CCP/INA/0/432660
- CCP/INA/0/483891
- INACT/INA/0/444689
- INACT/INA/0/451287

Governance and Administration

23.10 The Magdalen Asylum was overseen by guardians and governesses. Male donors were described as guardians and the management committee was drawn from their members. Women donors, or the wives of prominent men, were known as
governesses, and they were involved in the internal running of the home.\textsuperscript{8} When the Nursery Rescue Society affiliated with Denny House, three of the governesses joined the Nursery Rescue Committee.\textsuperscript{9} By 1958 the women were being described as associate guardians. The archives do not include the minutes of the management committee or meetings of the trustees. The guardians and associate guardians/governesses included the Church of Ireland Archbishop of Dublin and on occasion his wife, plus prominent Dublin doctors, including leading paediatricians and gynaecologists. Miss B Odlum, the organising secretary of the Church of Ireland Moral Welfare Society served as an associate guardian for many years. In 1952 the Minister for Health, James Ryan, attended the AGM.\textsuperscript{10}

23.11 As the list of records indicates there were a number of active committees, though it is unclear when these committees were established, or whether their responsibilities changed over the period covered by this report. It is clear that similar committees existed before 1920. The case committee (first entry in the surviving records is for 1955) met once a month. The meetings discussed the individual cases - mothers and children. The home also appears to have had appointed visitors; the case committee records state:

- That the visitors should be free to walk around the Home on their own and talk to the girls.
- That staff and girls should feel free to discuss any problems with the visitor.
- That any problems arising about the mothers and babies should be dealt with by the case committee.
- That a special book should be kept for the visitors to note any household needs, suggestions or problems.

**Premises**

23.12 Denny House occupied the original 18\textsuperscript{th} century premises in Lower Lesson Street which was close to the junction with St Stephen's Green until 1958. The 1911 Census describes it as a ‘first-class dwelling’ with 18 rooms. When the original premises were sold in 1958, the site was described as being approximately 22,800 square feet in area, 9,312 square feet of which was occupied by ‘a fine masonry church structure’ and two three-storey houses with basements. It had a 123 feet

\textsuperscript{10} Irish Times, 28 May 1952.
The original buildings were demolished. The home moved to Eglinton Road in Donnybrook in March 1959.

23.13 There is no indication that this home was overcrowded at any time, in contrast to the other mother and baby homes. In 1950 a Department of Health inspector reported that she had visited and inspected this home and the Bethany Home. She described both as ‘clean and well kept; comfortable beds and they appear to be well fed’. However surviving records suggest that the heating was probably inadequate; and the home suffered frequent problems with leaks, broken boilers and other shortcomings. Matron’s Report book in 1946 reports frequent shortages of fuel, which meant that at times they were unable to use the ‘range’/stove in the kitchen. However, the home managed to secure coal from the Gas Company and unidentified fuel from the Church of Ireland labour yard. In 1953 the Matron recorded that ‘The continuous burning fire has been put into the [day] nursery’, replacing the previous open fire which did not provide adequate heat. In 1954 ‘due to colder weather and fewer numbers’ the ‘girls’ were eating their meals in the kitchen and the staff were eating in the boardroom ‘which is much warmer for everybody’. That boardroom was turned into a nursery with a new ‘stove fire’ in 1955. At around the same time a governor provided two ‘aladdin heaters’ - which were fuelled by paraffin; they were still in use when the Lesson Street premises closed. In 1955 the Matron complained that the nurse was running an electric fire in her bedroom ‘off the light plug which is expensive and causes fuses frequently’; a gas fire was later installed in her bedroom. The Commission has not seen many details about the sanitary facilities, although in 1949 a new bathroom was installed, plus a water tank in the roof to ensure a ‘satisfactory’ supply of water to the new toilet. Despite its location in the centre of the city the home had quite a substantial garden. Matron’s Report Books give details of bottling applies, and making gooseberry, rhubarb and blackcurrant jam from ‘our own fruit’; in 1948 ‘a large turnip crop seems possible’. There are also frequent references to employing a gardener.

23.14 In 1955 Matron lamented that ‘The house is in great need of repairs and I cannot get anyone to do them’. She also reported that Miss Lyster (sic) had spent an hour in the home on 3 May 1954:

---

11 Irish Independent, 19 July 1958.
and went into great detail. She was sympathetic and helpful and called this building a “housewives’ nightmare”. On the strength of the expense of running it, she suggested that we should ask the Minister for Health for an additional grant.

23.15 Miss Litster’s report stated that the home occupied two houses, ‘over 200 years old’ that ‘have not been designed for labour-saving’. ‘The Home is as well-kept as can be expected; charges for upkeep and repairs must be large’. She described the nursery, ‘formerly the board room’, as ‘large and airy, containing 9 cots with wooden frames. Here there are 3 infants, 2 being breast-fed. All 3 appear healthy and thriving and were clean and comfortable’. The remaining two were in prams in an outside shelter; all the infants were described as healthy, well cared for and contented.

23.16 It appears that efforts were underway by 1955 to sell the premises; Matron noted that two valuers had visited recently. A special meeting was called in March 1957 to consider the sale and the purchase of alternative premises. This would require an application to the court for permission to sell and to dispose of the adjoining chapel and its chattels. The guardians determined that it was essential to move, ‘having regard to the state of repair of the premises…and to the expense and inconvenience involved in carrying on the work of the Asylum in these premises’. The home plus the adjoining chapel was sold on 25 September 1958 to the state-owned Irish Sugar Company for £23,000. The houses and chapel were demolished and a modern office complex was constructed on the site. The new home at 83 Eglinton Road - a detached nineteenth-century suburban house, cost £5,250 and the trustees proposed to spend approximately £4,000 fitting it out.12

23.17 Mothers, children and staff moved to Eglinton Road between 23 and 25 March 1959. The guardians were concerned that news of the sale of the Leeson Street premises might create the impression that the home had closed, so they issued a Change of Address notice to Church of Ireland clergy, asking that it be brought ‘to the notice of Parish Organisations and your Parishioners’. The annual report for 1963 described Eglinton Road as:

an ordinary house in an ordinary road, and has a friendly and welcoming look even from the outside, while once inside the door, the cheerful brightness of

---

12 Irish Independent 15 December 1958.
the newly decorated hall and the comfort of the rooms and the friendly efficiency of the staff must bring a sense of relief and security to many a frightened girl and her worried parents. The move to Eglinton Road from the old Magdalen premises in Lower Lesson Street is in line with modern trends which do not favour the old “institutionalism” of barrack-like buildings, bare furnishings, dark paint and the usual large notice at the entrance.

23.18 A newspaper advertisement, seeking to recruit a midwife, said that the home had 12 beds.\textsuperscript{13} The mothers were accommodated in single or double-bedrooms and there was space for nine cots.

23.19 Conditions undoubtedly improved following the move to Eglinton Road and the surplus money that was available for equipment and improvements. Matron’s report books describe new nursery curtains, an ‘elegant new gala washing machine’ and a Burco boiler; a television and the purchase in 1963 and 1964 of a spin dryer and a tumble drier, which meant that it was no longer necessary to send sheets to a commercial laundry in the winter. The home had a temporary chapel, pending the construction of a new chapel. A new laundry and a new bathroom were also constructed. The most significant expenditure involved the provision of a delivery unit, and associated facilities. (This is discussed below). In 1979 Miss Clandillon described the home as:

a detached red brick house on three floors. There is a large reception room on the left of the hall and a living room on the right. [Matron’s] office is also on this floor. There is a dining room and well laid out kitchen area. The gardens are spacious. To the side of the reception room is the chapel (C.of I). The first and second floors are well designed with eight bedrooms, one occupied by the Matron and one by the cook/housekeeper who is off duty from 4 pm. There is also a delivery room but the Matron informed me that this is seldom used now.

Staffing

23.20 In the 1911 Census there were three staff and eleven resident women. As noted earlier, the Commission has not seen any detailed records of the running of the home before 1945 when the first of the Matron’s report books survives. When Miss Litster carried out an inspection in May 1955 she reported that the staff

\textsuperscript{13} \textit{Cork Examiner}, 23 March 1964.
consisted of: ‘Matron (not a nurse), nurse, student nurse, night attendant, cook, porter’; they were caring for three expectant and four post-partum mothers and ten babies; six babies were in the home without their mother. She also noted that the housework was ‘done mainly by the mothers’. Matron’s book suggests that the nurse who was present in May 1955 was a qualified midwife. Staffing fluctuated and there were many changes, but there would appear to have generally been a resident matron and a resident cook/housekeeper; at times there was also a nurse. Matron’s book makes occasional references to outside staff. In 1952 a man came for three hours most mornings; he was paid 5s a day, and ‘does polishing and cleaning’. She noted that ‘a woman cleaner and a napkin (nappy) washer will be urgently required when all girls leave next week’. In 1953 the home employed a Catholic nurse - her religion was noted - who was given notice within two months because there were ‘no admissions in view’. She was described as ‘an unsatisfactory influence in the Home’. At this time the home was employing a second, part-time cleaner, presumably because there were few resident mothers. In 1955 it advertised for a porter, but Matron reported that ‘total wage of £4 with meals does not exceed unemployment benefit enough to make it worthwhile to do it 7 days a week’. They hired a portress who cleaned the house and washed nappies in addition to her other duties. The small size presented some difficulties when it came to retaining qualified staff. In 1958 the medical officer reported that he had spoken with the nurse, and she did not wish to remain because she had ‘very little scope for her qualifications and she felt she was getting rusty’. By the early 1960s there is some evidence that the home was recruiting former ‘inmates’ for domestic duties. One mother was hired as ‘cook/general’; she was given a bed sit, a ‘late pass at times’ and her own key; her child was either being adopted or placed in a foster home. However, this arrangement was not a success because this woman became pregnant (the butcher’s assistant was suspected to be the putative father) and she was dismissed.

23.21 Staffing became more critical when babies began to be delivered in the home and it had to meet the requirements of the Registration of Maternity Homes Act 1934. In 1963, when women were giving birth in Eglinton Road, it proved impossible to recruit a permanent nurse so they had to rely on temporary appointments or agency nurses. The annual report lists the staff in 1963 as matron, a nurse and a housekeeper. In 1972 Matron noted:

No answer to any advert, I am finding the constant changing of staff very trying and tiring. We have a night nurse at present but they will only work 5
nights at the most as they are mostly married from the Agency and it is often very difficult to get relief at weekends.

23.22 Staffing difficulties persisted despite the decision in 1973 that all mothers should give birth in hospital. The home continued to be registered under the 1934 Act. In 1979 Miss Clandillon reported that there was a resident cook/housekeeper, who was off duty from 4 pm; a matron, who was a trained midwife; and, if necessary, the home would call on an agency midwife. The local doctor and a public health nurse visited three times a week. At the time of Miss Clandillon’s visit there was only one woman in residence; two had left some days earlier. Throughout the 1980s, when Denny House provided short-term accommodation for a larger number of pregnant women and unmarried mothers and their children than in the 1970s, a resident nurse was in charge and agency nurses were hired when the mothers and/or babies required additional care, especially at night. By this time Denny House also had a social worker, who was unpaid, but appears to have played an active role.

Finances

23.23 Some financial reports/accounts survive but the earliest is for the year 1958. In the 18th and 19th centuries the income for this home came from pew rentals (payments by prosperous individual/families to reserve a pew in the Magdalen Chapel for their exclusive use) and from charity sermons and bequests. In the early/mid-twentieth century there was an annual charity sermon in the Magdalen Chapel, preached by a Church of Ireland archbishop or bishop. For example, the 1929 sermon was preached by the Bishop of Ossory. The governesses organised annual gift days and sales of work, and a number of branches of the Mothers’ Union raised money on its behalf. The annual report for 1948 reported that an improvement in the balance sheet from £119 to £309 was largely due to the interest taken in the asylum by various branches of the Mothers’ Union and to the fact that a special effort was made during the year to cut down expenses as far as possible ‘in order to meet the cost of projected repairs’. The annual report for 1963 lists receipts from collections taken in the dioceses of Kilmore and Ferns and in the parishes of Rathfarnham, Donegal, Carlow, Maryboro and Killeshin on behalf of the home. It also received many gifts in kind, baby clothes, women’s clothes, fruit, vegetables,

---

14 *Irish Times*, 11 February 1929.
15 *Irish Times*, 1 June 1949.
cots and prams. The annual report for 1963 mentions a ‘generous cheque from a friend of the Home’, who stipulated that it should be used to purchase ‘up-to-date household equipment, including a refrigerator”; the governors proposed to also buy a spin dryer, a heated cot and garden seats. In 1966 a bicentenary appeal was launched with the target of raising £10,000. There is no information available as to its success. Accounts for the year ended December 1971 record a sum of £616 under the heading ‘Bi-centenary appeal’ that was used to make a final payment for the cost of the extension to the house, containing a laundry and a chapel.

23.24 When the Bethany Home closed in 1972 the property was sold for £38,000. In 1974 a High Court judgement determined that the net proceeds of the sale - £37,232 and an additional £4,000-£4,500 in other securities should be allocated to the Magdalen Home, Eglington Road (later Denny House) and Miss Carr’s Children’s Home on Northbrook Road, with the Magdalen Home receiving 85% of the proceeds.17

23.25 In contrast to the Bethany home, Denny House was in receipt of state funding from 1920. In 1916 the UK government introduced a programme of grants to local authorities and voluntary agencies in urban districts (including county boroughs), for health-visiting, maternity centres, midwifery facilities and day nurseries. In 1918 the sum of money provided was increased and the items covered were extended to include provision for the young children of widowed, deserted and unmarried mothers and Exchequer payments for health visitors. By 1920 this grant was providing financial support to a number of Dublin voluntary organisations that assisted unmarried mothers and their children, including the Magdalen Asylum (Denny House) and the Nursery Rescue and Protestant Children Aid Society. The grant covered half of the cost of boarding out these children up to the age of five, which would reduce the amount of money that a single mother needed to provide, and half of the estimated costs of keeping mother and baby in the Dublin Magdalen Asylum. In 1925 an official from the public health section of the Department of Local Government and Public Health told the Commission on the Relief of the Sick and Destitute Poor that this was the only residential institution that had applied for funding under this programme. The home submitted accounts of its expenditure, with sub-headings twice a year, together with a table giving dates of a mother’s admission, the date of birth of her child and the number of days

16 Irish Times, 21 October 1966

spent in the home. The DLGPH reimbursed the home for half of the cost of maintaining mother and child, up to a maximum of six weeks before the birth and one year after the birth. This official claimed that the maintenance cost per person was approximately 32s 6d a week.\footnote{Oireachtas Library, Minutes of evidence to the Commission on the Relief of the Sick and Indigent Poor, 10 June 1925.}

23.26 The Magdalen Asylum expected a payment, or at least a partial contribution from every woman who was admitted; these payments might come from her family or a local clergyman and it would appear that women who had not paid an agreed contribution were pursued. The case committee noted that one woman who had been in the home in 1956 had paid all arrears, which had amounted to £9 7s 6d. She told them that ‘she is settling down’; however they noted that she continued to smoke. The mother of one woman sent twelve dozen eggs in part-payment for her maintenance. The mother of another woman who left owing £10, sent £7. The case committee noted that this woman had been asked for money by the Rotunda. It was agreed that one member of the committee would discover from the Rotunda whether an application had been made to the woman’s county council for financial assistance.

23.27 There is no evidence that any Public Assistance Authority (PAA) paid for the maintenance of a mother or child before the mid-1950s. When Miss Litster visited in May 1955 she suggested that the Matron should approach the local authority
from which every mother in the home came, requesting that they should contribute to her maintenance, as happened in Catholic mother and baby homes. The matron replied that ‘her Committee would have to give this very careful consideration as a great emphasis is placed on secrecy’. Miss Litster suggested that there appeared to be no reason why this should not be done in cases where the ‘girl’s’ parents were aware of her pregnancy. This file suggests that the Magdalen Asylum began to approach local authorities following Miss Litster’s visit. Counties Laois and Donegal sought the Department’s approval to pay for mothers in 1956. A handwritten note on this file, dating from 1967, or slightly later, stated that ‘accounts are not received from these institutions’. In 1971, two of the women admitted were paying patients, one was maintained by her parents and one by the firm that employed her; the remainder were paid for by the regional health boards.

23.28 The annual report for the year 1958 shows that subscriptions and collections totalled £80 and the home received a special donation of £100 from the Representative Body of the Church of Ireland (this would appear to have been an annual donation); a ‘bring and buy’ sale raised £18; annuities yielded £92 and dividends a further £474. The two largest sources of income were ‘inmates payments’ at £523 and a grant from the Department of Health amounting to £755 (presumably from the Maternity and Child Welfare Grant). The total income was £2,825 - wages and salaries amounted to £959; provisions £623; fuel, gas and electricity £205. By 1962 total income had increased to £3,347; ‘inmates’ contributed £1,006 but the Department of Health grant had fallen to £694 - reflecting smaller numbers in the home; salaries and wages had increased to £1,151. The contributions from ‘inmates’ included payments by PAAs and social insurance payments (maternity benefit) and maternity grants to which many of the women would have been entitled. This report stated that a member of the ladies’ committee had volunteered to collect maintenance contributions for the ‘girls’ and to handle applications for government and local authority grants; she ‘worked indefatigably to help the girls with claims for county grants or insurance benefits where applicable’. In 1963 the weekly cost per admission was approximately £12. During the previous year ‘10 of the girls were maintained without charge, as a lack of means is not a bar to admission’.

23.29 Accounts for the year ending December 1971 showed subscriptions, donations and collections, included a grant from the RCBI, totalled £1,252. Contributions towards maintenance, including local authority payments, totalled £1,368, grants
from the Department of Health £2,233, and a refund of two years’ of income tax amounted to £1,038. Income totalled £7,390. The largest single expenditure item was salaries, wages and superannuation at £3,284.

23.30 Capitation payments by local authorities were not keeping pace with rising costs in any of the mother and baby homes. In 1972 the accountants to the Magdalen Asylum asked the department to approve a doubling in the weekly capitation rate for mothers and children from £4 and £2 respectively to £8 and £4. They enclosed a copy of the latest accounts. A review of the accounts for the years 1970 and 1971 by the department determined that the average weekly cost per patient in 1971 was £12.60; they described the current capitation rate of £4 per week for a mother as ‘highly unrealistic’. The department suggested that allowing for other sources of income a minimum payment of £6.50 was necessary. They recommended a capitation rate of £7, but decided to abolish the payment under the Maternity and Child Welfare Grant, which a governor of the home described as ‘the sting in the tail’. This compared with £10 a week paid in Bessborough and £8.40 in Dunboyne. The rate paid for women in this home had not increased since 1967. Within a short period the home was again seeking a higher capitation rate and approval was given for £10 beginning in July 1973; this compared with £12 for Bessborough. There was a further increase in 1974 to £12, which remained the figure until the end of the decade.

23.31 Women who were receiving maternity benefit and later (from 1973) unmarried mothers’ allowance were expected to contribute towards their maintenance in the home (in addition to the maintenance grant paid by the regional health boards). In 1973 it was agreed that women could keep £15 from their insurance payments. By 1983, weekly maintenance payments had increased to £42 and £21. There is no indication that this home faced acute financial difficulties, but its services were subsidised by donations and bequests.

The Mothers

23.32 The institutional records include the rules for admission as outlined in 1927 (which is the earliest year within the Commission’s remit for which they are available). These rules stipulated that admission was confined to women who were members of the Church of Ireland or ‘any Protestant denomination’, and to ‘first fall’ women ‘if they have hitherto borne a thoroughly respectable character’. Women were only
admitted on the permission of the 'Vice-Patroness or the lady acting as such', and character references were required. The rules stipulated that 'mentally deficient girls are not suitable for admission'. A medical certificate, which should stipulate that they were free from venereal disease and other infectious diseases, was required. Mothers could be admitted before the birth and were expected to remain for at least six months after the birth of their baby. The home would not care for the baby when the mother left but she would be assisted in making arrangements for her child. Every woman 'or her friends' was expected to contribute to her upkeep while in the home. Women had to give an undertaking to conform to the rules of the home, obey the Matron, and do such work as was assigned to her; the rules specified that no outside laundry work was undertaken.

23.33 A total of 1,416 mothers were admitted between 1921 and 1994; the largest number of admissions was in the 1980s. The numbers in this home at any one time were always small; the highest average occupancy was 13 in 1932. Before 1980, virtually all the women were Protestant; any Catholic woman, who had inadvertently been admitted, was sent to another institution. In 1980 the charter was amended to permit the admission of Catholics.

23.34 The character of the home changed in the 1980s - see below. In that decade, most women were now admitted following the birth of their child.

23.35 The modal age of the mothers was in the late teens; very few women were over the age of thirty.

23.36 Most women, 29%, gave Dublin addresses; over 13% came from counties Cavan, Donegal and Monaghan, and almost 10% were from Northern Ireland.

23.37 Pregnant women were generally admitted approximately two months before the birth of their child and that remained constant from the 1920s until the end of the 1970s. The major change was in the length of stay after the birth; this fell steadily over the years.

Referrals

23.38 The institutional records show the referral pathways for 1,008 of the 1,416 mothers. Over one-third - the largest single category - were referred by a clergyman; almost 15% by a PAA; almost 16% by a voluntary organisation and
over 14% by a social worker. Referrals by social workers increase significantly from the 1970s. Many came through the Church of Ireland Social Service. These referral letters often contain background information about the women, their families and the circumstances of their pregnancy. In 1927 one clergyman explained that

This is a particularly painful case. The girl's father is dead, and her mother is married again. They are very respectable people, but not well enough off to afford much payment. It will be a severe strain on the step-father to pay the promised sum. I have done all in my power to get the young man to marry this girl, but he positively refuses, although he does not deny the fault. As both parties are Protestants the girl's people do not like to have the matter made public in the Courts. In any case the young man has no visible means, and the girl's mother is too poor to prosecute, perhaps a losing case.

In 1930 one Church of Ireland rector explained that ‘The girl - a very nice girl - has unfortunately fallen, and as the other party concerned is not of her religion nor of her class in life, her parents who are parishioners of mine do not on any account wish her to marry him’. In 1944 a clergyman explained that ‘I am endeavouring to keep things quiet in the village - at any rate, until the girl gets away … [the woman] will not divulge who the father is. You will, I am afraid, find her very stubborn on the whole matter. I do not mean by this that she will be disobedient or troublesome’. The mother of one pregnant woman, writing in 1944, asked the home to permit her daughter to remain with friends as long as possible, because ‘we are not well off people and every 10 shillings counts, especially having to stay so long’. She continued, ‘It was a hard blow to see a child’s life disgraced and ruined, if ever it becomes known. Everyone doing their part to keep it secret’. In 1945 a Church of Ireland rector who had referred a parishioner, informed the Matron that he had visited her in Holles Street hospital and had discovered that the putative father of her child had tried to visit her but had not been permitted to see her. He expressed concern that: ‘As she seems very attached to the baby I would be afraid that she might marry the man as a means of keeping it with her’. The file contains a letter from her boyfriend to the young mother:

I hope the day is dawning near when we would meet again with hand in hand … and you a free girl once again. I hope and pray to live to see the day that
you and I shall be sweet hearts again. I shall say no more until I see you in [place] and I hope that day is coming on it can not come too soon. I was saying I would go up on St Patrick’s day but if it was a thing that I could not get to see you it would be foolish. So please write and let me know when you are coming home and if you do not be to [sic] long up there … A lot of people does be asking for you so I say you are up in Dublin at a job and of course you like it ok … I hope you will drop me a line before long … your fond sweet heartboy.

23.40 It is not clear whether she received this letter. This woman's former employer arranged for her to take a job as a servant to her sister in Northern Ireland; she promised that the baby could be placed in a foster family nearby. One letter concerning a pregnant woman, who was travelling to Dublin by train, where she would be met at the station by a representative of the Church of Ireland Moral Welfare Society explained that: ‘She is to wear a tan coat, green hat, red shoes and a poppy’. The date was November 1957.

23.41 During the 1950s, admissions to all mother and baby homes declined, presumably because of the fall in the number of ‘illegitimate’ births, and this home was no exception. In September 1952 for example, there were only three resident women; there was only one mother and child in the home for several months in late 1953 and early 1954. In 1953 the Magdalen Asylum contacted Bethany Home regarding its admission policy. Under the terms of the trust, they were not allowed to admit any but ‘first fall’ cases. Very few such girls were now seeking admission; the number of illegitimate births had fallen sharply and they suggested, given that Bethany admitted women having a second or subsequent ‘illegitimate’ pregnancy, that ‘first fall’ cases coming to Bethany should be ‘diverted’ to the Magdalen Asylum. Bethany’s management committee declined this request, noting that the ‘vast majority’ of women admitted were ‘first falls’ and that if they excluded ‘first fall’ mothers the numbers admitted to Bethany ‘would be negligible’.  

23.42 In January 1959, when there were six ‘girls’ in the home, the matron commented that she was:

Glad to have enough girls in to be company for one another; it is always difficult when there are only one or two, and no matter how hard the staff may

---

19 Bethany Home Management Committee minutes.
try, we are far too middle aged to be at our most useful with 1 or 2 girls in their teens, as happened at the beginning of December.

23.43 The refusal to admit women who were giving birth to their second or subsequent child was maintained into the 1960s, though on occasion a woman might gain admittance without that being known. In 1964 a clergyman in Cork was contacted because the home had failed to secure any contribution for a woman who had been discharged. They informed him that: ‘As you know we never refuse to take girls because they cannot pay. [The woman’s] child has proved to be unadoptable (on medical grounds) as was her first child. She should therefore never have come to this Home which is for first cases only’.

23.44 The clergyman suggested that the woman’s mother or uncle should ‘settle’ her debt. He explained that it was ‘a great surprise and shock for me to learn from your letter that this was [the woman’s] second child’. He claimed that neither the boy she was about to marry or his parents were aware of her previous pregnancy: ‘it would be a terrible shock to them to discover this later, as they are bound to do’. He sought permission to inform them. An unidentified man, from the same area (possibly the woman’s uncle) then contacted the home; he had apparently heard the story, and suggested that he would have paid the outstanding bill. He had not been aware that this was the woman’s second pregnancy; he reported that her fiancé had heard the full story, ‘do you realise that this could well breech [sic] their marriage plans which is to take place next month, after all [the fiancé] was willing to marry her even when she had a child, just what must he think now … if anything happened to [the woman] in the past, it should certainly not be broadcast now’. It is evident that the clergyman had informed the young man’s parents; he claimed that he would have a very uneasy conscience if ‘I left the [family] in the dark about what I know … especially as [the fiancé] had asked me to marry them. There has been a great deal of deception in this case’.

23.45 The proportion of mothers who were giving birth to their second or subsequent child rose steadily from the late 1960s. In April 1972 two of the eight resident women were pregnant for a second time; a 1973 a pregnant woman was admitted, who had given birth to her first child in 1969, while in this home. The proportion of mothers giving birth to a second or subsequent child increased in later years.
CHAPTER 23 DENNY HOUSE

Births in Denny House

23.46 A total of 869 women were admitted before giving birth and stayed until after the birth. Twenty per cent of these women gave birth in Denny House; 38% gave birth in the Rotunda; 25% in Holles Street and 15% in the Coombe. Only two babies were born in Leeson Street and it would appear that these were emergency deliveries because the policy at that time was for women to attend ante-natal classes and give birth in a Dublin maternity hospital.

23.47 Following the move to Eglinton Road preparations began for births in the home. In 1959 the case committee requested the general committee ‘to expedite deliveries in the Home for the following reasons: Girls have to go to hospital at the time when they need most help; greater privacy; Home would be able to help more people’. At a subsequent meeting the medical officer reported that a consultant obstetrician, who was attached to the Rotunda, ‘is very willing to take on Home deliveries if appointed and to do antenatal care’. It was agreed that the doctor would decide whether women should give birth in hospital or in the home.

23.48 There is no indication that the Home had previously been registered under the Registration of Maternity Homes Act 1934. It does not appear on the register of private maternity homes in 1957 or 1958, or in the inspection reports for 1937/38 or 1944/46 of homes in the Dublin County Borough that were registered under this Act. A handwritten note on a Department of Health file in 1974 stated that it only registered under the 1934 Act in the 1960s. However the home was visited regularly under the Dublin Maternity and Child Welfare Scheme; for example the annual report of the Dublin city medical officer of health for 1940 stated that the home ‘was visited several times during the year by the Medical Officer and found very satisfactory’. The Dublin corporation inspector of midwives visited the home in the autumn of 1956. According to the Matron, the inspector stated that ‘as we don’t have confinements here, we will no longer be on the list of Homes registered’.20 Following the decision to permit births in the home, an application was made to Dublin Corporation in December 1960 to register under the 1934 Act. Some weeks later the same Dublin Corporation inspector, who had visited Leeson Street in 1956, confirmed that it would be recognised as a maternity home under the 1934 Act, when the instructions given by the Dublin fire brigade - they required an escape ladder on to the chapel room - had been carried out and approved. In May

---

20 This is not a correct interpretation of the Act’s requirements – see Chapter 1.
1961, the Matron was informed that the home had been registered and that they had been provided with the forms that should be completed to comply with the Act.

23.49 The first two babies were born in the home in May 1961. The annual report for the year 1962 highlighted that fact that this was the first full year in which deliveries have been carried out in the Home. We are proud to have achieved this ambition and are happy that the girls entrusted to our care have expressed their appreciation of this arrangement and the privacy it ensures. There have been 18 deliveries in the Home during the year - the latest being our first twins. No obstetrical abnormalities or emergencies were encountered. Two very small babies were transferred to the Paediatric Unit of the Rotunda Hospital, so that they might have the advantage of the special facilities there for the first few weeks of life.

23.50 The visiting obstetrician reported that ‘On the material plane we can be proud of the facilities and equipment of the Home, which need not fear comparison with any other similar institution. I wish to record my own pleasure in being associated with the Home and to thank all the staff for their willing and efficient co-operation during the year’. In October 1966, it was noted that 78 babies had been born in the home since May 1961.

23.51 Occasional comments in the Matron’s books suggest that the home was scrupulous about having the appropriate equipment. In 1967 the Matron ordered a second smaller oxygen cylinder to be kept in either the post-natal or delivery room so that they would not have to rely on one cylinder. She noted that one of the maternity cases in the current month was expected to be a breech delivery. An anaesthetist attached to the Rotunda paid a visit and advised the Matron to purchase additional equipment, including ‘a baby’s oxygen resuscitator’ and an infant’s laryngoscope. By this time however, the Department of Health was pressing for all women to give birth in maternity hospitals where specialist medical and nursing staff were available at all times. Facilitating births in Eglinton Road placed considerable pressure on the Matron; there were potential risks for mothers and infants and the home was very reliant on temporary agency nurses. In 1972 the Matron commented that ‘Having the girls delivered in hospital has lightened the night work burden for me considerably and the girls do not seem to mind going into hospital for a short time’, which would appear to suggest that they had suspended deliveries because of staffing difficulties. A report by a Department of Health
medical official in 1978 stated that, until 1973, ante-natal and post-natal examinations were carried out in the home, but since 1973 the women attended regular clinics in the Rotunda and gave birth in the hospital. Eglinton Road had space for 12 women but they preferred to cap the numbers at ten; the maximum occupancy between 1973 and 1978 was six women at any time.

23.52 Of the 21 women admitted during the year 1973, 13 were referred by the Church of Ireland Social Service; one by Dr Barnardo’s; seven were referred by their local rector, a doctor or a health officer. Nine of the 21 women kept their baby; 10 infants went to children’s homes to await adoption. One premature baby died, and one woman who only remained in the home before the birth made her own (unspecified) arrangements for her child.

From Magdalen Asylum to Denny House

23.53 The numbers admitted began to fall towards the end of the 1960s. In 1970 the Matron noted that the

Fact that there are still no bookings for the Home has caused concern, [inspector] from Maternity and Child Welfare Dept. visited the Home last Thursday morning. She stated we will probably have to shorten the time of the girls stay in the Home before and after confinement, she said that the age now of the unmarried mother in the last two years is usually under 18 years of age and in many cases the parents do not know of the pregnancy... [she] also said it is time we changed the name of the Home or dropped the title altogether, but this is only a suggestion.

23.54 The Matron contacted the social worker at the Rotunda about the lack of bookings and was informed that the number of Catholic and Protestant unmarried mothers had doubled over the past three to four years. The Rotunda social worker suggested that they should shorten the length of stay. The closure of Bethany to admissions in late 1971 - the home closed the following year - meant that this was the only Protestant mother and baby home. However that does not seem to have resulted in a noticeable increase in admissions. In the autumn of 1972 the Matron expressed concern that they had not received ‘any bookings and will only have 1 girl and baby in home from Wednesday’. She continued to check with the Rotunda, in an effort to determine how many Protestant women were giving birth and had not been in the Home. The governors were obviously considering amending the charter because they sought information about Catholic women and deserted
wives. The visiting obstetrician told them that ‘deserted wives are usually independent their problems are usually care of their children and paediatric nursing’.

23.55 In 1973 the Department of Health examined the viability of the home. One official estimated that it cost £30 a week for each mother. The average length of stay now ranged from two weeks to two months. When an inspector from the Department of Health visited, she expressed concern at the ‘very small numbers and would like to see the Home kept going’. There were no mothers or children resident in November 1973. On a number of occasions during the 1970s the minutes of the monthly committee meeting record that there were no mothers in the home. It closed for three weeks summer holidays in 1974 and again for a week at Christmas. For much of the time between the summer holidays and Christmas there were no resident mothers or children. It also closed for a three-week summer holiday the following year. In April 1976 the minutes of the committee meeting reported that: ‘From 10th of last month, the Home began to fulfil its purpose and operate normally again. Two years since so many were in the Home’. There were five women, two babies and one child - all admitted in the past month.

23.56 Conversations about the future of the home continue throughout the 1970s in the Department of Health and among the governors and matron. Mothers were returning home or to work shortly after the birth of their child but children who were being adopted were not generally placed until they were approximately six months old. Consideration was given to providing accommodation for pre-adoption babies (without their mothers). However, both the obstetrician and the Rotunda social worker indicated that this was ‘a work outside the present scope and that ongoing expenses for staff would exceed any payments received for the babies care’; they suggested that there were not sufficient Protestant babies ‘to keep the project going’. The obstetrician emphasised that it would be essential to have a paediatrician on call, night and day, if babies were being kept without their mothers. The social worker suggested changing the name of the home to something more modern; she also highlighted a need for bed-sitting rooms for ante-natal residents. Department of Health inspectors continued to recommend that it remain a mother and baby home for Protestants. In December 1974 the committee reported that the department inspector had said that ‘the Home had a very good report as a Nursery Home and the patients seemed to have excellent care’. She discouraged them from de-registering as a maternity home, suggesting
that there should be a need for one Protestant home for unmarried mothers and their children. But the numbers remained tiny which encouraged a flexible approach to women’s demands. One pregnant woman who was admitted in 1975 went out to work as a part-time child minder, three or four days every week, and an unmarried pregnant woman spent her weekends in the home, because otherwise she would be alone when her housemates went home. This woman was described as of a mixed marriage and not practising any religion. The Matron and the home’s social worker liaised with the social worker in Holles Street about her care.

23.57 In 1978 the medical officer reported that most of the women admitted were from outside Dublin. The length of stay varied but it was usually from three to five months. Over the previous two years there had been on average 13 ‘girls’ in the home each year. Cherish, an organisation that supported single parents, contacted the Matron and suggested that they should concentrate on providing temporary accommodation for mothers and infants immediately after the birth. Many mothers had to place their infants in residential care when they left hospital, because they had nowhere to go, and this disrupted the bonding between mother and infant. Cherish also wanted the home to provide emergency accommodation for mothers and babies from the country who often arrived at its offices with nowhere to live. Cherish also suggested extending the facilities to woman of all Christian denominations.21

23.58 A growing number of women in the home with their child were awaiting accommodation in Miss Carr’s Flatlets in Northbrook Road - see Chapter 25. In 1979 the Matron addressed the Protestant Child Care meeting in Miss Carr’s Home, describing the changes that had taken place in the work of the home over the previous ten years ‘and the possible scheme to broaden the scope of the work’. Miss Clandillon paid a visit to discuss the proposed changes. At the time of her visit there was only one resident woman. Consideration was being given to admitting women who were not Protestant. Miss Clandillon told the Matron that many women no longer went to mother and baby homes. She suggested that the home should take Protestant women ‘from any part of the Republic’ (there is no indication that they were not already doing this), and they should advertise in parish magazines, newsletters and women’s magazines and place small notices in

21 Information provided to the Commission by Cherish which is now called One Family: https://onefamily.ie/
church porches. This was the practice of the Catholic agency CURA. The Matron stated that abortion was responsible for the drop in admissions, and many women were now staying with friends before giving birth. Miss Clandillon obviously believed that it should continue to operate as a Protestant mother and baby home; however, there appeared to be little demand. In April 1979, when there were only two resident women, the committee recorded that

Any inquiries re admission have only been of a tentative nature. There are so many organisations and suggestions of alternative care for the girls before and after confinement. Two inquiries last month from Social Workers were for RC girls, neither were refused but were offered short accommodation stay, however both girls made other arrangements apart from the help of the Social Workers, one brought her baby to her Aunt's home and the other girl has found accommodation near her home for herself and her child.

23.59 There were no resident women between June and late August 1979. A senior official in the Department of Health told the guardians that ‘this Department would encourage efforts by your Board to develop and expand the work of the Home with unmarried mothers and wives who for one reason or another require assistance and care’. He emphasised that the department was not in a position to advise the board. In June 1980 a resolution passed at the joint meeting, presumably of the trustees and governors of the home, determined to change the charter to enable them to admit unmarried mothers without religious restriction, and, in certain circumstances, married women who were separated from their husbands or deserted and pregnant widows. The name of the charity was changed to Denny House, which honoured the home’s 18th century founder Arabella Denny and the restriction to Protestant women no longer applied.

23.60 In 1981 the Matron of the renamed Denny House wrote to the Department of Health explaining that over the past three to four years the home had been underused, so the board ‘after much consideration, decided to apply to the Court to vary the Scheme…the primary purpose of the Home is now to provide residential accommodation for and the other needs of unmarried mothers and their infants, irrespective of religion’. The Matron noted that recent applications came from unmarried mothers who had given birth and sought temporary accommodation for up to three months while they made long-term arrangements. Following the changes to the charter, women were being admitted to Denny House in the final weeks of pregnancy. They gave birth in a Dublin maternity hospital, presumably
the hospital of their choice, because the records show no consistent pattern, and they returned with their baby shortly after the birth. During their time in Denny House they were expected to decide whether or not to keep their baby and to make future living and housing arrangements. Mothers had to take responsibility for caring for their baby while in the home to make them aware of the demands of motherhood. When Denny House staff met the department’s social work adviser, they cited several instances where young women, who had planned to keep their baby, changed their mind ‘when faced with the reality of caring for the small baby’, and contrary cases where women who had planned on adoption also changed their minds. The decision to admit Catholic women had an immediate impact. In July 1981 there were six mothers and five babies in Denny; one infant was in hospital; all five of the recent admissions were Catholics.

23.61 In 1982 Denny House told the Department that ‘a wind of change’ had blown through the home, with the appointment of a new Matron. They planned to offer cookery and budgeting classes, elementary biology (presumably a euphemism for birth control), and marriage counselling. The home, which only accommodated ten women, had a waiting list.

Life in the Magdalen Asylum and Denny House

23.62 In 1925 Emily Buchanan, a former member of the Dublin Board of Guardians, and a long-term member of the Committee of the Home and of the Protestant Children’s Aid Society, told the Commission on the Relief of the Sick and Indigent Poor that ‘the secret of saving both mother and child is to be found in our system’. The objective should be to save the child ‘physically’ and the mother ‘morally’. She explained that mothers gave birth in either the Coombe or the Rotunda hospitals and returned to the home with their baby. They were obliged (if physically possible) to nurse the infant for 8 or 9 months during which time the girl is trained for domestic service and in needle work - making outfits for both children and mothers. There was an average of twelve women in the Home at any time; they arrived 2-3 months before the birth. When the baby is weaned the girl is sent to a situation and the child is handed over to the Boarding out Committee who place it with a ‘nurse’ carefully selected and who visit the foster homes at least once a month.
23.63 The ‘girls’ contributed towards the maintenance of their child ‘in proportion to their wages’; she claimed that the death rate among the children was ‘almost nil’ and few women defaulted on maintenance payments although many mothers went to England. Miss Buchanan suggested that a mother who nursed her child for 8-9 months ‘grows to love it devotedly - She will face the world for its sake - and does. Second offences in such cases are rare’. She claimed that the Boarding Out Committee inspected the children every month, and they wrote to the mothers about their children.

23.64 Following this model, she suggested that small mother and baby homes, with 15-20 resident women, under religious management, should be opened in every county. ‘You must get to know the girls individually. They must get kindly and sympathetic treatment and to my mind treatment with a distinctly religious bias. To my mind these girls want something like that to fall back upon’.22

23.65 It would appear that most mothers in this home breastfed their infants. In 1948 the Matron noted that eight of the nine babies were being breastfed; the exception was a premature baby. In May 1955 she recorded that ‘As there is a surplus of [breast] milk here, the Rotunda nurse calls daily for it. The girls are glad to keep other babies, so we do not let the Rotunda pay their usual price -2d per ounce’.

23.66 Occasional comments in the records indicate that some women used an alias. This may have replaced the earlier very impersonal Mrs One, Mrs Two in the nineteenth century register. In 1945 Matron’s book noted that four new dresses were needed ‘as we will soon have 14 girls in Home’. Some women appear to have arrived with a complete wardrobe, but others had to be kitted out; it is not clear whether uniforms were mandatory or supplied only to women who had inadequate clothing. In 1951 the home was ‘very short of girls underclothing and we have a lot of old stockings’; the Matron had ordered ‘girls afternoon dresses’.

23.67 Voluntary workers were active in the home; in 1953 the Matron noted that one volunteer was holding singing classes (which must have been difficult as there were only three mothers in residence); another taught embroidery and a third had started a class in handcrafts and painting. There were also dressmaking classes; most of the women made babies’ dresses. Following the move to Eglinton Road,

---

22 Oireachtas Library, Minutes of Evidence, 23 Sept. 1925.
the Matron wrote that they were spending ‘a good deal of time in the garden. Very
gratifying to see the amount of embroidery, knitting and sewing which they are
completing in addition to the routine household mending and in many cases they
have done work which they had never attempted before’. This would appear to
refer to household laundry, which was now being done in the home following the
purchase of a washing machine and spin dryer.

23.68 When Miss Litster inspected the Leeson St premises in 1955 she remarked that
most of the work was done by the mothers although the records note the hiring of
temporary staff to carry out nappy washing and cleaning. By the early 1960s, a
physiotherapist attached to the Rotunda hospital was running relaxation classes.
In the mid-1970s a volunteer arranged for the women to assemble boxes used to
package a board game; mothers would be paid for this work.

23.69 Matron’s book records excursions to gather blackberries, visits to the Zoo, the
cinema, and the Gaiety pantomime during the 1950s. In 1956 a named doctor,
who was associated with the charity, drove three mothers to the Children’s Fold - a
children’s home in Monkstown - ‘which pleased them a lot’; this may have enabled
the mothers to see their children. In a later entry she wrote that she was ‘Glad to
say that the girls all go out from time to time, church, shopping, visiting another girl
in Rotunda and occasionally going to the cinema’; ‘on probably the wettest day of
the month’, she had taken three women to Glendalough ‘where we had a picnic
tea’. The Matron recorded the Christmas day menus, which followed the traditions
of Irish homes at the time, with either turkey or a goose, and other trimmings.

23.70 By the 1950s (there are no comparable records for earlier decades), the home was
taking an active interest in the mothers’ health. Women were tested for TB and
given BCG immunisation; many underwent eye tests and were fitted with
prescription glasses, and they were sent to the dental hospital for treatment.
Babies received BCG and other infant immunisation; the Matron arranged for the
public health nurse to call to do this. The public health nurse also checked the
children’s health and development. A nurse from the Rotunda reviewed the
babies’ diet and recommended changes.

Religion

23.71 In the 19th and the early 20th centuries, religion was seen as playing a major role in
the rehabilitation of unmarried mothers, and the regime in the Magdalen Asylum
reflected that culture. There was an adjoining chapel that was open to the public; it appears that women in an advanced stage of pregnancy attended services in a gallery, which presumably gave them privacy. There are several references to baptisms in the Matron’s book; and in one case there is a note that the Matron had baptised an infant who was ill. In May 1952 the Matron reported that ‘all the mothers had been churched’. There are further references to churching in later entries. In 1953 the Matron noted that ‘The girls went to Church on 5 days of Holy Week and 3 of them went to Holy Communion on Easter Sunday which was a happy day here’. There are occasional reports of mothers being baptised in St Peter’s Church in Aungier St. In 1952 the chaplain visited twice a week, on one day he spoke to each woman individually; on his second visit he met them as a group. In the mid-1950s he was giving classes in church history. Attendance was said to be voluntary, but the Matron noted that ‘all the girls go’.

23.72 In 1954 the nurse was holding weekly bible classes and she and another woman (who was probably the housekeeper) led evening prayers; the Matron led the morning prayers. The Matron hoped to recruit someone who could come in ‘to play hymns in the evenings between 8.30-9pm’. One of the resident women was visiting the Metropolitan Hall, a Gospel Hall in Abbey St. She informed the Matron that ‘I have found the Lord. I have been converted’. This has caused much quiet rejoicing in the Home’. In 1955 the Matron reported that some women went to services in St Ann’s Church in Dawson Street, others went to Christchurch in Leeson Park. ‘Their choice depends on their desire to avoid being seen by acquaintances’. They also attended sessions of the diocesan youth conference ‘and liked that very much’. The chaplain issued a series of rules relating to ‘religious work’ in the home. This stipulated that the women should attend services at either St Ann’s or Leeson Park. ‘Family prayers’, morning and evening should be taken by the Matron or her deputy. Other members of staff should not take classes or prayer meetings in the house. The Matron noted that these rules were not acceptable to the nurse or another staff member, who was probably the housekeeper, ‘both of whom have told me that they are here because of their wish to do mission work among girls’. Both women resigned as a consequence. The chaplain also specified that the Bible, the Book of Common Prayer, the New Every Morning and Acts of Devotion should be used for daily prayers, ‘and no other’. However, it appears that his efforts to determine religious practice were not wholly

23 This was a religious service where mothers who had recently given birth were ‘purified’. It appears to have been universal in the Catholic church; it is unclear how extensively churching was practiced in the Church of Ireland.
successful because there were reports of women attending ‘a healing service’ given by a named ‘Brother’; others attended ceremonies in the Merrion Hall.

23.73 The home expected a high level of attention from its chaplain. In the late 1950s the Matron met the Archbishop of Dublin and asked that a new chaplain be appointed because the then chaplain, who was attached to a Dublin city parish, did not have sufficient time to give to the home. It was also visited by Methodist and Presbyterian ministers and occasionally by the Archbishop of Dublin. Every woman was given a copy of the Bible when she was leaving the home, if she did not already own one.

23.74 When the home moved to Eglinton Road a temporary chapel was set up almost immediately, pending the construction of a chapel adjoining the house. In 1973 the Matron reported on the baptism of two babies: ‘It was a very happy occasion, we had 19 people for tea in the Nursery and 7 babies. One girl brought her baby from the flat, another of our girls and her baby came from the country. We had 2 babies in the Home at the time and [a mother] invited their families and her friends, 2 were African’. The home maintained close contact with the archbishops and bishops of the Church of Ireland. In October 1975 the archbishops of Dublin and Armagh and the bishops of Tuam, Limerick and Clogher had lunch with three governors and were shown around the home.

23.75 During the 1970s the records indicate a gradual blurring of denominational boundaries between the agencies that assisted unmarried mothers. One woman, who was pregnant for the second time, was referred by Ally, a Catholic charity that arranged family placements for pregnant women. A Catholic religious sister, who worked with CURA, the Catholic Hierarchy’s agency to assist women in crisis pregnancies, inquired whether they would admit a pregnant woman, but as this woman was Catholic they were unable to do so. The home admitted a number of women who claimed not to practice any religion. The change to the charter reflected the reality. In 1980 the renamed Denny House was visited by two social workers who were attached to Pelletstown and the Matron was invited to visit Pelletstown.

**Putative Fathers**

23.76 Some of the individual case files in the institutional records refer to the putative father. In 1957 the rules of the home stipulated that there should be strict
supervision of male visitors and generally the only male visitors permitted were a woman's father or brother. From the 1960s, however the women's boy-friends begin to feature in the everyday life of the home. In 1961 the Matron noted that one woman's fiancé arrived and asked to see her; her parents did not know that she was in the home and she had no visitors. Matron noted that her fiancé 'seems anxious about her and appears to be a responsible person. He is paying all expenses. I told him it was against the rules of the Home but that I would put it before the Committee. Having driven from [a distant part of the country] I allowed him to see her for a few minutes while I contacted a few members of the case committee by phone'. In 1965 one mother was reported as having disobeyed the house rules; she had gone out on a Sunday afternoon with the father of her child. Her parents were informed. This mother was described as 'very apologetic on her return and she was given a second chance and has settled down again and not given any further trouble'. In 1972 one pregnant woman was discharged 'at her own request' to live at the home of the father of her baby; it was reported that they might marry. In 1974 a woman who was staying in the home until she found accommodation - she had already arranged a job - was permitted to attend a dance with her boy-friend. The Matron hired a night nurse to look after her child until 2 am. The Matron asked the committee whether such an arrangement should be permitted in future. One mother who was admitted, and hoped to marry the father of her child, had several meetings with a clergyman who was advising the family. The marriage took place shortly after she left the home with her baby.

A growing number of women were marrying the father of their child after the birth. Others were co-habiting with their boy-friends, but there were several instances where the relationship proved difficult. One mother, who gave birth and returned to Denny House with her child, had 'a row with the father of the baby' some days later. She discharged herself 'against the advice of her social worker who was called in'. This woman was given a room in a mother and baby flat. A pregnant woman who was described as 'undernourished, tired and frightened', had bruises and cigarette burns on her body - inflicted by her boyfriend. She had to be protected against further assaults. Denny House changed her ante-natal clinics to a different hospital because he used to wait for her at her original hospital. A mother and her child were admitted to Denny House because her relationship with the father of her child was 'unsatisfactory because he was jealous of the baby' and he occasionally beat the mother. As she was fearful of meeting him it was
arranged to transfer mother and baby to Bessborough. In 1982 Denny House arranged for a marriage counsellor to give a four-week course to the mothers.

**Mental Health and Special Needs**

23.78 The institutional records from the 1950s contain much greater detail about the women than the records of the larger mother and baby homes and they provide some insights into the mental health of the mothers. Although there is a lack of comparable records for other homes, it would be unrealistic to presume that Denny mothers were atypical in this respect. In 1956 one mother, who gave birth in the Rotunda, refused to see her child. The Matron noted that ‘there were many discussions with the hospital and our case committee met also. The Rotunda psychiatrist examined her and said that her mental condition was such that she should not see the baby and that it would be suitable for adoption’. The home determined that she should not be readmitted on her discharge from the Rotunda; the woman’s mother collected her from the hospital and brought her home. A mother who had ‘an attack of hysteria’ and ‘behaved abnormally for 4 days’ was seen by the Rotunda hospital psychiatrist who diagnosed ‘a mild attack of post-puerperal mania’. He arranged for her to be admitted to St Patrick’s psychiatric hospital. In 1959 the medical officer to the home stated that the mental health of one woman ‘presented us with an insoluble problem’. This woman had several violent outbursts and one occasion she broke a window. In 1956 the case committee reported that a mother was troublesome’, she slapped her baby, who was described as ‘nervous’. They suggested that she should be seen by the doctor ‘in company with other girls, so as not to draw attention to her mental state’. Although the doctor did not recommend that she should be seen by a psychiatrist, she was later admitted to a psychiatric hospital. Another woman, who was reported to have experienced, ‘several attacks of violent hysterics’ was sent to a psychiatric hospital where she was visited by her father. Her case notes stated that there it was possible that she would take up employment when she left the hospital; the home was seeking a ‘solution’ that would ‘safeguard’ her son, and give the mother ‘a chance’.

23.79 There are many references in the institutional records to women who were depressed. One woman took a drug overdose in 1976. A mother who was described as ‘very restless…went on hunger strike and behaved very strangely’. Arrangements were made for her admission to a psychiatric hospital, and the Matron watched her during the night before her admission. 'Next morning docile at
first but when 3 nurses from St Brendan’s arrived she refused to go. We telephoned for social workers, she jumped out the window. Finally went'. In 1971 a mother who was described as ‘depressed after birth, now better’; was seen by a psychiatrist. This was not the woman’s first child. The file noted that she ‘Had breakdown after parting with first child. Was looking after children’. Another woman who had been discharged from the maternity hospital was described as ‘depressed for 3 days, threatened suicide. Nurse came next evening and took her home’. In 1970 one woman was reported to have been ‘emotionally disturbed for over a week before she left, partly due to a delay in the adoption of the baby’; however, she left the home ‘quite calm’ and her mother had sent ‘a good report’. In the late 1970s another mother, who was awaiting a vacancy in a nursery for her child, who was to be adopted, ‘became depressed after 3 weeks when no definite arrangements could be made on account of shortage of cots in [a children’s home]. She became angry and difficult’. Matron arranged for this mother to be seen by a gynaecologist, and having spoken to her, he arranged for her to be sedated. The home hired a night nurse to care for her baby. It was reported that ‘she behaved normally when she knew her baby would probably be moved the following week’. This mother returned to her home. Another mother was re-admitted to hospital for medical care because she made herself ill after discharge from hospital as she decided she wanted her baby after the baby was placed in a children’s home to await adoption’. This woman’s parents agreed that she could bring the baby home; the baby remained in Denny until the mother was discharged from hospital and collected her baby. She was described as ‘happy and well on discharge’.

23.80 The original charter for the Magdalen Asylum precluded the admission of women with special needs, but that policy appears to have eased by the 1950s, perhaps because there were few women in the home. One such woman was described as ‘a problem’. Arrangements were made for her to be seen by the Rotunda psychiatrist, accompanied by her mother; the case committee described her baby as ‘unadoptable’, though no details were given. The Matron emphasised that this woman is not to go out alone as she is entirely irresponsible in her conversation. We manage to keep her occupied with small jobs and that is the best we can do. The other members of the staff and I feel that mental defectives are not

24 Grangegorman Mental Hospital.
suitable companions in a small Home such as this and hope that in future we need not admit such girls or if admitted keep them when their presence endangers the smooth running of the Home.

23.81 In the late 1960s the home accommodated a teenager who was described as a ‘mongol’; she was accompanied by her mother who cared for her daughter. Arrangements were made for mother and daughter to eat together, apart from the other residents; her baby was born in the Rotunda. In the same year they admitted a much older woman, who was described as having the ‘intelligence of 15 year old’. She ‘settled in remarkably well to the life of the Home and is very co-operative with staff and girls, she can work well at times but only at her own pace and time’. The case committee recommended that this woman should be seen by a psychiatrist; ‘her people’ claimed that ‘she is not co-operative at her home’. In 1973 they accepted a woman who was pregnant for the third time; she was referred by the Church of Ireland moral welfare committee. This woman, in her 30s, was brought to the home by her mother, who hoped that she would remain as long as possible. She was described as a low IQ - she could read a letter but not write a letter and she had worked in Bethany for several years. She was reported to have settled into the home. They also admitted a pregnant mother of two who was separated from her husband; the child was not her husband’s. She had arrived from a psychiatric hospital and was ‘helpful in the Home and has not caused any anxiety up to this’. A woman admitted some years later was ‘a retarded girl but not a mongol’. She was described as ‘good tempered, well behaved but childish and has very little idea that she is going to have a baby’. This woman had been in institutional care since she was four or five years old. ‘She can read and write a little, she cannot carry a conversation but can say short sentences, she enjoys company and does not like to be left on her own at all. She can wash and dress herself and do little household duties. She has settled in well with us and seems quite happy’. There is no indication whether the pregnancies of these women with intellectual disabilities had been reported to the Gardaí.

Post 1980 Admissions

23.82 Many of the women who were admitted in the later years appear to have been experiencing a variety of personal difficulties. In 1981 Denny placed an advertisement seeking a ‘responsible person … to assist in the running of a small home for single mothers, with their babies, ability to handle young mothers under
stress and small babies essential’. In 1982 the committee recorded that all the women were in good physical health but ‘most of the girls have emotional problems’. Some women left abruptly, and some returned later. One woman had ‘seemed contented to be back in the Home but then towards the end of this week became determined to return to […] and we allowed her to go away for the weekend’, but she did not return. Her boy-friend contacted Denny and indicated that she would probably return because the people that she was staying with ‘will not keep her any longer’. She was described as ‘a very trying girl, has no money, is a very heavy smoker, could get some Home Assistance each week but would not get up in the morning to collect it. If she returns to the Home I would certainly like some help with her…will be a very bad influence on any girl coming to the Home’.

23.83 An older single mother was referred with her baby by the social worker in the Rotunda; she asked Denny House staff to determine whether she was capable of looking after her baby. This woman was described as having a ‘low IQ…very slow in every way but has improved since admission, she needs constant supervision’. A woman who was referred by Cherish, and was described as a ‘special case’, was ‘rather difficult after admission, defiant in manner if corrected for smoking upstairs, and dissatisfied with the food, particularly the evening meal. She bought extra food and cooked it for herself but she has eased off that now and has improved in manner. She is out most of the day, her baby is due soon’. Another mother was admitted with her six-week old baby because her social worker wanted to determine whether she was capable of looking after the infant. This woman was described as ‘very disturbed’. After she had spent four weeks in Denny the staff and the ladies committee decided that they could be of little help. At this point the social worker began to plan to place her child with a foster family with a view to adoption, however the mother, having agreed to this arrangement ‘on the surface’, made accusations in the public health clinic that Denny was trying to take her baby away. Another mother, who was admitted with her two-week old baby was described as of slow mentality and not capable of looking after her baby. She needed constant supervision - which we could cope with during the day owing to so few girls in the house - but at night […] failed to wake up to feed her baby and

---

26 Home assistance had been replaced by Supplementary Welfare Allowance in 1977 but the name continued to be used – see Chapter 1.
continuously took her baby into her own bed although she had been told not to.

Denny told her social worker that they could not be responsible for the baby’s safety because they did not have night staff, so this mother was transferred to Pelletstown. A woman was ‘found to have hit her baby and she became very sullen and uncooperative’. A psychiatrist determined that her baby should be removed temporarily to a children’s home, and it was reported that the mother ‘improved for a while, and become more co-operative’. When she was permitted to reclaim her baby, a decision that was thought to be ‘best for both’ she left and appears to have returned home. Her baby was adopted. One woman, who was described as ‘slightly retarded’ was initially admitted for two weeks, but it was decided to extend her stay ‘as the staff feel she is unable to cope’. The records relating to another mother state that ‘it is combined opinion of nursing staff that she is far too immature and not fully aware of the responsibility entailed in looking after her baby. Case is to be discussed with psychologist and Social Worker’.

23.84 A social worker from the west of Ireland requested that a mother and baby should be admitted with a view to assessing the mother’s mental state and capacity to cope with her child. This woman was described as ‘mildly mentally handicapped’. However, while in Denny House her behaviour became very disturbed; a staff member from Denny House had to collect her from a Dublin hospital, where she had gone with her baby. She was transferred to a psychiatric hospital; the Western Health Board agreed to pay the cost of an agency nurse in Denny to look after her child, pending a placement with foster parents.

23.85 When Gardaí or social workers came into contact with vulnerable women, who were pregnant and were members of a Protestant church, they often sent the women to Denny House. In one case where a pregnant woman had run away from her home in Northern Ireland, the Matron determined that she was ‘a very complicated case as she was of very low IQ and needed more care than we could offer’. A woman, who was for a time the only mother resident with her baby was described as ‘a girl who needs a lot of help and understanding’, disappeared for several days, leaving her baby in the home. She returned and discharged herself and her child, despite being advised not to do so. This woman had planned to place her child in a children’s home, presumably prior to adoption, but had changed her mind.
23.86 In 1982 it was noted that of the ten girls admitted only three presented major problems. One mother was admitted with her baby because ‘she had encountered problems at home’. Her emotional state was described as ‘bizarre’ and she failed to settle in Denny; mother and baby returned home within a day. A second mother, who was admitted with her son, ‘had a long history of mental disturbances. Her behaviour was quite psychotic and bizarre’. Denny House tried to have this woman admitted for psychiatric treatment but the hospital could not care for her child, who remained for a brief period in Denny House before being sent to temporary foster parents. When the mother was discharged from hospital, the social worker asked Denny House to readmit her and her child but ‘from personal observations we declined because of the long-term history of illness and the very poor supportive behaviour of [her] family and baby’s father’.

23.87 A number of women remained in Denny House for only a very brief time and some, who were brought there by a social worker, refused to stay. One mother was described as ‘very emotionally upset and no amount of care by the staff drew any response’. She was ‘adamant about not staying in Denny House’. When her infant had to be readmitted to hospital, she discharged herself and ‘went back to PF’. Another mother who appears to have been emotionally disturbed ‘became aggressive when the staff spoke to her about the care of the baby and decided to take her own discharge’. She had been away from the home for the day, having not made any arrangements for the care of her baby. Another woman, who was admitted with her child for short-term care because she was unable to cope, stayed in Denny while undergoing some form of therapy. Mother and baby then went to live in the putative father’s flat. Another mother, who had been receiving psychiatric treatment since her early teens, was sent to Denny with her child in order to see whether she could cope with the baby. She became ‘very disturbed’ and was admitted to a psychiatric hospital; her baby went to a children’s home.

23.88 In 1984 the Denny social worker, who was an unpaid volunteer, refuted claims by the Department of Health that the home was overstaffed: ‘the type of girls we have are largely problem girls be it, homeless, mentally retarded, on drugs, drink and some in trouble with the law - not to mention the social problems of being unmarried. For that reason the Home needed to have experienced staff on hand at all times’. Turnover could be ‘very frequent as housing or parents permitted the girls to leave’. She attached a list of recent admissions; the women were referred by maternity hospitals, a probation officer, Ally, the Eastern Health Board, a
psychiatrist, the Protestant Adoption Society, CPRSI and Cherish. The Department of Health recommended that responsibility for Denny House should be transferred to the community care section of the Eastern Health Board, and that happened in 1985. By the mid-1980s there are references to heroin addiction; one mother, who was in Denny House with her child and was being treated at the Jervis St Drug Centre, disappeared and had to be traced by her social worker. Two mothers underwent treatment for alcohol addiction. One woman who had been admitted was discovered to be HIV positive so protective gloves and gowns were ordered.

23.89 A set of house rules drafted in 1981 stated that ‘Each mother takes full responsibility for her baby with the help and supervision of the staff. Mothers are expected to play their part in the day to day running of the house’. Visitors were welcome in the afternoon and evening. Mothers would continue to meet their social worker, if possible, while in Denny House; if that was not possible the Denny House social worker would fill that role. They recommended that each mother and her social worker should visit the home before booking a place. Breakfast was at 8.30; lunch at 1 pm and tea at 4.30. Visiting hours were 2-4.30 and 6.30 to 9. Alcohol was forbidden; a mother was required to take her baby if she was going out unless she had made an arrangement with the staff or another mother. Women were required to be back by 8.30 pm unless given permission. Disposable nappies27 were not permitted and babies were not to be in ‘other rooms’. Women had to supply their own washing powder and soap. Smoking was forbidden in the kitchen, dining room and upstairs.

23.90 Many mothers and children who were in Denny House in the 1980s were awaiting long-term accommodation. Housing remained a major difficulty, perhaps the major challenge for mothers who wished to keep their child. Other women were in Denny House because of difficult relationships with their family. In February 1984 three of the four mothers with children who were admitted were homeless; all were referred by social workers. When one mother was discharged from the home and her baby went to foster parents, Denny House ‘managed to secure temporary accommodation…at the Magdalen Convent, Donnybrook, as the mother refused to have her home’. In another case the records state that ‘there was a lot of family conflict as a result of her intention to keep the baby’. A volunteer with Denny

---

27 Cloth nappies were probably used much more widely than disposable nappies at this time.
House ‘spent the entire afternoon of that day trying to restore harmony between girl’s mother and her boyfriend with good result. The girl and child were discharged home (rented accommodation)’. One mother and child who spent three months in Denny House in the mid-1980s had been discharged from hospital to her parents’ house. Because of disagreements with her family she was admitted to Denny House. The staff reported that she needed constant supervision in caring for her baby, and had a poor standard of hygiene. Mother and child moved into a flat in Ballymun. A pregnant teenager was admitted because of family problems particularly with her step-father. Another young pregnant woman was admitted because there was ‘great tension in the home, her father does not speak to her. The siblings want her to place baby for adoption. She is very “anti” family at present’. The mother of another young pregnant woman was aware of her pregnancy and was supportive; however this young woman could not remain at home because her father would discover that she was pregnant. Another pregnant woman came to Denny because she was frightened. Her father had threatened, ‘to kick the baby out of her’ and had refused her permission to eat in the family home. Another mother arrived with her baby following a row with her mother; she was now homeless. She was not in contact with the baby’s father, who was an alcoholic.

23.91 Denny introduced family counselling talks and discussions but they claimed that this received ‘a mixed reaction - most felt it beneficial but were rather disappointed as regards the fact that they were collectively asked to discuss their own problems to each other, this they resented’.

The Children

23.92 The institutional records analysed by the Commission show that a total of 1,294 living children were associated with Denny House. Of these, 1,134 were born in or admitted to Denny House. An additional 139 children were not associated with Denny House - their mother left the home before giving birth, or did not return after the birth. The discrepancy between the 1,134 who were admitted and the 1,294 living children relates to children whose mothers, having given birth in hospital, returned having arranged for their child to be adopted, or placed in an institution. There is no information available regarding the discharge date or possibly the death in the institution of 101 children.
A total of 1,134 children were admitted to the Magdalen Asylum/Denny House. There is no date of admission for 25 children.

The peak in admissions of children was in the 1980s; in earlier decades the number of children admitted in any year never exceeded 20. The length of stay was highest in the 1920s, it fell steadily from the 1940s, and by 1960 it was under 50 days. A total of 55 children, who were associated with Denny House, died. This includes children who died in the home, children who were admitted to the home and died elsewhere and children who were never in the home but whose mothers were resident before the birth; 13 children died in the 1920s, 24 in the 1930s, 16 in the 1940s and two in the 1950s. The last death of an infant associated with Denny House was in 1959. Thirty-four of these infants are buried in Mount Jerome cemetery. The burial place of the others is not known; they may have been buried by their family or in a plot owned by the hospital where they died.

The infant mortality rate was substantially lower than in other mother and baby homes. However, the trends are broadly similar to the other homes. Mortality peaked in the 1940s and fell sharply around the end of that decade. Children who were under 28 days old accounted for 46.3% of the deaths; 48.1% were aged between 29 days and a year, and the remaining children were over one year when they died. Just under one-third died in the home; 35 died in hospital, one died at a private address and one died in Bethany.

The question arises as to why the infant mortality rate in this home was much lower than in other homes. The small size was undoubtedly a factor; babies had much less exposure to infection than in larger homes and, in contrast to the other homes, there is no evidence that it was ever over-crowded. Mothers were screened before admission for infectious diseases, which would have prevented the entry of women suffering from venereal disease which contributed to infant mortality. The home did not admit older children who might transmit infectious diseases to infants. The apparently high rate of breastfeeding would have been a significant factor in reducing infant mortality in the 1920s-40s. Although the detailed records are available only from the 1940s, these suggest that doctors - a general practitioner, paediatrician, obstetrician and psychiatrist - were regularly called into this home, and several served as governor or in another capacity.
Chapter 23 Denny House

Exit Pathways

23.97 The exit pathways changed very significantly during the years examined by the Commission. In the 1920s, 73% of children whose exit pathway is known were nursed out, as were 30% in the 1930s - a decade for which no information is available about the outcomes of half of the children. In the 1940s, 76% of children were nursed out, and informal adoptions, which were not common in the earlier decades, accounted for 12% of known outcomes. The introduction of legal adoption in 1953 brought a major change in the outcomes for children, most significantly a major decline in the number placed at nurse. In the 1950s (and adoption began only in 1953), 51% of children were placed for adoption. This rose to 62% in the 1960s. The data for the 1970s show that just under a quarter (23.9%) left with a family member, which included their mother; 14% were placed for adoption but almost 62% went to ‘other institutions’ - it is highly likely that many of these children were subsequently adopted. The 1980s marks another major change - this was the decade when the renamed Denny House opened its doors to Catholic mothers and the number of resident women and children increased significantly. In the 1980s, 58% of children either left with their mother or they were taken by another family member, and the figure for the 1990s was almost similar.

Placed at Nurse

23.98 As was noted in the introduction, from the early 1920s the Magdalen Asylum worked closely with the Protestant Nursery Society. The annual report of the Protestant Nursery Society for 1922/23 stated that this was ‘the first year of our new arrangement’. The society placed children born to mothers who were in the Magdalen Asylum in Protestant foster homes. In 1932/33 the society placed 15 children; they placed 17 in 1941/42, the largest number of any year.

23.99 Foster parents recruited by the Protestant Nursery Society received £1 14s 8d a month, a sum that remained unchanged until the 1940s; foster parents recruited by Bethany received £1 10s. The society sought foster mothers in the counties close to Dublin, in order that members of the committee could visit the foster homes as could the mothers, many of whom were in service around the city. Many foster mothers were recruited through the Mothers Union, and chapters of this charity raised money to support this society. However, it proved difficult to secure sufficient Protestant foster homes and by 1938 the society was placing infants with Catholic foster parents. They emphasised that this was a temporary arrangement and no child would be left in a Catholic foster home after his/her third birthday. In
common with local authorities and charities that placed children in foster homes, the Nursery Rescue Society found it increasingly difficult to find foster homes during the war years, because of shortages of food and rising prices. In 1939/40 they reported that the war had reduced the incomes of people who made a regular subscription to the society and several mothers had lost their ‘situations’ or were forced to accept lower wages which meant that were unable to maintain their contributions to their child's upkeep. The annual report for 1943/44 stated that the increasing number of foster children and the rising cost of food and clothing was causing ‘great anxiety’. The peak in the number of children placed in foster homes by the Nursery Rescue Society was in 1942/3 when they had 73 children on their register, compared to 41 in 1922/23. The numbers remained high throughout the 1940s; there were 72 children at nurse in 1948/49; this fell to 46 in 1951/2, and the reduction accelerated following the introduction of legal adoption. In 1957/58 it was reported that, for the first time, no infants were transferred by the Magdalen Society. A number of the older children were sent to Protestant boarding schools. In 1951/2 the society noted that ‘Placing children in country foster homes has the additional value of increasing the child population in districts where the Protestant schools have difficulty in keeping up their numbers’. Some boys were sent to the cathedral school in Tuam where they were trained as choristers. The cost of their education was assisted by a grant from the Galway Protestant Orphan Society.

23.100 Mothers were expected to contribute towards the cost of foster care for their child, and the society also received funding from the DLGPH under the Maternity and Child Welfare Grants scheme. The annual report for 1923/4 stated that four of the 38 children under the care of the society were entirely supported by their mother; two by Barnardo’s, one partly by the mother and partly by Barnardo’s, three were wholly supported by the society, and the remaining 28 children were partly supported by the mother or her relatives. In 1927 two mothers who had married in England, not to the fathers of their children, were sending money every month towards the cost of their foster home. When mothers travelled from England to visit their children, the society exempted them from contributing for that month, although one mother ‘refused this option’. Requiring the mother to support her child and continuing to promote maternal love were seen as contributing to the mother’s rehabilitation. Mothers were encouraged to visit their children ‘when possible…from time to time, so that they are not allowed to lose their mother-love and sense of responsibility, but a dangerously close influence is avoided which might cause difficulty as the child grows older’.
23.101 In 1924-25, total receipts of the Protestant Nursery Society amounted to £649; the largest single item, £262, was 'payments by mothers on behalf of children', followed by £193 from the DLGPH. The report for the year 1922/23 noted that 'Most of the girls are paying their share towards the support of the children honourably and punctually'; however, two had disappeared. These two mothers were described as 'both girls of a low, of what may be called the workhouse class, and had always given us much anxiety'. By 1940 the society had 'a growing number of deserted children on our hands. The time is long gone by when these girls can be expected to have much sentimental feeling towards their children, and it is with increasing difficulty that we are able to get regular payments from the mothers'. In the earlier decades a mother's contribution was determined by her earnings; however, in 1950/51 payments by all mothers were set at 25s a month, on the grounds that 'all girls leaving the Asylum can now command good wages'.

23.102 The society did not approve of unmarried mothers raising their children. The report for 1929/30 emphasised that

The care of her child is one of the most important levers in the reformation of the mother, the love and regard for it acting as a deterrent should temptation assail her. At the same time, it seems a very doubtful desirable arrangement that she should retain the charge of it personally, especially if a girl. As the child grows up, and learns something of life, it is inevitable that either a very painful situation must arise, or the daughter must think lightly of her mother's lapse, and therefore be herself more open to temptation.

23.103 They were much more enthusiastic about mothers who reclaimed their child at a later date, generally following her marriage. The report for 1952/3 stated that 'over the past eight years 16 mothers have eventually taken the children themselves'.

23.104 Two of Ireland's leading female paediatricians, Drs Ella Webb and Dorothy Stopford-Price were honorary physicians to the Nursery Rescue Society. The annual reports contain references to illness or occasional deaths among the children at nurse. In 1922/23, one child died from pneumonia. This was the only death among the 42 children aged from seven months up 'born under the unfavourable conditions which handicap our poor little ones, even before they enter a world where we try to provide them with the loving care which would otherwise be denied to the unwanted child'. In 1927/28, there were no deaths, although one case of pneumonia 'gave us some days of acute anxiety'. In 1929/30
however two young children died but ‘in neither case due to any neglect of the nurse. Both were taken to hospital and everything possible was done for them’. A girl who died of measles in the early 1930s was described as ‘a mentally deficient as well as delicate, and her death can hardly be regretted’. Another infant suffered from acute pneumonia that year but survived. There were epidemics of measles and whooping cough in several of the ‘cottage homes’ in 1934/35 but none of the 57 children died, though a number had been seriously ill. There were further outbreaks of infectious disease in the following year, but no deaths, and the report for 1938/39 expressed the hope that an epidemic of whooping cough is ‘nearly over’; one ‘delicate baby’ was in St Ultan’s children’s hospital, and a boy was convalescing in the Sunshine Home. Two children died in 1939/40, ‘a little girl who was always delicate but who had been nursed through bronchial pneumonia and then measles, got whooping cough and bronchitis and passed away; a little boy died of pneumonia’. A boy died of meningitis in 1947/48. The last death of a child recorded was in the early 1960s when a five-year old boy, who was described as ‘always delicate’ died in hospital of broncho-pneumonia; the report noted that the last death had occurred seventeen years earlier.

Adoptions

23.105 There are references to ‘adoption’ in annual reports of the Nursery Rescue Society from the early 1920s; in 1922/23, for example, it reported that two children had been ‘happily adopted; and we have received very pleasant accounts of 3 who were so taken in former years; but as a rule the adopting parents prefer to drop all links with the child’s past’. In the following year the society had received a number of offers to adopt children, which were being explored. They expressed the hope that ‘we may look to this outlet to keep our numbers within bounds and to prevent a cloud of discouraging difficulty settling on our future’. Adopting parents signed an agreement. The adoption form in 1923 was as follows:

We [adopting couple] of [address] do hereby adopt [name] to be our son, undertaking to feed, clothe and educate him as our own, and to bring him up in the faith of the Church of Ireland.

23.106 The early ‘adoption’ forms were handwritten, later forms were typed. These were signed, witnessed and dated. The mothers signed a form surrendering the child. One adoption in the 1940s stipulated that the ‘adoption’ would take place ‘on the understanding’ that the child’s mother, ‘while surrendering all claim to her may by arrangement with us visit her from time to time as her Godmother’.
These early ‘adoptions’ in the 1930s and 1940s were informal adoptions if they were in Ireland but many of them were legal adoptions in Northern Ireland, and occasionally in Britain. At least one request seeking children to adopt came from the Church of Ireland Moral Welfare Society in Northern Ireland. It would appear that children being adopted in Northern Ireland were escorted there by women members of the Salvation Army. In 1948/9 the society sent a child to the United States by plane for legal adoption. The report for the following year stated that ‘During this year the rage for adoptions has reached an unbelievable peak, not only here and in the rest of the British Isles but also in America’. The society was ‘inundated with demands for adoptions’; they decided not to engage in any ‘distant adoption’ without personal recommendations. The report for 1951/52 noted that ten children were adopted during the previous year, three to the United States, one to Australia and six to Ireland.

Following the passing of the Adoption Act 1952 the society referred all applications for adoption to the Protestant Adoption Society. The report for 1953/4 stated that a total of 29 ‘adoptions’ which took place before the passing of the Adoption Act had been legalised - including some that took place 15 or 20 years earlier. These involved contacting the mothers to secure a sworn statement of consent. They noted that this required ‘a very tactful approach to mothers, who may have married and whose husbands might not have been aware of the child’s existence’. They secured the mother’s consent in all but two cases.

The introduction of legal adoption changed the work of the society. The number of children placed in foster homes fell sharply. Children who were awaiting adoption were generally transferred to a children’s home. The society expressed its thanks to the Children’s Fold ‘for kindly keeping several babies for us until an improvement in their health makes them suitable for adoption’. The children who remained in the long-term care of the society tended to be children with special needs, or children whose family histories were deemed to make them unsuitable for adoption. The report for 1957/58 stated that ‘Except for the children whose mothers do not wish to part with them, it is all too clear that, in future our work will be more and more with the backward child, as all others with normal intelligence and good backgrounds will surely be adopted’. The society welcomed the opening of Sunbeam House in Bray which provided a school for ‘mentally backward children’. In the 1950s, foster children who needed medical care in Dublin, but did not necessarily require hospitalisation, stayed in the Magdalen Asylum. By the late
1960s a number of mothers were placing their children in foster care while they decided whether to keep the child or place her/him for adoption and there are a growing number of reports of babies who were being raised by their grandparents.

23.110 The Commission has not seen any evidence about the closure of Denny House or when or why that decision was taken. The last available annual report of the Protestant Nursery Society is for the year 1978.
Chapter 23 A: Denny House: Statistical analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.
Admissions

From the institutional records, the Commission identified 1,416 women who were admitted to Denny House in the years 1921 to 1994.

Information relating to date of admission was available for 1,412 women (99.7% of admissions). The busiest period was in the years 1981 to 1993; one in three of all admissions to the home were recorded in that period and peaked in 1984 when 53 women were admitted. Increased admissions in this period resulted from the decision to admit Catholic women. In the 60 years spanning 1921-80, 16 women on average were admitted annually; admissions were above 20 on 11 occasions during this period and peaked in 1972 when 27 women were admitted.
Analysis by decade shows that more women (24.8%) were admitted in the 1980s than any other decade followed by the 1930s (13.2%); 1960s (12.5%); 1940s (11.6%); 1970s (10.9%); 1990s (10.4%); 1950s (8.9%) and the 1920s (7.7%).

**Age on admission**

Information relating to age on admission was available for 1,398 women (98.7% of admissions).

The institutional records show that the age on admission ranged from 13 to 44 years. Most women (78.8%) were between 18 and 29 years; 12.8% were 17 years and younger and 8.4% were 30 years and older. Just over 6% were between 13 and 16 years on admission.

Mode of age on admission from the 1920s to the 1940s was 20 years, this increased to 21 in the 1950s and reduced to 18 years in the 1960s. The mode of age on admission remained at 19 years in the 1980s and 1990s.
Previous pregnancy

Information relating to previous pregnancy was available for 1,215 women (85.8% of admissions). The institutional records show that most women (91.2%) were admitted on their first pregnancy; 6.2% on their second pregnancy and 2.6% on a third or subsequent pregnancy.

Outcome

The institutional records show that almost 62% of expectant women admitted to Denny House stayed and gave birth. Of those, 98.4% delivered living infants; 1.5% delivered stillborn infants and 0.1% experienced a miscarriage. 25.7% of women were admitted in the first instance accompanied by their baby and 12.4% left Denny House before the birth and did not return. A total of 869 women were admitted before giving birth and stayed until after the birth. Twenty per cent of these women gave birth in Denny House; 38% gave birth in the Rotunda; 25% in Holles Street and 15% in the Coombe. Only two babies were born in Leeson Street.

Marital status

Information on marital status was available for 1,410 women (99.6% of admissions). The institutional records show that the vast majority of women (99%) were single and the remaining 1% of women were either married, separated or widowed.
Information relating to occupation was available for 950 women (67% of admissions). The available records show that most women (39.8%) were recorded as domestic servants or other unskilled worker; 22.8% as teacher/civil servant/nurse/clerk or other skilled worker; 21.9% were recorded as being unemployed or in receipt of government assistance; 8.5% were recorded as working in the family home or on the family farm and 7% were recorded as being in full time education. Most full time students were in second and third level; one was recorded as a primary school student.

The proportion of women in each occupation category altered over the timeframe of the home’s operation. For instance, women recorded as being unemployed accounted for 3% of admissions in the 1920s and 75% in the 1990s. Women recorded as civil servants/skilled worker accounted for 15.2% of admissions in the 1920s; 46.3% in the 1960s and 6.1% in the 1990s. Women recorded as being in full time education accounted for 6.1% of admissions in the 1920s; 9.7% in the 1970s; 11.4% in the 1980s and 6.1% in the 1990s. Women recorded as a domestic servant/unskilled worker accounted for 72.7% of admissions in the 1920s; 62.1% in the 1950s and 12.9% in the 1990s. Women recorded as working in the family home or on the family farm accounted for 3% of admissions in the 1920s; 34.9% in the 1940s and 0.9% in the 1980s.
Information relating to previous address by county was available for 1,365 women (96.4% of admissions).

The institutional records show that most women (29%) gave Dublin as a previous address followed by Cavan (6.4%); Wicklow (4.5%); Cork (4.2%); Donegal and Tipperary (4%); Wexford (3.8%); Carlow (3.5%); Monaghan (3%); Laois (2.9%); Westmeath (2.7%); Offaly and Kildare (2.4%); Kilkenny and Meath (2.3%); Sligo and Antrim (2.2%). The remaining 18% of admission combined gave one of the remaining 15 counties as a previous address.
Information relating to occupancy was available for 1,394 women (98.4% of admissions). The institutional records show that average occupancy in Denny House from the 1920s to the 1940s was ten women; from the 1950s to the 1990s around five women were living in the home at any one time.
Information relating to referral pathways to Denny House was available for 1,008 women (71.2% of admissions).

The institutional records show that the most frequent referral pathway (35.7%) was by a reverend, dean or canon; 15.9% were referred by Church of Ireland voluntary organisations as well as Cherish, ALLY and Barnardo’s; almost 15% were referred by a local authority board of assistance; 14.3% by a social worker; 7.5% by Church of Ireland adoption societies - most notably the Church of Ireland Moral Welfare Society; 2.8% by hospital personnel; almost 2% were referred by staff in other institutions; 1.2% by family or friends and 0.6% self-referred. The remaining 5% of women were referred by named individuals. From the 1920 to the 1950s referral by a member of the religious was the most frequent referral pathway; from the 1960s, however, voluntary organisations, adoption societies and boards of assistance assumed more significant roles in this regard. The available information shows that most women entered Denny House directly from the family home, a private address or transferred from a maternity hospital.
Length of stay

Information relating to length of stay was available for 1,394 women (98.4% of mothers). The institutional records show that women admitted to Denny House in 1924 stayed there for 341 days on average; this had reduced to just 175 days for women admitted in 1935 and 1936. Although the average length of stay for women admitted in 1941 had increased to 277 days, a staggered decrease in the average length of stay is observable from then. For instance, women admitted in 1959 spent 86 days on average in the home; for women admitted in 1983 this had decreased to just 41 days.

In the 1920s, women were generally admitted approximately 59 days before giving birth. This increased to 76 days on average in the 1940s but decreased to 43 days on average by the 1980s.
In the 1920s, most women spent between six and 12 months in the home after giving birth; 34% had left within six months and 8% remained there for between 13 and 24 months. One woman was in the home for just over two years. In the 1930s, most women (52%) again stayed for between six and 12 months after giving birth. However, the proportion of women who left within six months had increased to 48% and no woman remained in the home for longer than a year. In the 1940s, over 75% of women remained in the home for between six and 12 months; the remaining 25% had left within six months. In the 1950s, the proportion of women who left within six months of giving birth increased to 82.4% - more than one fifth of whom had left within 50 days. The remaining 17.6% remained for between six and 11 months. In the 1960s, every woman left Denny within six months of giving birth; one in three had left within 50 days. In the 1970s, all but one woman left within six months of giving birth; almost 80% had left within 50 days. In the 1980s, almost 60% of women left within 50 days of giving birth and the remaining women left within six months. This pattern continued in the 1990s when 84.5% of women left within 50 days of giving birth and all remaining women had left within six months.

Information relating to exit pathways was available for 1,165 women (82.3% of admissions). The institutional records show that the majority of women (69.6%) were discharged from Denny to the family home or to another private address; almost 11% were discharged directly to employment; 9% transferred to one of the other institutions under the Commission’s remit; almost 6% transferred to hospital and 2% transferred to a hostel or other supported accommodation. Small numbers of women were admitted to other mother and baby homes (8); left in the care of a voluntary association (6); ‘absconded’ leaving their babies in Denny (6); left in the care of a social worker (4) or in the care of a nurse (1). One woman was transferred to a Magdalen laundry. There were no major deviations in exit pathways over the lifetime of the home’s operation.

**Maternal deaths**

The Commission identified four deaths among women associated with Denny House. Two occurred in the 1930s and two in the 1940s; all four deaths occurred in external hospitals. Cause of death was available for two women - their deaths were notified as being due to bronchopneumonia, and puerperal sepsis.
From the institutional records, the Commission identified 1,134 children who were born in or admitted to Denny House in the years 1920 and 1994. Information relating to date of admission was available for 1,109 children (97.8% of births/admissions). The busiest period was between 1981 and 1993; 30% of births/admissions were recorded in these years. From 1920 to 1980 an average of 13 births/admissions were recorded annually ranging from one in 1920 to 25 in 1972. More births/admissions (26.87%) were recorded in the 1980s than any other decade followed by the 1960s (14.43%); 1930s (13.8%); 1940s (12.17%); 1950s (10.19%); 1920s (9.29%); 1970s (8.48%) and the 1990s (4.78%).

The available information shows that over 99% of children were admitted to Denny House with their mothers; eight children were admitted unaccompanied and one child was admitted with its mother as an accompanying sibling.
Information relating to occupancy was available for 1,034 children (91.2% of births/admissions). Occupancy rates peaked in 1932; nine children on average were living in the home that year. This was the only occasion in Denny’s 74 year history when more than eight children on average were in the home at any one time; average occupancy over this entire period was just four children.

The available information shows that 86.6% of children were discharged either on the same day as their mother or before their mother was discharged; just 13.4% of children spent a period in Denny after their mother had been discharged. A comparison of average occupancy among mothers and children appears to confirm this. On just four occasions the average number of children in Denny exceeded the average number of mothers and it must be pointed out the most pronounced discrepancy related to 1955 when the average number of children exceeded the average number of mothers by two.
Exit pathways

Information relating to exit pathways was available for 949 children (83.7% of births/admissions). The institutional records show that the majority of children (29.8%) were either discharged with their mother or other family member; transferred to another institution (28.2%) or were legally adopted (23.5%). A further 16.1% were placed at nurse and 2.3% were informally adopted (pre 1953).

From the 1920s to the 1940s the most frequent exit pathway was ‘nursed out’ and accounted for 73% of exit pathways in the 1920s and almost 76% in the 1940s. Legal adoption was the primary exit pathways in the 1950s and 1960s and accounted for 51% and 62% respectively. In the 1980s and 1990s approximately 60% of children left Denny with their mother; around 30% of children transferred to other institutions and less than 10% were placed for adoption in this period.

The available records identified eight children who were placed for foreign adoption from Denny as follows: USA (3); Great Britain (3); Australia (1) and Canada (1).
Child deaths

From the institutional records, the Commission identified 55 child deaths associated with Denny House. This includes children who died in Denny House, children who were admitted to Denny but died elsewhere and children who were never admitted to Denny but whose mothers had been resident there prior to their birth. GRO death records were located for 47 children. The 1930s was the worst decade for child deaths in Denny; the peak was in 1936 when seven deaths were recorded. The majority of child deaths (35) occurred in external hospitals - mainly in the National Children’s Hospital - and 17 occurred in Denny House. One death occurred in a private address and one occurred in the Bethany home. Burial records were located for 34 children - all are interred in Mount Jerome cemetery.

Age on death
Information relating to age on death was available for all but one child. The available records show that 94.4% of deaths occurred in infants as follows: perinatal (0-7 days) 22.2%; neonatal (8-28 days) 24.1% and infant (29-365 days) 48.1%. The remaining children were aged between 12 and 16 months at the time of death.
Information relating to cause of death was available for 48 children (85.7% of child deaths). The available records show that the most frequently notified cause of death (35.4%) was non-specific - mainly congenital debility and weakness from birth; 16.6% of deaths were notified as gastroenteritis; 12.5% as respiratory infections - mainly pneumonia; 12.5% were notified as being due to a range of other, mainly one off, causes such as pertussis (whooping cough), jaundice and birth injury; 8.3% were notified as malabsorption - mainly marasmus; 6.2% as congenital heart disease and 4.1% as tuberculosis. Influenza and meningitis were notified in two cases.
Chapter 24: Dunboyne (Árd Mhuire)

Introduction
24.1 The Mother and Baby Home in Dunboyne Castle was opened in 1955 and closed in 1991. It was operated by the Good Shepherd Sisters. It was generally known simply as Dunboyne mother and baby home even though the Good Shepherd Sisters gave it the name Árd Mhuire. The first use of this name in the documentation is on 8 March 1956. Earlier (June 1955), it was recorded that an agreement had been reached between the Good Shepherd Sisters and Meath County Council to call it ‘Marianville’ but there is no further mention of this name.\(^1\) The institutional records analysed by the Commission show that a total of 3,156 mothers were resident there over the period.\(^2\) It was not intended that there would be any births in Dunboyne; in fact, eight are recorded as being born there (they were probably emergency births) but 1,148 of the children born to Dunboyne resident mothers spent some time in Dunboyne.

Origins
24.2 The decision to set up a mother and baby home in the north east seems to have been made around 1953. The impetus to establish it was provided by the 1951 *White Paper on the Reconstruction and Improvement of County Homes*.\(^3\) This restated the policy which had been in existence since the early 1920s (but not fully implemented\(^4\)) of not maintaining unmarried mothers and children in county homes. Among other things, it provided that the Minister for Health would invite local authorities to submit proposals about how they proposed to ‘deal with the classes no longer to be provided for in the County Home’.\(^5\) Significantly, it provided that grants would be available to local authorities for the provision of new homes for unmarried mothers and children and to ‘voluntary agencies willing to provide a portion of the cost of new homes for unmarried mothers and children’. These grants were to be:

---

\(^1\) The Good Shepherd Sisters had two mother and baby homes in Northern Ireland; Marianville was the name of one in Belfast; Marianvale was the name of the one in Newry.

\(^2\) As some institutional records were not available, this may be lower than the actual number - See Statistical Analysis.

\(^3\) [https://www.lenus.ie/handle/10147/574552](https://www.lenus.ie/handle/10147/574552)

\(^4\) The White Paper shows that there were 450 unmarried mothers and 829 children in County Homes on 31 March 1950.

\(^5\) It was proposed that the county homes would be used only for aged and infirm persons and the chronic sick; unmarried mothers and children, mental defectives, the blind, deaf and dumb would no longer be housed there but in specialist institutions.
by way of contribution to loan charges on moneys borrowed for the purpose of carrying out the works now recommended. The grant will be at the rate of 50 per cent of the loan charges, subject to the provision that the maximum capital outlay per bed in each institution on which such contribution will be paid will be £500.

24.3 In January 1952, the Department of Health issued a circular to each city and county manager and each public assistance authority (see Chapter 1) detailing how the White Paper was to be implemented. This stated: ‘The removal of children from the county homes is a fundamental part of the scheme of improvement.’ It then outlined suggestions for the improvement of the boarding out system. In relation to unmarried mothers, it noted that there were 450 unmarried mothers in county homes on 31 March 1950 and that a proportion of these were mothers of more than one child. ‘As there may be difficulty in securing accommodation for such mothers in existing homes it may be necessary to provide new accommodation for them.’ The minister suggested that public assistance authorities whose areas were contiguous should combine to provide such accommodation. It is notable that Dunboyne was the only new institution for unmarried mothers which was established under this provision.

24.4 The department’s circular was quite specific about the role of any such institution for unmarried mothers:

For the proper rehabilitation of the unmarried mothers it is essential that every effort be made to provide training designed to fit them for employment e.g. in private houses or in institutions. The Minister is aware that training is provided in some existing institutions, but he suggests that arrangements might be made with County Vocational Education Authorities to provide instruction for the unmarried mothers in the special homes, in such subjects as cookery, laundry work and domestic duties generally. In this way the unmarried mothers would acquire the knowledge and training which they would need for employment in district institutions or elsewhere.

It is suggested that unmarried mothers trained in domestic duties might be given the option of employment in a district institution, preferably elsewhere than in their home counties. They should receive the appropriate remuneration applicable to the office in which they are appointed. While so

6 Department of Health Circular 7/52.
employed they should be obliged to contribute towards the support of their children in the special homes.

24.5 It seems that six county councils - Cavan, Longford, Louth, Meath, Monaghan\(^7\) and Westmeath - got together to try to establish a mother and baby home in their area. The Commission has not seen any local authority documentation about how this initiative started but it is clear from documentation provided to the Commission by the Good Shepherd Sisters that Meath County Council took the lead. The relevant county councils were inspecting various properties in the area in 1953. Meath County Council told the Department of Health, in April 1954, that intensive efforts had been made to find a suitable premises but ‘...it would appear that most houses now available are too remote for this purpose as the Religious Orders generally are of the opinion that such Homes should be near transport facilities and relatively near towns or villages’. Dunboyne Castle was inspected in 1954. In early 1954, the Good Shepherd Sisters were approached by the county managers of the six counties concerned to discuss the possibility of establishing a mother and baby home in their area. (There seems to have been an informal approach at an earlier stage). The negotiations were conducted mainly by the chief officer in the health and assistance sections of Meath County Council who was based in Navan. He together with the Meath county manager and the Longford and Westmeath county manager inspected Dunboyne Castle with two representatives of the Good Shepherd Sisters in April 1954. The asking price was in ‘the region of £30,000’.

24.6 The actual asking price was £35,000. Negotiations with the vendors were conducted by the Meath county solicitor, who reported on the matter to the Good Shepherd Sisters; he was the county solicitor for Meath so, while he was acting on behalf of Meath County Council, he seems to have treated the Good Shepherd Sisters as his client.

24.7 In June 1954, the Meath county manager reported to the Good Shepherd Sisters that the councils had generally agreed the proposals in relation to Dunboyne Castle. Westmeath County Council’s deliberations on the issue had been reported in the *Irish Times*. This quoted the Westmeath county manager as saying that the cost would be £60,000 which included the cost of the building plus the necessary extension. A £25,000 grant would be available (presumably from the Department

---

\(^7\) Monaghan ceased to be involved in the project within the first year or so; the Commission has not seen any documents which explain this.
of Health) leaving the six councils to provide £35,000 between them. The Meath county manager, not surprisingly, regarded the publication of this information as unfortunate and pointed out to the Good Shepherd Sisters that departmental approval had not yet been granted and the purchase price had not been agreed.

24.8 Other locations were examined but Dunboyne was considered to be the only suitable option. The chief officer in the health and assistance sections of Meath County Council wrote to the Department of Health in October 1954 outlining the proposals of the six counties in relation to Dunboyne Castle. He pointed out that it was well served by public transport. The Good Shepherd Sisters had wanted a location which could be easily visited by relatives and from which the mothers could get out and about. He also noted that the Bishop of Meath had agreed in principle.

24.9 A draft agreement between Meath County Council and the Good Shepherd Sisters was drawn up. The agreement contains details of the proposed payment arrangements - how the payments would be decided but not the actual amounts. The payments were to be based on the previous year's expenditure. The draft contained a clear right of inspection by the various health authorities and the Department of Health. The agreement was not signed until 1959.

24.10 It would appear that Meath County Council bought Dunboyne Castle and the Good Shepherd Sisters took possession on 1 June 1955. It was blessed by the Bishop of Meath on the day.

24.11 On 11 October 1955, the first women and babies arrived. An internal history of Dunboyne Castle compiled by the Good Shepherd Sisters points out that this was the Feast of the Maternity of Our Lady. Four mothers and five children (all aged under nine months) are listed in the Department of Health inspector's report of August 1955 on the Trim county home as being due to be transferred to Dunboyne. In fact, only two of these children and their mothers transferred.

---

8 The Good Shepherd Sisters gave the Commission copies of ‘histories’ of Dunboyne whose authors are not named but clearly were members of the order. These contain interesting snippets of information but the dates of compilation are unclear and they cannot be regarded as totally reliable.

9 There were 6 unmarried mothers and 13 children resident in the Trim County Home in August 1955. The other two children resident with their mothers were older and arrangements had been made for adoption and boarding out. There had been 11 unmarried mothers and 33 children resident in the county home in April 1954.

10 It is not known what happened to the other three children.
Sources

Dunboyne institutional records

24.12 The records of admissions, departures, births and entry and exit pathways which were compiled in Dunboyne were handed over to the North Eastern Health Board when Dunboyne closed in 1991. They are now in the possession of the Child and Family Agency (Tusla). These records provide details of the women admitted to Dunboyne. The details are not exactly the same in all cases but, in general, the information that is available about the mother includes:

- Name, address, date of birth, date of admission, expected date of delivery, date of admission to maternity hospital, date of discharge from maternity hospital and date of discharge from Dunboyne;
- Name of next of kin, by whom recommended or referred;
- Some information on background, for example, level of education, relationship with parents, employment experience;
- In some cases, information about the putative father is included and names are given in 437 cases - 13.85% of the total admissions;
- Address to which discharged.

24.13 There is some very limited health information available about the women. The visiting GP and the maternity hospital held the health records of the pregnancy and birth.

24.14 Information about the baby includes name, date of birth, vaccinations (if any in Dunboyne), date and place of baptism, date of discharge and to whom discharged. In many cases, particularly in the later 1970s and 1980s, the babies did not go to Dunboyne but were discharged from the maternity hospital; in these cases, the destination of the baby is recorded if known.

Discovery from the Good Shepherd Sisters

24.15 The Good Shepherd Sisters provided extensive documentation to the Commission. This included information about:

- The setting up of the home, the involvement of the local authorities concerned;
- The involvement of the local authorities and the Department of Health in the running of the home;
• The arrangements for closing down including material on the assessment of the need for the service in the late 1980s;

• Financial arrangements: there is extensive financial information including audited accounts for nearly all the years of its operation. There are some cashbooks and some lists of cheques issued but these are only available for a small number of years. Much of the correspondence between the Good Shepherd Sisters and the health authorities concerned financial matters;

• Some documentation about referring girls and women to the institution and about individual local authorities taking responsibility for the payments involved;

• The names of the various Sisters and lay staff who were in the institution; the dates involved and who was responsible for what;

• Various internal Good Shepherd Sisters documentation such as Chapter Books, Annals of the Convent, Book of Benefactors and reports of council meetings. The Chapter Books were required to be kept in all of the Good Shepherd Sisters' locations. They contain the Acts of the Chapter, that is, the elections of the Superior General for the Mother House and, in local and provincial houses, the elections of the delegates and deputies to the Provincial and General Chapters. The books also list canonical visitations by the Superior General, the Visitor, the Provincial Superior or the Bishop and an account of such visitations. The Dunboyne Chapter Book provided to the Commission has entries from 1972. The entries are all handwritten but it is not clear if they were made contemporaneously; The ‘Book of Benefactors’ records donations received from 1969; these are mostly modest amounts, for example, a total of £240 was received in 1969. It is not possible to clearly identify the names of the donors. The reports from council meetings are from 1986 onwards; the discussions were mainly about maintenance issues;

• Various accounts of the history of the institution: the authors are clearly members of the Good Shepherd Order; some accounts are contemporaneous and some were written after the institution was closed.

Department of Health

24.16 The Department of Health provided a range of documentation. The main files used for this chapter were:
24.17 In spite of extensive enquiries and searches the Commission has been unable to find any records from these sources relevant to Dunboyne. These records should now be held by the HSE but it was unable to find any.

**Governance**

24.18 In October 1955, the Meath County Council official wrote to each district medical officer employed by the council telling them that:

- Dunboyne had been acquired as a regional home for unmarried mothers and their children, other than first confinements;
- First confinements were to be accommodated in Castlepollard as heretofore;
- Dunboyne was not a hospital and confinements would take place in maternity hospitals in Mullingar, Trim and Dublin;
- It was established primarily for the purpose of replacing the county home as a place for single mothers; single mothers were not to be sent to county homes in future;
- It was being administered by Meath County Council on behalf of the participating councils and was under the care of the Good Shepherd Sisters.

24.19 The county council was involved in arranging doctor’s services but not chaplaincy services. The Good Shepherd Sisters were told that they could order medical and other supplies required by the doctor and charge them under the capitation charge. The doctor’s services were to be supplied by the local doctor; his pay was a matter between him and the Good Shepherd Sisters.
24.20 The lease arrangements between the local authorities and the Good Shepherd Sisters gave the local authorities and the Department of Health the right to inspect the premises. This right seems to have been very rarely, if ever, exercised. Meath County Council officials frequently visited, especially in the 1950s, but the visits do not seem to have involved any element of inspection. They seem to have been mainly concerned with maintenance of the premises and possible further development. There was also a social element to the visits, for example, the Meath county manager and the chief officer in the health and assistance sections of Meath County Council visited on Christmas Day 1955. The Commission has not seen any evidence that the other county councils involved took an active part in decisions about Dunboyne - the practical arrangements seem to have all been dealt with by Meath County Council officials.

24.21 Meath County Council was very involved in the practical arrangements - there are letters between the council and the Good Shepherd Sisters about a wide range of practical issues, for example, the felling of trees, buying lawnmowers, rates of pay for the gardener, buying a new tumbler (dryer) and the cost of transport to maternity hospitals.\(^{11}\)

24.22 The county council also seems to have been involved in adoption arrangements. In 1958, the head of the public assistance section spoke to the authorities in St Clare’s, Stamullen (see Chapter 2) about adoptions direct from Dunboyne. The county council as the public assistance authority was entitled to place children for adoption in Ireland but not for adoption abroad - see Chapter 32.

24.23 Dunboyne was not registered under the Registration of Maternity Homes Act 1934 until 1982. Meath County Council, and subsequently the North Eastern Health Board, should have ensured that it was registered. Initially, it may have been assumed, wrongly, that registration was not needed because there were no births in Dunboyne. However, in 1963, there is evidence that Meath County Council officials thought that the babies were generally born in Dunboyne. This arose when the Department of Health received the annual statistical return from Dunboyne and noted that there were no births there. The department contacted Meath County Council and was told that there was normally 'no break in the period for which they pay for patients in the institution except on an odd occasion when a

\(^{11}\) The bills for transport were to be sent directly to the local authority involved.
patient might be sent to Holles Street. The Meath official presumed from that that the children were born in the institution. The department official noted that Dunboyne was not registered under the Act but neither the department official nor the Meath official seems to have done anything about this. Inspections under this Act were carried out regularly by the Department of Health. The fact that it was not registered probably contributed to that department’s general lack of awareness or knowledge of the institution.

24.24 Apart from the annual consideration of the capitation rate and other financial matters, the Department of Health seems to have had a minimal involvement with Dunboyne. It is clear that the policy makers in the department, as distinct from the financial sections, were largely unaware of what happened there. The annual statistical returns were noted but there were no departmental inspections. The first time it was visited by a department staff member seems to have been in 1981. This visit was undertaken in the context of the review which the department was then conducting into the future of mother and baby homes. While the report of the visit (see below) described the institutional arrangements, it seems to have been conducted for information rather than inspection purposes.

Physical conditions

1954 description

24.25 The representatives of the county councils and the Good Shepherd Sisters inspected Dunboyne in April 1954. The inspection report shows that the premises consisted of a reception room, drawing room, dining room, eight bathrooms, bedrooms with minimum and maximum bedroom accommodation as follows:

- 1st floor: 4 (6); 4 (6), 4 (6), 10 (16)
- 2nd floor: 4 (6); 6 (8), 3 (4), 2 (3), 1 (2) 1 (1) 1 (1)

24.26 There was also a pantry, staff dining room, kitchen, scullery, larder, brushroom, two servant’s bedrooms, coal cellars and boiler house. It had independent oil-fueled arrangements for central heating and water heating; a tank to hold 1,020 gallons was installed.

---

12 This practice seems to have changed some time later as in was noted in correspondence in 1973 that payments were not made during such absences.
24.27 After Meath County Council bought the premises, there were continuing discussions between the Sisters and the council about the details of how the institution would be run. For example, it was agreed in June 1955 that the Sisters would continue to employ the gardeners who were already working there. Two gardeners were being paid £5 a week each; the county manager thought this was a reasonable rate. Also in June 1955, the county manager and other officials met the Good Shepherd Sisters at Dunboyne. There were detailed discussions about wallpaper, floor coverings, how the rooms would be used and a range of other matters. For example, it was agreed that the library would be used as a reception room and the drawing room would be the oratory. It was agreed that there would be accommodation for 22 ‘adult patients’ with a possible maximum of 25 and the same number of children. There was sleeping accommodation for five or six Sisters. The Sisters agreed to supply lists of required equipment such as beds, bedding, cots, lockers and crockery and this equipment would be bought by the county council. The county council carried out some structural and maintenance work and advanced £1,000 for maintenance.

24.28 In August 1955, Meath County Council sent the Good Shepherd Sisters in Dunboyne a list of the equipment it had ordered from various suppliers following the Sisters’ request. This list is extensive and covers everything from beds to forks, eggcups and bedpans; later lists show that items such as a cakemixer, a potato peeler (costing £57), radiogram and records were bought by Meath County Council and delivered to Dunboyne. There can be no doubt that the institution was very well equipped. In one of the Good Shepherd Sisters’ histories of Dunboyne, it is stated that the Superiors of the Province ‘very generously’ provided the new foundation with ‘all requirements from Altar, Sacred Vessels, down to the smallest details’. This presumably relates to all the religious requirements as all the practical requirements were provided by Meath County Council.

24.29 In October 1955, Meath County Council arranged for the laundry from Dunboyne to be carried out by the firm that provided the service for the hospital in Navan. The cost of each item was listed and included the ‘alter (sic) linen’.

24.30 One of the internal histories of Dunboyne described the property as being in excellent condition when the Good Shepherd Sisters arrived, with four reception rooms, ten bedrooms, all modern conveniences and central heating already installed; the extensive grounds included a hard tennis court and many beautiful
trees. The ‘largest and best’ of the reception rooms was chosen as the oratory. This history credits St Joseph with ‘having a hand’ in getting them the premises and in getting them a new car.

1981 description

24.31 An extension to the premises was built in 1963. Planning permission had been granted in October 1960; according to one of the internal histories of Dunboyne, building was delayed by strikes. The extension was a two-storey building of 5,000 square feet with five reception rooms, two domestic offices, six double bedrooms with wash hand basins and two single bedrooms. This cost £28,000 and was paid for by the Good Shepherd Sisters.

24.32 Repairs had to be carried out to the roof of the original building in 1980. In February 1981, the Good Shepherd Sisters applied to the Department of Health for assistance with the cost of roof repairs. They said that the repairs which they had carried out in 1980 had left them heavily in debt.

24.33 In response to this application, the department’s architect visited Dunboyne in June 1981. He described the building as being set in about 45 acres of farmland. It consisted of three parts built at different times. The original 18th century Georgian mansion was a three-storey house with some very fine Georgian plasterwork and fireplaces. It had a double roof with a very wide valley gutter. A lot of the roof timbers had been replaced and the remaining ones had been treated with an epoxy resin treatment. The original natural slates and lead had been replaced with asbestos slates and copper flashings. All the chimneys had been demolished and rebuilt in brickwork. Several ceilings and walls of rooms on the top floor had been re-plastered and decorated. The roof was now in excellent condition and had an expected life of 50–60 years. The architect noted a musty odour in one room which he thought may have indicated timber rot. He was unable to confirm this.

24.34 A single-storey extension had been built 50 to 80 years earlier. It was built in the style of the original house with a flat asphalt roof. This roof was leaking in several places. It was planned to renew the flashings to the parapets but if this did not cure the water penetration the whole of the roof might have to be replaced at a cost of between £4,000 and £5,000.
24.35 A modern two-storey extension had been built in 1963. This building was ‘institutional’ in appearance and contained most of the sleeping accommodation for the unmarried mothers. It had a flat concrete roof with asphalt. There were lines of discoloration and mildew on the 1st floor ceiling at regular intervals which could be caused by condensation due to cold bridging from the electrical conduits buried in the plaster soffit. It was noted that the addition of insulation slabs on top of the existing asphalt (an upside down roof) might have been a feasible solution to the problem.

24.36 The builder’s final account for the roof repairs was for just over £58,000 including VAT. The architect considered this to be excessive; the builder’s original estimate had been £30,000. The architect concluded that the building was in a very good state of repair but given its age and style, a continuing high level of maintenance costs was to be expected.

24.37 In July 1981, a department memo noted that the activity in Dunboyne is one ‘towards which everyone is sympathetic’. The writer suggested a grant of £30,000 to meet some of the cost of the roof works. It was also noted that the roof was likely to need further work and the department ought not be seen as a likely source for these further costs. The memo suggested that the general hospital services division should inform the Good Shepherd Sisters that the grant was being made from the limited funds at the Minister’s disposal and as a most exceptional measure as it was not the practice to provide finance for schemes without prior departmental approval.

Financial arrangements

24.38 The Commission has been provided with extensive information about the financial arrangements in Dunboyne. The Good Shepherd Sisters provided the audited accounts for virtually every year of its existence. These accounts were submitted to the Department of Health every year and the capitation rate was decided on the basis of the expenditure in the previous year. This was a reasonably satisfactory arrangement when there was little or no inflation but it gave rise to problems when there was high inflation, particularly in the 1970s and 1980s.

24.39 As already stated, the local authorities and the Department of Health do not seem to have paid a lot of attention to what was happening in Dunboyne. The bulk of the
correspondence between the authorities and Dunboyne was about the financial arrangements.

24.40 Soon after it had bought the premises, it seems that Meath County Council suggested that the Good Shepherd Sisters should buy it from them. However, the Department of Health preferred a leasing arrangement. The issue of leasing versus buying remained a topic for discussion until the lease was finally signed in 1959.

24.41 In October 1955, the lands belonging to the Castle (approximately 55 Irish acres\textsuperscript{13}) were let for grazing at £12 10s an acre. In accordance with the terms of the lease arrangement, this income was paid to the Good Shepherd Sisters. The rate increased over the years and the income was paid to the Good Shepherd Sisters for the duration of their stay. This income was taken into account when the capitation rate was set each year.

24.42 In August 1956, Meath County Council wrote to the Department of Health looking for approval for:

- A per capita weekly charge of £4 16s10d for the woman and £2 8s 5d for a child for the period 1 June 1955 to 31 March 1956;
- The same for the period ending 31 March 1957 pending revision when the actual costs were available plus interest costs.

24.43 In September 1956, there were discussions between the Good Shepherd Sisters and their solicitor about the lease. The Good Shepherd Sisters seem to have been concerned about security of tenure; no lease had been signed at this stage but they did seem to have a caretaker’s agreement.\textsuperscript{14} The issue of the Good Shepherd Sisters buying Dunboyne was discussed.

24.44 In March 1957, the Good Shepherd Sisters wrote to the Meath county manager about buying Dunboyne Castle. They pointed out that additional building was needed and they could not build on a property which was not theirs. They further

\textsuperscript{13} Different estimates of the total acreage around Dunboyne Castle are given in different documents and, to add to the confusion, the acreage is sometimes given in Irish acres and sometimes in statute acres. An Irish acre is approximately 1.6 times a statute acre. This means that about 88 statute acres were let and the rest was available for the use of the Good Shepherd Sisters and the residents. The Land Registry deeds relating to the 1959 lease show that the total acreage was 112 statute acres.

\textsuperscript{14} The Commission has not seen a copy but other documents refer to such an agreement.
pointed out that it was a rule of their order that members of the community live apart from the ‘patients’ and it had not been possible for them to conform to this rule.

24.45 In April 1957, Meath County Council told the Good Shepherd Sisters that accounts for the maintenance of patients should be sent directly to each county council concerned and Meath County Council would deal only with residents from Meath.

24.46 In May 1957, Meath County Council wrote to the Good Shepherd Sisters to tell them that the county manager had discussed the ownership issue with the Bishop of Meath and he (the bishop) wanted to talk to them. It seems that they had a satisfactory meeting with the bishop. The councils were planning to put proposals to the Department of Health about ownership. The Good Shepherd Sisters’ solicitor was concerned about the exact nature of the proposal.

24.47 In June 1957, the Good Shepherd Sisters appointed auditors. The appointed auditors wrote to them in July 1957 about the Sisters’ salaries. It was ‘tentatively decided’ to charge £500 for the period to 31 March 1956 and £600 for the subsequent year.

24.48 In August 1957, Meath County Council wrote to the Department of Health and stated that:

- The Good Shepherd Sisters were anxious to enlarge the institution and build a convent;
- The counties could not provide for this;
- A loan of £2,372 had been approved by each of the counties in addition to the loan of £40,000 already obtained for the purchase and fit out;
- The councils had agreed, subject to the approval of the Minister for Health, that the interest in the property be transferred to the Good Shepherd Sisters;
- Capital expenditure would be met one third by the councils, one third by the State and one third by the Good Shepherd Sisters;
- The institution would be run on a capitation basis and the five counties would have priority in accessing places.

24.49 In August 1957, the solicitor for the Good Shepherd Sisters wrote a letter summarising the position: they were prepared to pay £14,184 for the property as it
stood and accept responsibility for any future developments or extensions. The solicitor also wrote to the Good Shepherd Sisters recommending they see some ‘high official’ in the Department of Health. This letter suggests that what the Good Shepherd Sisters were offering was to repay the interest on the loan of £14,124; the capitation charge would take account of this interest charge and the interest on loans for future development.

24.50 In December 1957, there was a meeting between the Department of Health, the managers of the five counties and the Good Shepherd Sisters in relation to arrangements for Dunboyne. The ‘most recent’ proposal was discussed:

- The charges on the loan - total £42,372\(^{16}\) would be met half by the State and half by the five participating counties (under the County Home Improvement scheme);
- The existing premises would be leased to the Good Shepherd Sisters for as long a lease as possible - upwards of 35 years;
- The Good Shepherd Sisters would build a convent;
- There would be arrangements to compensate the Good Shepherd Sisters for additional buildings if they vacated the institution.

24.51 The Department had written to the county councils in April 1956 with other conditions; the Commission has not seen this letter but it seems that these other conditions included the term in respect of new buildings and that the lease could be for 99 years at a rent of £1. It was agreed that there would be compensation for new building only if the county council terminated the services of the Good Shepherd Sisters; the loan charges would be dealt with separately to the capitation charges and other local authorities who used the institution would be required to contribute to the loan charges.

24.52 In February 1958, Meath County Council wrote to Offaly County Council (which was not one of the participating councils) agreeing to take a patient at a capitation rate of 69s 8d a week for a woman and 34s 10d for a child plus an amount (unspecified) to cover a proportion of the loan charges.

24.53 On 13 May 1958, the question of buying the property was in issue again; the agreed lease had still not been signed. In May 1958, the draft lease was sent to

\(^{15}\) This probably should be £14,184.

\(^{16}\) This seems to be the original £40,000 plus one county’s contribution as mentioned above
the Good Shepherd Sisters solicitor by the Meath county solicitor. The accompanying letter suggests that the level of capitation charge was to be agreed between the Good Shepherd Sisters and the Department of Health with the county councils having no say in the matter.

24.54 The arguments about money and ownership continued for some time. Meath County Council gave an advance to the Good Shepherd Sisters as the Minister for Health had not yet decided what the appropriate capitation payment would be even though audited accounts had been submitted.

24.55 In January 1959, Meath County Council sent a bill to the Good Shepherd Sisters for two years rent of £100 a year plus other items supplied. It is not clear what the basis for this was but it may have been the caretaker’s agreement. The county council proposed to hold a conference in Dunboyne to deal with the issue of whether repairs were capital or revenue, and how salaries should be dealt with.

24.56 In May 1959, Meath County Council told Waterford County Council that the capitation rate was 96s 10d for adults and 48s 5d for children plus a contribution to interest charges (on the loan to buy and fit out the premises).

24.57 In August 1959, the superior in Dunboyne wrote to the Mother Provincial of the Good Shepherd Sisters about the financial discussions. She said that ‘four men’ had spent several hours with them (they are likely to have been from the auditors), the Sisters were ‘glad to see them depart’. The discussions had been mainly about what constituted capital and what revenue; the calculation worked out that the capitation should be £3 10s for the mother and £1 15s for the child. The councils were comparing charges in the different institutions; Castlepollard’s charges were lower and the Congregation of the Sacred Hearts of Jesus and Mary there were looking for salaries. The Dunboyne superior lamented the absence of co-ordination between the institutions and said that the same problem existed in the industrial schools before they formed an association.

24.58 In September 1959, the auditors wrote to the Good Shepherd Sisters giving an account of a meeting between them and representatives of Meath County Council. The accounts for the years ended 31 March 1958 and 31 March 1959 were discussed and it was proposed that the following adjustments be made:
Miscellaneous receipts, for example, grazing rents should be deducted from the gross expenditure figure to arrive at the figure on which the capitation charges would be based;

Abnormal repairs should be excluded (£1249 11s 5d in year ending 31 March 1958 and £284 8s 9d in year ending 31 March 1959); however, the cost of these abnormal charges would be recovered over a period of 10 years (in effect they were being treated as capital costs).

24.59 These changes meant that the Good Shepherd Sisters had been paid too much for the years in question. The capitation rate should have been 4s 9d a day for each child for the year ending 1958 and 5s 2½d for the year ending 1959. The actual rate paid was 6s 11d for both years. There was a total overpayment of £3836 18s 2d for the two years; a breakdown between the counties was provided and it was suggested that repayment should be made partly in cash.

24.60 The meeting also discussed salaries. It was agreed that prior consultation with the Meath county manager would be held before any changes were made to establishment and/or salaries. The financing of any future abnormal repairs would be discussed in advance with the Meath county manager.

24.61 In October 1959, the solicitors for the Good Shepherd Sisters replied to the auditors’ letter. They were unhappy with the outcome of the meeting. They pointed out that there was no mention of the capitation rate for mothers or what the capitation rate for the subsequent year would be. They also said that there was a conflict with the letter which they had received from the county solicitor which stated that they would not have to repay any overpayment. They objected to the deduction of the abnormal repairs amounts and noted that the abnormal repairs and the grazing income (£1318 19s 11d for the two years) constituted a large sum. They pointed out that the Good Shepherd Sisters had recently signed a lease and should not be involved in making other agreements outside the lease (it seems that the lease had been signed by the Good Shepherd Sisters in July 1959 and the minister was expected to sign on the day this letter was written, that is, 8 October 1959).

24.62 In reply, the auditors said that there was no conflict except that the county solicitor said that no repayment would be required in cash. The suggestion of repaying partly in cash had been made because the Good Shepherd Sisters in Dunboyne
had over £3,000 on hands in March 1959. The auditors explained that the capitation rate for mothers was double that for children so was 9s 6d a day for the year ended 1958; 10s 5d a day for the year ended 1959 and capitation rates for the year ended 1960 would be the same. In all subsequent years, the rate would be settled by reference to the previous year’s accounts. The arrangements had been discussed at a meeting with the Good Shepherd Sisters before the meeting with the county council and the auditors understood that the Good Shepherd Sisters were in agreement. The letter noted also that the capitation rate should not be significantly greater than Castlepollard or councils would not send women there.

24.63 In November 1959, a letter from the solicitors noted that the lease had been signed by the minister. In January 1960, the solicitors reported to the Good Shepherd Sisters on a meeting which was held before Christmas between them, the auditors and Meath County Council. The meeting was ‘slightly unpleasant’ at times. The meeting agreed a reduction in the amount of the repayment (the amount is illegible). The letter also pointed out that staff salaries were a matter for the Good Shepherd Sisters but advised that consultation should take place, otherwise the costs might not be accepted for capitation purposes.

24.64 In February 1960, the superior in Dunboyne wrote to the Mother Provincial. She commented on how cold the weather had been but how good the central heating was so there were no colds among the residents. The letter was mainly about the money situation. The superior had not known that the solicitor had looked for a reduction on the amount owed and did not like his suggestion that repairs be agreed at the start of the year ‘as it would tie us down’. With regard to salaries ‘it would be better not to question it again, unless they do, as there was nothing definite about it’. She also mentioned the need to discuss plans; ‘I would also like to be sure about the private people before we do anything’ and ‘I recommended the Clare patient to Newry as she would be private’. Dunboyne had a small number of private patients. The institutional records show that there were 21 private patients admitted in the 1960s and 1970s. The lease provided that all the beds had to be available to the county council and no one could be admitted without council approval. It is not clear if this approval was sought or received for the admission of private patients.

24.65 In March 1960, the Meath county solicitor wrote to the Good Shepherd Sisters’ solicitors to say that the Minister for Health had approved:
• An arbitrary rate of 6s 11d a day for each child until 31 March 1958;
• An audited rate of 5s 2¼d for periods 1958/59 and 1959/60;
• Rate for subsequent years to be the audited rates for previous year.

24.66 This meant that there were some overpayments by councils and gave rise to arguments about repayment which were eventually resolved.

24.67 The financial situation does not seem to have generated much correspondence in the 1960s even though the annual accounts showed a deficit in 1962. Meath County Council’s applications for changes in the capitation rate were generally approved by the Department of Health without much commentary. It did become a significant issue in the 1970s. The North-Eastern Health Board (NEHB) took over from Meath County Council as the relevant health authority when it was established in 1970 (see Chapter 1). The original five counties involved in establishing Dunboyne were not all in the NEHB area so this gave rise to some problems about repaying the original loan.

24.68 The capitation rate for 1967/8 was 6s 5d a day for children and 12s 10d a day for women. This went down to 6s 2d and 12s 4d for 1968/9 and back up again for 1969/70. In 1970/71 the rates were 3s 6½d and 7s 9d. In 1972/3 the rates were £0.60 and £1.20. 17

24.69 In June 1972, the Good Shepherd Sisters’ auditors wrote to the Department of Health and outlined the financial difficulties they faced. Increasing costs of food and transport and the fact that the capitation rate was set retrospectively were the major problems but there were others. For example, the doctor attached to Dunboyne had advised against the use of non-pasteurised milk. Dairies would not deliver to Dunboyne in large quantities so the Sisters were obliged to use patent foods for the children. The auditors argued that the overdraft had arisen because of significant capital costs and then outlined the further costs which had arisen and were likely to arise. They asked about the possibility of a capital grant to meet these costs.

---

17 The changeover to decimal currency happened on 15 February 1971.
The Chief Executive Officer of the North Eastern Heath Board (NEHB) visited Dunboyne to discuss the matter. In a letter to the department, the NEHB outlined the work for which this grant was requested:

- Replacing the boilerhouse: £600;
- New incinerator: £350 (this had already been bought);
- Replacing fire extinguishers: £150;
- Replacing existing bedding ‘which is very bad’: £600;
- Roof repairs and maintenance; £900;
- Reconstruction and equipping of milk kitchen (no price given).

In January 1973, an accountant who was a relative of the superior wrote to the Good Shepherd Sisters’ accountants about what he regarded as the very bad financial situation in Dunboyne. He said that the ‘financial position is going from bad to worse and the Health Board do not realise what is involved’. He outlined the problems:

- Overdraft was now over £5,000;
- The 1959 lease was a very bad deal;
- Accumulated losses in the years ending 31 March 1967 to 31 March 1972 were in excess of £9,000;
- The Sisters’ salaries were £1,500 for many years, then £1,750, then £2,800 recently; the staff were the Mother Superior, a Sister who was a qualified social worker, a Sister who was a qualified State Registered Nurse, a qualified nursery sister, a cook, telephonist and a female porter.

The Mother Superior replied thanking him for his help and outlined options:

- Buy the property;
- Refuse consent to sale of land and leave things as they are (the Good Shepherd Sisters had been in discussions with the Meath County Manager about the sale of land);
- Give consent to sale of lands and make a new deal;
- Leave the institution.

She noted that the house was in good condition except for the roof. She also referred to the incinerator and a legacy from the USA for the ‘old nun’.
24.74 In January 1973, the Meath county manager offered to pay £15,000 for 46 acres of land; this was calculated on the basis that it was the amount which would yield the approximately £1,000 a year which was then being earned from the land. This offer seems to have been rejected as the county manager wrote to the superior in June 1973 asking on what basis she would consider selling the lands.

24.75 The superior was in discussions with the bank manager about the financial situation. He wrote to her in February 1973 about the overdraft which now stood at £5,250; he said that the overdraft used to be temporary and he could not see how it would be addressed. Further correspondence ensued without any resolution. In January 1974, the superior's accountant relative said that he, the Good Shepherd Sisters’ auditors and solicitor were in ‘full battle array in the front line’ on behalf of the Good Shepherd Sisters when dealing with the health authorities. The issue seems to have remained in abeyance until the 1980s.

24.76 The capitation rates were £2.10 for mothers and £1.05 for children in 1973/4 and £1.58 and £3.15 respectively from January 1975.

24.77 In October 1983, the Provincial Superior granted a request from the superior in Dunboyne to spend £13,241 on a new asphalt covering for the flat roof of the convent. It was noted that ‘The house is able to meet this expense without contracting a debt’. Similarly, in July 1984, a request from the Dunboyne superior, to spend £10,000 for the installation of fire prevention was granted by the Provincial Superior. Again, in January 1986, a similar permission was granted to spend £10,000 on a minibus.

24.78 The Good Shepherd Sisters applied for an increase in the capitation rate in 1984. The capitation rate from July 1983 was £9.75 a day for women and £5 a day for babies; the auditors proposed an increase to £10.32 and £5.16. They were granted £10.70 and £5.50. The Department of Health said that no additional funds were required to fund the proposed fire system as, having examined the audited accounts, they noted a surplus of over £10,000 on the income and expenditure accounts for 1982 and again in 1983. The Department wanted the NEHB to take over funding and budgeting responsibilities for Dunboyne. The NEHB was concerned about the absence of a basic fire warning system in the building and was looking for about £8,000 to provide for this.
In 1984, the Department of Health wanted to change the financial arrangements for Dunboyne to a budgeting basis. The department understood that the following staff were in Dunboyne: one each of midwife, social worker, nursery nurse, receptionist (part time), domestic, administrator, gardener and two cooks. The department considered that the teaching staff should be paid by the Department of Education.

In 1986, the child care division of the Department of Health drew up a proposed rationalisation programme for mother and baby homes and infant nursing homes. This envisaged the continued use of Dunboyne and noted that it had received £70,000 in capitation in 1984.

The daily capitation rates for mothers and children during the 1980s were:
- 1 July 1981 - £7.30 and £3.65
- 1 July 1982 - £8.50 and £4.25
- 1 July 1984 - £10.70 and £5.50
- 1 July 1985 - £11.30 and £5.80
- 1 July 1986 - £11.75 and £6
- 1 July 1987 - £12.10 and £6.20.

Residents in Dunboyne 1956-1959

In March 1956, the Meath County Council official wrote to the Good Shepherd Sisters about the proposal to send women to St Kevin’s Hospital for confinement. He said that the Dublin Board of Assistance wanted each mother to have at least one visit to an antenatal clinic before confinement and that a medical report should be furnished to the hospital.

It seems that, from the start, admission to Dunboyne was not confined to women from the five counties involved nor was it confined to women on second or subsequent pregnancies. In March 1956, Meath County Council wrote to the Department of Health inspector, Miss Litster, about the ‘repatriation’ of a woman from Dublin who could have a place in Dunboyne if the Dublin Board of Assistance would get permission from the Department of Health to pay the capitation fee; this was £3 3s a week at the time. However, in June 1956, Meath County Council told the Good Shepherd Sisters that it had been decided the previous April not to admit mothers from outside the region unless the numbers should drop below 75% occupancy which ‘would be about 15 adults and 15 children’. The lease which had
been agreed between the Good Shepherd Sisters and Meath County Council said there was accommodation for 22 adults and 22 children.

24.84 By December 1956, there were concerns that too many women were being referred to Dunboyne. There is evidence that Miss Litster was involved in placing mothers there. It seems that Meath County Council wrote to the Department of Health suggesting that women who could not be accommodated in Dunboyne would be sent to a similar institution in Newry, which was also run by the Good Shepherd Sisters. The department did not agree to this. The department replied in January 1957 stating that unmarried mothers on their second pregnancy could be sent to Castlepollard, Sean Ross or Bessborough provided the first baby had not been born in the particular institution.

24.85 In January 1957, Meath County Council wrote to the Good Shepherd Sisters about overcrowding. The county manager had directed that, when there was pressure on space, arrangements should be made to discharge mothers who were there without children but the discharge should not take place without informing the local authority concerned. The letter went on to say that if arrangements are being made ‘whereby the patients would enter one of your houses’, the patients would in those circumstances take their discharge rather than be discharged.

24.86 The institutional records show that the maximum number of mothers resident in Dunboyne at any one time in the period 1955–59 was 24. So, while there was concern about overcrowding, its level was never as bad as in other mother and baby homes.

24.87 The institutional records do not always record whether or not the woman had a previous pregnancy. They show that 10 women were admitted in 1955; four of these had a previous pregnancy (one a multiple) but there is no information about the other six. In 1956, 20 were admitted; 15 are recorded as having had had a

---

18 The Good Shepherd Sisters had a mother and baby home, a children’s home and a Magdalen laundry in Newry. All are mentioned in the report of the Northern Ireland Historical Institutional Abuse Inquiry (the Hart Inquiry) and the children’s home was part of that investigation. The report states that the Newry mother and baby home opened in the 1950s and closed in 1984. The Good Shepherd Sisters also had institutions in Derry and Belfast including a mother and baby home in Belfast which operated from 1950 to 1990. There is quite extensive information about all the Good Shepherd Sisters activities in Ireland on the website of the inquiry: [https://www.hiainquiry.org/historical-institutional-abuse-inquiry-report-chapters](https://www.hiainquiry.org/historical-institutional-abuse-inquiry-report-chapters)

19 Presumably an industrial school or a Magdalen laundry; the Good Shepherd Sisters had 4 campuses in Ireland on each of which there was a Magdalen laundry and an industrial school – in Limerick, New Ross, Sunday’s Well (Cork) and Waterford.
previous pregnancy (five multiples). In 1957, 14 were admitted; nine are recorded as having a previous pregnancy (two multiples).

24.88 Statistical returns made by the Good Shepherd Sisters to the Department of Health show that there were 20 women and 16 children in residence on 31 March 1957; 14 women and 16 children had been admitted in the year ending 31 March 1958. On 31 March 1958, there were 16 women and 14 children resident.

24.89 According to a Good Shepherd Sisters history of Dunboyne, a projector for showing films was acquired at Easter 1957 and a television set at Christmas 1957. Very few people in Ireland had TV sets at this time; RTE had not yet started its TV station. A Volkswagen car which could carry eight people was bought in May 1959; this was used for transporting the residents to Holles Street.20

1960–1979

24.90 There is very little documentation available about the 1960s and 1970s apart from the statistical returns made to the Department of Health and documentation about the financial situation.

24.91 According to the statistical returns to the Department of Health, on 31 March 1960 there were 17 women and 15 children resident. In a note on these returns, the superior in Dunboyne said that ‘The average duration of the stay of mothers and children vary according to circumstances, usually until children can be provided for. The maximum is two years.’ The institutional records show that the average length of stay was always less than two years; from 1962 onwards, the average length of stay was less than a year.

24.92 The Cavan children’s officer wrote to the Good Shepherd Sisters in October 1961. The letter said that when the ‘girls’ gave birth in Holles Street, they were giving their home address when registering the births. This had caused problems with American adoptions when the birth certificate was issued and the adopters contacted the mothers at their home address.

20 The projector and the TV were bought by Meath County Council; it is not clear who bought the car.
Complaint about being pressured into adoption

24.93 In 1966 a woman made a complaint to the Department of Justice about the adoption of her child from St Clare’s, Stamullen and about the involvement of the Good Shepherd Sisters in Dunboyne in that adoption. The matter was referred to the Gardaí. The Gardaí called to Dunboyne in January 1966 to discuss the matter with the Good Shepherd Sisters. The Garda report states that the woman, who was aged about 16 at the time, had been moved from an industrial school to Dunboyne when she became pregnant in 1961. She was recorded as having no living relatives and the Good Shepherd Sisters told the Gardaí that no one visited her while she was there.

24.94 The following is a passage from the Garda report of the visit to the Good Shepherd Sisters:

In accordance with normal practice she was due for release\(^{21}\) in January 1963. The matter of adoption of the child was discussed on a number of occasions and was recommended to her. She was informed of the consequences of adoption in so far as she was concerned and was fully instructed in all aspects of it. She was told that an illegitimate child grew up to hate its parents and in her case it would be the mother. Other than that point no pressure was placed on her to part with the child and she was quite agreeable to hand over the child for adoption.

24.95 The statement goes on to say that she was brought to a solicitor in Dublin and completed the adoption papers before him. (The Good Shepherd Sisters have pointed out to the Commission that they were not directly involved in arrangements for adoption and the Commission accepts that they were not. The arrangements would have been made by the adoption society involved.) The baby was taken to Stamullen where ‘the transaction was completed’. The mother left Dunboyne on one of the two days after the baby went to Stamullen. ‘She was quite happy leaving and gave no indication of objection to the procedure.’ The Good Shepherd Sisters got her a position in a hospital and ‘she appeared happy to restart life again’. In December 1965, she called to Dunboyne accompanied by two men and inquired about the whereabouts of her child. The Reverend Mother said she could not supply that information. ‘They discussed the matter at length and [the mother] appeared satisfied with the position as it stood.’

\(^{21}\) The use of the word ‘release’ suggests that the Garda thought the woman was incarcerated.
24.96 The Garda read out the allegations made by the woman regarding duress and threats applied, for example, that she would never get her freedom. The Good Shepherd Sisters denied that any such threats were ever used towards any unmarried mother. They said that the women were encouraged to part with their babies for the reasons set out earlier and nothing irregular occurred in this instance.

24.97 The baby had been adopted to the USA. The mother had signed the consent to placement for adoption in December 1961. The child was placed with the American adoptive parents in 1963.

24.98 In 1965, a man who described himself as the mother’s brother contacted Dunboyne to say that the mother was getting married and she wanted her child back. He was told that this was not possible as the child had been adopted.

24.99 In November 1965, the mother wrote to Stamullen inquiring about the child. She said that she expected that the Sisters in Dunboyne had not told Stamullen that her father and brother had not been aware of the adoption. They had each died recently and she was now all alone in the world and she wanted her child back. (The Dunboyne institutional records state that her parents had been dead when she went into Dunboyne and she had never had any visitors while there.) She said that the Sisters in Dunboyne had persuaded her to give him up for adoption and she had not done so of her own free will.

24.100 In May 1971 the Salvation Army wrote to Stamullen looking for help in finding the child.

**Numbers**

24.101 During the 1960s and early 1970s, the Good Shepherd Sisters made annual statistical returns to the Department of Health in the same way as other mother and baby homes did. These show that the numbers of mothers in residence increased after the extension was built in 1963. For example, there were 20 mothers and 18 children resident on 31 March 1964; of the 21 children discharged, 15 were adopted. The numbers of mothers admitted increased significantly as they were staying for shorter periods. The numbers of children in residence decreased as the practice developed of not taking the babies to Dunboyne but placing them directly from the maternity hospital into foster care pending decisions.
about their future. In the year ending 31 March 1973, there were 31 mothers resident in Dunboyne but a total of 131 had been admitted during the year.

**Private patients**

24.102 The institutional records show that there were 11 private patients admitted in the period 1965-68. Most stayed for short periods; five stayed for less than three months, two stayed for just over three months, one stayed five and a half months and one stayed for just over a year; no information is available about the length of stay of the other two. The statistical returns do not record that there were private patients there in the years 1965-67 but do record that there were private patients resident in the period 1968-1973. The institutional records show that the private patients who were there in 1965-68 paid between £5 and £6 a week for their stay.

24.103 One of the internal histories of Dunboyne records that, in the 1970s, there was less ‘institutional life’ there; boyfriends started visiting and the ‘girls’ went off for weekends. The numbers continued to remain steady: 130-140 annually. (The numbers are largely consistent with the institutional records.)

**1980 - 1991**

24.104 In May 1981, when the Department of Health was discussing which section should be responsible for the mother and baby homes, Dunboyne was described as follows:

This home (29 beds) accommodates mainly very young unmarried mothers - many of them school-girls. The occupancy rate is very high. The girls stay on average 3 months, are delivered in one of the Dublin Maternity Hospitals and, in most cases, are discharged directly from the hospital. Seldom do they or their babies return to Ard Mhuire.

24.105 The department suggested that any babies not kept by their mothers and not adopted probably went to St Clare’s, Stamullen. The Good Shepherd Sisters have told the Commission that the babies usually went into foster care in the area where the agency dealing with the mother was based.

24.106 The fact that Dunboyne was not registered under the *Registration of Maternity Homes Act 1934* was noted and ‘This is to be looked into’. Dunboyne did register in 1982.
24.107 The capitation rates at the time were £6.30 a day for mothers and £3.15 a day for babies. It was noted that an extension had been built at the expense of the Good Shepherd Sisters in 1963. The roof of the original building had to be replaced in 1980 at ‘a heavy cost’ (amount not stated) and the Good Shepherd Sisters were looking for a grant of 75% of this cost from the Department of Health.

24.108 It was also noted that the department’s inspector, Miss Reidy, had inspected Dunboyne and reported that it was comfortable and well run and that she was much impressed with the work carried out there.

1981 visit/inspection

24.109 Miss Reidy visited Dunboyne in 1981. It would appear that the visit was arranged because the Department of Health needed to know more about Dunboyne in the context of its general review of mother and baby homes. In her report, Miss Reidy reported that she visited the institution, looked at and listed the available accommodation and had discussions with the superior, a social worker, a midwife (all three were members of the Good Shepherd Sisters) and the visiting medical officer. She also had discussions with the NEHB’s Director of Community Care.

24.110 Her report described the sleeping accommodation available and noted that the nursery was seldom occupied by infants. The other accommodation included a residents’ TV room, a smoke room, a record (music) room, a dining room, two parlours for girls’ visitors, a surgery which was used once weekly by the dispensary doctor and more often by the public health nurse, an office for the social worker, a kitchen with scullery area, store cupboard and cold room, a milk kitchen (which was seldom used), three staff bedrooms with bathroom facilities, a launderette for the residents’ personal clothes, and an occupational therapy room. There were five bathrooms, nine toilets and a toilet for visitors.

24.111 There were two cooks (one for weekdays and one for weekends), one domestic, a full time and a part time (summer only) gardener. These were all secular staff. There were five members of the Good Shepherd Sisters, an administrator, a midwife, a social worker, a nursery nurse and a receptionist. There were six part time paid teachers and a part time voluntary worker who supervised studies.

24.112 She made the following observations: residents were first admitted in 1955 and ‘in more recent years the number of school girls is increasing annually’. In 1980, the
Department of Education had agreed to recognise the institution as an examination centre to accommodate 14 entrants for the Intermediate and Leaving Certificate examinations. The Director of Community Care considered that occupational therapy was necessary. ‘Card packing for Union greetings, Greenmount estate and Harold’s Cross is undertaken, knitting and sewing and a weekly lecture from the Board’s consultant dietitian on appropriate subjects is given.’

24.113 Miss Reidy said that most mothers were discharged directly from Holles Street; the few who returned to Dunboyne stayed for only two to three days on average. Infants were seldom brought back. Dunboyne was primarily, therefore an antenatal centre. Miss Reidy concluded that it was ‘comfortable, well run and a relaxed homely atmosphere prevails. All accommodation is clean and well kept and all day living-units are nicely appointed. I am much impressed with the work carried out here.’

Closing

24.114 The 1981 Department of Health review of mother and baby homes and the 1986 proposed rationalisation programme for mother and baby homes and infant nursing homes did not propose any changes in the status or work of Dunboyne. This was mainly because it was a relatively small institution and because it catered for young women who were school going.

24.115 However, the Good Shepherd Sisters were considering its future. This was partly because they were having difficulties with the finances. It was also because their own numbers were declining (which, of course, further affected the finances) and their members were becoming more involved in community work and in the organisation, CURA. They also recognised that several aspects of Dunboyne, for example, its rural setting and the absence of single rooms for all residents, meant that it was not meeting the needs of unmarried mothers at this time.

24.116 In April 1989, a representative of the Department of Health met the Good Shepherd Sisters and their accountant in Dunboyne to consider the financial position. The capitation rate from 1 July 1988 was £12.34 a day. The department’s note of the meeting records that ‘The income is insufficient to provide any real contribution towards Sisters salaries. There is no funding for minor capital projects.’ The description of Dunboyne in the note was presumably provided by
the Sisters who attended. Dunboyne was described as having 30 places and, according to the Sisters, was almost always near capacity. The residents were referred by CURA, adoption societies or Good Shepherd Sisters and not by health board social workers.\textsuperscript{22} ‘It would seem that Health Boards are often not informed of placements until after arrangements are made, hence some Boards are slow to pay.’ The length of stay varied from one to six months; about half the residents were aged between 14 and 18. School going girls tended to arrive early in their pregnancy. The Sisters received grant assistance from Dundalk Vocational Education Committee with which they funded ten part-time teachers. Fourteen sat the Inter or Leaving Certificate in 1988. There were no activities for the older girls - the Sisters said that they often did not arrive until near delivery. They were trying to get a grant from the Department of Social Welfare to buy typewriters for this group.

24.117 About 40\% of the babies were placed for adoption. Most of the mothers returned to Dunboyne for about a week after the birth.\textsuperscript{23} Babies not being placed for adoption were placed in foster homes ‘near to where the girls live until they return home to care for them’.

24.118 The staffing was five Sisters and lay staff. The Good Shepherd Sisters were concerned that there was insufficient cover for Sisters who needed a break; there were insufficient resources to recruit lay staff to replace any of the Sisters and the current level of staffing was inadequate. There was a need for counselling and advice on personal development - this was being provided by volunteers from Maynooth.\textsuperscript{24} There were three items needing capital funding: installation of smoke detectors as stipulated by the Fire Officer (£3,000); felling of dangerous trees at front entrance (£3,500) and purchase of typewriters (£3,000). The premises also would also soon need rewiring and this would cost at least £10,000.

The 1989 review and proposals

24.119 In May 1989, the Good Shepherd Sisters started an evaluation and review of Dunboyne’s services. This was completed by October 1989. They sent

\textsuperscript{22} This was not correct as is clear from the later analysis of the figures for the period 1987–89.

\textsuperscript{23} The Good Shepherd Sisters told the Commission that those who did return to Dunboyne stayed only for three or four days. The institutional records show that 116 women entered Dunboyne in 1989; 69 of them returned there after the birth and they stayed an average of 12 days after the birth.

\textsuperscript{24} The Good Shepherd Sisters told the Commission that this was not correct. The Sisters did believe that there was a need for counselling but it was not provided by volunteers from Maynooth; they visited socially to provide music and entertainment but not counselling.
questionnaires to social workers, CURA personnel, school principals and counsellors involved with pregnant girls. They tabulated the information they had about the residents from 1987 onwards and they conducted exit interviews with the residents when they were leaving.

24.120 In October 1989, the Good Shepherd Sisters discussed the evaluation process. They were all agreed on the need for smaller units, more activities for the girls, ‘a greater insertion into the reality of today’s world, a less remote setting and the points made by the girls in their exit interviews’. They defined their philosophy:

The purpose of our work here is to give loving and compassionate care to girls at a particularly vulnerable time in their lives. We also enable younger girls to continue their studies … Our hope is to help the girls develop and mature personally so that they can make responsible decisions about their own and their babies’ futures and cope with the consequences of their decisions.

24.121 The review included an analysis of the numbers who used the service in the period January 1987 to June 1989 (a total of 298). In 1987 there were 114 residents of whom 31 were students; 33 were non-students aged 15-19 and 50 were aged 20 or over. The divide was similar in the later years. Overall, one in four were students; 58% of admissions were under the age of 20.

24.122 Of the 298, four stayed for less than two weeks, 138 stayed for between two and 10 weeks; 118 stayed for 11-19 weeks and 38 stayed for 20 weeks or more.

24.123 On admission, 187 said they planned to place the baby for adoption; 53 planned to keep the baby and 58 were undecided. In fact, 149 placed the baby for adoption, 143 kept the baby.25 Three babies died and three mothers left before the birth so it is not known what happened to them or their babies. It is notable that 25% of those who initially planned on adoption actually kept the baby and 76% of those who were undecided also kept the baby.

24.124 The major referral agencies were the CPRSI, social workers and CURA; between them, they referred 236 of the mothers.

---

25 Research carried out by UCD and Holles Street hospital in the late 1980s shows that mothers who were in Dunboyne were much more likely to place their babies for adoption than other unmarried mothers who gave birth in Holles St: Valerie Richardson and Others Unmarried Mothers delivered in National Maternity Hospital, 1986; https://www.lenus.ie/handle/10147/624070 ditto 1987; 1988
24.125 The consultation process which was conducted showed that former residents and the referral agencies expressed a high level of appreciation of the service. They highlighted two aspects in particular:

- The opportunity for girls to continue their education and sit for State examinations;
- The importance of group support experienced in Dunboyne; the former residents saw this as an advantage over what they perceived as the isolation of a family placement.

24.126 There were four issues raised which impinged on the quality of the service and had implications for future policy:

- 48% of the mothers decided to keep their babies: referral agencies and the former residents emphasised the need for a place to go during the pregnancy even if it was intended to keep the baby. This was related to the difficulty of being publicly pregnant in their own neighbourhoods.
- 75% were not involved in an organised educational programme: they had some occupational therapy (packing cards) but the former residents and the staff considered that this was unstimulating; it was difficult to find challenging opportunities for young women and girls in a rural village setting; a better service could be delivered in an urban setting where they could avail of opportunities in the community for developing skills.
- The institutional character of the service: accommodation was provided in rooms with three or four beds in each. There were only five single rooms. Meals were prepared for the residents and eaten in a common dining room. A minibus provided transport to Holles Street every week. ‘The girls become more dependent on the institution’ and ‘a certain laziness’ pervades. The service needed to be redesigned to allow the residents to live in a bedsit type setting, budgeting, shopping, cooking and making their own medical appointments.
- An unrealistic and inadequate financing system: the Good Shepherd Sisters had been working in Dunboyne for 34 years. The annual payment being made in respect of their service was a total of £12,000. The capitation rate of £12.70 a day would meet current costs only if the service was at full bed capacity (31) all the time. The total number of residents annually remained fairly constant but they were staying for shorter periods.
The capitation system failed to deal with the cost problems which arose from fluctuating numbers and fixed overheads.

24.127 The review put forward the following vision for a redesigned service for pregnant women and girls who had to leave home during the pregnancy. It proposed that there would be two types of premises in an urban setting:

- One should be self-catering flats grouped together, for example eight to 12 in one building for non-students and those aged 18 and over. This would have some communal space to facilitate group support and counselling and would have a housemother’s flat.
- The other should be bed-sits for students and girls under 18. It would have a study room and a communal room. One cooked meal would be provided each day and there would be closer supervision than in the self-catering flats. There would also be a housemother’s flat.
- The residents could avail of existing educational opportunities in the community and other social opportunities.
- There would be three full time staff for each house giving 24 hour cover. The directress would have overall responsibility, deal with staff issues, arrange community liaison, social arrangements and contact with funding agencies. There would be two housemothers for each house. They would supervise the residents, provide counselling when required, organise individual plans and programmes with each resident and ensure that these take place, deal with maintenance, and liaise with social workers, referral agencies and families.
- Volunteers would be recruited to share skills such as budgeting and parenting skills and act as a befriending network and aftercare support group.
- The total annual cost of these proposed arrangements was assessed at just under £150,000 a year.

24.128 In July 1989, while this evaluation was going on, the Good Shepherd Sisters met representatives of the North Eastern Health Board (NEHB) including its Chief Executive Officer. The Good Shepherd Sisters explained that it was not financially viable to maintain Dunboyne because of the reduction in the number of residents; they noted that when the CEO saw the bank statements, he agreed. It seems that the decision to close Dunboyne was made around this time. The Bishop of Meath
was told that it would be closed within a year. In August and September 1989, meetings were held between the Good Shepherd Sisters, their auditors, their legal advisors and the NEHB in which the terms of the Good Shepherd Sisters’ departure were discussed. In October, according to the Good Shepherd Sisters, the CEO refused to pay them the amount they asked for and the meeting ended ‘rather abruptly’.

24.129 The Good Shepherd Sisters were also in contact with the Department of Health. A letter from their accountants to the Department of Health in August 1989 argued that they were entitled to support to maintain the property. It mentioned the £28,000 spent by them in 1962.

24.130 This letter also raised concerns about the social welfare payments which were paid to the residents. It said that ‘as a result of individual interviews held in the centre with Social Welfare Personnel some receive the Dole, others £10 weekly pocket money’. ‘While all those in receipt of the Dole should sign weekly at the Local Garda Station, in fact one might attend on behalf of 5 or 6 and this appears to be acceptable.’ The letter argued that because of the non-requirement to sign individually the opportunity exists for people who have been discharged from the centre to continue to draw the dole. ‘The Sisters would like to see proper procedures being implemented by Social Welfare’.

24.131 It is not clear where the accountants got this information or if it was accurate. At the time, the word ‘dole’ was used in relation to both Unemployment Benefit (UB) and Unemployment Assistance (UA). UB was payable on the basis of social insurance contributions; the earliest age at which it could be paid at the time was 16½. UA was payable on the basis of a means test from age 18. In both cases there was a requirement that the applicant be available for and actively seeking work. It is difficult to see how residents in Dunboyne could have met this criterion. The Good Shepherd Sisters told the Commission that the Community Welfare Officer (see Chapter 1) gave financial assistance to those who were not eligible for UB or UA.

24.132 In August 1989, the NEHB programme manager for community care wrote to the Department of Health to say that he had considered the future of Dunboyne with the CEO and the community care staff in Navan. ‘We have no doubt whatever that the service should be continued for the foreseeable future.’ The Southern Health
Board (which covered counties Cork and Kerry) told the department that it referred 10 to 12 girls to Dunboyne on average each year. Very few girls from Cork city and county chose to go to Bessborough for reasons of anonymity and privacy; conversely, girls from Kerry did choose Bessborough ‘where they can keep in contact with friends and family’. The atmosphere in Dunboyne was described as warm, homely and emotional. ‘Psychological and educational needs are taken into consideration by the staff who are approachable, caring and supportive.’

24.133 In November 1989, the Good Shepherd Sisters wrote to the CEO of each of the eight health boards seeking information about the likely future use of Dunboyne. This letter pointed out that the capitation rate was £12.70 a day. This was not enough to meet running costs due to a reduction in the number of referrals and the reduction in the length of stay. The Good Shepherd Sisters were examining the feasibility of setting up two small units, in an urban setting and preferably close to a hospital, with one unit catering for students and girls aged up to 18 and the other catering for non-students. The Good Shepherd Sisters wanted to know what the likely demand for such places would be over the following four or five years. They also asked if the boards would be willing to pay the economic cost which they assessed at £22.75 a day.

24.134 In June 1990, the superior in Dunboyne wrote to Dublin Corporation seeking to be relocated. She said that due to financial difficulties, inadequate fire precautions and the present needs of single pregnant girls, they had decided to leave Dunboyne. They proposed to offer services to two groups: school age girls and homeless older girls; eight to ten in each category; they wanted to move to the city to be closer to maternity hospitals, courses and means of socialising; they had approached a reputable voluntary organisation about this.

24.135 Further meetings were held between the Good Shepherd Sisters, their financial and legal advisors and the NEHB and about the terms of their departure from Dunboyne. The Good Shepherd Sisters wanted money from the NEHB to cover the following:

- Money for a house to live in;
- Compensation for structures (building of home, laundry and two garages) and maintenance (new roof, flat roof, boiler, painting and decorating, plumbing, work in basement, central heating); personnel (salaries unpaid for four Sisters);
• Redundancy money for lay staff;
• Fire installation equipment, smoke detectors, alarm system;
• Teachers’ salaries plus nurses;
• Felling of dangerous trees;
• Retraining courses;
• £20,000 owed to Provincial funds;
• Compensation for lodge which Meath County Council promised to build when they took back some land for housing.

24.136 In November 1990, the Good Shepherd Sisters and the NEHB agreed that Dunboyne would close in June 1991. The NEHB agreed to pay the Good Shepherd Sisters £150,000 when they left the premises; the furniture was considered the property of the Good Shepherd Sisters. Shortly afterwards, the Good Shepherd Sisters made arrangements with an archivist to sort out what records should be archived.

24.137 In February 1991, the last two residents left. In June, the people of Dunboyne village arranged a thanksgiving Mass and party. All remaining Good Shepherd Sisters members and staff left on 1 July 1991.

Financial arrangements at the closure
24.138 In November 1990, the CEO of the NEHB wrote to the Good Shepherd Sisters confirming the agreed arrangements:

• The NEHB would pay the Sisters £150,000 in recognition of ceasing occupancy of the convent in Dunboyne around June 1991 (the date was flexible and there was no pressure);
• The furniture belonged to the Good Shepherd Sisters and they could do what they liked with it;
• The CEO would write to his colleagues to have outstanding bills paid; the NEHB would pay the outstanding amounts from Cavan, Louth, Meath and Monaghan at the earliest possible date - probably January;
• The CEO expressed ‘extreme gratitude’ to the Good Shepherd Sisters.

24.139 The CEO explained to the Department of Health in December 1990 that he had been approached by the Good Shepherd Sisters as they were finding it increasingly difficult to provide a service. They had 45 places available and the
The average number of residents was about 20. The service was therefore not viable. The Good Shepherd Sisters had a debt of about £60,000 and no way of repaying it. They wanted out of the agreement with the NEHB. He had agreed a closure date of June 1991 with them. He also agreed to pay the £150,000.

This figure is in respect of all outgoings which our Board would be responsible for, and in addition, is a sum in settlement of the Sisters relinquishing their lease which ran to the house and lands of 110 acres and for which the Sisters were entitled to the proceeds when this land was let. This is a fair figure in all the circumstances and has been accepted by the Provincial on behalf of the Order.

24.140 The CEO went on to say that institutions such as Dunboyne were no longer required.

Certain small individual splinter groups will contest this issue, but by and large, we are able to make arrangements for anybody who wishes them on a satisfactory basis. It is no longer feasible to provide accommodation for months on end for anybody without charging an appropriate rate. The appropriate rate in Dunboyne would be a number of pounds per week and this would be obviously impossible.

24.141 The NEHB asked the department to approve an overdraft of £200,000 to allow for the purchase of the lease. Department of Health officials were perplexed about the exact arrangements that had been entered into; they asked what exactly the NEHB was getting. The CEO gave a detailed reply to the department. He said that the potential loss to the Good Shepherd Sisters of future letting of the remaining 67 years of the lease was £505,900. The Sisters were entitled to compensation for any outlay by them on additions and improvements to the property. They had asked for £400,000; he refused this but his offer of £150,000 was accepted.

24.142 There were further enquiries made by the Department of Health about the exact acreage involved. The department established that no consideration had been paid by the Good Shepherd Sisters when the lease was agreed and that they had surrendered about eight acres to Meath County Council in 1975 for house building;

---

26 The consent of the Minister for Health was required for the transaction (under Section 89 of Health Act 1947)
they received consideration of £1,762 for this. The department approved the arrangements.

24.143 A departmental memorandum in May 1991 explained that the property and about 70-80 acres of land had been bought by Meath County Council in the 1950s. It was leased to the Good Shepherd Sisters for 99 years from 6 July 1959 on condition that they would carry on a home for unmarried mothers. There was a subsequent agreement that, if the sisters were asked to vacate before the termination of the lease, they would be compensated in respect of an extension they built in 1962 from their own funds at a cost of £28,000. A handwritten note commented that compensation of £100,000 would be excessive.

24.144 The memorandum stated that the department had been in touch with the other health boards to determine what impact, if any, the closure of Dunboyne would have. Three boards, the Eastern Health Board, the Southern Health Board and the North Western Health Board, all had other facilities available and were not affected. The other boards indicated that the closure had not created any particular difficulties for them and they intended to provide support for expectant women on a community basis. The department noted that one of the arguments put forward by CURA was that the health boards did not see the full demand for this type of service because many of the women involved preferred to seek support from Church based services.

24.145 The department had met CURA in May 1991 to discuss the closure. CURA was very concerned about the closure of Dunboyne as it had been used by CURA very extensively over the years. There were suggestions at the meeting that the closure was not initiated by the Sisters but had been forced on them by the decision of the NEHB CEO to reclaim the premises. The department noted that it was clear that the closure of Dunboyne had left a gap in the facilities available for young pregnant girls, particularly younger girls who wanted to continue their studies. CURA accepted that Dunboyne was too big for the then current needs but stressed that an alternative facility to cater for up to 20 pregnant girls would have to be provided, preferably in Dublin.

24.146 A social worker in Cork told the SHB director of community care that the closure was a big loss for girls from Cork. It meant that Bessborough was the only facility of its kind left in the country and it could not guarantee anonymity and privacy for
Cork girls who usually opted to go to Dunboyne. She described the services in Dunboyne as ‘welcoming, reassuring and professional’ and particularly appropriate for girls who wanted to continue their education. She said it was regrettable that the Department of Health did not prevent its closure by providing adequate financing. She further remarked that ‘Consultation also would have been more helpful if sought prior to closure and not after’.

24.147 The Board of Holles Street hospital also expressed concern about the closure.

Evidence from former residents

The experiences described by the former residents who gave evidence to the Commission are largely set out in their own words. In some cases, particular information which might identify the witnesses has not been included.

The Commission received a number of affidavits from former residents. These are sworn statements and are reported largely in the words used by the former residents. Unlike those who gave direct evidence, the Commission did not ask any questions of these former residents.

24.148 The Commission has received very few complaints about the conditions in Dunboyne or the physical treatment of the mothers there. All the evidence seen by the Commission and the evidence of the vast majority of former residents who spoke to the Commission suggests that Dunboyne provided comfortable, warm accommodation and the residents were well looked after physically. The younger residents were provided with educational opportunities from the 1980s. There are a number of letters in the Dunboyne institutional files from former residents expressing gratitude for the kindness shown to them. A letter, written in the 1990s by a woman who was in Dunboyne in the 1970s and who kept her baby, stated that she was very grateful for the time spent in Dunboyne; she described it as ‘a refuge, a sanctuary, a place of tranquillity, stability, rest and safety’.

24.149 Former residents did make complaints about the adoption process. In general, the adoptions were arranged by adoption societies and not directly by Dunboyne. However, the Sisters in Dunboyne did talk to the residents about adoption and clearly did encourage them to place the babies for adoption. Many of the mothers
clearly felt that they had no choice about adoption but it must be recognised that the pressure for adoption was also coming from their families.

24.150 A small number of former residents did make other complaints. These complaints are all firmly rejected by the Good Shepherd Sisters.

24.151 One former resident said that, from when she arrived in Dunboyne, the nuns in Dunboyne and the health board social worker ‘persistently’ talked to her about adoption. She said she was called into the nuns’ office once a week to sign the papers for adoption but she refused. (As already pointed out, the Good Shepherd Sisters were not directly involved in the adoption process; this was arranged by the relevant adoption agency.) She said that she was given tough jobs to do such as cleaning windows, tidying the nuns’ bedrooms and cleaning the bedrooms and the en-suites; the other girls who were ‘compliant with the nuns and agreed to adoptions’ were not asked to do these jobs. The Good Shepherd sisters have pointed out that the residents were expected to carry out light household chores but not heavy cleaning. This was carried out by paid staff members. The resident did not clean or tidy the Sisters’ bedrooms; they were not allowed into these rooms.

24.152 This former resident said that, in general, there were good opportunities for recreation and socialising. However, there was limited opportunity for education. She said there was a strict rule that first names and surnames were not to be mentioned as, according to the nuns, many residents did not want to be identified. She said that the doors of the institution were not locked and that the residents were allowed into the village at weekends and even managed to go to Dublin one day over the weekend.

24.153 She said that she did not want to give her baby up for adoption. After the birth in Holles Street, she and the baby went to Dunboyne. She said he was the only baby she saw in Dunboyne and she actually only saw him in order to feed him as he was kept in the nursery. She was told she would spend two weeks there but he was removed after a few days. She was not told he was being removed or where he was going. She left Dunboyne immediately and eventually found out from the health board social worker that he had been sent to St Clare’s, Stamullen. She

27 It should be noted that she went into Dunboyne almost at the end of the school year and had not been attending school prior to her going in.
said that the health board social worker had sent a letter to the priest who was involved with St Clare’s stating that she wanted the baby placed for adoption and that Dunboyne proposed to do a ‘direct placement’. The letter asked that the baby be kept for two months in Stamullen. She says that, contrary to what was stated in the letter, she had never agreed to any of these arrangements. She visited Stamullen and was initially not allowed to see her son. She says she created a lot of commotion and was eventually allowed to see him. After three months she managed to take him home.

24.154 Another woman who was in Dunboyne in 1980 said that the arrangements for her to go there were made by family members. She was there for three months which included the Christmas period. She shared a bedroom with three others. It was a large room with four beds and a large bathroom. She was given a different name. She says this was to protect anonymity but she thinks it was psychologically damaging.

24.155 She was 16 at the time but she said that she did not go to school while there. She said that everyone had jobs to do. She had to fill the salt and pepper shakers, make sure there was cutlery and do other domestic duties. Others had to mop floors or do other cleaning or domestic duties. She felt that she had the easier jobs and that the jobs were allocated depending on the social status of the women. She believed that some worked in the laundry but she never saw the laundry. She said they did domestic duties in the morning. In the afternoon they packed greeting cards. She believes the Good Shepherd Sisters had a contract to take boxes of greeting cards and put them in cellophane; she did this job but others did typing or other jobs. ‘You could choose what jobs you wanted to do in the afternoon, and in fact a few of the girls did nothing.’ There was a cook, a gardener and a minibus driver.

24.156 She said that the regime was very much that the women were ‘all sinners’ and had brought shame on themselves and most especially on their families. She was visited by her mother and other family members but the visits were not easy as they were trying to persuade her not to see the baby’s father and to give the baby up for adoption. Her father did not visit. The baby’s father visited but could not come into Dunboyne; they had to meet at the shops. Although the doors were not locked, it felt like incarceration. They were technically free to leave but they had
nowhere to go. She said there was a great sense of camaraderie among the ‘girls’.

24.157 The Sister in charge of blood pressure and weight checks was dutiful but always seemed a bit stressed. They got ante-natal care at Holles Street where she alleges they were treated differently by the nurses. She overheard the nurses refer to ‘that lot’ with a ‘bad connotation’. She says that they were not given any education about giving birth. She did not take the baby from Holles Street. She believes that she had no choice about adoption. Her family, the nuns etc all believed that adoption was the only answer.

24.158 Another former resident provided an affidavit. She was in Dunboyne for six months in the early 1980s. She was aged 15. She said they were told to go by first names and that second names were not mentioned. She said that she was pressurised into adoption. (There is a thank you letter from her in the Dunboyne institutional records.)

24.159 She said that there were no formal rules and regulations but they were ‘made to go to Mass and confession on a regular basis’. She described packing greeting cards and ‘doing cleaning and washing jobs that needed to be done around the house and for ourselves, sometimes a bit of gardening’.

24.160 She said that they were made to watch videos showing abortions which were sickening. She complained that the father of her child, who was considerably older than she, was not prosecuted.

24.161 Another former resident who filed an affidavit was in Dunboyne in the mid 1980s. She was 16 and she travelled there alone. She described doing chores and packing cards. She said that the timetable and the rules were fairly strict but they were never treated badly. ‘We were fed and we were warm.’ She said that there were no opportunities for education.

Evidence of former staff heard before the Commission of Investigation

24.162 A Sister who was in Dunboyne from 1964 to 1971 told the Commission that it was a very busy place at that time as the new extension had opened two years before
she arrived and there was a high demand for the service. Initially, there was accommodation for 15 mothers but the extension meant they could accommodate 30 residents - or 32 ‘at a squeeze’. She said the accommodation for the women and girls was on the ground floor. There was a kitchen, a dining room, a recreation room, a ‘famous smoke room’, and a small laundry for the use of the residents to deal with their personal belongings. Later a small building housing a small launderette was built.

24.163 The nursery was on the second floor ‘because, at that time, the mothers came back with their babies to Dunboyne’. There was a childcare nurse. There were two bedrooms with four beds in each room. The bathrooms were at the end of the corridor. She slept in a room off this corridor. There was a backstairs up to the old building. There were three four-bed rooms there and a bathroom.

24.164 This Sister was a midwife but she also did the administration. Later on, social workers took over the administration role. At that time, there were three staff - herself, a nursery nurse and a cook; there were no lay staff.

24.165 In the convent ‘which was really the old building’, there was the superior, her assistant and another Sister.

24.166 The residents did not go out to the village or generally at this time. Boyfriends did not visit. She remarked on how much things changed in these respects after she left in 1971.

24.167 The women went to Holles Street to give birth. (This Sister said it was exclusively Holles Street; they did not use St Kevin’s). A local GP visited on a weekly basis. The women were driven to Holles Street for ante-natal care and then taken back to Dunboyne. The Sisters had a minibus for this purpose. This Sister drove women to Holles Street as required when birth was imminent. The mothers came back to Dunboyne about seven days later and cared for the baby while there. Initially, the mothers stayed for two years but this was no longer the practice by the late 1960s. Mostly they stayed for about six weeks but some stayed longer because they could not come to a decision or maybe hoped that their parents would facilitate their return with their babies to the family home. Some women were visited by their parents but some did not want their parents to know they were there. The Sister said it ‘was very tough’ on them.
24.168 Babies were generally brought to St Clare’s, Stamullen for adoption. Some went to the CPRSI - mainly those who had been referred by this Society in the first place (these were mainly PFI s - see Chapter 7). This Sister had never been in St Clare’s. The Good Shepherd Sisters had nothing to do with adoptions.

24.169 Another Sister was in Dunboyne from 1975 to 1985. She was a midwife and had childcare experience. Her main responsibility in Dunboyne was to provide ante-natal care. When the women were admitted she took a medical history and recorded it on their chart. She conducted ante-natal classes twice a week. The local doctor visited once a week. She took blood pressures and did other routine tests before he arrived.

24.170 It was during her time there that educational facilities began to be made available. The girls who were preparing for exams studied in the mornings as the teachers came in the afternoons. Initially, the girls had to go to a centre in Dublin to do exams but then they got a designated centre in Dunboyne.

24.171 She described the atmosphere as lovely and relaxed. The grounds were lovely and facilitated the girls taking walks without being seen.

24.172 While she was there, there were never more than five or six babies; generally they went straight to foster care.

24.173 They grew some of their own vegetables; they were not self-sufficient but they did have potatoes, carrots, strawberries, blackberries and gooseberries.

24.174 Another Sister who gave evidence had worked in Dunboyne from 1982 to 1987. She was a qualified social worker. She considered Dunboyne a very happy place, effectively a refuge for the residents. The residents supported each other; they would come in tense and anxious. Confidentiality was a huge issue for them.

24.175 They had a full time housekeeper/cleaner at this stage. The residents did routine tasks.

24.176 When asked by the Commission, she said that they probably would not have taken mothers with mental health issues because they did not have the capacity to deal with them. She remembered one mother who was a member of the traveller
community. She said that this young woman found it difficult to settle; she left because she could not cope.

24.177 There was Mass every day but the residents were not obliged to go.

24.178 Even though a significant number of their residents were underage, the Sisters did not make any reports to the Gardaí. The Good Shepherd Sisters have pointed out that they regarded their role as providing care and support and that any criminal justice issues would have been a matter for the social workers dealing with the mothers. Mandatory reporting was not required at the time.

24.179 They had a lot of contact with CURA. A number of the Sisters were volunteers with CURA.

24.180 The mothers wanted to do what was best for the babies and the perceived wisdom at the time was that adoption was best. This perceived wisdom was not necessarily correct either then or now.

24.181 In an affidavit for the Commission another Good Shepherd Sister said she had worked in Dunboyne from 1971 to 1975 and again from 1985 until its closure in 1991. She was a qualified nurse and midwife. She had shared responsibility for pre-and post-natal care of the women. She drove them to Holles Street for check-ups and medical care and when they were ready to give birth.

24.182 She said that the Sisters had daily Mass in the convent but there was no obligation on the women to attend and, in general, they did not attend daily Mass. She said that nutritious and healthy food was prepared by the Sister in charge of the kitchen with help from some of the residents. The kitchen garden provided fresh fruit and vegetables.

24.183 Each resident usually had some light cleaning to do each day (provided there were no medical contra-indications); the heavy housework was carried out by a lay staff member. The residents did not do any outside work; this was done by a gardener/general handyman. The large laundry items (bed linen, towels) were sent weekly to a commercial laundry. There was a household launderette for the women's personal washing.
24.184 When she was first in Dunboyne, there was a nursery with a qualified nursery nurse in charge. This closed at some stage - she could not remember the precise date - when the babies went straight to foster care from the maternity hospital.

24.185 She described the atmosphere in Dunboyne as ‘very free’. The women were encouraged to go to the village and to meet friends, including boyfriends. Family, friends and boyfriends were welcome to visit on the premises. There were no standard visiting hours: ‘people came and went frequently’.

24.186 She said that there was no set getting up time or going to bed time. The residents decided for themselves; bedtime was significantly related to the TV schedule. There was a pay phone and the residents were free to use it. There was no question of anyone opening someone else’s post.

24.187 The residents all wore their own clothes; there was no uniform.

24.188 There was no burial plot in the grounds of Dunboyne. The Good Shepherd Sisters bought a plot in the local authority graveyard in Dunboyne where some infants were buried.
Chapter 24 A: Dunboyne Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

Dunboyne Total Mothers Admitted per Year
The Commission identified 3,156 women who were admitted to Dunboyne in the years 1955-90 from the institutional records.\textsuperscript{1} Information relating to date of admission was available for 3,138 women (99.4% of admissions). In the years 1955-70, 606 women were admitted - representing 19.3% of admissions. In the 1950s, 17 women on average were admitted annually; this increased to 46 average annual admissions in the 1960s. A significant increase in admissions was recorded in the 1970s peaking in 1973 and 1974; 144 women were recorded in each year. Although admissions had decreased by 1980 - 113 women were admitted that year - they increased steadily until 1986 when 143 women were recorded. Average annual admissions in the late 1980s stood at 117 and 95 women were recorded in 1990, its last full year in operation.

Analysis by decade shows that most admissions to Dunboyne were recorded in the 1980s (40.34%) followed closely by the 1970s (39.42%); the 1960s (14.53%); the 1990s (3.03%) and the 1950s (2.68%). Eight in every ten women admitted to Dunboyne entered the home in the 1970s and 1980s.

\textsuperscript{1} Some admission registers relating to the late 1960s and early 1970s are not available, presumed missing from the Dunboyne institutional records. As a result, the number of admissions identified by the Commission must be regarded as incomplete. Department of Health returns for this period suggest that the discrepancy may amount to 49 women. However, it was not possible to identify the extent of the discrepancy with any great accuracy.
Information relating to age on admission was available for 3,139 women (99.5% of admissions).

The institutional records show that age on admission ranged from 12 to 45 years; the mode of age on admission was 19 years. The average age on admission in the 1950s was 26 years. This declined to 20 years in the 1970s and 1980s and increased slightly to 21 years in the 1990s.

Most women (70.5%) were aged between 18 and 29 years on admission; 23.5% were 17 years or younger and 6% were 30 years and older.

Over one in ten of all admissions to Dunboyne (11.7%) were aged between 12 and 16 years and under the legal age of consent.
Information relating to previous pregnancy was available for 2,413 women (76.5% of admissions).

The institutional records show that most women (82.5%) were admitted on their first pregnancy; 12.6% were admitted on their second pregnancy and 4.9% on their third or subsequent pregnancy. In the 1950s, over 63% of all admissions were women on their second or subsequent pregnancy; by the 1980s this cohort represented a much reduced 7.3% of admissions. Conversely, women admitted on their first pregnancy represented around 12% of admissions in the 1950s but made up over 81% of admissions in the 1980s.

**Marital status**

Information relating to marital status was available for 2,925 women (92.7% of admissions). The institutional records show that most women (98.4%) were single. The remaining women were recorded as married, separated or widowed.
Information relating to occupations was available for 2,207 women (69.7% of admissions).

The institutional records show that most women (43.7%) were recorded as domestic servant or other unskilled worker; 25% were recorded as teacher, civil servant, nurse, clerical or other skilled worker; 23.3% were in full time education; 6% were unemployed or in receipt of state benefit and 2% were engaged in home duties - working in the family home or on the family farm.

Of the 514 admissions recorded as being students 81.1% were second level and 18.5% were third level students. Two were recorded as primary school students.
Information relating to previous address by county was available for 3,082 women (97.7% of admissions).

The institutional records show that most women (18.92%) gave Dublin as their address prior to entry followed by Cork (10.19%); Meath (7.59%); Wexford (5%); Louth (4.96%); Westmeath (4.67%); Limerick (4.15%); Cavan (4.06%); Galway (3.86%); Tipperary (3.44%); Offaly (2.66%); Donegal (2.56%); Waterford (2.53%); Kildare (2.47%); Kilkenny (2.43%); Mayo (2.3%); Wicklow (2.14%); Laois (2.14%) and Sligo (2.04%). The remaining 11.88% of women combined gave addresses in Roscommon, Monaghan, Clare, Kerry, Carlow, Longford, Leitrim, Antrim, Down, Fermanagh, Derry, Tyrone and Armagh.
Referral pathways

Information relating to referral pathways to Dunboyne was available for 3,036 women (96.2% of admissions).

The institutional records show that most women (37.3%) were referred to the institution by an adoption society - the majority by CPRSI. The second most frequent referral pathway was local boards of assistance/health boards - 34.8% of women were referred by these bodies. Voluntary organisations - mainly CURA - referred 13% of women to the home; 4.5% were referred by a priest or nun; 2.9% by a friend of family member; 2% self-referred; 1.5%

---

2 The majority of referrals to Dunboyne from adoption societies (67%) were through CPRSI. Women were also referred by St Anne’s Adoption Society; St Patrick’s Guild; St Clare’s Adoption Society; St Bridget’s Adoption Society; Ossory Adoption Society; The Rotunda Girls’ Aid Society and St Catherine’s Adoption Society.
were referred by a social worker; 1% transferred from a Magdalen laundry; 0.8% transferred from another institution, county home or hospital and the remaining 2.1% combined were referred by other named individuals, via a nurse, doctor, guard or solicitor or transferred from an industrial school or supported accommodation.

From the 1950s to the 1970s, referral via a board of assistance/health board was the most frequent referral pathway; by the 1980s most women were referred by adoption societies. In the 1950s, only one woman was referred by a priest or nun. In the 1980s, 40 women were referred in this way. In the 1970s most women referred by a voluntary organisation were referred by ALLY; in the 1980s most referrals from this sector were from CURA.
Information relating to average occupancy was available for 3,004 women (95.2% of admissions).  

On opening, Dunboyne was deemed suitable to accommodate 22 and a maximum of 25 adults. The institutional records show that average occupancy in the years 1955-63 was generally below maximum accommodation levels. Average occupancy in this period was greatest in 1957; it may have been operating close to its maximum occupancy limit at that time. However, Dunboyne did not experience the acute overcrowding which was a perennial feature of other mother and baby homes. The premises were extended in 1963 and average occupancy increased steadily from that year. The busiest period of its operation was 1973-74 when 144 women were admitted in each of those years - average occupancy for those years was 32 and 31 women respectively.

3 Records for 1969, 1970 and 1971 are incomplete. Average occupancy presented here is based on the available records.
Comparative analysis of admissions per year and average occupancy confirms that, in the main, Dunboyne was not prone to overcrowding. Average occupancy exceeded annual admissions on just two occasions - in 1957 and 1961. It should be stressed that the number of admissions in these years was relatively small and that any overcrowding cited in the historical record most probably meant having one or two extra women on the premises. The addition of extra accommodation in 1963 appears to have solved the matter.
The occupancy comparison chart shows a comparison between the occupancy recorded in the Commission’s database (compiled from the institutional records) and returns sent to the Department of Health by Dunboyne for the years 1957-69 inclusive. Temporary absences from Dunboyne, which were frequent, are not recorded in the Commission’s database so this may slightly inflate the Commission’s calculations regarding occupancy. It seems clear, however, that the numbers forwarded by Dunboyne to the Department of Health are largely in line with those recorded in the institutional records.
Length of stay

Information relating to length of stay was available for 3,004 women (95.2% of admissions).

The institutional records show that the average length of stay in Dunboyne declined from a high of 582 days on average for women admitted in 1955 to 74 days on average for women admitted in 1990. Some of the longest length of stays were recorded among women admitted in 1957 and 1961 (437 and 446 days respectively) - this most likely contributed to the relative overcrowding previously identified in Dunboyne in those two years.

Women admitted to Dunboyne in the 1950s spent 383 day on average there; women admitted in the 1970s spent a much reduced 85 days on average there.

In the 1950s, women were admitted to Dunboyne 63 days on average before giving birth; by the 1980s this had increased to 81 days on average before the birth.
In the 1950s, most women (52%) left Dunboyne within a year of giving birth. Of those, 17.4% left within 50 days; 18.8% within six months and 15.9% within twelve months. Of the remaining women, 29% remained in the home for between one and two years after giving birth and 18.8% remained there for periods of between 25 and 32 months.
This pattern altered somewhat in the 1960s. In that decade 30.4% of women left within 50 days of giving birth and a further 46% left within six months. Just over 10% of women remained in the home for between six months and one year and a further 10% remained there for between 12 and 24 months. The percentage of woman who remained in the home for over two years had reduced from 18.8% in the 1950s to 3.4% in the 1960s. The longest recorded stay after birth in the 1960s was 32 months.

By the 1970s the pattern had altered significantly. By this time 89.7% of women had left Dunboyne within 50 days of giving birth and 9.7% within six months. Just four women remained in the home for between six and twelve months and one woman remained for 403 days.

In the 1980s, 98.8% of women left Dunboyne within 50 days of giving birth and most of the others had left within three months. One woman remained in the home for a little over one year. In the 1990s, all but one woman left the institution within 50 days of giving birth.

**Place of birth**

Information relating to place of birth was available for 2,773 women (87.9% of admissions).
The institutional records show that most women (88.5%) gave birth in Holles Street (National Maternity Hospital). Just over 11% of women gave birth in other hospitals and institutions including the Coombe, the Rotunda, St Kevin’s/St James’s Maternity Hospital, Pelletstown and Castlepollard. Eight women gave birth in Dunboyne.

**Outcome**

Information relating to birth details was available for 3,008 women (95.3% of admissions). The institutional records show that 66% of women were admitted to Dunboyne, left to give birth and returned to the home; 29% left to give birth but did not return to the home and 5% were admitted in the first instance accompanied by their baby.

**Birth details**

Information relating to birth details was available for 2,843 women (90.1% of admissions). The institutional records show that 98.73% of women gave birth to living infants; 1.2% gave birth to still born infants and 0.07% suffered a miscarriage.
Information relating to exit pathways was available for 2,783 women (88.2% of admissions).

Most women (68.99%) were recorded as leaving Dunboyne and returning to the family home or other private address; 21.52% were discharged to hospital - mostly women who left to give birth and did not return; 4.06% were discharged directly to take up employment; 1.87% transferred to Magdalen laundries; 1.29% were discharged to hostels and other supported accommodation; 1.19% transferred to other institutions under the Commission’s remit; 0.5% ‘absconded’ leaving their baby in the home; 0.25% transferred to industrial schools and children’s homes; 0.22% transferred to mother and baby homes outside the Commission’s remit; two left accompanied by a nun or priest and one woman left in the care of a voluntary organisation.

Exit pathways from Dunboyne did not alter significantly in its period of operation. The majority of women discharged from the home in each decade either returned to the family home or transferred to hospital. The available records show that in the 1950s, 69% of women left via those routes - in the 1980s they accounted for 80% of discharges.
Child admissions

The Commission established that 1,148 children were admitted to Dunboyne in the years 1955-90.\(^4\)

Information relating to date of admission was available for 1,098 children (95.6% of admissions). In the period 1955-62, 15 children on average were admitted annually; 20 children were admitted in the years 1958 and 1960. Child admissions began to increase steadily in 1963; extra accommodation had been added that year. Child admissions peaked in 1971, when 80 admissions were recorded, and remained relatively high until 1976. A steady decline in admissions was recorded thereafter falling from 66 in 1976 to 17 in 1980. Admissions remained relatively low during the 1980s; during 1982-90 just two children on average were admitted annually.

\(^4\)Some admission registers relating to the late 1960s and early 1970s are not available, presumed missing, from the Dunboyne institutional records. As a result, the number of admissions identified by the Commission must be regarded as incomplete. Department of Health returns for this period suggest that the discrepancy may amount to 65 children. However, it was not possible to identify the extent of the discrepancy with any great accuracy.
Analysis by decade shows that most children (53.83%) were admitted in the 1970s followed by the 1960s (34.97%); 1950s (6.74%); 1980s (4.37%) and the 1990s (0.09%).

In the 1950s, 88% of children born to women admitted to Dunboyne were subsequently admitted to the home. This decreased to 84% in the 1960s, to 47.77% in the 1970s and to 3.79% in the 1980s. Although 95 women were admitted to Dunboyne in 1990 just one child was admitted to the home that year.
The institutional records show that, of the 1,148 children admitted to Dunboyne, 98.9% were admitted accompanied by their mothers; 0.6% were admitted with expectant women and 0.5% were admitted unaccompanied.
Information relating to average occupancy was available for 882 children (76.8% of admissions).

Child occupancy in Dunboyne was highest in the period 1956-69; an average of 17 children were living in the home in this period. Occupancy peaked in 1965 and 1966; an average of 22 and 21 children respectively were living in the home in those years. Average child occupancy exceeded admissions in 1957, 1959, 1961 and 1962. After extra accommodation was added in 1963, average occupancy remained well below admissions from there on in. Although child admissions to Dunboyne increased significantly in the 1970s, average occupancy decreased to single digits. This is most likely attendant on the decrease in the
number of women who returned to Dunboyne after giving birth and the increase in the number of women who left the institution within 50 days of giving birth.

The occupancy comparison chart shows a comparison between child occupancy recorded in the Commission’s database (compiled from the institutional records) and returns made to the Department of Health by Dunboyne for the years 1957-69 inclusive. Temporary absences from Dunboyne, such as cases where a child was receiving treatment in hospital, are not included in the Commission’s calculations so this may slightly inflate the Commission’s calculations regarding occupancy. It seems clear, however, that the numbers forwarded by Dunboyne to the Department of Health are largely in line with those recorded in the institutional records.
Child length of stay

Information relating to length of stay was available for 882 children (76.8% of admissions).

Children admitted to Dunboyne in the 1950s spent the longest periods in the home. The average stay in that decade was 379 days and ranged between 569 days on average in 1955 to 325 days on average in 1958. Although child length of stay in 1961 was relatively high - 476 days was the average stay that year - by 1970 average length of stay had fallen dramatically to 63 days. By 1978 average length of stay had decreased to just eight days. Although average length of stay increased in the years 1979-81 average length of stay for the remainder of the 1980s was between one and six days.

Child discharge relative to Mother

Information relating to child discharge relative to the mother was available for 899 children (78.3% of admissions).

The institutional records show that most children (71%) were discharged from Dunboyne on the same date as their mothers; 21% were discharged while their mothers remained in the home and 8% remained in the home for periods subsequent to their mothers’ discharge.
Child exit pathways

Information relating to child exit pathways was available for 1,121 children (97.7% of admissions).

The institutional records show that most children (68.2%) were placed for adoption - mainly through St Clare’s Adoption Society, Stamullen, and the CPRSI; 22.2% were discharged with their mother or another family member; 8.9% transferred to other institutions - mainly children’s homes and hospitals - and 0.6% were boarded out.

The available records show that, in the 1950s, 39.66% of children discharged from Dunboyne were placed for adoption. This increased to 71.16% in the 1960s but had decreased to 44.44% by the 1980s. In the 1950s, 32.76% of children left Dunboyne with their mother or other family member. This decreased to 20.9% in the 1960s but had increased to 50% by the 1980s. In the 1950s, 20.69% of children (1 in every 5) transferred to other institutions - by the 1960s, 5.56% of children exited the home via this route.
The Commission identified 47 children who were placed for foreign adoption from Dunboyne. Most children (89.4%) were adopted in the USA; 8.5% in Great Britain and 2.1% were adopted in Northern Ireland.
Child deaths
The Commission identified 37 child deaths associated with Dunboyne. These include one child who died in Dunboyne; five who were admitted to Dunboyne and died elsewhere and 31 children who were never admitted to Dunboyne but whose mothers had been living in the home prior to their birth.

The child who died in Dunboyne was born in Holles St and admitted with the mother when five days old. The child died in Dunboyne aged 27 days; the cause of death was notified as pneumonia.

Information relating to date of death was available for 34 of the 37 children. The available records show that 33 were born in Holles St hospital\(^5\) - 20 subsequently died there; five died in Our Lady's Children's Hospital, Crumlin; three in Temple St Children's Hospital; two in the Rotunda Hospital and one in Dunboyne. Place of death was not available for the remaining cases.

The worst year for child deaths was 1975 - five children died that year. All five were born in Holles St hospital to women transferred from Dunboyne - three subsequently died in Holles St and the others died following transfer to Temple Street and Our Lady's Children's Hospital.

---

\(^5\) The birth place of the remaining child was not identified.
Information relating to age on death was available for 32 of 37 child deaths.

All deaths occurred in infancy as follows: Perinatal (0-7 days) 65.6%; Neonatal (8-28 days) 15.6% and Infant (29-365 days) 18.8%.
Information relating to cause of death was available for 32 of the 37 child deaths (86.5%). Most deaths (37.5%) were notified as being due to one off incidents of sudden infant death syndrome; potter syndrome; pyloric stenosis; congenital malformation and perinatal asphyxia. Respiratory infections - mainly bronchopneumonia - accounted for 28.1% of deaths; 15.6% were notified as spina bifida; 12.5% as non-specific causes - generally prematurity and 6.3% were notified as congenital heart disease.

The Commission located a GRO death record for 32 of the 37 children.
Chapter 25: Miss Carr’s Flatlets

Introduction

25.1 Miss Carr’s was not a traditional mother and baby home. It provided hostel type accommodation for unmarried mothers and their children. It opened in 1972 and is still in operation. Initially it was at 16 Northbrook Road and it moved to 5 Northbrook Road in 1992. No 5 was renamed ‘Ecclesville’ at this time. This was to honour Miss Leonie Eccles who was the driving force behind the establishment of the service. The 1989 and subsequent Annual Reports describe the Flatlets as ‘Miss Carr’s Girls Hostel’. The service is now known as Carr’s Child and Family Services.

25.2 The total number of women and children who lived in the Flatlets is not known but, based on the evidence as outlined below, it is likely that about 180 women and 200 children lived there in the period 1972 to 1998.

Origins

25.3 Miss Carr’s (Flatlets) opened in 1972 to house one parent families in need of temporary accommodation. The service was an extension of Miss Carr’s Children’s Home1, a Protestant institution, which was located at 5 Northbrook Road. The Protestant Child Care Association and the Eastern Health Board (EHB) were both supportive of this extension of services to single mothers.

25.4 The idea for establishing the Flatlets seems to have come from Miss Eccles who was the manager of another children’s home but was involved with Miss Carr’s Children’s Home. She reported that, at an AGM of the Protestant Child Care Association in April 1972, an EHB social worker outlined the urgent need in the community for accommodation for one parent families, so that mothers could be given an opportunity to bring up their children independently and to avoid, if possible, separation of mother and child in the early years. At this time, there were one or two single parent families resident in the children’s home (No 5). Miss Eccles suggested that Miss Carr’s should buy a house close to the children’s home.

---

1 The Commission is not investigating Miss Carr’s Children’s Home but it is inextricably intertwined with the Flatlets. It was founded by Miss Lizzie Carr in 1887 and for a time had five houses. It moved to 5 Northbrook Road in 1920. Miss Lizzie Carr died in 1932 and the running of the home was taken over by her cousin Miss Eunice Carr. Miss Eunice Carr died in 1970 so there was never a Miss Carr involved in Miss Carr’s Flatlets. Miss Carr’s Children’s Home closed in 2007. It was one of the institutions covered by the Residential Institutions Redress scheme (see Chapter 2).
to accommodate six or seven families in flatlets. It would be funded by
government sources and tenant rents. The aim would be to help these families to
reorganise their own lives with a minimum of interference so that in a few years or
less they could reintegrate into the community. She argued that a mother with a
young baby should be encouraged to stay at home with her baby, the Health
Board would pay rent and maintenance. When the children reached school age,
No 5 could be their second home until the mother returned from work.

No mother can be expected to understand the full implications of bringing up
her own child until she has had the full responsibility of caring for
him/her....The mother who cares for her baby entirely unaided will very quickly
discover if she is suited to take on full time motherhood…or if the alternative
of Adoption would be in the best interests of herself and child.

25.5 A special meeting of Miss Carr’s Children’s Home committee was held in June
1972 to consider the proposal that Miss Carr’s Children’s Home should extend its
activities by making flats and rooms available to unmarried mothers and deserted
wives. A memorandum prepared in advance of this meeting noted that the council
of the Protestant Child Care Association (PCCA), a body representative of all
Protestant organisations concerned with the welfare of children, was agreed that
‘the greatest unfulfilled need at the present time is the provision of accommodation
for unmarried mothers and their children’. It also noted that the welfare section of
the Eastern Health Board (EHB) attached considerable importance to the
proposition. ‘They have looked to the Protestant Community to give a lead in this
matter by establishing a successful model for others.’ The memorandum outlined
the probable costs involved. It noted that Miss Carr’s owned a house worth (say)
£40,000, and had investments and cash of perhaps £4,000, out of which about
£1,500 would be applied to the fire precautions. A new house, including
alterations, might involve an outlay of £30,000. ‘We can probably borrow this sum
on the security of the two houses we would then own.’ The EHB had indicated,
unofficially, that it would ‘substantially increase’ the grants which it gave for
children already in Miss Carr’s and those who would occupy the new residence
and this would provide an additional sum of perhaps £2,500 a year. The memo
proposed a once-off appeal for capital funds for the new house and recognised
that some mothers would be in a position to pay for accommodation. It also noted
that it was ‘conceivable that part of the funds of Bethany home (now closed), could
be allocated to us by the committee and by the Charitable Commissioners on the
basis that work carried out would be similar in nature’.
The proposal was agreed and, with remarkable speed - two days later - No 16 Northbrook Road was bought. It was converted into nine flatlets. The first residents arrived in October 1972.

**Sources**

**Carr's Child and Family Services**

Carr's Child and Family Services provided the Commission with photocopies of the relevant records which it holds. These records are the main source of information available to the Commission. The main records involved are:

**Admission Records:** The Admission Records cover the period from October 1972 to March 1987. There are entries for 111 mothers with a total of 120 children. A range of information is recorded for each mother including date of admission, age group, number of children, referring body, reasons for referral, length of stay, subsequent accommodation, training/job and use of nursery. The person in charge of Miss Carr’s from its opening to 1987 was Miss Leonie Eccles. It seems that her thorough record keeping was not continued by her successor. (The Commission recognises that detailed records are not as important in a context where tracing does not arise.)

**Minutes of House Committee Meetings:** The house committee dealt with Miss Carr’s Children’s Home, the nursery and the Flatlets. The available minutes of its meetings cover some of the period from 1972 until the sale of No 16 in February 1992. The period from January 1974 to March 1987 is not covered with the exception of a document in 1977 outlining the pros and cons of moving the day nursery to Wesley House. There are a number of additional documents within the minutes relating to the foundation of Miss Carr’s (Flatlets) and outlining the aims and organisational structure. The meeting minutes contain short reports from the case committee and the nursery committee (see below). The case committee reported on interviews for admissions, places offered and occasionally on other issues concerning individual residents. The remainder of the minutes are largely concerned with financial, administrative and building maintenance matters.

**Annual Reports (1972-1998):** The published annual reports of Miss Carr’s Children’s Home included a section each year on No 16 and, after 1992, on Ecclesville. The tenor of the reports is in general very positive and there is an
emphasis throughout on the importance of keeping mothers and babies together. The annual reports from 1972 to 1983 cover the 12 months from October to October. The 1984 report covers 14 months from October 1983 to December 1984. All subsequent reports cover the calendar year. The reports generally note the number of families living in No 16 in a given year and whether those who left during the year went on to private or public accommodation. Occasional rent increases and house renovations are also documented. There is a continuing, and understandable, lament about the lack of social housing, rising rents in the private sector together with the unwillingness of landlords to accept young children. Donations of gifts and money are recorded as well as fundraising initiatives such as an annual sponsored cycle, Christmas parties, sales and coffee mornings. Holidays to Rush were also organised. Occasionally the reports document specific details in relation to an individual mother or her child.

Evidence

25.8 The Commission heard evidence from the current CEO of Carr’s Child and Family Services and from Miss Nan Dwyer who was the manager of the Miss Carr’s Children’s Home from 1969 to 2000.

Department of Health files

25.9 There are a small number of references to the Flatlets in the Department of Health files. They are mainly concerned with financing. The main files used for this chapter are:

INACT/INA/0/454197
CCP/IMP/0/45687

Funding

25.10 The cost of the house (No 16) and its refurbishment was £30,000 which Miss Carr’s Children’s Home borrowed. While there clearly had been sympathetic noises, and indeed expressions of enthusiasm, from the EHB, there were no prior commitments to provide additional funding. The EHB applied to the Department of Health in January 1973 for approval to cover half the costs involved - the proposal was to give the Flatlets a Section 65 grant of £15,000.²

² These were mainly organised for Miss Carr’s Children’s Home but the finances of the children’s home and the Flatlets were intertwined and, effectively, the children’s home fundraising subsidised the Flatlets.

³ Section 65 of the Health Act 1953 allowed health authorities to provide money to various bodies which provided services similar or ancillary to the services directly provided by the health authority. It was the legal basis for practically all health authority payments to voluntary organisations until 2005.
Initially, the Department of Health was reluctant to agree to the EHB’s proposal to part fund the Flatlets. In March 1973, the argument was made that this was a housing issue rather than a health issue and the department drew the EHB’s attention to the existence of various Department of Local Government grants for housing.

A Department of Health memorandum dealing with the application for funding stated that the Flatlets would be non-denominational. The argument was made that the provision of housing accommodation for unsupported mothers and their children was in line with the Social Recommendations published by the Council of Europe in 1970. It also pointed out that there was a growing feeling that unmarried mothers should, if they wished, be helped to keep their children rather than have them adopted or placed in health board care.

It is clear that this type of accommodation with some degree of benevolent supervision and protection for the children would be more desirable especially for unmarried mothers, than flats in privately owned homes. Miss Carr’s Home is to be commended for embarking upon such a project without any private funds or securities at their back.

The grant was approved by the Department of Health in October 1973. The Department of Local Government calculated that it could pay £583 a year for five years as a subsidy to the loan charged on the remaining £15,000. It is not clear if this actually happened.

In 1977, the bank loan for the purchase of the house was paid off: ‘Early in the year we realised that our biggest financial burden had been lifted from our shoulders…’

The children’s home was financed mainly from private sources and there were a small number of children resident there who were being paid for on a capitation basis by the health authorities. The evidence available suggests that the Flatlets were subsidised by the children’s home through its fundraising activities and access to some trust funds.
25.16 As had been hoped, some of the proceeds of the sale of Bethany home were allocated to Miss Carr’s Children’s Home. The High Court ordered that the Commissioners for Charitable Donations and Bequests retain the capital and pay 85% of the income from it to Denny House and 15% to Miss Carr’s Children’s Home.4

25.17 The plan was that the residents would support themselves and, if unable to do so, would get Home Assistance (see Chapter 1). The Unmarried Mother’s Allowance was introduced in 1973 and many of the residents would have qualified for this. Home Assistance was replaced by the Supplementary Welfare Allowance scheme in 1977. This scheme included provisions for the payment of Rent Supplement in appropriate cases (see Chapter 1).

25.18 The heating and lighting costs were the responsibility of each resident, apart from the general areas (sitting-room, bathroom) and they paid a small rent. Individual electricity meters were installed in each flatlet in 1985 but the Annual Report notes that hot water was still ‘on the house’ and there was a fire in the sitting room each evening. A charitable trust contributed to the cost of the metering.

25.19 In 1976 a laundry room was installed at the back of the house.

**The Nursery**

25.20 Initially, the residents of the Flatlets could avail of the nursery free of charge but in 1987 it was decided that new entrants to the Flatlets would pay £3 a week if using the nursery. The Nursery was not used exclusively by residents of the Flatlets. It was used by local residents and when women left the Flatlets they sometimes continued to use the nursery for day care.

25.21 The importance of day care was emphasised in the 1983 Annual Report:

> If we wish to continue our policy of helping families to become self-supporting we have to persuade the authorities that subsidising nursery care for working mothers is money well spent in the long term. Our own experience to date has been that by and large, mothers who do not have the stimulus of even part-time work become very depressed and their children then need nursery care to counteract this unhappy state of affairs.

---

4 *Irish Independent*, 13 November 1974; see also Chapter 23.
Charitable donations

25.22 The Annual Reports show that the Flatlets received charitable donations and contributions by way of voluntary work. In 1972, the year of its opening, it is recorded that gifts were received of bedding, furniture, electric cookers, kitchen equipment and furnishings. Other examples reported in the Annual Reports include:

- In 1975, the Mothers’ Union of the Diocese included No 16 in their centenary project and raised €900 which was spent on a laundry, curtains and carpet. The North Strand Church provided Christmas hampers for each resident family.
- In 1976, there were gifts of additional furniture and a spin-dryer
- In 1990, a new shed, washing machine, freezer and night light at the back of the house were gifted; the living room was given a ‘face lift’ with new curtains and paint colour and the roof was insulated.

25.23 In 1984, the Annual Report noted that No 16 and the nursery day centre had to receive a healthy injection of funding from No 5 to survive. The rent was increased in July in an effort to make No 16 self-financing:

The increased rent this entails poses a problem for some of the people we feel can benefit most from what we have to offer. Mothers not working can avail of Supplementary Benefits to help pay both rent and fuel bills, but full time students, who cannot count on help from parents, are not at present entitled to any benefit other than the unmarried mother’s allowance. - a strange anomaly when one realizes that, hopefully, these families would only need State Benefits for a limited period.

25.24 In April 1992, No 16 was sold at auction for £192,000.

Governance

25.25 Miss Carr’s Flatlets was a purely private institution which was not subject to any State inspection. Miss Carr’s Children’s Home had a general committee and it agreed that a specially appointed committee of management would be established to deal with all matters relating specifically to the Flatlets. This was initially appointed by the general committee but later was able to appoint its own members who were then ratified by the general committee. Financial matters and staff appointments were dealt with jointly.
25.26 A case committee was also established with people experienced in this work. Two members of the case committee were also on the Flatlets Committee for liaison purposes. The case committee was completely responsible for the choice of residents, within the principles laid down by the general committee:

- The sole criterion for admission should be 'need'
- Not more than three units of accommodation were to be used for families with older children

25.27 The case committee was also required to review the tenancies\(^5\) regularly, together with the resident and her social worker or other interested body, so that the future could be thought about.

25.28 For administrative purposes the day nursery and the Flatlets were incorporated into a company called Miss Carr’s Housing Association Limited in July 1992.

**Living conditions**

25.29 No 16 was a large Edwardian house in a residential area which, as already stated, was divided into nine flatlets. Each flatlet housed one mother and her child(ren). There was no indication from the outside that the house was used for accommodating mothers and children. Its location was convenient to shops and places of employment.

25.30 In 1973, Miss Eccles visited a number of similar establishments in England; she described the basic structure of No 16 as being in line with the 'more forward thinking English units'.

**Nature of the service**

25.31 The residents of Miss Carr’s had sheltered housing at a reduced rent in what appears to have been a supportive environment. The intention was to enable mothers and their children to move on to independent living. The average stay was around one year with the aim of making the family self-sufficient.

25.32 The aims of Miss Carr’s Flatlets were:

---

\(^5\) The terms ‘tenant’ and ‘tenancies’ are used frequently in the various records but it seems that there was not a standard landlord and tenant relationship; it was more akin to a licence arrangement.
- to supply temporary accommodation for one parent families in need (applications to be made through social agencies or voluntary body).
- to allow a family to work through a particularly traumatic experience with the help of a social worker.
- to enable a mother to establish a work pattern suited to herself and her child, actively seeking training if appropriate.
- to give a mother time to assess what mothering is all about and either to accept this role or the fact that adoption may be the most loving thing she can do for her child: ‘A terribly difficult choice and one that, in the child’s best interest cannot be kept on the long finger’.

25.33 It was accepted that long stay accommodation in No 16 was not in the best interest of a family. Ideally, by the time a family moved on, the mother would know how to manage a home, to budget and to cope with household problems and if necessary have acquired sufficient furniture. It was envisaged that mothers would stay for between six and 18 months and then move into private or public accommodation.

25.34 The 1972 Annual Report outlined the options facing unmarried mothers

As regard the question of returning to work, in the interest of both the mother and the child this must vary with the individual. It may be that a young mother on finding herself coping single-handed with a baby, and observing the problems facing mothers with older children, may realise that adoption may be the most loving thing she can plan for her child’s future. We hope that we can help her to feel that an irrevocable step like this can be as much, if not more of a sacrifice than keeping her child with her.

Conversely, if a mother decides to keep her child we hope to be able to find a family who will give her the supportive help so necessary, especially when she leaves our more sheltered surroundings… we have to work on the proper balance between demanding more of these families than they are ready to cope with, and cushioning them too much so that they may not be able to survive in ordinary society later on. On the one hand we must be realistic, and yet the problem of coping with a minute amount of money could well deter a mother who would in other ways be ideally suited to care for her child. One does not want her to think of marriage just as a meal ticket for the two of them, but we would rather like her to feel able to cope independently and
then, if marriage comes later, there will be a greater chance of happiness for all concerned.

25.35 As already stated, a nursery was operated initially in No 16 and from 1977 onwards in nearby Wesley House. This gave mothers access to child care which enabled them to go back to work or study. Mothers who stayed in the area could continue to avail of the nursery after they had moved out of the Flatlets.

25.36 In April 1980 a part-time social worker was appointed.

25.37 The minutes of the meetings of the house committee show that the committee was mainly concerned with practical aspects of repairs and maintenance and acquiring equipment. In the early years, there are numerous references to painting and decorating, installation of heating, problems with the water supply, general maintenance and repairs and trying to get a telephone connection. As is described above, sometimes voluntary workers were used to carry out works.

25.38 The minutes give an indication of the issues which arose specifically for the Flatlets. For example, in 1972, the case committee had to consider whether or not a child with an infectious disease could be allowed return.

25.39 In 1973, the residents request to run a coffee evening was granted. The house must have had more than one TV as the committee considered whether or not they needed another TV licence. It was noted that Home Assistance was providing the rent for one mother.

25.40 The Annual Report for 1976 notes that the Flatlets were now ‘a much more accepted part of the community’. A coffee evening organised by the residents was supported by the local residents association.

25.41 In 1987 the case committee considered the visiting rights of a father with a history of psychiatric illness. It was agreed that he could visit once a week at a mutually agreeable time.

25.42 In 1988, there was a resident who had a drug problem and there was concern that she might have been peddling drugs. This person left soon afterwards. The
washing machine was giving trouble and it was suggested that they get a commercial machine. However, the hire company would accept only a householder as guarantor and not Miss Carr’s!

25.43 In 1989, the case committee noted that there had been few suitable applicants recently and a review of the aims might be needed. It was noted that there were problems with one resident who had been followed by a ‘criminal element’ whom she had known. Items had been stolen from the house.

25.44 The case committee considered how long they should keep a room for a resident who had been in hospital with psychiatric problems for eight weeks. It was felt that, as no applicants were waiting, the room should be held for the time being. Another recently arrived resident was a serious problem because she had a very low IQ and was not coping at all. It was agreed that they could not offer this girl the supervision and training in baby care that she would need if she was ever to cope independently. They decided to look into alternative placement. In 1990, the case committee reported that the resident who had been in the psychiatric hospital had gone home and the resident with the low IQ had gone to Denny House. In June 1990, it is recorded that all the residents were working and there was one vacant room.

25.45 The move to No 5 was being planned in 1991. There were concerns about the coexistence of the two different services and the effect of noise from the children’s time out room on the Flatlets. The move took place in June 1992. It was agreed to draw up a new tenancy agreement to be used from the time of the move. This was to cover the eventuality of someone refusing to move out. The 1992 Annual Report noted:

The house is beautifully decorated, it is bright, cheerful and spacious...we no longer have the headache of broken cookers or fridges. The laundry is also within the house, this is a major improvement on our previous facilities.

25.46 In 1992, there was an information evening on family planning and sexually transmitted diseases held in the house.

25.47 In 1993 and 1994, the Annual Reports note that the residence at No 5 was now well established. The difficulties facing new residents were described:
The first month is usually the hardest, as it involves endless visits to Social Welfare, in order to arrange for payments and rent allowance. In all it takes at least 6 weeks before a young mother will get her full allowance. This can be a trying time, as a shortage of cash, on top of a major move with a baby can be somewhat overwhelming for a young girl.

Holidays
25.48 Miss Dwyer told the Commission that Miss Eccles had a holiday home in the west of Ireland and she sometimes brought mothers and babies there. From 1977 to 1983 Miss Carr’s had the use of a holiday home in Rush and there were annual holidays for the mothers and children. The 1978 Report refers to one carload of parents commuting to work each day from Rush. From 1983 onwards there were still annual holidays at mobile homes and caravans.

Mothers
25.49 The admission records have entries for a total of 111 mothers between October 1972 and March 1987. The Annual Reports provide figures for the number of families who were in the Flatlets in the years in question but do not provide information on how many new families entered. Based on the pattern from 1972 to 1987, it is likely that there was an average of six to eight new entrants each year. The following analysis is based on the 111 mothers for whom admission records are available.

25.50 The individual age of the mother is not recorded but their age group is entered as 1, 2, 3 or 4. It has not been possible to establish what exactly the age ranges were but it appears from the evidence of Miss Dwyer that 1 was the youngest age group. There were 46 mothers in age group 1; 45 in age group 2; 19 in age group 3 and one in age group 4.6

Entry Pathways
25.51 The admission records include a heading ‘Referred by’. Sometimes more than one referral agency is recorded. The main referral agencies for the 111 mothers were as follows: Cherish (17); Denny House (13); EHB (13); Dr Barnardos’s (ten); Church of Ireland Social Services (nine) the Coombe (nine); CPRSI (six); Protestant Adoption Society (four) Mid-Western Health Board (three).  

---

6 It seems likely, but is not established, that No 1 were aged under 20, no 2 aged between 20 and 30 and so on.
25.52 Other referral agencies include organisations for unmarried mothers, social workers and doctors. Sometimes more than one referral agency is named.

Circumstances and Arrangements for Entry
25.53 The ‘Reasons for Referral’ are recorded for each entry and the majority of entries are some variant on the following reasons:

- supporting the mother to cope alone;
- giving the mother space to make decisions and plan future;
- enabling the mother to establish work patterns, continue education or training;
- use of the nursery to facilitate work, education or training.

25.54 The following are some examples of the entries:

- To enable mother and child to live together while making decision re keeping him or otherwise. Also to have time to stabilise job prospects
- Time to care for baby alone - to develop self-confidence - to establish work pattern, & plan the future.
- To allow mother opportunity to complete course in U.C.D. and to establish relations at home.
- Needing time to care for her baby/develop skills/make decisions for future

25.55 There are four entries classifying the mother as homeless prior to her arrival. Occasionally there are unusual entries, for example,

- Broken marriage. Temporary emergency to allow Social Worker to assess and make future plans.
- Accommodation urgently needed when mother decided against adoption
- Baby considered to be in physical danger at home.
- Mother needed time to recover from shock of [baby’s] father’s death, before planning future.
- Mother deaf, needing support from other mothers, and opportunity to train through N.R.B.\(^7\)

\(^7\) NRB was the National Rehabilitation Board which provided training for people with disabilities. Its training functions were transferred to FÁS in 2000.
CHAPTER 25 MISS CARR’S FLATLETS

Length of Stay
25.56 The average length of stay for mothers was approximately 428 days or 1.17 years.8

Exit Pathways
25.57 The entries record the ‘Accommodation Found’ for each mother on leaving Miss Carr’s Flatlets. About half (55) found private accommodation; 36 got public housing; 12 went home; one emigrated; one went to a hostel; one went to Denny House and the exit pathway is not specified in five cases.

25.58 Many entries contain further details such as the address of subsequent accommodation, whether the mother was sharing and with whom. There are a few notes documenting financial assistance from families and one mother is recorded as having purchased her own home. There are two entries relating to foreign mothers, who returned home; one to an African country and one to a European country.

25.59 The Annual Report for 1974 reports on a happily re-settled family:

mother in a good steady job, and with more than ample baby minding services. Fears of ‘what the neighbours might think’ proved unnecessary. Undoubtedly the fact that the mother had proved herself to be loving and unselfish, very well able to cope on her own…has contributed largely to this happy state of affairs.

Difficulties in finding alternative accommodation
25.60 The difficulty of finding alternative accommodation for the mothers and children is a constant theme of the Annual Reports. The 1976 Annual Report noted that there were again difficulties in finding suitable accommodation; only one family was given public housing during the year. ‘In private accommodation it would appear that children were welcomed in accordance with the height of the rent charged’.

25.61 The Annual Report for 1975 noted that the No 16 committee was actively involved with the relevant authorities in efforts to find alternative accommodation. A friend ‘let’ a house to Miss Carr’s to sub-let to one-parent families on a temporary basis and two families were housed there.

8 The 1st of the month was used in those cases where the month only was recorded. The average is based on 109 entries as there were no dates recorded for the other two.
25.62 The 1977 Annual Report noted that housing remained a problem: ‘Little by little it is becoming easier in the public housing sector but high rents in the private sector means shared accommodation is the only option.’

25.63 The availability of public housing improved in the 1980s but then declined about 1987/88. The 1990 Annual Report records that it was nearly two years since a resident from No 16 was housed by Dublin Corporation. The problem was intensified for a young mother as the majority of landlords would not accept young children. The demand for places in Miss Carr’s was increasing.

25.64 A staff member from the Flatlets visited former residents when they moved into other accommodation. ‘On Wednesday morning [a staff member] dispenses ‘coffee and comforts’ to former tenants who may be feeling lonely in their new surroundings’.

Training/Job

25.65 There is a heading entitled ‘Training/Job’ for each entry. There is no information under this heading in 24 cases; 61 were recorded as working with the majority in secretarial or domestic work. There was a wide variety of other occupations recorded, for example, laboratory technician, teacher, actress. There were 22 women on training courses including secretarial courses, university courses, teaching qualifications and AnCo courses. There were a few women engaged in very unusual work or training. The Commission has decided not to mention these as it might serve to identify the women.

Use of Nursery

25.66 The records have a field for each entry entitled ‘Use of Nursery’. Many mothers working, looking for work or studying availed of the nursery facilities; 53 were regular users and 20 used it on an occasional basis; only ten are recorded as not having used the nursery and there is no entry for the remaining 28 mothers.

Mortality

25.67 There are no records of any maternal deaths.
Possible discrimination

25.68 As already stated, the Flatlets were intended to be non-denominational from the start and the only criterion for entry was need. The records make no reference to the religion of the mothers with the exception of one mother who is recorded as giving up work to study a particular religion. Miss Carr’s childrens home had originally been a Protestant institution but by the 1970s it was admitting Catholics and Protestant children were soon in the minority. Twenty two of the 111 women whose records are available were referred by either Church of Ireland Social Services or Denny House. However, mothers were also referred by CPRSI and the Eastern Health Board. It is unclear from the records to what extent, if any, Miss Carr’s (Flatlets) discriminated in favour of Church of Ireland applicants.

25.69 Two mothers are recorded as being deaf and one as ‘handicapped’. There is no evidence of any discrimination on the grounds of disability.

Children

25.70 There were a total of 120 children in the institution during the period covered by the admissions register; 103 mothers had one child; 7 mothers had 2 children and one mother had 3 children. The age of the children on entry ranged from six days to nine years. The approximate average age of a child on entry was 316 days. If the eight families with multiple children are excluded this average drops to 231 days. All values relating to the children’s ages are approximate as the entries for the children’s dates of birth are incomplete and 01 has been entered where the day or month field is missing.

25.71 Three of the entries record a child’s date of birth as after the commencement of the mother’s residence. In two of these cases, the mother had one child on entering and the second child appears to have been born subsequently. The remaining entry records the baby’s date of birth as approximately 8½ months after the mother entered and the mother had no other children in Miss Carr’s.

Exit Pathways

25.72 The majority of children appear to have remained with their mother on leaving Miss Carr’s flatlets. A small number went to grandparents, ten went into care and only one is recorded as being adopted. It is not explicitly stated in the records that the mother and child remained together on leaving. However, the entries under
‘Subsequent Accommodation’ specifically mention the child only in situations where the child did not remain with the mother. The implication appears to be that in all other cases the mother and child remained together after leaving. This conclusion is also supported by the Annual Reports.

25.73 The 1988 Annual Report notes: ‘One mother decided that adoption would be the most loving option for her child, and perhaps you would remember this family especially in your prayers as despite other difficulties this mother had been devoted to her babies.’ There is no further detail in the report and no discussion of the practice and procedures regarding consent or placement of children. The 1979 Annual Report states that one child returned home to live with his grandparents. The mother is not mentioned and it is unclear whether he remained in her care or was sent on his own.

**Entry of children when their mother was not also resident**

25.74 There are no records of any children being resident in Miss Carr’s (Flatlets) when their mother was not also resident.

**Mortality**

25.75 There are three infant deaths recorded; these all occurred within an 18 month period between September 1979 and February 1981. The first infant death recorded is a cot death. There is no entry for the day or month of birth but Miss Carr’s Annual Reports state that the baby was 3½ months old at the time of death. There is an entry under the heading ‘Social Work Support’ indicating that the social work support was very good. The mother appears to have stayed on for three months after her child’s death before finding accommodation in the private sector.

25.76 A second cot-death is also recorded. The baby was 62 days old at the date of death. The records note that the social work support was good and the mother availed of the No. 16 social worker. After her baby’s death the mother moved to rented accommodation in the private sector.

25.77 A third baby died from viral pneumonia. The mother went to live with friends after the baby’s death. The records state that she availed of the No.16 social worker.
Chapter 26: The Castle

Introduction

26.1 The Castle, Newtowncunningham, Co Donegal opened in 1982 and closed in 2006. It was not a traditional mother and baby home. It was a supported hostel for women and their children which aimed to give time to the women to make decisions about their futures and that of their babies. Between 1997 and 2000, the Castle building was not used as a mother and baby hostel but as a children’s home and for access visits by fostered children to their mothers (a Young Person’s Residential Unit). During this time, the mother and baby hostel was in a house in Letterkenny but moved back to the Castle in 2000.

Sources

Institutional records

26.2 At the time of the establishment of this Commission the records of the Castle were held by St Mura’s Adoption Society, Pastoral Centre, Letterkenny. The Commission collected the records from St Mura’s in August 2015, photocopied them and returned the originals to St Mura’s. In 2018, St Mura’s handed over the originals to the Child and Family Agency (TUSLA). The main records are as follows:

- **Admission records**: The admission records contain various details about the residents including when they arrived and when they left but generally do not systematically include the date of birth or age of the mothers. The places and dates of birth of the babies are generally recorded. The exit pathways of the mothers and the babies are recorded in some cases.

- **The Castle Diaries**: From 18 June 1984, detailed diaries were kept recording what happened each day. The entries were handwritten by the staff. They provide a comprehensive account of the day to day activities in the Castle including routine housekeeping issues and problems with maintenance. They reveal a great deal about the personalities and circumstances of the women (including their ages in some cases), the attitudes of the staff and the role of the social workers and other health board staff.

Between the admission records and the Castle Diaries, it is possible to get a quite detailed picture of the women’s lives, whether they were school going or had a job; their family relationships, for example, whether the
woman’s parents were aware of the pregnancy, whether they were supportive; and relationships with the fathers of the children. The Commission interviewed one of the longest serving staff members of the Castle. She worked there from 1986 and was regarded as a ‘house mother’.

- **Financial records**: There is some limited financial information for the period January 1997 - October 1990 including some information about the payments which the women made towards their stay. The major financial input came from the North Western Health Board whose records are not available.

- **Work records**: These mainly consist of rotas and lists of staff; the records are for the period July 1984 - December 2000.

**Other records**

26.3 The North Western Health Board (NWHB) was the principal financial backer of the Castle and was very closely involved with its running. It employed the staff who worked there. Other staff including social workers and community welfare officers as well as maintenance staff were frequent visitors. The HSE (the successor to the NWHB) has been unable to provide the Commission with any records of this involvement. A former senior social worker with the NWHB gave evidence to the Commission about her involvement with the Castle during the 1980s.

26.4 The Department of Health does not seem to have had any involvement.

**Background**

26.5 A document compiled by the management committee of the Castle in 1993 states that, following discussions between the North Western Health Board (NWHB)\(^1\) and the Derry Diocesan Child Welfare Society about the need for a hostel service for unmarried mothers and their babies in the north-west area, the NWHB bought the Castle in 1978 for £48,000. The total cost after fees and repairs was expected to be £65,000. The Catholic dioceses of Raphoe and Derry each contributed £10,000 to the capital cost. A management committee was established to run the hostel. It had representatives from each diocese and three NWHB representatives - the Director of Community Care (who was the chair), the Senior Social Worker and the Superintendent Public Health Nurse.

---

\(^1\) The North Western Health Board covered the counties of Donegal, Leitrim and Sligo.
26.6 According to this document, the project ran into a number of difficulties. Extensive repairs to the roof and additional changes to the interior cost a further £15,000 and delayed the opening. It had been hoped that there would be a formal agreement between the NWHB and the Western Health and Social Services Board (Northern Ireland) about admissions to the Castle from Northern Ireland but the Northern Ireland board could not formally co-operate with this. There were then difficulties in recruiting a suitable person to run the hostel. The position of hostel supervisor was advertised in July 1979. This stated that the NWHB was shortly going to open a hostel for unmarried mothers to cater for a maximum of ten mothers and their babies. The successful candidate was required to be a qualified nurse and midwife. ‘The successful applicant will be a good organiser and administrator with the ability to foster and maintain a homely atmosphere in the Hostel. She would be required to work a 40 hour, five day week but ‘will deal with important or urgent matters occurring outside these house as necessary’. The salary range was £3,660 to £4,623 with a self-contained flat provided free of charge. The Commission does not know what the recruitment difficulties were but, in December 1981, it was decided to appoint a housekeeper rather than a midwife. The Castle officially opened on 7 December 1982 and the first resident arrived that day.

26.7 The NWHB Annual Report 1982 recorded that ‘an important additional resource in 1982 was the opening of the Mother and Baby Hostel in the Castle, Newtowncunningham for pregnant women who are unable to stay at home for the duration of their pregnancy’. It went on to say that ‘Referral to the Castle involves follow-up support and services by the social work department to a greater degree than has been possible in the past when mothers were referred to homes and places as far away as Dunboyne and Dublin’. This suggests that the NWHB intended it to be mainly for women from its area but, in practice, many of the residents came from other parts of the country.

Governance

26.8 As already stated, the hostel was run by a management committee which had representatives from the NWHB and the dioceses of Raphoe and Derry. The management committee met once a month in the Castle. The Commission has not seen any minutes of these meetings but there are a number of references to them and decisions made at them in the Castle diaries. In practice, it seems that overall

---

policy was set by this committee and the day to day management was largely in the hands of the NWHB. The house mother who was interviewed by the Commission said that there was a ‘heavy input’ from the social work department in the diocese of Derry as well as from the senior social worker in the NWHB. She said that a priest from Derry attended the monthly meetings as did the local curate from Newtowncunningham (which is in the Raphoe diocese).

26.9 The NWHB senior social worker who gave evidence to the Commission, and who was herself on the management committee, said that there were social workers from the dioceses and from CURA on the committee. She said that interviews for Castle staff were conducted by interview panels with representatives from the health board and the dioceses. She said that there were some disagreements between the health board approach and that of the diocesan representatives. She said that ‘there was an assumption that whatever the church wanted ruled’. She said that the NWHB had plans to ‘arrange courses in health education and nutrition and women's health and things like this, and immediately alarm bells rang’. She was told, in no uncertain terms, that talking about women's health would be cutting across or going against Catholic teaching. The health board made it clear that it intended to provide this for the women it referred.

The women

26.10 Between 1982 and 1998 (the years covered by the Commission’s remit), a total of 325 women entered the Castle. Seven of these are recorded as not being pregnant. They were accompanied on entry by 64 children. (In the period 1999-2006, a further 70 women entered the Castle; they were accompanied by 30 children.) The vast majority were referred by either a health board or CURA; small numbers were referred by adoption societies and voluntary agencies.

26.11 There was a general policy of not accepting women until they were at least six months pregnant but exceptions were made for particular circumstances. There was also a general policy that women could remain for six weeks after the birth even if the baby was not with them. Women rarely stayed that long but, again, this policy was not rigidly applied and a few women were allowed stay longer because of their particular circumstances. In one case, the mother stayed for longer because her baby was in Letterkenny hospital.

---

3 They were mainly young girls whose foster arrangements had broken down.
26.12 The records of admissions start in December 1982; six women entered in that month. All were referred by CURA. One baby was born in 1982 and the other five births took place in 1983.

26.13 The NWHB *Annual Report 1983* noted that there were 28 women in the home in 1983. The institutional records show that 23 women entered in 1983; the other five were presumably there from 1982. Eight of the 28 were from Co Donegal, 13 from Northern Ireland and seven from other counties. The report noted that 15 mothers kept their child; 11 were placed for adoption and two babies died. The average length of stay was 72 days.

26.14 At any one time, there were only a small number of women resident, for example, in June 1984, there were four women and one child present and two women in hospital. In 1997, a total of six women entered the Castle; this may reflect the move to a smaller premises.

26.15 Because women tended to stay for a while and then leave but return, it is difficult to be accurate about the length of stay. The average length of stay before the birth for those women who stayed until the birth was 62 days. The average length of stay after the birth was 27 days.

26.16 The women who were in the Castle were quite a diverse group. They came from many different parts of Ireland and a number came from Northern Ireland. There were a number of professionally qualified women. There was at least one third level student who travelled to her course in Derry from the Castle. Some of the younger women went to school from the Castle and a teacher came in to one woman. There were a few women from a Traveller background and, in the later years, some immigrant women (a few may have been illegal immigrants). There were women with intellectual disabilities (generally mild) and some with serious mental health, addiction, social deprivation or related issues. Some had seriously deficient parenting skills and this caused the staff a great deal of concern. It appears that, particularly in the late 1990s/2000s, the placement of a woman with her baby in the Castle served as an alternative to social workers seeking a care order through the courts. From the 1990s onwards various supports and services were offered to the women in the Castle such as counselling and parenting courses and behavioural therapy.
The Castle diaries provide some insight into the personalities of the women. Some were meek, somewhat bewildered by their situation and probably frightened while others were feisty, outspoken and well able to stand up for themselves. Not surprisingly, there is considerable evidence of emotional upset, sometimes following a meeting or phone call with family members, and particularly when leaving the children with foster parents or in the orphanage and when wrestling with the decision on adoption.

The children

Older children

Pregnant women were allowed bring any older children with them to the Castle. In total, 64 such children were resident there over the period covered by this report. The children of school going age were brought to school by taxi which was paid for by the NWHB. In general, these children did not stay in the Castle while their mothers were in hospital; other arrangements were made such as placing them in St Mura’s, Fahan or with a foster family. They returned to the Castle when their mother did.

Where women had other children who were not staying with them, these children were brought to visit (they are not recorded among the resident children).

Babies

The babies were born in maternity hospitals - mainly Letterkenny Hospital and Altnagelvin Hospital, Derry. The NWHB social worker who gave evidence to the Commission said that all women who were referred by the health board gave birth in Letterkenny while a number of women referred by CURA gave birth in Altnagelvin. It appears that the question of using Altnagelvin was somewhat contentious. In 1993, the issue of using Altnagelvin was discussed by the management committee; the staff member recorded ‘it’s still only to be exceptional cases due to the politics (religion) of the high up people on the board’. It is not known what exactly constituted an exceptional case but it is possible that the different rules about adoption in Northern Ireland may have been a factor; in particular, the situation of extra-marital children was easier to deal with in Northern Ireland.
26.21 Five babies died in the period 1984-1998; two died in 1983, one in 1984, one in 1988 and one in 1989. All died soon after birth in the hospitals in which they were born. The diaries record that the staff were upset by the deaths and they helped with funeral arrangements if the mothers were not getting family assistance.

26.22 The newly born infants sometimes came to the Castle with their mothers but some went straight from the hospital to foster parents or to St Mura's Orphanage in Fahan. The NWHB made arrangements for the women whom they had referred while the CURA social workers made the arrangements for the women they referred. If the women had decided to place the baby for adoption, the NWHB arranged for the baby to be placed with foster parents while CURA arranged that the baby went to St Mura's. The women visited the babies in their foster homes; they were encouraged and facilitated by the Castle staff to do this. Sometimes the foster parents brought the child to the Castle to visit the mother.

26.23 The NWHB social worker told the Commission that the health board had no difficulty in finding suitable foster parents. The diaries provide evidence of dedicated, selfless foster parents who took babies for short periods while adoptions were being arranged or while the mothers were still considering their options.

26.24 The length of stay of the babies who went to the Castle was quite short - generally not more than two to four weeks. In some cases, the babies were placed in foster care while the mother stayed in the Castle even if she had not yet made a decision on adoption. The records usually show that decisions were made to keep the baby or to place for adoption but it is not always clear what the final outcome was. There is evidence of a number of women changing their minds more than once on keeping the child or placing the child for adoption - see below.

**Day to day life in the Castle**

26.25 The Castle records include the work records for the staff during the period 23 July 1984 - 24 December 2000. The staff were local women who, in the Commission’s view, showed a great deal of empathy and, possibly more importantly, common sense. In general, a staff member was present during the day but not necessarily

---

4 Connections between Fahan and children's homes in Northern Ireland are mentioned in the Report of the Northern Ireland Historical Institutional Abuse Inquiry: https://www.hiainquiry.org/sites/hia/attachment/files/Chapter%201%20-%20Introduction.pdf
for the whole day and there were occasional days when there were no staff present. Again, in general, the staff did not stay overnight but a staff member sometimes stayed overnight if she thought her presence might be required or if there was a concern about a particular resident.

26.26 As already stated, the Castle Diaries provide a very good insight into daily life. They record the normal problems of everyday life - delays in getting maintenance done, problems with the heating system or the washing machines; there were persistent problems with leaks and with getting maintenance men to come when they had said they would. These details are interspersed with references to possible child abuse; potential self-harm; psychiatric health issues; drink problems; and manipulative boyfriends and families.

26.27 The diaries describe in some detail what each resident did or felt - for example, got up late, stayed out late, was very quiet, was depressed, got phone calls (sometimes the phone calls caused distress); was visited by boyfriend, by parent(s), friends; went out with boyfriends/friends; had a few drinks.

26.28 The NWHB senior social worker told the Commission that the objective of the Castle was to provide a space for women with unplanned pregnancies who did not want to stay at home and who needed to think about the future. She said that ‘It was the automatic assumption in other homes that the baby would be put up for adoption’. The plan was to have communal eating and living areas; the women would work together in cooking meals and planning menus. It would not be institutional; the bedrooms were big enough to accommodate a mother and more than one child.

26.29 While the women were expected to look after themselves and their children, it seems that, in practice, they got a great deal of help from the staff especially if a staff member thought that the mother was not properly caring for the child. The women kept their own rooms clean and took turns to deal with the communal areas, light the fire and carry out normal household activities. Sometimes they had to be reminded by the staff to do these things. Some cooked just for themselves, others cooked for all the residents; the diaries suggest that many bought ready cooked food or made use of a local fast food outlet.
Family attitudes

26.30 It appears that the majority of families were aware of the pregnancy and of the women’s presence in the Castle. However, there are examples where the family thought that the woman had gone abroad.

26.31 There are a number of examples of women visiting with their parents to see what the Castle was like before deciding to go there. Some families were supportive and visited frequently. Where relationships were reasonably good, there was considerable contact between the women and their families and with the fathers of their children. All were able to visit freely. The women often went on outings with their families or the fathers of their children. Some women went home for evenings and weekends or went out with their boyfriends (sometimes staying away overnight) and then returned to the Castle. Occasionally a friend stayed the night in the Castle.

26.32 Some of the women did return to their family homes with their babies but these arrangements did not always prove successful. Other families, while supportive to a degree, were very conscious of keeping secrecy; there are examples of parents warning their daughters not to go outside the Castle in case they would be recognised.

26.33 Some women were completely shunned by their families. In 1986, a woman’s brother phoned to tell her not to dare to come back with the baby and to give it up for adoption; it seems he had told their mother that she had had a baby but it had died. Other parents made it clear that the woman was not to return home. As late as 2002, a mother is recorded as telling her daughter that ‘no man will want her now’. An 18-year-old was put out of her home by her mother when she became pregnant in 2005.

26.34 Some of the fathers of the children were supportive and visited the Castle. In one case, the father of the child wanted the woman to stay in the Castle for longer as he could get to see her more often without his wife being suspicious!

Payments by the residents

26.35 The records show that in the period January 1987 - October 1990 women were expected to pay £24 a week for themselves, £5 a week for a baby and £7 for an older child. It is not clear if these payments were always made; there is some
evidence that lesser amounts were paid and that payments were made on behalf of some women by the organisations that referred them to the Castle. The social worker who gave evidence to the Commission said she understood the women paid about £16 or £17 a week for their stay.

26.36 Almost all of the women would have had an income. A small number were working while staying at the Castle. They travelled by bus to Letterkenny or Derry for work. Some were entitled to Maternity Benefit. A small number were on maternity leave from work where full payment was made by their employer (for example, public servants). Those who already had children were most likely receiving the Unmarried Mother’s Allowance (and monthly Child Benefit) and those who had no other source of income were receiving weekly Supplementary Welfare Allowance. In January 1987, the rate of Unmarried Mother’s Allowance (UMA) was £44.90 a week with £11.25 for the first child and £12.35 for subsequent children. The rate of weekly Supplementary Welfare Allowance (SWA) was £33.50 (plus extra amounts for children but, once the child was born, the woman would have gone onto UMA). In 1990, the UMA rate was £53 a week with £13.50 for each child. The SWA weekly rate was £45.

26.37 Women from Northern Ireland received social welfare payments from there, sometimes by post. Some travelled to the Northern Ireland Department of Health and Social Services (DHSS) to collect allowances/benefits. There is some evidence of payment being claimed from both jurisdictions - a woman who was receiving SWA was also signing on for the dole in Derry.

26.38 The payments by the women were given to the staff on Friday and the staff bought the food and other requirements for the house. Maintenance costs and utilities were paid directly by the NWHB. The house mother understood that the diocese of Derry reimbursed the health board for some of the costs involved.

**Concern about privacy**

26.39 Although many of the women moved around freely and did not seem to be concerned about being recognised, others were concerned. One woman stayed in her room all day because she recognised a workman who was carrying out maintenance and was afraid he would see her.
26.40 A staff member was concerned about the Census forms in 1986. She was advised (she phoned a named person, probably in the local authority) that if there were any problem to put the names down as Ms A, B, C etc.

Medical care

26.41 It is clear from the diary entries that standard medical care was provided. The women were taken to doctors or the hospital for regular ante-natal care. Nurses called to the Castle to take blood pressures. Local doctors and doctors in Letterkenny hospital spoke to the women about contraception. Women were brought to doctors and the hospital for post-natal visits. The children were brought for vaccinations. Doctors were called when required.

Interaction between women and staff

26.42 The diaries show that the staff were very sympathetic towards the women and probably did more for them than was envisaged when the hostel was established. They recorded how the women were feeling, noted any pains or sicknesses during the pregnancy and called for a doctor when they considered this necessary. They were very attentive to the needs of the women, particularly as they approached their due date. On one occasion a staff member talked to an upset resident until 3 am. Constant supervision was provided for a mother with an intellectual disability. Staff stayed overnight because of a concern that a mother was abusing her child. A woman who alleged that she had been raped was taken to a Garda station.

26.43 The staff monitored the women and ensured that they got to hospital for the birth. Taxis were used to bring women to the hospital but sometimes a staff member drove the woman. On occasions, a staff member stayed with the woman while she gave birth. They frequently visited the women when they went into hospital and/or spoke to them on the phone during this time.

26.44 They often acted as advocates with the social workers or other officials and frequently made arrangements for the women to visit their families or to get appointments with health services. On a few occasions, they express their exasperation with particular behaviours but these are rare and understandable.

26.45 The staff brought the women and children on outings, for example, to the beach. It would appear that the staff went over and above the call of duty. For example, a
staff member collected a woman and her baby from Letterkenny hospital, called to Fahan to collect her other child and drove them all home.

**Interaction with NWHB staff and social workers**

26.46 Social workers from the NWHB and the referring agencies visited the women in the Castle and in hospital. The community welfare officer (see Chapter 1) visited the Castle and helped the women claim their social welfare payments and other benefits. He delivered cheques to those who qualified for Supplementary Welfare Allowance (SWA). He helped them to apply for Child Benefit and, when they were leaving, he helped them with claiming Rent Supplement if they were getting rental accommodation. He also processed Exceptional Needs Payments to help the mothers with the costs of clothing for the children and sometimes with furniture for rental accommodation or local authority housing. It seems that the women got a highly personalised service and were not required to go to the health board offices as was the norm for most recipients of SWA (see Chapter 1 for information about SWA).

26.47 The staff and the health board officials helped with finding accommodation when the residents were due to leave.

**Decision to keep the baby/place for adoption**

26.48 There is a great deal of evidence that the women agonised over the adoption decision and a number of women changed their minds a number of times. The diaries record the upset suffered by the women when they left the baby with foster parents or to St Mura’s.

26.49 It is very clear from the diary entries that the attitude of the woman’s parents was a very, probably the most, significant factor in the decision about whether to keep the baby or place for adoption. There is evidence of considerable pressure being exercised by families and sometimes by the fathers of the children. The house mother who spoke to the Commission was very conscious of, and concerned about, the pressure from parents for adoption.

26.50 The availability of accommodation was another major factor. The women were helped by the social workers to find accommodation but it was always difficult to find. In a number of cases, the diaries record the woman's initial determination to
keep the baby and then her gradual realisation that she would not be able to manage without family support which was not forthcoming.

26.51 There are some quite heart-breaking examples of the very difficult dilemmas women faced. One woman wanted to keep her child but knew she could not cope with two children. The child’s father would beat her up if she proposed adoption. She could not live with him because he was mentally unstable. Another woman realised she would probably not be able to look after the baby because she suffered from a chronic illness.

26.52 The women often talked to the staff about their options. It appears that the staff were very careful not to express their own views but they did sometimes express serious concern about a mother’s ability to care for her child. In some cases, the mothers recognised their inability.

26.53 There is evidence of some conflict between women and their social workers when making their decisions. One woman was described as ‘seething with anger’ at the social worker and the doctor. There was also some conflict between women’s families and the social workers.

26.54 It seems that doctors and priests also discussed adoption with the women. For example, the hospital chaplain talked to one woman about keeping her baby; she thought he was ‘very one sided in his opinions’; it is not entirely clear but it seems he was encouraging her to keep the baby.

26.55 It seems to the Commission that women were given the time and space to make their decisions.

Life after the Castle

26.56 The Castle diaries provide some information on the lives of the women and children after they left the Castle as a number of the women stayed in touch with the staff. There are some examples of women leaving the Castle after giving birth and living in a flat for some time but then returning to the Castle. There are also examples of former residents coming back for visits and spending a night/weekend. The staff of the Castle continued to be concerned about the women even after they had left.
26.57 The women who moved into rented accommodation with their children and who remained in touch with the Castle staff had some difficulties with keeping their accommodation and with managing their children. Former residents frequently phoned the Castle staff for advice. Sometimes the staff contacted social workers on their behalf, for example, when a woman was evicted.

26.58 The house mother was interviewed by the Commission in 2016. At that stage, she was still getting Christmas cards and occasional phone calls from former residents.

26.59 When asked in 2002 by a child, who was entering the Castle with her mother, what kind of place it was, a staff member replied that ‘it was a home for people to come for a wee break’.
Chapter 27: St Gerard’s, originally 39 Mountjoy Square

Introduction

27.1 A mother and baby home was opened in 39 Mountjoy Square in Dublin’s north inner city in 1920 by Miss Cruice. It seems to have been called St Patrick’s - this is the name used on the 1937 report of an inspection under the Registration of Maternity Homes Act 1934 but the Commission has not found this name used on any other documents. Miss Cruice had already established St Patrick’s Guild in the early 1910s. 39 Mountjoy Square was sold in 1938 and the institution transferred to St Gerard’s which was a house formerly known as ‘Lowville’ in Herbert Avenue, Merrion in what is now Dublin 4. St Gerard’s closed in 1939. It was taken over by the Irish Sisters of Charity in 1943 (as was all of St Patrick’s Guild) but it did not function again as a mother and baby home.

Sources

27.2 The records of St Gerard’s are part of the very large records of St Patrick’s Guild (SPG). These were handed over to the Child and Family Agency (TUSLA) in 2017 but are not yet fully processed. To date, it has not been possible to extract the St Gerard’s files from the overall SPG files; as a result, the Commission has not had access to the St Gerard’s files.

27.3 The Commission has very little information about St Gerard’s. Some information has been found in Department of Health files and in published material.

27.4 A Department of Local Government and Public Health (DLGPH) note from September 1943 described the background to St Gerard’s. This note was drawn up in the context of the examination of the finances of St Patrick’s Guild, including St Gerard’s, which was being conducted by the DLGPH and the Hospitals Trust. Archbishop McQuaid had insisted on a thorough examination of its finances before allowing the Sisters of Charity to take over.

1 The surname is frequently misspelled as Cruise.
2 The Irish Sisters of Charity are sometimes known as the Religious Sisters of Charity. They are completely separate from the Daughters of Charity who ran Pelletstown – see Chapter 13. They were founded by Mary Aikenhead and are now involved in various activities in Ireland including healthcare (for example, St Vincent’s Hospital).
3 Department of Health file: RM/ARC/0/521022.
27.5 When the takeover was complete, an article about St Patrick’s Guild was published in *The Irish Monthly*.\(^4\) The following information comes mainly from these two sources. There are minor factual differences between the two but they are not significant. The Commission is not investigating St Patrick’s Guild itself or St Patrick’s Infant Hospital, Temple Hill (sometimes called Temple Hill Dietetic Hospital) but they are inextricably linked with 39 Mountjoy Square/St Gerard’s.

**St Patrick’s Guild**

27.6 St Patrick’s Guild was founded in the early 1910s as an organisation for the care of destitute Catholic pregnant women and nursing mothers and their children. It first acquired a premises in 1914. According to the DLGPH, its aims were:

- to provide spiritually and temporally for destitute children by securing their admission into existing institutions, or by boarding them out in the homes of respectable families or by providing and maintaining a home or homes for these purposes or by other methods;
- to provide attendance and necessaries for women who were expectant mothers and whose circumstances called for such assistance and to provide during convalescence for the mother and child;
- to provide training of probationers in infant welfare work and in nursing.

27.7 Initially, its premises were in Middle Abbey Street.

**39 Mountjoy Square**

27.8 The mother and baby home at 39 Mountjoy Square was established in 1919 by St Patrick’s Guild for the care of unmarried expectant women and nursing mothers and their babies. It also acted as a training school for nursery nurses.

27.9 Before this Commission was established, the Department of Children and Youth Affairs examined birth records and established that 45 babies are recorded as having been born in 39 Mountjoy Square in the years 1933-1938. There were no births recorded from 1920 to 1932. On the basis of its capacity and the recorded births in the 1930s, it seems likely that it catered for no more than 200 women and their children.

---

27.10 39 Mountjoy Square was registered under the Registration of Maternity Homes Act 1934 in November 1936. An inspection was carried out by a DLGPH inspector in January 1937. The registration was cancelled in July 1938. (The cancellation stated that the address was 37 Mountjoy Square and it misspelled Miss Cruice’s name.)

27.11 According to the 1937 inspection report, there was accommodation for 19 patients in five wards. There were two baths and four WCs. There had been four confinements since May 1936. The person in charge was a qualified nurse and midwife. There were two qualified nurses and two qualified midwives but it is not clear if this meant there were two, three or four staff. There was also a maid and a nursery maid employed. The inspector considered that it was adequately staffed. The report noted that the infants were ‘kept till adoption’. This is a reference to informal ‘adoption’ as legal adoption did not become available until 1953.

**Temple Hill**

27.12 Temple Hill was opened in 1930. Children boarded out by St Patrick’s Guild ‘who become delicate’ were transferred there, as were babies from 39 Mountjoy Square.

**State involvement**

27.13 St Patrick’s Guild (SPG) and Temple Hill were recouped from the National Maternity and Child Welfare grant on the basis of 50% of approved expenditure in respect of children under the age of five. According to the 1943 departmental note, ‘such payments have in some years amounted to £1,700’. SPG’s income from parents and guardians was considerably more than its income from this grant.

27.14 39 Mountjoy Square applied to the Department of Local Government and Public Health (DLGPH) for payment from the Maternity and Child Welfare Grant in July 1933 and this payment was made from 1 January 1934.

27.15 The Hospitals Commission made payments of £5,054 in respect of deficits in the three institutions for the years 1933, 1934, 1935 and 1936. Grants of £3,284 were paid in respect of deficits arising from 39 Mountjoy Square/St Gerard’s and Temple Hill in the years 1927, 1938, 1939 and 1940. The Hospitals Commission had decided that no further grants could be made to St Patrick’s Guild itself as the work

---

5 Department of Health file: 34/58 Vol 1
could not be described as a hospital activity. (It would appear that the Hospitals Trust was previously under the impression that the SPG premises in Abbey Street was the out-patient department of Temple Hill.)

**Transfer to Merrion**

27.16 In January 1937, the DLGPH was told by the Hospitals Commission that St Patrick’s Guild had applied for a grant to enable it to buy a house on Merrion Road (in what is now Dublin 4) for use as a ‘Children’s Dietetic and Convalescent Home and Nurses Training College’. The Hospitals Trust recommended that this house be acquired by SPG for use as a maternity home for unmarried mothers on the understanding that the premises in Mountjoy Square be sold. The Hospitals Commission did not favour giving a grant for its use as a dietetic hospital as it considered that this work should be undertaken by the local authorities.

27.17 In 1938, the institution in Mountjoy Square was transferred to the Merrion Road and became known as St Gerard’s. Towards the end of 1939, there was a dispute between members of the committee of St Patrick’s Guild about the operation of St Gerard’s. Miss Cruice decided to close it down as she considered that ‘the type of cases for which this Home was intended were not coming there’.

**Sisters of Charity**

27.18 St Patrick’s Guild (including all its three parts: St Patrick’s Infant Hospital, Temple Hill; St Patrick’s Guild, Abbey Street; and St Gerard’s Home, Herbert Avenue, Merrion Road) was placed under the charge of the Irish Sisters of Charity in 1941 by Archbishop McQuaid. Efforts to legally transfer SPG to the Irish Sisters of Charity were hampered by the tangled state of its finances. Some of the SPG investments were held in the names of individual members and it seems that St Gerard’s itself was vested in Miss Cruice. Archbishop McQuaid supported the DLGPH’s attempts to have the finances examined and rectified; it is clear that the Archbishop did not have great faith in Miss Cruice: ‘I have obtained nothing from Miss Cruice except flamboyant declarations of good-will’ (24 July 1942).

27.19 The Hospitals Commission carried out a detailed examination of the finances of St Patrick’s Guild before Archbishop McQuaid consented to its being taken over by the Irish Sisters of Charity. This showed that St Patrick’s Guild had received £31,274 from the Hospitals Trust Funds; at the end of 1940, £10,302 had been spent and the rest was invested.
In 1942, options for the continued use of St Gerard’s were being considered. One option was the resumption of its role as a mother and baby home. The Minister for Local Government and Public Health wrote to Archbishop McQuaid in January 1942 proposing its use as a convalescent home for children from all the city’s children’s hospitals. This was in the context of a shortage of beds in the children’s hospitals and a very severe outbreak of gastroenteritis in Dublin. In the letter he said that St Gerard’s was a ‘substantial stone built house with 5½ statute acres, has accommodation for about 33 children, and is in good condition and ready for immediate occupation’. The minister and the secretary of the department called on Archbishop McQuaid in February 1942 to discuss this proposal. The archbishop supported this proposal but wanted to sort out the ownership and finances of the property. (The meeting also involved discussions about the Dublin voluntary hospitals, the training of almoners and the provision of school meals.)

St Gerard’s was transferred temporarily to Dublin Corporation under an emergency powers order made by the minister in October 1942 as an ‘urgent measure to provide additional bed accommodation required as a result of the serious outbreaks of Diphtheria and Gastro-enteritis in Dublin’. Archbishop McQuaid consented to this. It was used as an adjunct to Vergemount Fever Hospital.

St Patrick’s Guild was transferred to the Irish Sisters of Charity on 1 May 1943. In September 1943, when the DLGPH note was compiled, St Gerard’s was still being used as an adjunct to Vergemount Fever Hospital. It never reopened as a mother and baby home.
Chapter 28: Cork county home

Introduction

28.1 Cork union workhouse was built in 1840-41 on a twelve-acre site at Skahabeg North Townland, now Douglas Road. The workhouse was based on the standard design of the Poor Law Commissioners’ architect, George Wilkinson, and had accommodation for 2,600 ‘inmates’. The main accommodation block had the master’s quarters at the centre with male and female wings to each side. At the rear, a bakehouse and washhouse were connected via a central dining hall and chapel to an infirmary and ‘idiots wards’. The premises were subsequently extended with the addition of a fever hospital and a school. In 1870, the Cork board of guardians invited the Sisters of Mercy at St Mary’s of the Isle, Sharman Crawford Street, to take charge of the workhouse hospital. The Sisters of Mercy had already established a ‘House of Mercy’ for homeless women and orphans in the city. As well as nursing the sick poor, the Sisters were also tasked with teaching workhouse children and caring for unmarried mothers and their children. The board of guardians administered the Cork union workhouse and oversaw admissions of the eligible groups including unmarried mothers and their children. Maternity services were available, and the ‘Union’ played a central role in the provision of institutional care of single expectant women, and unmarried mothers and their children, for over a century as the Cork union workhouse, then renamed the Cork County Home and District Hospital and subsequently named St Finbarr’s Hospital.

Sources

28.2 The following are the main sources for this chapter. A full description is given in Part 5: Archives.

Combined Indoor Relief Registers, Cork County Home and District Hospital, 1921-60

28.3 The Cork City and County Archive holds a largely intact collection of Combined Indoor Relief Registers relating to the Cork Union Workhouse/Cork County Home and District Hospital/St Finbarr’s Hospital for the period January 1921 to March 1960. All admissions to Cork County Home and District Hospital were recorded in

---

the Combined Indoor Registers. Medical cases, maternity cases, children admitted for boarding out, the elderly and all classes of destitute poor were recorded chronologically in the registers. Each admission was assigned a unique register number. Personal details recorded in the registers included name; date of admission; age; gender; marital status; residence prior to admission; occupation; religion; reason for admission; name of spouse; admitted by; date of discharge and number of days in the institution. The recording of patient details appears to have been strictly observed by the gate porter and administrators at the home. However, discharge dates of women who entered the institution as single expectant women were frequently left blank. This made it difficult to establish how long most single expectant women and single mothers spent in the institution. A separate section on each page recorded discharges and deaths which occurred in the institution. As no register number was recorded against those discharged, or those who died in the institution, it was not always possible to establish if those details related to women and children under the Commission’s remit. Children admitted to the institution were classified by age and designated ‘legitimate’ or ‘illegitimate’.

28.4 Registers relating to the years 1921-23 make up part of the collection of Cork Union workhouse indoor relief registers 1840-1925. This collection is on microfilm which proved to be a difficult medium for the purposes of identifying and extracting information relating to the admission of single expectant women and associated children.

28.5 The combined indoor relief registers for Cork county home and district hospital cover the years 1925-57. This collection has survived in its original form and consists of 55 ledgers. The indoor relief register relating to 1959-60 is part of a 2009 accession from St Finbarr’s Hospital (formerly Cork county home).

28.6 The combined indoor relief registers are 400-page ledgers. They recorded 30 admissions on each page and approximately 12,000 admissions per ledger. The Commission examined 60 ledgers, covering the period 1921-60. Over 720,000 admissions to Cork county home, recorded in the period under review, were scrutinised. The Commission identified 13,283 admissions as maternity cases: 10,965 married women and 2,318 single women.
It was reasonably straightforward to link a new-born infant with a married woman in the registers. Other than emergency cases, married women entered the institution two to three days before the birth of a child. As a result, both mother and child appear in the registers at a short interval. As most married women admitted to Cork county home gave birth there, it was easy to make an association between married women and their infants. Married women were always recorded with the prefix 'Mrs'.

Conversely, because of the negative familial and social mores associated with single motherhood and the abandonment of familial and social support networks, most single expectant women were left with little option but to seek admission to the county home at an early stage of pregnancy. In many cases this resulted in a stay of up to six months in the institution before the birth of a child. Consequently, the admission of a single woman, and the subsequent birth of her child, may not be recorded in the same register and a trawl of two or more separate registers was often necessary to make an association between a single woman and her child.

In the earlier registers, particularly those relating to the 1920s and early 1930s, particulars of individual admissions were not comprehensively recorded and the column where the 'debility' or reason for admission should have been recorded were usually blank. Furthermore, administrators at Cork county home made no conscious effort to identify women as 'unmarried mothers' in the registers. While all women admitted to the home are recorded as being 'married' or 'single' there is little to indicate that they were maternity cases. However, all married women were recorded with the prefix 'Mrs'. In the case of single women, forename and surname were recorded. In some instances, a handwritten (and sometimes barely legible) note which reads 'Child in 12345' indicated where a woman’s child was entered in the register. This facilitated efforts to link single women and their children, although this still required a search of two, or more, registers.

The registers had a section where admissions of 'illegitimate' children were recorded. A running total of 'illegitimate' children appeared at the bottom of each page. However, as this running total included older 'illegitimate' children admitted as surgical or medical cases, it could not be relied on to identify infants born to single women in the institution. Births which occurred in the institution were recorded systematically and in some detail and entries relating to new-born infants were recorded as being either 'legitimate' or 'illegitimate'. In some instances, a
handwritten entry 'Mother in 12345' may appear next to the name of a new-born infant, which assisted the task of linking a single woman and her child. In cases where the register number of the mother was not noted with a new-born, a trawl of the register index revealed a match.

28.11 This methodology successfully identified most single women who gave birth in Cork county home during the period under review. However, from the early 1930s, many expectant single women were transferred to extern institutions, most notably to Bessborough, and gave birth there. In cases where expectant single women were admitted to the county home and subsequently transferred to Bessborough, the county home registers give no indication that such admissions were in fact ‘maternity cases’. However, associated historical records, such as the County Home Matrons’ Journals, South Cork Board of Public Assistance Minutes, South Cork Board of Public Assistance files and the South Cork Board of Public Assistance Managers’ Orders proved to be invaluable keys in unlocking further information relating to single expectant mothers not readily discernible from the county home registers alone.

Other records

28.12 Apart from the institutional registers, the Cork City and County Archive holds a substantial collection of historical documentation relating to the Cork Union Workhouse/Cork County Home/ St Finbarr’s Hospital. The collection comprises over 600 individual bound volumes and relate in the main to the day to day running and staffing of the institution. The surviving records are not concerned solely with the institutional care of single expectant women, or single mothers and their children, but references to them can be identified across the disparate files which make up this collection. Files which were of most relevance to the Commission are as follows:

**Cork County Home, Matrons’ Journals, Jan 1927 - March 1945**

28.13 The available Matrons’ Journals recorded correspondence between the matron of Cork county home and the secretary of the South Cork Board of Health and Public Assistance. The journals also recorded details about the discharge of patients from Cork county home to extern institutions and hospitals, including Bessborough, along with their unique county home register number. This allowed for the identification of single women who were transferred to Bessborough before giving birth.
South Cork Board of Public Assistance Minutes, 1924-42 (28 volumes)

28.14 These files recorded details of all patients discharged from Cork county home to extern institutions including Bessborough. It was possible to locate all named women transferred to Bessborough in the years 1924-42 in the county home registers and to identify them as single expectant women. This enabled the confirmation of information relating to single women and their children already gleaned from the county home registers and revealed information relating to hitherto unidentified expectant single women transferred from the county home to Bessborough in the period 1924-42.

Cork Board of Public Assistance, Managers’ Orders, 1942-69 (16 volumes)

28.15 The Cork Board of Public Assistance Managers’ Orders recorded the Board’s activities in minute detail. Boxes six to twelve (files 19-36) relate to the South Cork district. These records facilitated identification of single expectant women transferred between Cork county home and Bessborough in the period 1942-60. Patients transferred to extern institutions, including Bessborough, were recorded with their associated county home register number. The Managers’ Orders also enabled the confirmation of information relating to single women and their children already gleaned from the county home registers and revealed information relating to hitherto unidentified expectant single women transferred from the county home to Bessborough in the period 1942-60.

South Cork Board of Public Assistance files, 1922-60 (158 boxes)

28.16 This collection contains the original admission tickets given by the matron of Cork county home to single expectant women on their transfer from Cork county home to Bessborough. The admission tickets recorded the names of the women and their dates of transfer. This facilitated their identification in the indoor registers.

28.17 These auxiliary collections facilitated the identification of 380 expectant single women who would have been difficult, if not impossible, to locate through the county home registers alone.

Records of deaths Cork County Home and Hospital 1931-40

28.18 This is the only surviving death register relating to Cork county home. It facilitated the Commission’s efforts to identify infant and child deaths which occurred in the institution in the years 1931-40. This register also recorded if the South Cork Board of Assistance allotted a shroud, coffin or burial plot to deceased patients.
Conditions in the 1920s

28.19 In the period 1920-22 various changes to poor law arrangements were implemented (see Chapter 1). In Cork, Séamus Lankford of the Cork board of guardians advocated separate institutions for the various categories of ‘inmates’ living in the Cork workhouse. However, in 1921 the general mixed workhouse system remained as the primary form of poor relief.4 On taking up his role as Senior Vice-Guardian in 1921, Mr Lankford reported:

The first issue which commissioners had to deal with was the appalling dirt throughout the workhouse. The male and female infirm wards were in an indescribably filthy condition….A meal being served in the female ward was served to inmates squatting on the floor…the bakery was in a filthy condition…blankets were rat and moth-eaten and had to be destroyed…bed linen was difficult to keep clean due to an antiquated laundry system…kitchens, bathrooms and toilets were in a state of disrepair…the mortality rate among young children was very high…and a floating population of undesirables had made the workhouse their home.5

28.20 In 1921, the matron of the Cork workhouse made an urgent appeal to Mr Lankford to provide alternative accommodation for unmarried women and their children outside of the workhouse setting. This led to the establishment of Bessborough mother and baby home - see Chapter 18. The indoor registers of the Cork Union workhouse show that, of the 76 single mothers living in the workhouse during 1922, 11 opted to, or were eligible for, transfer to Bessborough.

28.21 In April 1924, the Cork County Scheme for the reorganisation of poor law institutions was given statutory recognition under Section 3 of the Local Government (Temporary Provisions) Act 1923 by the County Scheme Order, Cork No. 1, 1924.6 Under this scheme, all poor law unions in the city and county were grouped into three districts: North Cork, South Cork and West Cork districts. Each district was administered by a board of health or a board of public assistance. In North Cork, the workhouse at Mallow was designated as the county home and the Fermoy workhouse became the county hospital.7 In West Cork, the Clonakilty workhouse became the county home and Skibbereen became a county

4 See, Virginia Crossman, Poverty and the Poor Law in Ireland, 1850-1914, (Liverpool University Press, 2013)
7 Fermoy was subsequently sometimes described as a ‘county home’.
hospital. The South Cork district had a board of public assistance which was responsible for the Cork union workhouse. This was renamed the Cork county home and district hospital. In later years it was given the name St Finbarr’s.

In 1927, the Commission on the Relief of the Sick and Destitute Poor reported that Cork county home had a good maternity department with separate accommodation for married and unmarried women but stated that the classification of patients living in the institution ‘leaves much to be desired’. The commission reported that 23 unmarried mothers and 55 children were living among ‘lunatics, imbeciles and idiots’ in the home. The commission also noted that, in March 1926, 1,020 single mothers, 1,000 ‘illegitimate’ children and 500 ‘illegitimate’ infants were living under ‘workhouse conditions’ in county homes throughout the country. The Cork county scheme did not envisage that unmarried women and their children would continue to be accommodated in Cork county home. It was to be for ‘aged and infirm persons, chronic invalids, idiots and epileptics’. The attached district hospital would treat medical, surgical and maternity cases and those suffering infectious and contagious diseases. It was envisaged that single expectant women would be admitted to Cork county home to avail of maternity services only and then transfer to what the county scheme described as the ‘auxiliary home’ at Bessborough with their babies. A report on county homes by the Department of Health in 1951 acknowledged that the county schemes made insufficient provision ‘for classes such as unmarried mothers and children’ and that county homes had continued to be occupied by ‘a miscellaneous population for which no special provision had been made’. In the period 1922-60, many single women refused to transfer to Bessborough following the birth of their baby and many more were ineligible for admission to Bessborough because they were on their second or subsequent pregnancy. In 1950, an inter-departmental committee, set up to examine the use of county homes, established that on 31 March 1950, 450 unmarried mothers and 829 children were living in county homes throughout the country. Cork county home played a significant role in the provision of institutional care for single expectant women, and unmarried women with more than one child, until the early 1960s.

---

8 Bessborough was not an auxiliary home in the sense that Pellesttown and Tuam were. It was not directly under the control of the board of public assistance.

9 Department of Health, White paper on the reconstruction of county homes and improved care of the aged and other classes at present in county homes, (Stationery Office, Dublin, 1951), 7.

10 Dept of Health, White paper on the reconstruction of county homes, 9.
The Women 1922-60

28.23 From the available records, the Commission established that, in the years 1922-60, 13,283 women were admitted to Cork county home as maternity cases. Of these, 10,965 were married women and 2,318 were unmarried women. Of the 2,318 single expectant women, 2,241 appear to be first time pregnancies; 64 were recorded as second pregnancies; ten as third pregnancies; two as fourth pregnancies and one woman was recorded as being on her fifth pregnancy.

28.24 In the period 1922-30, the number of single women who entered the home as maternity cases was twice that of married women. The number of married women availing of maternity services in the institution increased from 60 in 1930 to 1,084 in 1960. This mirrored a general trend in Cork city which saw the number of institutional maternity cases/institutional births rise from 40% in 1944 to 66% in 1954.11 Conversely, the number of single women availing of maternity services in the institution decreased from a high of 98 in 1926 to an average of 14 in the years 1957 to 1960.

28.25 In his report for 1954, Dr J C Saunders, the medical officer of health, stated that available bed accommodation in the city’s maternity hospitals ‘had not kept pace with the demands made upon it’.12 A discussion document on a suggested mother and child services scheme in Cork in the 1950s noted that, owing to the shortage of maternity beds in the city, hospital confinements were restricted to ‘difficult’ pregnancies and where home conditions were unsuitable for confinement.13 Increased and sustained demand for institutional maternity care, particularly in the post-war period, may have influenced administrators at Cork county home to prioritise the admission of married women over single women. In the 1950s, the Department of Health was trying to ‘raise the status’ of county homes as institutions catering for the elderly and the chronic sick, so it put greater emphasis on its existing policy of removing unmarried mothers from county homes. The Congregation of the Sacred Hearts of Jesus and Mary had also agreed to admit single women on their second or subsequent pregnancy to Bessborough at this time (see Chapter 18). It appears that in the 1950s there was a concerted effort by local and central health authorities to discontinue the practice of accommodating

---

12 ibid
13 NAI, Department of Health file: HLTH/M/33/9
unmarried mothers in county homes for periods longer than that typically associated with the provision of maternity services.

28.26 Admissions of single expectant women to Cork county home were at their highest in the years 1922-33 and peaked in 1926 when 98 women were admitted. An average of 75 single expectant women were admitted annually in this period. There is a notable decrease in admissions in 1934. This followed the opening of the maternity hospital in Bessborough and suggests that more single expectant women sought admission to Bessborough rather than Cork county home at that juncture. Admissions of single expectant women to Cork county home began to increase from 1944 and remained high until 1948. One of the reasons for this was the increase in the number of children born to single women in the war years 1939-45. The General Register Office (GRO) recorded that 1,878 children were born to single women in 1938. By 1945 this figure had increased to 2,626.\(^\text{14}\) This increase was accompanied by increased demand for institutional care for single women and their children. The other major factor which may have influenced more single expectant women to seek admission to Cork county home in the mid-1940s was the overcrowding experienced in Bessborough, Sean Ross and Castlepollard. Admissions of single expectant women to the county home began to decrease again from 1949. This downward trend continued throughout the 1950s. In 1958 a new maternity hospital opened on site and the institution was renamed St Finbarr’s Hospital. While single expectant women continued to be admitted to the institution in the 1960s and later, they availed of maternity services only and were discharged a few days after giving birth.

Age on admission

28.27 Analysis of available records shows that the age of single expectant women admitted to Cork county home ranged from 14 to 50 years: the average age on admission was 24 years. Single women aged between 18 and 29 years accounted for 81% of admissions while 5% were 17 years or younger. The remaining 14% were women aged between 30 and 50 years.

Occupations

28.28 Of the 2,318 single women admitted to Cork county home, 98% were recorded as a domestic servant, factory hand or other unskilled worker; a small number are

---

\(^{14}\) Annual reports of the Registrar General of marriages, births and deaths in Ireland 1938-45.
recorded as a barmaid, shop assistant, nurse, millworker, typist and photographer. Thirty women (4%) stated that they were widowed and four are recorded as orphans.

Address prior to admission

28.29 Of the 2,318 single women admitted to Cork county home, over 92% gave their address prior to admission as Cork city or county. 7.5% of women were admitted from Bessborough, 2.7% from the Braemar Home for Protestant Girls and 1.5% were admitted from a Good Shepherd Convent. 1.5% were of ‘no fixed abode’.

Admission Pathways

28.30 Single expectant women, and unmarried women accompanied by a child, who sought admission to Cork county home were required to get an admission ticket from the South Cork Board of Public Assistance or one of its agents. Most women secured an admission ticket from local dispensary medical officers (doctors) who most probably confirmed their pregnancy. The admission ticket ensured that the South Cork board would assume responsibility for the maintenance of a woman and her child in the county home. However, it is clear that the matron frequently admitted single expectant women who presented without an admission ticket as she considered that ‘to refuse them shelter in their plight would be a grave responsibility’. The matron told the board that one in four single expectant women admitted to the home were from outside the South Cork district and were asked to make a contribution to the cost of their maintenance.

28.31 Women who sought admission to the home without an admission ticket were usually from outside the South Cork public assistance district and their maintenance was the responsibility of the North and West Cork health boards or local authorities in their home counties. However, boards of health responsible for these women frequently refused to accept responsibility for their maintenance in Cork county home. The secretary of the South Cork board stated:

That, as it is the experience of the South Cork Board in their dealings with other Boards that liability for maintenance and treatment at the Cork County Home and Hospital is repudiated on the slightest pretext or the merest technicality, the loss in all such cases has to be borne by the ratepayers of South Cork.

15 Either an industrial school or a Magdalen laundry, most likely the latter.
The South Cork board decided that if this continued, it would terminate its agreements with other boards of health/public assistance and that the county home would be reserved exclusively for ‘bona fide’ residents of the South Cork district. In order to get around this, many single expectant women from outside the South Cork district, who most probably travelled to Cork for reasons of anonymity, took up temporary residence in lodging houses and hostels in Cork city and secured admission tickets with a city address. Some Cork city addresses associated with the admission of single expectant women appear in the indoor registers with some regularity.

In March 1930, the Mother Superior at Bessborough asked the board’s permission to admit single expectant women directly to the mother and baby home rather than going through Cork county home. The Congregation of the Sacred Hearts of Jesus and Mary had opened a maternity ward in Bessborough at that time. The board agreed to admit women from the South Cork district directly to Bessborough on production of an admission ticket secured from the board or one of its agents, but insisted that women from other counties and the other Cork districts were to be admitted to the county home in the usual manner. When the matron of the county home queried this decision the board instructed her to transfer all ‘first offenders’ to Bessborough regardless of which district they were admitted from. However, most single expectant women admitted to Cork county home did not opt to transfer to Bessborough. In the period 1922-60, 340 women (one in seven) transferred from Cork county home to Bessborough. Although the overwhelming majority of women admitted to Cork county home in this period were first pregnancies, and eligible for admission to Bessborough, the majority chose not to transfer there.

When the new Bessborough maternity hospital opened in 1933, the number of single expectant women seeking admission to Cork county home decreased and the number of women admitted from outside the South Cork district became less of a concern to the board of public assistance. However, from 1939 admissions from outside the South Cork district began to increase. The matron of the county home wrote to the South Cork board with her dilemma:

I take this opportunity of putting before the Board the difficulties with which I am confronted from time to time, in dealing with the admission of expectant mothers from outside the South Cork area. To admit them, with the probability that they may - mother and child - become a tax on this Board is a serious matter, but to refuse admission to these girls, who are often desperate
and open to grave temptation, is a responsibility I am unwilling to take. Girls in difficulty such as this will naturally endeavour to get away from home, and unless given shelter in Homes such as this, will be forced to seek help in undesirable quarters. As shielding the girl’s reputation and helping to restore her self-respect are of primary importance, these objects will not be achieved if the girl’s position is exposed through making application to her own Board for cost of maintenance in Bessboro’ Home or here.

28.35 The board stated that it recognised the matron’s position. Although it did not direct her to refuse admission to single expectant women from outside the South Cork district, it did not agree to bear the cost of maintaining them. The board resolved to contact the secretaries of boards of health in the districts from which the women came to ask them to take responsibility for their maintenance. The South Cork board stated that it did not object to protecting women and their children for a few months but sought to obviate the prospect of assuming liability for boarding out their children for 15 years.

28.36 In 1942, a single expectant woman from North Cork was admitted to Cork county home as an emergency case. The South Cork board contacted the North Cork board which stated that it would not accept responsibility for the woman as her admission to the county home had not been recommended by the medical officer of the North Cork board. Similarly, the Limerick board of health refused to accept responsibility for the maintenance of a woman from Kilmallock as there was no agreement between the Limerick board and Cork county home under the county scheme. The secretary of the South Cork board told members that a grave responsibility rested on them in connection with these and similar cases. He stated:

If they discharged the woman and her child, a tragedy might result or the child might fall into the hands of proselytisers, who were always on the lookout for such victims. If the Board refused such cases admission in the first instance, the expectant mother may have recourse to a variety of alternatives that may have evil social consequences.

28.37 It is clear from the surviving records that the matron of the county home regularly contacted families of single women from outside the South Cork district once they had given birth. It appears that women were much more likely to disclose details about their families and home life in the post-natal period. While the matron
successfully convinced some families to take women and their babies back to the family home, in most cases, she reported that ‘there is not much likelihood that their family and friends will claim them’.

**Single women ‘absconding’ from Cork County Home 1922-60**

In the years 1922-60 several women ‘absconded’ from Cork county home. The term ‘absconded’ was applied to women who left the county home without their babies and without arranging for their future care. These cases appear to have been of more concern to the board of public assistance and the DLGPH than the matron of the home. In May 1930, a woman ‘absconded’ from the county home leaving her three-week old baby behind. The board asked the matron what steps she was taking to locate the woman. The matron informed them that the Gardaí had established that the woman was living with her sister in England and asked if they wished to proceed further. The board directed that no further action should be taken in the matter. The DLGPH directed the board to identify the putative father in order to try to recoup the cost of their maintenance in the county home. In 1932, two women ‘absconded’ leaving their children aged 18 and 22 months respectively unaccompanied in the county home. One woman was returned to the home by her father and the other was never heard of again. In May 1938, four women left for mass and did not return. The Gardaí were notified of the ‘child desertion’. Although the matron was obliged to notify absconders to the Gardaí it appears that they did not pursue such women with any real vigour. They took the view that abandoned babies were ‘kept in safety’ in the county home and that they had no power to act in these cases. The matron advised the board that there was ‘little difficulty passing out of Cork County Home unnoticed’ and that there was nothing she could do if a woman decided to leave the institution without her baby. In 1938, the board’s solicitor indicated that legal proceedings could be taken against ‘absconded’ women under Section 12 of the *Children Act 1908* (see Chapter 1) and advised that he would take a test case. He told the board that he had previously tried to have proceedings instituted against an absconder under the *Vagrancy Act*, but the Gardaí considered vagrancy to be a matter for the board and outside their remit. Reports of ‘absconders’ appear throughout the Board of Assistance records during the period under review. It is unclear whether there were any successful prosecutions for child abandonment.

Violence in the home

28.39 Overcrowding in the Cork mental hospital in the 1920s meant that many people with psychiatric illnesses were living in Cork county home. In the 1930s the board of assistance discussed the transfer of psychiatric patients from the Cork mental hospital to Cork county home because it was cheaper to maintain them in the latter institution. It is not clear if this proposal was ever put into practice. In 1933, the matron complained to the board of assistance that the Gardaí routinely admitted people who were excessively drunk to the county home and that the practice ‘had the effect of disturbing the ordinary patients occupying the same wards’.\(^\text{17}\) Court cases relating to assaults in Cork county home and other criminal proceedings where the defendant was living in Cork county home were frequently recorded in local newspapers from the 1920s to the 1950s. Reports of drunk and disorderly ‘inmates’ were common and women living in the home were regular victims of physical assault. On one occasion, a woman smashed 38 windows in the institution and physically assaulted another woman. Another was admitted drunk and assaulted a woman. Many attempted suicides were reported - ‘inmates’ cut, or attempted to cut, their own throats open in front of other residents. Others threw themselves from open windows. In one incident, a male inmate killed an elderly male resident and a member of staff by repeatedly hitting them both with an iron drawn from a fire.

Living conditions

28.40 In 1931, the board of assistance instructed the local authority veterinary inspector, Dr Cussen, to inspect the meat being supplied to Cork county home. Dr Cussen reported that the contractor was supplying poor quality meat - some of which was so bad he ordered its destruction in a furnace. Dr Cussen reported that the contractor had tendered a price at which he could not supply the quality of meat required and stated that the contractor ‘was not a public philanthropist, and never was’.\(^\text{18}\)

28.41 In 1934, local authority analysts reported that a sample of milk supplied to Cork county home was ‘not of the nature, substance and quality of ordinary milk by reason of its being deficient in milk solids’. The analysts concluded that the milk supplied to the institution had been diluted by the addition of 18% water. The

\(^{18}\) Irish Examiner, 12 November 1931.
board undertook to publicly name and prosecute the supplier.\textsuperscript{19} The board frequently advertised, inviting tenders for the supply of beef, mutton, tripe, drisheen, fowl, chickens, milk, butter, eggs, flour, oatmeal, potatoes, yeast, fish, salt, golden syrup and alkali.

28.42 Members of the board of assistance visited Cork county home in September 1932 and reported that there were no fires lighting in some sections of the home and hospital. The matron explained that not all fires were lit during the summer. The board members then complained about the quality of the tea in the institution which was made and served by a 12 year-old boy. They complained that the boy did not know what quantity of tea and sugar to put in the water and concluded that ‘it was not fit for pigs’.\textsuperscript{20}

28.43 In 1938, an unmarried mother living in Cork county home was found lying in bed with a new-born baby lying dead at her feet. The woman had previously been admitted to Cork county home pregnant in 1930. She gave birth there, but the child died soon after. She was admitted to the home again in 1933 and gave birth to another child. Both mother and child had been living in Cork county home for five years. One night she complained of abdominal pains to the nurse on duty. The following morning the nurse discovered the body of an infant in the woman’s bed. At the inquest, medical staff told a jury that:

[The woman] was unmarried, was an inmate of the institution for the past five years, and had already given birth to two other babies. Nobody ever suspected that [the woman] was pregnant, for she dressed in such a way that her pregnancy could not be observed. She was mentally deficient.\textsuperscript{21}

28.44 A doctor gave evidence that the baby was born alive and fully developed but that there were no marks of violence on the body. He stated that the child had been born around 12 hours before the body was discovered. A pathologist stated that death was due to ‘inattention at birth’. The institutional records show that the woman’s four-year-old child was boarded out soon after the incident and the woman herself was transferred to a Good Shepherd Convent (a Magdalen laundry).

\textsuperscript{20} \textit{Irish Examiner}, 29 September 1932.
\textsuperscript{21} \textit{Evening Echo}, 23 July 1938.
28.45 The board of assistance visiting committee sought to establish how the woman became pregnant while in Cork county home and why she concealed her pregnancy. The DLGPH also dispatched an inspector, Dr Florence Dillon, to investigate the matter. The department concluded that no institutional staff were to blame for the incident and that no corroborative evidence was produced to support the woman’s claim that a named individual was responsible for her pregnancy. The board of assistance did not accept the department’s findings as ‘a satisfactory termination of the case’ and that ‘responsibility for neglect should be placed on whoever was responsible’. However, it does not appear that any further action was taken. The DLGPH concluded by recommending that:

Unmarried mothers, especially those with marked mental or moral defect should not in future be put to work in any place alone and should, where possible, be directly under the observation of a member of the staff, or failing that, accompanied by a more reliable type of inmate.

28.46 No descriptive accounts of living conditions in Cork county home were found in the institutional or related records. However, a controversy in 1937 did throw some light on the matter. In this instance a married woman sought admission to the home with her three children. A member of the South Cork board remonstrated that this ‘respectable lady’ was forced to ‘consort with women of ill-fame’ in the county home and that her children were housed in a nursery ‘not fit for a kennel’. These comments were subsequently published in the local press and drew angry responses from several board members. The matron of the county home told the board that she did not appreciate that ‘alleged defects’ in the institution were broadcast in such a manner without attempting to have them remedied in a more satisfactory way. She stated that, in terms of ‘cleanliness and brightness’, the nursery in the home compared favourably with any hospital. The matron stated that single women living in the institution were ‘greatly pained by the appellation applied to them’ and that the married woman in question had expressed her regret that women living in the home had been degraded by the board member who sought to help her and her family. The matron stated that the married woman ‘showed no pharisaical spirit during her time in the nursery, nor have any other married women, who, from time to time, are admitted there’. The Board investigated the allegations and concluded that they were unfounded and a ‘gross misrepresentation’ of conditions in the county home nursery.
28.47 In 1949 an inter-departmental committee was established to examine conditions in county homes. The committee reported that although buildings were generally ‘sound and spacious’ they were ‘lacking in comfort and amenities’. The committee found that county homes were ‘cheerless and badly furnished’, that wards were large with un-plastered walls, no ceilings, rough floors, poor beds and bedding, with few chairs, lockers, dressing tables or mirrors and that the general atmosphere in the institutions was ‘depressing’. The committee reported:

Sanitary and bathing facilities are insufficient and generally rather crude…Supplies of running water, especially hot running water, are frequently insufficient…Central heating is a rarity and the standard of heating resulting from the single open fire in a large room or ward is inadequate, the fire smokes, thus adding to the prevailing gloom. There are no single rooms or cubicles for special cases requiring them on medical grounds and small wards are rare.

28.48 Regarding accommodation provided for unmarried mothers and children in county homes the committee reported that conditions were ‘equally unsatisfactory’. The committee stated that the county home environment was ‘most unsuitable’ for children and that ‘nurseries were rough, poorly furnished and lacking in elementary playing facilities’. The committee stated that in some county homes it was not possible to properly segregate children from adult patients and recommended that separate institutions should be established to house unmarried mothers with children younger than the normal boarding out age (2 years). The committee also recommended that local authorities should consider employing unmarried mothers in county homes when their children were boarded out ‘so as to aid in their rehabilitation’. However, the committee reported that there was some reluctance on the part of county home authorities to ‘get rid’ of unmarried mothers as matrons of the homes relied ‘almost wholly’ on these women to undertake the ‘burdensome and menial work’ necessary for running ‘large institutions’ such as county homes. Matrons told the committee that the removal of unmarried women from county homes would make it impossible to run the institutions. The committee reported that unmarried women engaged in ‘menial duties’ incidental to the running of county homes without pay. They further reported that accommodation for unmarried mothers in county homes were ‘the worst furnished and most unattractive in the institutions’ and that their treatment while living in county homes led them to develop ‘a soured and distrustful attitude to society generally’.
CHAPTER 28 CORK COUNTY HOME

Single mothers employed in Cork county home

28.49 An incident in 1938 is illustrative of the attitudes of the matron of Cork county home and members of the South Cork Board of Public Assistance towards single mothers. In this case, a councillor told the board that five single women, who were former residents of the home and whose children were boarded out, were employed as paid wards maids in the county home. The councillor objected to the fact that ‘past inmates’ were employed in the home and proposed that the women should contribute to the cost of their children’s maintenance. The board agreed to the proposal and stated:

The Board deprecates the practice of recruiting staff of the Cork County Home and Hospital from inmates, particularly the mothers of illegitimate children, as it tends to lower the status and prestige of the Hospital. The Board re-directs that under no circumstances is such practice to be adopted in the future. The Board further directs the Matron to deduct from the salaries payable to such temporary employees the full amount of the boarding out allowance incurred by the Board, i.e. £15.00 per annum from date of boarding out until the age of 9 years, and £16.00 per annum from 9 to 15 years.

28.50 The matron asked the board to reconsider their decision on the basis that the women would see their weekly wage reduce from 15s to 9s, ‘for which they would be unwilling to work’. She informed the board that the women would not be expected to contribute to their children’s maintenance if they worked outside the institution. In the women’s defence, the matron stated:

They are very good girls and though rated as wards maids they carry out important duties. One is employed as a cook in the fever hospital; a second works in the nurses home; a third gives valuable and skilled assistance to nursing staff in the Female Mental Division and the fourth is employed as a maid in the Fever Hospital where she works in an infected atmosphere. Owing to the delicate nature of their position, these girls are naturally averse to having their names published. The probability of being asked to pay was not put to them when they were engaged here.

28.51 Although some councillors agreed with the matron, a motion to reverse the board’s decision was not carried. The board did not consider that the women involved were ‘indispensable’ to the running of the county home and directed the matron to deduct the cost of maintenance from their wages. The board’s solicitor informed them that the women involved in the dispute had not agreed to have the cost of
maintenance deducted from their wages when they were first employed and had threatened legal action to recover any deductions. He advised that such action would succeed. The board resolved to terminate the women’s employment unless they were prepared to agree in writing to the reduction in wages. In a bid to keep their jobs, two women agreed to accept the conditions laid down by the board. The other two women did not and issued legal proceedings against the board. The latter two women were dismissed from their posts. The board ordered their solicitors to pursue these two women for the cost of their children’s maintenance even though they were no longer in employment. The board’s solicitor informed them that the women were not in a financial position to bear the cost of their children’s maintenance and advised that it would be a waste of money to pursue the matter. The board instructed the matron to monitor the women and to inform the board if they ever became financially secure enough to pay for their children’s maintenance. The board also instructed the matron to engage the Garda authorities to trace their whereabouts.

Discharge pathways

28.52 Most women either returned to their family home with their children or arranged for their future care through the boarding out system or by making private arrangements with a nurse mother – 340 women transferred to Bessborough.

28.53 If a woman was able to return to her family home with her child, her family would write to the secretary of the Board of Assistance stating that they were willing to take their daughter and her child home. The board would then seek a recommendation, generally from a parish priest, to vouch for the family. In addition, the board might also ask one of their assistance officers (see Chapter 1) to inspect the family home to ensure that it was fit for the reception of the mother and child. Once the board was satisfied that the home environment was suitable, it notified the matron of the county home that the mother and her child could be discharged to her family. The Commission is not aware of any legal basis for the board to prevent a mother leaving the institution with her child, but the measures taken may have been due to a concern about the welfare of the child, in particular in the light of some high profile cases of infanticide.

28.54 If a woman sought to make private arrangements with a nurse mother to look after her baby, she could do so herself or use an intermediary such as the Catholic Women’s Aid Society (CWAS). The CWAS was set up in 1919 by Sister Laurentia
in the Sisters of Mercy convent attached to the Cork union workhouse (Cork county home). Sister Laurentia set up CWAS in response to a number of high profile court cases where nurse mothers were charged with neglecting and causing the death of ‘illegitimate’ children they had been paid to care for.  It appears that when the lump sum received for a child’s care was spent many nurse mothers lost interest in the child and their wellbeing. With CWAS, a woman deposited £60 to the CWAS bank account and handed over her infant and the deposit receipt to Sister Laurentia. Sister Laurentia then sourced a suitable nurse mother for the infant and paid her the £60 over three years in twelve quarterly instalments. If a woman did not have £60 to deposit, she could pay Sister Laurentia in instalments. For women who had difficulty paying instalments CWAS used interest accrued in their bank account to pay nurse mothers on their behalf. Women who accepted a child under a nursed-out arrangement were required to notify the Board of Assistance of the reception of a child, whether they received payment or not - see Chapter 1.

28.55 If a woman could not return to her family home and did not have the means to pay a nurse mother, or to provide for herself and her child, then her only option was to place her child in foster care under the boarding out scheme. The policy was that a child could not be boarded out until the age of two. This option invariably meant that mother and child remained in the institutional setting of a county home for several years. A woman did not give up her parental rights when her child was boarded out and could reclaim the child at any time. The available records do not suggest that this was a frequent occurrence. Prior to the introduction of legal adoption in Ireland, many foster parents informally adopted children boarded out from Cork county home by informing the board of assistance that they no longer wished to receive a boarding out allowance for them.

Braemar Rescue Home for Protestant Girls

28.56 In the period 1922-60, 64 single expectant Protestant women were admitted to Cork county home. All were admitted from the Braemar Rescue Home for Protestant Girls, Old Blackrock Road. Braemar was a lay run maternity home under the auspices of the Cork Women’s Aid Association. Women admitted from Braemar were aged between 15 and 42 years old and most stated their occupation as domestic servant. While most women gave addresses in one of the three Cork

Although the initials are similar, this was a different organisation from the Catholic Women’s Aid Society.
health districts, some had travelled from Armagh and Donegal. Women stayed in Braemar until they went into labour and were then admitted to Cork county home. The South Cork board of public assistance took responsibility for their maintenance. Protestant women and their children were discharged to the Braemar home and their children were fostered out from there.

Maternal mortality

28.57 The Commission has identified 35 deaths among single expectant women and unmarried mothers admitted to the Cork county home between 1923 and 1960. Thirty deaths occurred in the institution; the remainder occurred subsequent to women’s transfer to Bessborough and the South Infirmary. The women were aged between 15 and 40 years at the time of death.

28.58 Sixteen maternal deaths were notified as being due to childbirth related causes such as eclampsia and puerperal sepsis representing a maternal mortality rate of 1.12%. Ten deaths were notified as being due to cardiac failure or heart disease and five as tuberculosis. Other deaths were notified as being due to, appendicitis, bronchitis, encephalitis and kidney disease.

Unaccompanied children 1922-60

28.59 In the period 1922-60, 375 ‘illegitimate’ children were admitted unaccompanied to Cork county home. Of these, seven children were found abandoned, 207 were admitted unaccompanied for boarding out or were returned by foster parents and 161 were admitted unaccompanied from Bessborough for boarding out. A further 23 children transferred with their mothers from Bessborough to Cork county home with a view to being boarded out.

28.60 The matrons’ journals, which are available for the period April 1937 to July 1940, record frequent admissions of unaccompanied children having been returned to the county home by their foster parents for various reasons. A three-year old boy boarded out from Bessborough was admitted to the county home after one day because the foster mother complained that ‘the child cried incessantly’. Two boarded out children aged eight and 11 years were returned to the county home by their foster parents. As no suitable foster parents were available both children were transferred to Kinsale industrial school. Another eight-year-old child returned
by foster parents was transferred to Greenmount industrial school. A two-year-old boy taken by his mother was returned unaccompanied to the county home because she could not support him. A four-year old girl was returned by her foster parents because she had ‘a marked cast in both eyes’ and they ‘found her appearance objectionable’. The girl was transferred to Kinsale Industrial School. A five-year old girl, born with one hand, was returned by several foster parents ‘owing to her deformity’. She was transferred to a Good Shepherd Convent. Many other children were returned by foster parents who claimed that the children were ‘backward’. Although some ‘returned’ children were subsequently re-boarded out from the county home with different foster parents, most, and children aged six years and over in particular, were transferred to industrial schools.

28.61 Unaccompanied children transferred from Bessborough to Cork county home were transferred in groups at the behest of the Cork board of assistance. For instance, on 13 September 1941, six children aged two years and older were transferred from Bessborough to Cork county home for boarding out. Group transfers of children from Bessborough to the county home were frequent during the period under review. The transfers were undertaken at the behest of the Cork board of assistance who refused to pay the Bessborough authorities maintenance for children aged two years and over. All unaccompanied children transferred in this manner were two years and over and the transfers occurred during periods of overcrowding in Bessborough or after a departmental inspection of that institution. On 1 October 1948, 11 women and their children, all aged over two years, were also transferred from Bessborough to the county home.

28.62 Throughout the period under review the matron of Cork county home continually notified the board of assistance that the nursery in the institution was overcrowded with children waiting to be boarded out. In October 1927, the board of assistance was informed that ‘illegitimate’ children of school-going age were living in the county home with their mothers. The board was told that these women were not likely to leave the institution because of poor health or inability to procure employment and resolved to seek ministerial approval to have the children boarded out. The issue was raised again in December. The board was again informed that the county home nursery was overcrowded due to the ‘large number of healthy older children’ living there. The matron asked the board to expedite the

25 Almost certainly an industrial school.
boarding out of older children to alleviate overcrowding. The board said they were taking steps to secure suitable foster homes.

28.63 In October 1938, the matron informed the board that there were several children of both sexes in the nursery suitable for boarding out or otherwise provided for and that the nursery was ‘rather crowded’. The board told her that all efforts by assistance officers had failed to secure foster parents and that the secretary was directed to issue a public advertisement. However, by 1944 the situation had worsened and the board undertook to ‘advertise intensely’ for foster parents at regular intervals.

**Infant mortality**

28.64 The Commission has not seen institutional death registers for the Cork county home for the years 1922-60. Other institutional records suggest that 545 ‘illegitimate’ infants and children born in or admitted to the institution died in infancy or early childhood. When cross referenced with documentation created by the South Cork board of public assistance and the Cork Health Authority, it was established that some infants, whose deaths seem to have been indicated in the institutional records, were in fact boarded out by the local authority or had been placed at nurse by their mother. Cross reference with records held by the GRO confirmed the deaths of 512 ‘illegitimate’ children.

28.65 Most deaths (55.5%) occurred among children who were accompanied in the institution by their mothers: 44.5% of deaths occurred among unaccompanied children. Most deaths among unaccompanied children related to children admitted unaccompanied from the Bessborough home.

28.66 Most deaths (89%) occurred in the institution. Around 9% of deaths occurred after children’s transfer to Bessborough. A small number of deaths occurred following transfer to the Braemar Home for Protestant Girls, the South Infirmary and the Victoria Hospital.

28.67 About 84% of deaths occurred among children who were born in the institution and 16% occurred among children who were admitted after birth. Most children who were admitted after birth and who subsequently died were admitted from Bessborough.
Women who experienced complications during pregnancy were routinely transferred from maternity hospitals in Cork to the district hospital attached to Cork county home. Many such emergency cases were women transferred from Bessborough. Of the 512 confirmed infant and child deaths in Cork county home, 109 were either transferred from Bessborough or born to women transferred from Bessborough.

Age at death

Around 93% of deaths occurred in infants less than twelve months old: among these 16% were less than a week old; 10% were between one week and one month old and 67% were aged between one and 12 months old at the time of death. The remaining deaths (7%) occurred among children aged one year and over.

Deaths by Year

Infant and child deaths in Cork county home were highest in the 1920s and 1930s, peaking in 1925 when 31 deaths were recorded. Infant and child deaths were relatively high during the war years, peaking in 1944 when 23 deaths were recorded. There was a noticeable reduction from 1948 and an even further reduction subsequent to the establishment of a paediatric unit at the institution in 1951.

Death rate

The average death rate among ‘illegitimate’ infants and children born in or admitted to Cork county home and district hospital in the years 1921-60 was around 20%. However, a death rate of 39% was recorded in 1935 which suggests that two in every five ‘illegitimate’ children born in or admitted to the institution in that year died. The relatively high death rate of almost 35% recorded in 1944 was a consequence of the increased admissions of single expectant women due to the closure of Bessborough that year.

In 1948, and due to the introduction of antibiotics, infant and child mortality in the institution began to decrease. However, a more marked decline in mortality can be observed from 1951 when Dr R G Barry opened the city’s first paediatric unit at Cork county home/St Finbarr’s Hospital. Chief Medical Officer to Cork City, Dr Jack Saunders wrote:
One could not fail to be impressed by the striking improvements effected for the treatment of children there in connection with the paediatric unit organised by Dr R. G. Barry. While admittedly not perfect in accordance with modern standards, this unit represents a great forward step in the treatment of infants’ diseases so far as this city is concerned…One was, in particular, impressed with the facilities now available for the treatment of Gastro-Enteritis and the prevention of its introduction into children’s wards by way of cross-infection.\textsuperscript{26}

28.73 Dr Saunders later wrote that, although the prevalence of epidemic diarrhoea and gastroenteritis in the city and in Cork county home increased during the 1950s, deaths from the disease remained low and stated that ‘it must be reasonable to suggest that the stand-alone paediatric unit at St Finbarr’s Hospital continued to play a positive role in reducing infant mortality in the city.’\textsuperscript{27}

\textbf{Cause of death}

28.74 The most common cause of death was gastroenteritis, which accounted for over 26% of deaths. About 17% of deaths were attributed to malabsorption which included deaths notified as marasmus and wasting from birth. A further 17% were attributed to non-specific causes such as congenital debility and prematurity. Around 13% were attributed to respiratory infections, mainly bronchopneumonia and 10% were attributed to tuberculosis. Other causes of death such as convulsions, syphilis, congenital heart disease, generalised infections, haemorrhage, meningitis, spina bifida, measles and diphtheria featured to a lesser extent.

\textbf{Infant Burials}

28.75 The Commission established that the Cork District Cemetery at Carr’s Hill, Cork, was owned and operated by the South Cork board of public assistance in the period in which Cork county home was in operation. The Commission understands that the unclaimed remains of those who died in Cork county home were buried at Carr’s Hill. The Commission and HSE staff made extensive efforts to locate burial registers for Carr’s Hill but none was located. A former administrator of St Finbarr’s Hospital told the Commission that he had access to mortuary records which recorded details of burials and the removal of remains of those who died in

\textsuperscript{26} J.C. Saunders, \textit{Report on the Health of Cork County Borough for the year 1951.}  
\textsuperscript{27} J.C. Saunders, \textit{Report on the Health of Cork County Borough for the year 1951.}
the institution from the 1940s to the 1970s. The Commission and HSE staff made extensive efforts to locate the mortuary records with limited success. Although some mortuary records relating to the years 1968-85 were located, mortuary records from the 1940s to the late-1960s were not found. Correspondence relating to an infant who died in Cork county home/St Finbarr’s Hospital in 1960 stated that the mortuary records for that year had been consulted and that the child’s unclaimed remains had been buried at Carr’s Hill. Aerial photography obtained by the Commission show that Carr’s Hill was in operation in the early 1950s. Anecdotal evidence from a former employee of St Finbarr’s Hospital suggests that burials of deceased patients from Cork county home/St Finbarr’s Hospital continued at Carr’s Hill until 1962.

28.76 The Commission examined all available burial registers relating to cemeteries in Cork city and hinterland. Of the 449 confirmed deaths of ‘illegitimate’ infants and children in Cork county home in the period 1922-60, burial records for just two were found. Both were found in the burial registers of St Finbarr’s Cemetery and related to burials in the ‘poor ground’ section in 1948 and 1950.

28.77 Archivists at Cork City and County Archives alerted the Commission to a ledger ‘Record of Deaths in Cork County Home and Hospital’ which covered periods between 1931 and 1984. The volume relating to the period April 1931 to August 1940 recorded whether the board of assistance issued a shroud, coffin or burial plot. Although many adults who died in the institution during this period were allotted burial plots, none was allotted to ‘illegitimate’ infants and children who died in the institution in this period. This volume recorded that 50 deceased ‘illegitimate’ infants and children were allotted shrouds: nine of these were also allotted coffins. It appears that those who were allotted coffins were children over one year old.

28.78 The Commission located mortuary records relating to St Finbarr’s Hospital for the years 1968-85 at Cork University Maternity Hospital. This set of index cards was compiled by a mortuary porter at the institution and recorded patient details including name, last address, date of death, name of undertaker and place of burial. Index cards relating to ‘illegitimate’ infants who died in St Finbarr’s Hospital in this period stated that all were interred in St Michael’s Cemetery. The Commission examined the burial registers at St Michael’s Cemetery but found no burial record for the infants identified on the mortuary index cards. Further analysis of the mortuary index cards revealed that in some instances deceased
infants were recorded as having been buried in the coffin of a deceased adult patient. In other instances, infants were recorded as being buried in coffins containing amputated limbs.\textsuperscript{28} The Commission established that the Cork Health Authority/Southern Health Board were buying burial plots in St Michael's Cemetery since its opening in 1948. These burial plots were used to bury the unclaimed remains of adults who died in Cork county home/St Finbarr's Hospital. The Commission has not been able to establish if the practice of burying the remains of 'illegitimate' infants in the coffins of deceased adults was undertaken as far back as 1948.

Chapter 28 A: Cork county home Statistical analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

From the institutional records\(^1\), the Commission established that 2,318 single expectant women were admitted to Cork county home in the years 1921 to 1960. Information relating

\(^1\) Indoor registers are missing for Jan-Dec 1924; March 1952; Feb-Mar 1953; Jan-Mar 1954; March 1955 and April 1957-March 1959
to year of admission was available for 2,255 women (97.3% of admissions). The busiest period was in the years 1922 to 1933; over 42% of women were admitted in that period. Admissions peaked in 1926; 98 women were recorded that year. Although Bessborough opened in 1922 it appears that many women either refused to enter, or were ineligible for admission to, Bessborough and continued to seek admission to Cork county home in this period. Admissions declined in 1934. This corresponds with the opening of a maternity hospital for single expectant women in Bessborough. Between 1934 and 1943, 58 women on average were admitted to the county home annually. However, numbers increased to 73 in 1944 and 83 in 1945. This was most likely due to overcrowding in Bessborough and the closing of that institution to public patients for most of 1945. Admissions remained relatively high in 1947 and 1948; 72 and 80 women were admitted respectively in those years. Admissions declined in a staggered fashion from 80 in 1948 to 29 in 1956. The records for 1957 to 1960 are incomplete; the surviving registers show that seven women on average were admitted annually in those years. Approximately 87% of single expectant women admitted to Cork county home were recorded prior to 1950.

\footnotetext{2 It was not possible to identify the date of admission for over 900 women. In those cases the date of birth of the child was used to inform data relating to the year of admission.}
Age on admission

Information relating to age on admission was available for 2,198 women (94.8% of admissions). Age range was between 14 and 50 years. The institutional records show that most women (81%) were aged 18-29 years; 14% were 30 years and older and 5% were aged 17 years and younger; 1.77% of women were aged between 14 and 16 years. The mode of age on admission was 23 years; this varied from 20 years in the 1920s to 21 years in the 1940s and 1950s. Average age on admission increased from 23 years in the 1920s to 25 years in the 1950s.

Previous pregnancy

Information relating to previous pregnancy was available for 77 women; 64 were second pregnancies, ten were third pregnancies and two were fourth pregnancies. One woman was admitted on her fifth pregnancy. In 2,241 cases information relating to previous pregnancy was not recorded.
Information relating to occupation was available for 765 women (33% of admissions). The available information shows that the majority (98.3%) were recorded as a domestic servant or unskilled worker; 1.57% as a teacher/civil servant/clerk or other skilled worker and one woman was recorded as being unemployed.

**Marital status**
Information relating to marital status was available for all 2,318 women. The institutional records show that the majority (97.8%) were single and the remaining women were either widowed or separated.
Previous address by county

Information relating to previous address by county was available for 2,245 women (96.9% of admissions). The institutional records show that the majority of women (92.43%) gave an address in Cork city or county as their residence prior to admission followed by Kerry (2.23%); Limerick (1.25%) and Waterford (1.16%). The remaining 2.93% of women combined gave addresses in 20 other counties.
Outcome
Information relating to outcome was available for 2,239 women (96.6% of admissions). The institutional records show that 83.4% of women admitted to Cork county home stayed and gave birth; 8.8% left before the birth - around one in three of whom gave birth in Bessborough following transfer there. The remaining 7.8% of women were admitted with their child having given birth elsewhere.

Place of birth
Information relating to place of birth was available for 1,965 women (84.4% of admissions). The institutional records show that most women (96.7%) gave birth in Cork county home; 2.1% gave birth in Bessborough following transfer there and the remaining 1.2% of women gave birth elsewhere. Of the women who gave birth in Cork county home, 99.89% delivered living infants; two women delivered stillborn infants.

Length of stay
In the institutional records, fields where dates of admission and discharge of unmarried mothers should have been recorded were frequently left empty. The Commission considered that the available information would not determine the typical length of stay with any accuracy. For the same reason, it was not possible to determine occupancy levels with any degree of accuracy.

Exit pathways
Information relating to exit pathways was available for 372 women (16% of admissions). The available information shows that the majority of the recorded exit pathways relate to women who transferred to Bessborough (340) and women who ‘absconded’ from the institution without their babies (14).

Maternal deaths
Through the institutional records, the Commission identified 35 deaths among women admitted to Cork county home: representing a mortality rate of 1.5%. The majority of deaths occurred in Cork district hospital - two occurred in Bessborough following transfer there. Eighteen deaths were not associated with pregnancy or childbirth - they were, in the main, due to tuberculosis, kidney disease, cancer, pneumonia and meningitis. Nine deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy and generally resulted in cardiac failure. Sixteen deaths were directly associated with pregnancy and
childbirth. Direct obstetric deaths were mainly due to puerperal septicaemia/sepsis, toxaemia eclampsia and obstruction of labour. Adhering to WHO guidelines the maternal mortality rate in Cork county home was 1.12%.³

Children: admissions

From the institutional records, the Commission identified 2,408 ‘illegitimate’ children who were born in or admitted to Cork county home in the years 1920 to 1960. Information relating to date of birth/admission was available for 2,395 children (99.5% of admissions). Births and admissions were highest in the 1920s and 1930s and peaked in 1926 when 107 children were recorded. Reduced births/admissions were recorded in 1934 - 47 children were recorded that year - but increased to 86 in 1938. In the 1940s, births/admissions peaked in 1945 when 85 children were recorded (Bessborough was closed to public patients for most of that year) but had decreased to 45 by 1949. Despite a slight increase in 1951, for the remainder of the 1950s births/admissions declined - just eight children were recorded.

³ Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. https://www.who.int/healthinfo/statistics/indmaternalmortality/en/
in 1957. More children were born in or admitted to Cork county home in the 1930s than any other decade (29.6%) followed by the 1920s (28.5%); 1940s (26.7%) and the 1950s (14.9%).

The institutional records show that the majority of children (83.6%) were born in the home or were admitted there with their mother; 16.2% were admitted unaccompanied and a small number were admitted as accompanying siblings.

**Length of stay**

Information relating to length of stay was available for 1,518 children (63% of births/admissions). The institutional records show that length of stay was longest for children admitted during 1922 and averaged 653 days. An average stay of over one year appears to have applied to children born/admitted in 1935 and 1945 only. Although average length of stay fluctuated wildly from 653 days in 1922, to 77 days in 1925 and 397 days in 1945, average lengths of stay from 1941 to 1945 were consistently high - children born or
admitted in those years spent 357 days on average in the home. In the 1950s, average length of stay varied from 208 days for children born/admitted in 1954 to 22 days for those born/admitted in 1955 and 87 days for those born/admitted in 1956. Analysis by decade shows that children born/admitted in the 1940s spent an average of 279 days in the home - by the 1950s this had decreased to 125 days.

**Discharge re mother**

The available information relating to a child’s discharge in relation to the mother shows that 65% left Cork county home on the same day as their mothers; 25.5% were discharged on dates before their mothers and 9.5% remained in the home unaccompanied for a period after their mothers had been discharged.

**Exit pathways**

Information relating to exit pathways was available for 577 children (24% of births/admissions). The available information shows that 38.82% of children transferred to other institutions - the majority to Bessborough and a small number to the Braemar Home for Protestant Girls; 38.47% were boarded out and 16.29% were placed at nurse; 5.2% left the home with the mother or other family member; 1.04% were legally adopted (post 1952) and 0.17% were informally adopted (pre 1953). Analysis of exit pathways for unaccompanied children shows that the majority (66.9%) were boarded out.

**Foreign adoption**

The available records show that four children born in Cork county home were placed for foreign adoption in the USA. Two were born to protestant women and were placed for adoption after their discharge to the Braemar Home for Protestant Girls. At least one of the other two children were placed for adoption through the Catholic Women’s Aid Society (CWAS) - the fourth child was placed for adoption after being placed at nurse, most likely through CWAS also.
The institutional records show that 545 ‘illegitimate’ children died in Cork county home in the years 1920-60.\textsuperscript{4} The Commission located GRO death records for 512 children (93.9% of child deaths). Information relating to date of death was available for 531 children (97.4% of child deaths). In the early 1920s child mortality in Cork county home was relatively low but increased substantially from 13 deaths in 1923 to 31 deaths in 1925 and remained high until 1931; one in three of all child deaths were recorded during those seven years. Between 1932 and 1947, an average of 18 child deaths were reported annually - ranging from 13 deaths in 1941 to 23 deaths in 1944. The introduction of antibiotics in 1945 appears to have influenced a downward trend in child mortality and the opening of a dedicated paediatric unit in the home (then St Finbarr’s Hospital) in 1951 saw just four deaths being notified that year.

\textsuperscript{4} Many children were associated with both Cork county home and Bessborough and may appear in records relating to both institutions. The Commission identified a combined total of 1,401 individual child deaths in both institutions.
For the remainder of the 1950s, three child deaths on average were notified annually. 95% of child deaths in Cork county home occurred before 1950.

**Place of death**

Information relating to place of death was available for 514 children (94.3% of suspected child deaths). The majority of child deaths (88.7%) occurred in Cork county home and district hospital; 9.3% occurred in Bessborough following transfer there; five children died in private residences - most after being placed at nurse; two died in the South Infirmary hospital and one in the Victoria hospital; one died in the Braemar Home and one died in Pelletstown having transferred there with mother.
Age on death

Information relating to age at death was available for 526 children (96.5% of child deaths). The available records show that 93.27% of deaths occurred in infants as follows: perinatal (0-7 days) 16.35%; neonatal (8-28 days) 10%; infant (29-365 days) 66.92%. The remaining deaths occurred in children aged between 366 days and just under five years.

The available records show that just under 55.5% of children were accompanied by their mother at the time of death; 44.5% were unaccompanied.
Information relating to cause of death was available for 512 children (93.9% of child deaths). The available records show that the leading cause of death - gastroenteritis - was responsible for 26.37% of child deaths; 17.19% were attributable to malabsorption - mainly marasmus; 16.8% were due to non-specific cause such as prematurity and congenital debility; 13.28% were recorded as due to respiratory infections - mainly bronchopneumonia; 10.35% were notified as tuberculosis - mainly general tuberculosis and tubercular marasmus; 5.08% were notified as being due to a range of other, mostly one off, causes such as asphyxia, pertussis (whooping cough) and icterus neonatorum; 2.73% as infantile convulsions; 1.95% as congenital syphilis; 1.37% as being due to generalised infections - mostly toxaemia; 1.37% were due to congenital heart disease; 0.98% to haemorrhage; 0.98% to meningitis/encephalitis; 0.59% were notified as spina bifida; 0.59% as being due to measles and 0.39% were notified as deaths due to diphtheria. In the 1920s, malabsorption
(marasmus) was the leading cause of death; by the 1940s, however, marasmus hardly featured as a cause of death and by the 1950s no death was notified as such. From the 1930s to the 1950s, gastroenteritis and respiratory infections were the most cited cause of death. Although tuberculosis featured as a leading cause of child mortality in the 1920s and 1930s, in the 1940s, just one child death was notified as being due to tuberculosis.

**Infant mortality**

The available records show that infant mortality in Cork county home peaked in 1925; a mortality rate of 33.7% was recorded that year. From 1926 to 1947 the average infant mortality rate was 23.7% and ranged between a low of 14.5% (1936) to a high of 31% (1940) in that period. The first real reduction was seen in 1948 - a rate of 13.2% was recorded that year - and by 1953 a rate of 0% was recorded. In the years 1954 to 1956 the infant mortality rate increased from 5.9% to 10%, which represented two infant deaths in 1954 and three each in 1955 and 1956.

---

5 Infant mortality was calculated as follows: (Living children born in the year who died before the age of 1)/(All living children born in the year).
Chapter 29: Stranorlar county home

Introduction

29.1 The workhouse in Lifford Road, Stranorlar was built in 1845. It occupied a seven-acre site and could accommodate up to 400 ‘inmates’. The building followed George Wilkinson’s typical design. An entrance and administrative block at the south contained a Porter’s Room and waiting room at the centre with the Board of Guardians’ board room on the first floor above. The main accommodation block had the master’s quarters at the centre with male and female wings to each side. At the rear, a range of single-storey utility rooms, such as bake house and wash house, connected through to the infirmary and ‘idiot’s ward’ via a central spine containing the chapel and dining hall. During the famine in the mid-1840s, a 60-bed fever hospital was erected at the north of the workhouse, beyond which lay the burial ground.¹

29.2 Like all workhouses, Stranorlar was administered by a Board of Guardians (see Chapter 1). The master and matron were responsible for the day to day running of the workhouse. In 1899, the Sisters of Mercy became involved and provided the matron and nursing staff.

29.3 The Donegal County Scheme for the reorganisation of poor law institutions was given statutory recognition under the Local Government (Temporary Provisions) Act 1923 (see Chapter 1). The County Scheme Order, Tirconail No. 1 1923 provided that the workhouse at Stranorlar would be the county home for ‘aged and infirm persons, chronic invalids, pregnant mothers, imbeciles and epileptics’.² The Donegal scheme did not make separate arrangements for unmarried mothers and their children.

Sources

Indoor Registers

29.4 The HSE (which is the current owner of what was the Stranorlar county home) gave the Commission access to digital copies of the Indoor Registers (record of

¹ www.workhouses.org.uk/Stranorlar/
admissions) of the home. This collection comprised six PDF documents, each a scanned copy of a register, covering the periods:

- 30 January 1921 - 31 March 1932 (179 pages, 4,581 entries)
- 1 April 1932 - 31 Dec 1942 (192 pages, 4,918 entries)
- 1 May 1943 - 30 April 1948 (118 pages, 2,520 entries)
- 1 May 1948 - 31 August 1957 (135 pages, 2,960 entries)
- 1 September 1957 - 31 January 1974 (140 pages, 3,000 entries)
- 1 February 1974 - 31 March 1994 (132 pages, 2,920 entries)

29.5 Each register included an alphabetical index of patients with surname, first name and reference number. The main body of the register included individual entries with the following information given: register number; date admitted; whether born in workhouse; name; residence prior to admission, sex; age; if adult, single, married or widowed; if child, orphaned, deserted, ‘legitimate’ or ‘illegitimate’; employment; religious denomination; if disabled what type of disability; name of wife/husband if not in workhouse; number of children if not in workhouse; observations on condition of ‘inmates’ when admitted; and date discharged or died. From 1932 there were further columns to record name and address of nearest relative and folio maintenance register. Maternal and infant deaths which occurred in the institution were also noted.

29.6 Where single pregnant women were admitted, some entries included details of the putative father. Where children were boarded out or sent to another institution, this information is also included in the register.

29.7 Single pregnant women and unmarried mothers were not identified as such in the indoor registers. Although marital status was recorded on admission, women were not identified as maternity cases. However, entries relating to newborn infants and children had an associated note such as ‘child of No. 1234’ attached which allowed the Commission’s researchers to identify the mother of a child and to determine if she was married or single.

---

3 Women entered workhouses for various reasons, for example, because they were old or poor, and not exclusively because they were pregnant or had children. There is a suggestion in the anecdotal evidence (below) that Traveller women (almost certainly married) may have entered Stranorlar to give birth.
Department of Health

29.8 The Department of Health gave the Commission substantial files with detailed reports about the Stranorlar county home. The files used for this chapter are INACT/INA/0/434275 and INACT/INA/0/434370.

Donegal County Archives

29.9 The Donegal county archives have a range of relevant material including
- BH/1-19, Minutes of the Board of Health and Public Assistance, 1922-42 (19 volumes):
- County Manager’s Orders 1942-98 (300 volumes)
- CC/17/3-11 County Medical Officer Annual Reports
- CC/15/4/6 County Council correspondence with Board of Health.
- CC/17/17 County Home Donegal 1946-53 (Paying orders and building plans)
- CC/30/58 Burial ground correspondence
- CC/30/59 Number of burials 1944-45
- BH/2/1/23 Board of Health Reports and Correspondence 1933-35

The women

29.10 The surviving indoor registers relating to Stranorlar county home cover the period January 1921 to March 1994. The last single pregnant woman admitted was recorded in 1964 but admissions of single pregnant women all but stopped in 1960. Between 1921 and 1960, about 22,000 people were admitted to the institution. The Commission identified 1,646 as single pregnant women and/or single women accompanied by children. The Commission also identified 1,777 ‘illegitimate’ children who were born in or admitted to the institution - 181 were admitted to the institution unaccompanied and 122 were admitted with their expectant mothers. The women and children who are the subject of this investigation constituted 15.5% of all admissions to Stranorlar county home during the period under review.

29.11 The Stranorlar indoor registers show that administrators were quite diligent in obtaining the name, address and other information relating to ‘supposed fathers’ from all single pregnant women entering the institution with a view to pursuing the men for maintenance. In June 1923, the Donegal News reported that the storekeeper was responsible for extracting this information from women on
admission. It is worth noting that the storekeeper also had responsibility for retrieving the cost of treatment from patients maintained in the county home by the board of assistance and who were later found to have the means to pay. He received a commission of 5% of all monies recouped.4 There is little doubt that the trauma experienced by women on their admission to the county home, pregnant and destitute, was exacerbated by the pressure to name the putative father. On those rare occasions when a putative father did appear before a court, there is no evidence to suggest that proceedings were successful.

29.12 The Stranorlar indoor registers were well-maintained and contain a wealth of information on single pregnant women admitted there. Single pregnant women had the same rights of access to hospital maternity services as married pregnant women. However, if a woman could not return to her family home with her child or was unable to support herself and the child, her only option was to remain in Stranorlar county home or to seek admission there after the birth.

Admissions

29.13 Admission rates of single pregnant women/single women accompanied by a child rose steadily from 14 admissions during 1921 to a peak of 71 admissions during 1948. By 1950, admissions had declined by almost 50% with 35 admissions recorded for that year. Admissions fell dramatically between 1950 and 1964. After this period, the county home began to cater almost exclusively for the care of older people. It was renamed St Joseph’s Community Hospital and continues to operate as a public nursing home to this day.

Age Range

29.14 The Indoor Registers recorded the age of 1,630 single pregnant women admitted to Stranorlar between 1924 and 1962. The youngest maternity admission was 13 years old and the oldest was 53 years old. The average age on admission was 24 years. Most admissions (75%) were aged between 18 and 29 years; 19% were 30 years and older and 6% were aged between 13 and 17 years.

4 Donegal News, 2 June 1923.
Home Address

29.15 The registers show that 99.8% of single pregnant women admitted to Stranorlar gave a home address in Co Donegal (1,607). The remaining women gave a home address in Sligo (11); Tyrone (5); Derry (3); Cork (3) and Antrim (1).

Occupations

29.16 The registers show that over 99% of single pregnant women admitted to Stranorlar were employed as domestic servants; a small number were factory workers, working in the hospitality industry or shop workers. Two were recorded as secretaries and one as a teacher.

Religion

29.17 The registers show that 98% of the single pregnant women admitted to Stranorlar were Roman Catholics: the remaining women were either Church of Ireland or Presbyterian.

Previous pregnancies

29.18 The registers show that at least 14.7% of single pregnant women were admitted to Stranorlar on their second or subsequent pregnancy.

Exit pathways

29.19 The registers suggest that 52% of single mothers returned to their family home or to the home of a relative on discharge from Stranorlar. It appears that the administrators of the home took measures to ensure that single women and their children were discharged to a named person, preferably a family member. In the few cases where a woman had no friend or relative to receive her, the matron assigned a nurse to accompany mother and child on discharge.

29.20 Other places of discharge recorded include other hospital (86); unspecified Good Shepherd Convent (19)\(^5\); psychiatric hospital (13); domestic situations (seven); mother and baby home (three); other county home (two); industrial school (one) and unspecified Magdalen laundry (one).

\(^5\) Almost certainly a Magdalen Laundry.
CHAPTER 29 STRANORLAR

Maternal mortality

29.21 The Commission identified 20 deaths among single pregnant women and unmarried mothers admitted to the home as recorded in the institutional records between 1922 and 1946. All but one death occurred in the institution: one occurred in Letterkenny fever hospital following transfer there. One woman died on the day she was admitted to the institution while others died having spent between three and five years living there. Women were aged between 17 and 45 years at the time of death.

29.22 Six maternal deaths were notified as being due to childbirth related causes such as eclampsia and puerperal sepsis representing a maternal mortality rate of 0.48%. Other causes of death included cardiac failure, pulmonary tuberculosis, influenza, typhoid and tabes mesenterica.

Children

Child admission pathways

29.23 Between 1921 and 1962, 1,777 children were either born in or admitted to Stranorlar county home. Of these, 83% were either born there or admitted with their mother; 10% were born in another institution and transferred to the county home with their mother; 10% were admitted unaccompanied and almost 7% were older siblings admitted with their expectant mother.

Exit pathways

29.24 The 'illegitimate’ children spent between one day and six years in Stranorlar. Most spent less than three months in the institution accompanied by their mothers. A small number of children who spent extended periods there were generally children with a physical or mental disability. The board of public assistance often found it impossible to get suitable foster homes for such children who were usually transferred to a specialist hospital or industrial school. Most children (57%) were discharged from Stranorlar with their mothers and are recorded as going to live in the mother’s family home or with another relative. These children did not show up in the Donegal Board of Public Assistance boarding out records, and very few were subsequently identified in any other local authority assistance records. However, it is probable that many, if not most, of these children were nursed out in the community under private arrangements between the parent and a nurse mother, where the parent either paid a lump sum or monthly or quarterly payments for the
Although nurse mothers were obliged under the *Children Act 1908* to notify the local authority of such arrangements, it would appear that very few did so. In fact, just 25 children recorded in the county home register (1.4%) are subsequently recorded as being ‘at nurse’ in the Donegal Board of Public Assistance records.

A woman who could not return to her family home, and who was not in a position to support herself and her child, or to pay for a nurse mother to care for her child, had little option but to place her child for boarding out by the local authority. Over one in four single women (27%) admitted to Stranorlar subsequently did this.

Almost 10% of ‘illegitimate’ children transferred from Stranorlar to another institution. The Sisters of Mercy at Stranorlar had an unofficial arrangement with the Sisters of Nazareth who ran the Nazareth Homes in Derry and Belfast and St Mura’s orphanage/nursery at Fahan, Donegal. The Commission identified 40 children discharged from Stranorlar who were subsequently admitted to one of the Nazareth Homes. Most of these children were placed in the Nazareth Homes by the mother or another family member; a small number were placed there by clergy. Prior to the 1950s, children from Donegal who were placed in a Nazareth Home were not under the aegis of the Donegal Board of Public Assistance. Parents voluntarily placed their children in the care of the Sisters of Nazareth and the Donegal Board of Public Assistance did not regard these children as their responsibility. In the 1950s, the public assistance authority began to send children to Nazareth Homes and paid for their maintenance there. However, public assistance records created after 1950 anonymised the children concerned and the Commission could not establish how many children were maintained in Nazareth Homes by Donegal County Council.6

During the period under review, one in five children born in or admitted to Stranorlar county home died there. The Commission confirmed 339 infant deaths by cross-checking them against records held in the GRO.

---

Infant and child mortality

29.28 The institutional records of Stranorlar county home for the years 1921-56 suggest that 343 ‘illegitimate’ children born in or admitted to the institution died in infancy or early childhood. Cross reference with records held by the GRO confirmed 339 child deaths.

29.29 Most deaths (75%) occurred among children who were accompanied in the institution by their mothers; 25% of deaths occurred among unaccompanied children. Most deaths (98%) occurred in the institution; 2% occurred subsequent to the child’s transfer to the county hospital, Letterkenny. One child was recorded as having died in a 'mental hospital'. About 82% of deaths occurred among children who were born in the institution and 18% occurred among children who were admitted after birth.

29.30 About 87% of deaths occurred in infants less than twelve months old. Among these 17% were less than a week old; 15% were between one week and one month old and 55% were aged between one and twelve months at the time of death. The remaining deaths occurred among children aged one year and over.

29.31 Infant and child deaths were highest in the years 1925-32, peaking in 1930 when 22 deaths were recorded. Infant and child deaths were also relatively high during the war years, peaking in 1944 when 17 deaths were recorded. There was a noticeable reduction in 1948 when just two deaths were recorded; this was down from 17 in the previous year.

29.32 The death rate among ‘illegitimate’ children in Stranorlar county home was highest in the 1920s and peaked in 1930 when a rate of 42% was recorded; two in every five ‘children born/admitted that year subsequently died. The institutional death rate among ‘illegitimate’ children averaged 24.5% throughout the 1930s and 18.4% throughout the 1940s. In 1956, the last year in which maternity services were available in the institution, a death rate of around 10% was recorded among ‘illegitimate’ children.

29.33 As is noted below, the institutional medical officer informed the DLGPH that the death rate among children in Stranorlar county home in 1930 was 68%. Analysis of institutional records and death records held by the GRO suggests that the medical officer’s return included all child deaths in the institution, ‘legitimate’ and
‘illegitimate’. Similarly, a return to the Department of Health for the period 1 April 1951 to 31 March 1952 stated that the death rate among children in the institution was 30%. This return most likely included deaths which occurred among all children in the institution also. The institutional records do not accord with these figures: they show that the death rate among ‘illegitimate’ children in this period was closer to 15%.

29.34 The most common cause of death among ‘illegitimate children’ in Stranorlar county home was respiratory infection: over 60% of deaths were attributed to bronchitis and pneumonia. About 12% of deaths were attributed to non-specific causes such as prematurity, congenital debility or weakness from birth and a further 10% were attributed to other causes such as birth injury, difficult birth and icterus neonatorum. Around 4% of deaths were attributed to congenital syphilis and 3% to malabsorption or marasmus. Other causes of death such as tuberculosis, convulsions, haemorrhage, congenital heart disease, influenza, measles, spina bifida, gastroenteritis, diphtheria, and meningitis featured to a lesser extent.

Burials
29.35 The first reference to a burial ground at Stranorlar county home appears in February 1927. An entry recorded by the institution’s storekeeper proposed an extension to the burial ground and asked permission to purchase stone, lime and sand to undertake the groundwork. In June 1927, another entry by the storekeeper stated that the county architect had inspected the burial ground site ‘some time ago’ and suggested that the ‘healthier inmates’ should be employed to do the ground work for the extension and that a contractor would be hired to build a boundary wall. However, it appears that no work was conducted, and the storekeeper complained that the overcrowded nature of the burial ground meant that ‘burials have already been made in open ground’.

29.36 The historical Ordnance Survey map below shows that the burial ground in use at Stranorlar county home was the original workhouse burial ground located north of the main building. The burial ground was subsequently doubled in size to take in the plot of land to the east of the site.

29.37 In April 1939, the storekeeper again reported that the burial ground was almost full and required extension. As there was a natural depression in the land between
the burial ground and the fever hospital a main drain to service the new burial ground site could not be carried through the county home fields. The board of assistance requested permission from the owner of an adjacent field to run a drainage pipe through his land. However, the board was already engaged in a legal dispute with the landowner and negotiations did not go well. In May 1945, the storekeeper reported that the county home burial ground was now ‘in a wretched state’ and had been ‘a matter of complaint by clergymen of every denomination’. The storekeeper further complained that the site was not suitable for a burial ground as the ground was ‘shallow and full of rocks and springs’. Two years later, in 1947, the matron complained to the board that the burial ground was now ‘in a deplorable condition’ and that ‘it was unattended to and remained a matter of complaint by the clergy’. In April 1948, the curate complained that it was ‘overcrowded and graves were overlapping’. As a result, the gravedigger had split another coffin while digging a grave which was reportedly ‘very unpleasant for all’. Following an inspection by the county engineer, work to open a new burial ground began in May 1949. The first burial at the new burial ground took place on 27 February 1950.

The Google Maps image above shows the location of the old workhouse burial ground outlined in red and the site of the new County Home burial ground outlined in blue. Both sites are now part of the fairways of Stranorlar and Ballybofey Golf Club.
A Burial Register relating to the new burial ground is held at St Conal’s Hospital, Letterkenny, and records 131 burials there between 27 February 1950 and 2 January 1973. However, none of the recorded burials relates to infants or children. Around 30 ‘illegitimate’ children died in Stranorlar county home in the period February 1950 and January 1973 but none appears in this Burial Register. It is possible that all were buried in family plots but, considering the circumstances which led to their being born or admitted to Stranorlar county home, this is highly unlikely. It seems reasonable to assume, and the evidence strongly suggests, that most ‘illegitimate’ children who died in Stranorlar county home were buried with other deceased ‘inmates’ in the old workhouse cemetery. The institutional records show that a carpenter was employed on a regular basis to make coffins, and notably ‘small coffins’, which suggests that the deceased were buried in lined red deal caskets and burial ceremonies were conducted by one of the three chaplains attached to the institution. The rocky terrain of the old burial ground could not facilitate deep graves and the institutional records clearly state that graves were shallow and that bodies were buried in an ad-hoc manner.

Living Conditions

More is known about the living conditions in Stranorlar county home than in the other county homes examined by the Commission. This is mainly because the detailed reports of inspectors from the DLGPH and later the Department of Health have been available to the Commission.

In May 1924, the matron reported that Stranorlar county home was ‘very congested’, and that there was ‘little available room for children’. In November 1924, a board member raised the question of the overcrowding and proposed that the disused workhouse at Ballyshannon be used as an auxiliary home. The question of which ‘class’ should be transferred would be left to the Minister for Local Government and Public Health to decide. In March 1925, an inspector from the Department of Local Government and Public Health (DLGPH) visited Stranorlar and recommended the immediate removal of children from the institution because ‘the contact with other inmates will have a very bad effect on their health, both bodily and mentally’. The minister suggested, as a temporary expedient, the removal of all infants and mothers to the Ballyshannon workhouse building. However, most board of health members were averse to the proposal and refused to do so.
29.42 In October 1924, the minister wrote to the secretary of Donegal Board of Health and Public Assistance asking to be informed of the steps the board was taking to find suitable homes for children in the county home who were suitable for boarding out. In March 1926, the matron submitted a list of children and sought a ruling on the advisability of having them boarded out. She advised that these children were ‘generally of the illegitimate class whose mothers are also in the County Home’. The board agreed that the illegitimate children should be boarded out but only in cases ‘where this course is not objectionable to the mothers’. However, the DLGPH also directed that:

Children boarded out whose mothers are alive and not resident in the County Home should be placed at nurse as far as possible from the district in which the mother resides, except in cases where the mother contributes to the support of the child. If this is not done, the probability is that the mother gives constant trouble to the foster parent.

29.43 The DLGPH maintained a keen interest in the health and wellbeing of every boarded-out child in Donegal. Although it pressured the Donegal board to find suitable foster homes for children in the county home the department closely scrutinised applications from prospective foster parents. The criteria laid down by the department as to what made a foster home ‘suitable’ to receive a boarded-out child were quite demanding - see Chapter 11. Local authority records for Donegal suggest that most assistance officers did not inspect foster homes and boarded out children with any regularity. Of the 20 assistance officers working in Donegal in the 1920s, just two returned monthly inspection reports on boarded out children.

29.44 In February 1925, discussions about the proposed removal of unmarried women and their children from Stranorlar were recorded in the Donegal Democrat. A DLGPH inspector, Dr Brendan McCarthy, initially raised the issue due to concerns over the congested living conditions there. Dr McCarthy received support from some members of the Donegal board of health. However, the board stated that ‘drastic measures were being taken to reduce the rates’ and this would determine the level of any alterations to be undertaken. A board member warned that the levels of overcrowding at Stranorlar increased the chances of an outbreak of typhoid and if that happened ‘no one would clear us of the responsibility’. Another member stated that at least half of the ‘inmates’ in the county home were mentally afflicted and recommended that the board establish a hospital in the county to provide separate accommodation for unmarried mothers and their children outside
of the county home system. He argued that ‘the children would then be free from
the influence that would be detrimental to their character’. He complained that the
issue had been under consideration for years and that the board had not acted.
The chairman of the board agreed that the ‘morals and health of these children
should be taken into consideration, so that they may be morally and physically fit to
fill their position in life capably’.

29.45 It was suggested that the board of health should remove unmarried mothers and
their children from the county home and accommodate them in other hospitals in
the county as a stop gap measure. However, it was also pointed out that
unmarried mothers undertook most of the work in Stranorlar county home and if
they were removed ‘a large number of staff’ would have to be employed to replace
them. A member, who appeared to be both surprised and appalled at the
revelation that unmarried mothers undertook most of the work in the county home,
argued that they should not have been housed there in the first place and that the
board should hire people to work in the county home who would run the place
efficiently. This suggestion and the expense attached drew the ire of some board
members. One member stated that children in the county home were ‘much better
off that a good many children outside’. Another said that the transfer of women
and children would cost up to £1,000 and another argued that the transfer would in
effect ‘create two County Homes’. The board voted in favour of postponing the
matter.7

29.46 In May 1925, a board of health member, Mr McGeadie, raised the question of
providing employment for unmarried mothers in Stranorlar county home. He cited
‘the nuns in Scotland’ as a good example as they ‘successfully ran laundries
providing employment for these people which gave them a better outlook on life’. He
stated that ‘these unfortunate people’ under the present system were ‘branded
with pauperism’ on leaving the county home. The chairman of the board, Mr
Gallen, suggested that this was not such a serious matter in Donegal and that ‘a
large proportion of these people were feeble minded’. Mr McGeadie replied, ‘I do
not mean to insinuate that Donegal is an immoral county, but something must be
done for the unfortunate few who have fallen’.8

---
7 Donegal Democrat, 20 February 1925.
8 Donegal Democrat, 22 May 1925.
29.47 Admissions of single women and their children to Stranorlar county home increased during 1924 and 1925. In January 1925, 29 single mothers and 51 ‘illegitimate’ children were living there. By December, numbers had increased to 36 women and 56 children. Overall occupancy in the home had increased from 275 to 292 over the same period and suggests that the board of health took no action to address the overcrowded conditions in the institution.

29.48 A report on the Tirconaill (Donegal) County Scheme, contained in the Report of the Commission of the Sick and Destitute Poor, confirmed that Stranorlar county home was ‘fully occupied’ and that the home was ‘prone to overcrowding’. Furthermore, the commission heard that there was no classification of ‘inmates’ on the female side of the institution and that single healthy women lived in extremely close quarters with ‘old women, lunatics and imbeciles’. The report also highlighted the inadequate and defective sanitary arrangements at the county home. It stated that the water supply was bad, there were two flush closets in the old infirmary part of the home, none in the main body of the home and that ‘the contrivances in the yards are very bad and rather revolting’.9

29.49 A report on Stranorlar county home by a DLGPH inspector confirmed that an inadequate water supply and the lack of flush closets, bathing and washing facilities ‘continues to be a great drawback to the Institution and impedes progress’. It is worth noting that a letter from the medical officer at the county hospital, Lifford complained of the unsanitary state of lavatory and bathing facilities available to women there and the fact that the operating theatre had no supply of hot water. The inspector stated that Donegal County Council had refused to remedy the deficiencies although administrators and medical staff working in the home had lodged complaints on numerous occasions.10

29.50 A report on Stranorlar county home made it clear that by 1927 the board of health had taken no remedial action to address the poor sanitary arrangements at the institution. At the time of this inspection, there were 269 residents in Stranorlar county home. The institution had two toilets and two ‘bad baths’ to cater for them:

The sanitary arrangements are very defective. Barrow privies. There are 2 w.c.’s in the infirmary and one bad bath on each side. The condition of this

10 Donegal Democrat, 21 August 1925.
CHAPTER 29 STRANORLAR

Home is most unsatisfactory owing to the absence of proper sanitary arrangements and drainage.

29.51 Other aspects of the home were also defective:

The beds and mattresses are mostly broken and dilapidated not fitting the floors where the old central trench still remains. The upper dormitories are unceilied and not heated. A new ward reconstructed out of an old store is the only pleasant-looking spot in the Institution. Lockers are required here. In the Fever Block which now accommodates the old men the ceilings are falling, and the walls are stained and broken. There is no disinfecting apparatus. With regard to the condition of the children some improvement has been made. In my last report, I drew attention to their dismal plight. Since then an Army hut has been erected to serve as a Day Room, and an old school room serves them for sleeping accommodation. Much more, however, needs to be done.

29.52 A report on the quality of water supplied to Stranorlar county home concluded that no sample was safe for drinking. Analysis of samples taken from the four wells supplying the home found that the water was ‘grossly polluted with sewage or manurial matter’ and ‘other animal organic matter’. In 1927, a new well with an electric pump did much to improve the water quality, but the lack of a general water scheme in Stranorlar town ensured that the water supply to the county home remained insufficient. In 1928, the storekeeper reported that milk supplied by a local producer was analysed and found to have been deprived of 27.7% of its original fat. Repeated examination found that the milk supplied was of lesser quality than the general milk supply and often failed to meet minimum legal requirements regarding nutrition. Similarly, analysis of the bread supplied to the home found that it contained 2.2% ash and 1.24% cellulose, indicating that the producer used low grade flour and that the bread had little nutritional value. It seems that some commercial vendors supplying foodstuff to Stranorlar county home knowingly supplied products of inferior quality and of little nutritional value, without any regard for the health and wellbeing of the men, women and children housed in the institution.

29.53 The diet for female patients, unmarried mothers and children living in Stranorlar county home was as follows:

Breakfast, 8.00 am: 6 oz’s. Bread, 1 oz. margarine, 1 pint tea.
29.54 Following representations from the minister, the DLGPH advised the authorities at Stranorlar county home that the amount of food given to residents was ‘too excessive’ and ordered them to reduce the food served to ‘bring it in line with other County Homes’. Although no record of the suggested revised diet was located, it can be determined that the DLGPH directed that residents received three, rather than four, meals per day. It is also clear that the county home administrators ignored the minister’s order for over two years and quietly continued to serve four meals per day. However, due to sustained pressure from the DLGPH, a reduced diet came into operation in the home in 1926. The storekeeper’s reports show that the meat supplied to the home was also of variable quality and, on occasion, found to be rancid. In addition, a DLGPH report in 1926 stated that cooking arrangements in the home were ‘bad’ and advised that the board of health should provide a suitable kitchen for the institution.

29.55 Every DLGPH report on Stranorlar county home referred specifically to the ‘primitive laundry arrangements’ in operation there and to the complete absence of disinfecting apparatus. In her monthly reports, the matron listed the number of old rugs, blankets and sheets removed from the infirmary and recommissioned ‘for nursery purposes’. It is not clear how these items were used in the nursery. Considering that this repurposing of bedding was common practice in the institution, an overcrowded institution without proper laundry or disinfecting facilities, it seems reasonable to assume this practice created increased opportunities for cross-infection among patients. Infants who came in contact with recommissioned items ‘for nursery purposes’ must have been most susceptible.

29.56 In 1929, members of Donegal County Council complained that the cost of running Stranorlar county home exceeded the cost of running all pre-amalgamation workhouses. The chairman of the board of health presented figures that showed that the cost of running it during 1929 was in fact £2,474.00 less than the cost in 1922. In light of increased pressure for reductions in the rates, there was little hope of local authority investment in the home and demands for greater economy
relating to the cost of running the institution ensured that calls to improve the living conditions of those housed there would not be realised.11

29.57 There were multiple outbreaks of typhoid in Stranorlar county home during 1930. The first outbreak was in May and five people were removed to Letterkenny fever hospital. The county medical officer, Dr O'Deagha, stated that the outbreak was ‘undoubtedly caused by the defective sanitary arrangements in the Home’ which he observed ‘associated one’s mind with concentration camps’. In September, two further outbreaks of typhoid occurred; both originated in the female side of the home. Twelve women contracted the disease; three died. It subsequently transpired that blocked drains on the women’s side of the home caused a buildup of ‘excrement and other effluent’. Donegal also experienced an outbreak of enteric fever in 1930: it occurred in the Stranorlar District and had its origin in the county home. Again, the county medical officer highlighted the ‘almost primitive sanitary arrangements prevailing at the Home’ and the dangers that this posed to the ‘large number of residents sheltered under its roof’.

29.58 The extremely poor living conditions in Stranorlar county home may also explain the excessively high infant mortality rates recorded in the institution during 1930. The institutional medical officer reported that, of the 37 infants born or admitted during 1930, 23 died there.12 Remarkably, this high infant mortality received no attention in the reports of the Donegal Board of Health and Public Assistance. The board did receive a letter from the Minister for Local Government and Public Health requesting a return showing the cause of death of each child who died in the home during the half year ended 30 September 1930. The Commission did not locate a reply in the Donegal public health records.

29.59 In February 1931, the minister again wrote to the Donegal board instructing them to ‘give early attention to’ and make ‘necessary orders on several matters’ highlighted by the departmental inspector, Mr Mc Lysaght, in his report on Stranorlar county home. The board replied stating that they were considering a scheme of general repair at the institution and had invited tenders for same. However, the board had decided that the provision of disinfecting apparatus was not a pressing issue and it formed no part of the proposed refurbishments.

11 Donegal Democrat, 21 December 1929.
12 The institutional records show that 1930 was the worst year for child deaths in Stranorlar but they do not tally with the medical officer’s report that child mortality rates were in the region of 62%.
Similarly, the board chose to ignore a DLGPH recommendation to bring the maternity ward up to ‘a state of modern efficiency’. The board advised the DLGPH that they would consider undertaking such work if they could participate in the Hospital Sweepstakes.

29.60 In July 1933, a report on Stranorlar county home by the DLGPH inspector, Dr Dillon, indicated that the board of health had made no effort to provide suitable laundry or disinfecting apparatus for the institution. Dr Dillon also noted that the board had made no improvements to the maternity ward, which she stated was ‘very small and had no equipment’. As the institution catered for an average of 40 births annually, Dr Dillon advised the board of health and the DLGPH that ‘some improvement should be considered’. In June 1934, another DLGPH inspector, Dr Doherty, reported that the wards in Stranorlar county home were unceiled and without central heating. He expressed concern that the wards were extremely cold during winter and this posed a danger to the elderly and to mothers and children in the nursery.

29.61 In June 1935, a letter from Dr J Gormley, obstetrician to Stranorlar county home, made it clear that the board had undertaken no remedial work to improve the institution’s maternity ward and that conditions had deteriorated to the extent that he was refusing to treat maternity cases there. Dr Gormley stated:

Owing to lack of accommodation and want of modern methods, admission of patients to the Labour Ward has been discontinued for the past two months. The patients are now transferred to the District Hospitals. There is no bathroom and no supply of wash basins with running water, hot or cold. The department is of the most primitive kind and I recommend the formation of a new department with increased accommodation. There would be required: Prenatal Ward of 12 beds; Labour Ward of 2 beds; Puerperium Ward of 10 beds; two modern bathrooms and lavatories; Wash basins and sterilizers. This is an absolute necessity if the care of the pregnant mother in County Donegal is to receive anything like fair attention

29.62 In Dr Gormley’s view, pregnant mothers in Stranorlar county home, single pregnant women in the main, were being let down by the distinct lack of investment in maternity services in the institution, a situation which put them at an unfair disadvantage. It is equally clear that Dr Gormley was no longer prepared to treat women under such ‘primitive’ conditions or subject women to inferior treatment. In
April 1935, he directed all pregnant women to attend one of the district hospitals in Donegal rather than seek admission to Stranorlar county home.

In February 1937, the county medical officer, Dr O'Deagha, reported that another outbreak of typhoid fever had occurred in Stranorlar county home. He stated that the main lesson to be learned from the outbreak was the importance of ensuring mechanisms for ‘the safe disposal of excreta and an adequate supply of unpolluted water’. This suggests that sanitary arrangements at the county home in 1937 remained substandard and continued to pose a serious health hazard to those living in the institution.

In February 1939, the matron again drew attention to the ‘very bad’ sanitary condition of the institution and expressed her concerns regarding the safety of the maternity and cancer cases to the board of health. She stated:

There are 40 or 50 patients there mostly maternity and cancer cases. There are no latrines upstairs and the slops have to be carried down and emptied in a manhole in the yard. This crude method of sanitation is very serious and dangerous to patients and nurses. The matter has been reported time and time again by the Medical Officer but has been held in abeyance awaiting a grant from the Sweepstakes or something of the kind, and the trouble still continues.

Similarly, the storekeeper reported:

The ceiling in the hospital hall is falling and in danger of injuring any person passing. This is due to the crude state of a W.C. directly over the hall and immediately outside the maternity ward.

The matron's and storekeeper's reports were unambiguous in their assertions that Stranorlar county home remained in a shockingly bad state of repair. The lack of a latrine in the hospital ward necessitated the conveyance of faeces through the body of the home to be dumped in a hole in the yard. It has already been established that the home contained just two toilets. The storekeeper's report revealed that one of them was in such a ‘crude state’ that waste was flowing down into the floor underneath and into the maternity ward.

Inaction on the part of the Donegal Board of Health and Public Assistance ensured that poor sanitation in Stranorlar county home continued to blight the institution.
throughout the 1930s. The brunt of this negligence fell heaviest on infants living in the county home. The institutional medical officer reported that although infant mortality fell from a high of 68% in 1930, a rate of 50% pertained over the decade. This suggests that one in every two infants born or admitted to the county home during this period died.\(^{13}\) Local authority health records give no indication that either the Donegal Board of Health or the DLGPH gave this matter any consideration.

29.68 In February 1938, the board of health heard that three girls aged 15 or 16 years were admitted to the county home, pregnant. All three were boarded out children and the board referred the matter to the Gardaí.

29.69 In October 1939, Miss Alice Litster reported on boarded out children in Donegal. She noted that 103 children were on the boarded out register at that time. The Donegal board of assistance paid foster parents a maintenance allowance of £1 a month per child and a clothing allowance of £3 a year. Miss Litster observed:

The destitute children of the County are maintained in the County Home prior to being boarded out. As a general rule, they are boarded out at an early age. It is satisfactory to note that the Board of Health and the authorities of the County Home realise the advantage of placing them in foster homes at an early age before Institutional life has had time to put its mark on them. The atmosphere of a County Home is not an ideal one in which to rear children and they are apt to acquire bad habits, of which it is very difficult to rid them afterwards.

29.70 In September 1945, a DLGPH report on Stranorlar county home stated that 218 people were living in the institution. Although this was 25% lower than occupancy rates recorded during the 1930s, there was no reduction in the number of children housed there. At the time of inspection 39 children, ranging in age from 2 to 8 years, were living in the institution. The report noted that accommodation for children in the home was ‘strictly limited’ and that the nursery was ‘very much overcrowded’.

29.71 In 1946, the matron reported that the county home nursery remained overcrowded and was too small to accommodate the number of children housed there. She

---

\(^{13}\) The Commission’s engagement with the institutional records failed to confirm the mortality rates cited.
expressed her concern that the approaching winter would bring more admissions and there was insufficient floor space to accommodate any more children. In January 1947, the matron again remonstrated with the public assistance authority regarding the county home nursery. She complained that the nursery had remained overcrowded and that the available floor space, ventilation and lavatory accommodation were ‘wholly inadequate’ to cater for the number of children living there. Furthermore, the matron complained that there were no proper bathing facilities in the institution to wash the children and no proper facilities for washing and drying their clothes. Matron asked the authority to intervene to make the nursery more comfortable for both children and nurses.

29.72 In February 1949, Alice Litster inspected Stranorlar county home. At the time of inspection, 27 unmarried mothers and 44 children were living there. Eighteen infants aged between one month and two years were housed in the nursery. Miss Litster reported that the nursery was a large room on the ground floor which had ‘a stuffy atmosphere on entering’. It contained 18 wooden cots, with wooden slats, straw mattresses and adequate blankets. She noted that babies slept in the nursery at night, but breastfed infants were taken to a dormitory on the second floor occupied by their mothers. Two mothers slept in the babies’ dormitory by night. Commenting on the health of the infants, Miss Litster noted that all but four appeared to be in good health. Two infants were described as ‘not thriving’, one as ‘delicate’ and the fourth was ‘suspected to be mentally deficient’. Six children aged between three weeks and 13 years were housed in the maternity ward.

29.73 Miss Litster encountered the remaining 20 children, aged between 13 months and 13 years, in ‘the Hut’, a long wooden structure in the yard. She stated that the hut was heated by a centrally placed stove, was ‘stuffy and unpleasant’ and carried ‘a strong odour of humanity’. Among this group, two boys aged 12 and 13 years were classed as ‘mental defectives’ and just two children were assessed as being suitable for boarding out. With regard to the remaining children Miss Litster noted that some were suffering from scabies; some could not, or made no attempt to, stand or walk; one suffered a prolapsed rectum; two were deemed to be mentally defective; two were returned by foster parents citing their ‘dirty habits’; two were admitted by the NSPCC in a ‘neglected condition’. The remaining children were reportedly ‘not healthy-looking children’. Miss Litster noted that there was no sanitary accommodation attached to the nursery or hut and that enamel chamber pots were kept there for the children’s use. The older children were bathed in a
bathroom off the women’s day room supplied by hot water from the laundry. Babies were bathed in the nursery. All children took their meals in the nursery and were fed five times a day as follows:

</tbody>
</table>

- **Breakfast**: 8.30am: Tea with bread and butter, or milk with bread and butter.
- **Lunch**: 11.00am: Milk (half pint). Cod liver oil is given at this time.
- **Dinner**: 12.20pm: Mashed potatoes and mincemeat. Soup (made with vegetables—carrots, turnips, parsnips, as in season and available, and barley).
- **Tea**: 3.00pm: Tea, Bread and butter.
- **Supper**: 6.00pm: Porridge and milk, or bread and milk.

29.74 Miss Litster observed that, on Fridays, children were given eggs, hard boiled and chopped through mashed potatoes, with egg salad and tea. No milk pudding except corn flour was given to infants starting to take solids. No fruit was given as part of the diet.

29.75 A report on ‘illegitimate’ children in Stranorlar county home, which appears to have been written by Miss Litster and informed by the county medical officer Dr Gormley, stated that in the period 1 April 1945 to 17 February 1949, 45 children were born in the home and a further 11 were admitted after birth; ‘making a total of 55’. However, the indoor registers for the home recorded 210 births and 48 infant admissions over the same period. Furthermore, Dr Gormley stated that eight infant fatalities occurred in this period giving an infant mortality rate of about 14%. However, the institutional records recorded 48 infant deaths in the same period: an infant mortality rate of 23%. Details relating to the causes of infant deaths contained in the report are also suspect: in every case Dr Gormley gave the cause of death as ‘weakness from birth’. The Department of Health informed Dr Gormley that these could not be accepted as ‘certified causes of death’. Dr Gormley expressed his willingness to give ‘more exact details’ ‘if requested to do so officially’.

29.76 On 31 March 1949, the Donegal public assistance authority reported that 216 people were living in Stranorlar county home including 22 unmarried mothers. There were 46 children living in the home; all but three were ‘illegitimate’. Most children ranged in age from newborn to five years old. Six children were between five and 15 years old. The public assistance authority reported that, at the time of
inspection, the institution was not overcrowded and was adequately staffed by two nuns, four nurses, two wardsmen, a cook, porter and ambulance driver. The water supply, method of sewage disposal, laundry and kitchen facilities were reportedly ‘good’. Sanitary arrangements, heating, and the general structure of the institution was said to be ‘poor’ and in need of improvement.

29.77 In August 1949, the Department of Health undertook a major programme of remedial and construction work at Stranorlar county home including the conversion of the old fever hospital into a new nursery. Other work undertaken included the replacement of doors and windows; plastering and distempering walls; fitting fireplaces in the mothers’ ward; the installation of a bath, WC and hand basin in the children’s ward and the installation of a wash hand basin in the labour ward.

29.78 In May 1950, the Department of Health inspected Stranorlar county home. The inspection report stated that accommodation for the unmarried mothers was of the ‘usual dormitory’ type with unplastered walls, uncovered ceilings and with no furniture other than beds. The children’s accommodation was, according to the report, ‘extremely crude’ with unplastered walls, uncovered ceilings and no furniture other than wooden cots. The women’s dining room was ‘very bad’ and the worst that the inspectors had seen in any institution. It noted that walls were unplastered, ceilings were rough and that there was ‘a general atmosphere of gloom’ made worse by overcrowding. The inspector also noted that unmarried women had no day room to avail of in the institution and ‘seem to occupy themselves throughout the wards and other parts of the institution’. The inspector noted that the old fever hospital located behind the main institution was being renovated to accommodate unmarried mothers and children. This work was not completed until January 1952.

29.79 In July 1952, Miss Litster inspected Stranorlar. At the time of inspection, 26 single mothers (including six pregnant mothers) and 36 ‘illegitimate’ children, aged from newborn to seven years, were living there. Miss Litster noted that the children were now housed in a new nursery on the site of the old fever hospital and that nursing and pregnant mothers had accommodation there also. She described the dormitory for nursing mothers as ‘a bright airy room’ containing six beds with fibre mattresses. She noted that the room was ‘clean, fresh and comfortable’ and that separate lockers were provided for all beds. Miss Litster noted that babies did not sleep in this dormitory.
Miss Litster reported that the dormitory for pregnant mothers was also ‘a bright airy room’ containing six beds with Dunlopillo mattresses and with a locker beside each bed. It had a bathroom attached and a large press for coats. The post-natal ward contained four beds. At the time of inspection there was one occupant, the mother of a day old ‘illegitimate’ infant. By day, children were accommodated in a dining room equipped with an Aga cooker and milk in a pantry covered in enamel pails. Miss Litster noted that the nurse in charge prepared food there for bottle-fed babies. The other side of this room contained a playroom which she described as ‘a somewhat dark room’. Miss Litster inspected nine children in the dining room. She noted that five ‘appear healthy’ and that the others were either ‘delicate’, or ‘mentally defective’. In one case, she noted ‘the child does not speak’.

The first floor of the new nursery contained 22 wooden and aluminium cots. Behind a screen at one end of the room there were three children with chicken pox. The room was ‘bright and airy’, lit by seven windows and floored with linoleum. It was heated by an open turf fire. A bathroom and WC were adjacent. There were 21 children aged between three months and three years living there at the time of inspection. Miss Litster reported that most children were in good health. She described the dormitory for older children as being ‘a bright and airy room’ with wooden cots with mattresses. The room was lit by seven windows and had a bathroom and a WC adjacent. She noted that there was no fire escape from the first floor of the nursery and that there were no fire extinguishers on the landings or in the rooms. The children received five meals a day as follows:

- **7.30 a.m.** tea (milky); bread and butter.
- **10 a.m.** milk; bread and butter.
- **1 p.m. dinner.** Mashed potatoes with butter mixed through; a little meat; milk to drink. Soup - vegetable soup made with meat and carrots, turnips, etc. as in season. No pudding is given. Fruit does not appear on diet sheet.
- **3.30 p.m.** Milk or tea, bread, and butter.
- **6 p.m.** Porridge and milk. Eggs occasionally i.e., about once or twice weekly. These are not on dietary scale and are signed for by the Medical Officer.

The bottle-fed babies get either cows' milk or Cow and Gate food. Routine daily doses of Cod Liver Oil to each child.
Miss Litster reported that, in the period 1 April 1951 to 31 March 1952, 36 ‘illegitimate’ children were either born or admitted to the institution and 11 ‘illegitimate’ children died there over the same period; this was an infant mortality rate of 30%. These figures correspond with the institutional records. On this occasion, the medical officer supplied more detailed causes of death as follows:

<table>

Miss Litster commented:

Of the eleven infants who died, nine were born in the Institution and two were admitted from outside. The death rate shown is high. It is to be hoped that the better conditions and equipment of the new Children's Home will be reflected in a lower death rate. It is pleasant to see the bright attractive quarters now provided for mothers and children. Sanitary and bathing accommodation are now adequate; cots and beds comfortable; cooking facilities good. A trained nurse is in charge of the maternity unit and children's quarters.

Miss Litster noted that single pregnant women in their first pregnancy were not routinely sent to an extern approved maternity home as a matter of routine, but that some were sent to Sligo county home.

Miss Litster reported that only pregnant and nursing mothers slept in the maternity and children's units and that mothers of babies who were not breast-fed and mothers of older children 'sleep in the main body of the County Home and work there’. Miss Litster stated that these women were allowed ‘no freedom of access
to their children’ and were only allowed to visit them on their day off (Sunday) and were afforded ‘special visits’ if the child was ill. The county home administrators rationalised this stance by claiming that more frequent visits ‘caused disruption to routine’ and resulted in ‘quarrelling and a general upsetting of the children’.

29.86 Miss Litster commented:

There is under this system no fostering of affection for and interest in their children. On the other hand, if we have nothing to offer the mother eventually but complete separation from her child, it is perhaps kinder to avoid the growth of affection. Nevertheless, we may have to consider whether or not the loss of maternal care may have some share in the mounting death rate.

29.87 In March 1953, the Donegal general purposes committee and county home visiting committee met to discuss the Department of Health *White Paper on the reconstruction and improvement of County Homes*. The committee members agreed with the department’s recommendations to provide improved accommodation for the aged and infirm in Stranorlar county home and agreed that the cost involved was justified. However, committee members did not agree with the department’s recommendation that the Donegal public assistance authority should provide new separate accommodation for unmarried mothers and children outside the county home setting. Committee members argued that unmarried mothers and children were housed in a separate building (the old fever hospital) and that accommodation for such classes had been ‘recently and substantially improved’.

29.88 In 1954, the Donegal public assistance authority drew up an estimate of future bed accommodation for Stranorlar county home. The report made provision for beds for the chronic sick, ambulant residents and casual patients, but made no provision for unmarried mothers and children. Under the heading ‘Classes at present in the Home and who are to be accommodated elsewhere in future’, it was noted that unmarried mothers and children were still being admitted to the home but gave no indication as to where they would be accommodated in the future.

29.89 When the Department of Health made inquiries regarding plans for the future provision of accommodation for unmarried mothers in Donegal the matron of Stranorlar county home replied that she could not countenance the removal of unmarried mothers from the institution as she would not be able to procure female
attendants to replace them. The department enquired if unmarried mothers ‘mixed with other inmates’ or if they were completely segregated. The department was informed that unmarried mothers mixed with all other inmates as they worked in the different departments of the institution. The Department of Health accepted this arrangement on the basis that it would not interfere with the development of the home as a hospital for the chronic sick.

29.90 In June 1958, the Department of Health Inspector, Miss Margaret Reidy, visited Stranorlar. At the time of this inspection there were 20 children, aged between one month and ten years, living in the institution; 17 were listed as ‘illegitimate’ children. Every ‘illegitimate’ child was to be ‘boarded out at a later date’ and Miss Reidy noted that all were in good health. Two children, aged 11 months and one year, were unaccompanied. A family of four ‘legitimate’ children were living in the institution because their mother was a ‘mental defective’. Another was there because her mother was in a mental hospital. One unaccompanied child was described as a ‘Mongol’, but no arrangements had been made to admit him to a ‘special home’. A nine-month old girl, deserted by both parents because she suffered from infantile eczema, was in the home unaccompanied. The remaining ‘legitimate’ children were accompanied by their mothers who were admitted because they were destitute. The matron told Miss Reidy that adoptions could be arranged for children in America, but proceedings could not be instituted due to ‘a Government objection’ to foreign adoptions of children from county homes.

29.91 The Department of Health wrote to the health authority:

I am directed by the Minister for Health to state that it appears from a report furnished by an officer of this Department that at the time of her inspection of children in the County Home, Stranorlar, in June 1958, that there were 20 children in the Home, 7 at least of whom were of a suitable age for boarding out. The Minister cannot too strongly deprecate the retention of children in County Homes beyond the age of 12 months and he would urge that the Health Authority should make every effort to secure foster homes for children over the age of 12 months who are suitable for boarding out. It would be appreciated if you would state what steps are being taken to secure more appropriate accommodation for [named child] who, it is understood, is mentally defective. I am to draw attention to this Department's Circular No.7/52 of 20/01/1952 relating to the scheme for the improvement of County Homes and to point out that it is an integral part of any scheme for
improvement of these Institutions that children should not be accommodated in them.

29.92 The draft of the response also included the following on the subject of American adoptions:

The Officer reports that the Matron of the Home stated that adoptions could be arranged for some of the children in America, but that because of a Government objection, proceedings could not be instituted. In this connection, I am to point out that the powers and duties of a Health Authority in relation to a child who comes under their care are set out in sections 54, 55, and 56 of the Health Act, 1953. The Minister is, in fact, advised that a Health Authority has no power to send any child abroad or to act as an agency for such purpose because in so acting it would be acting ultra vires. Because, however, of the peculiar relationship of a Health Authority to children under its care, deriving from the general obligation to seek, consistent with the moral welfare of the children, to bring about their material and social advancement, the Minister would see no objection to a Health Authority’s co-operating with a responsible person (not being a member of the Health Authority’s staff) or appropriate charitable organization to the extent of passing on to such person or organization any requests which might be received from abroad for a child for adoption and later handing over any child to such person or organization or a representative of such person or organization at any appropriate place in the State when it had satisfied itself;

(1) By the production of a formal consent, on the lines of the forms of “consent to adoption” present in the Adoption Act, 1952, Rules, 1953 (S.I. No. 104 of 1953) to the removal of a child out of the State, that it (the Health Authority) was not a party to an infringement of section 40 of the Adoption Act, 1952; and

(2) That, where necessary (e.g. in the case of a child going to the U.S.A.), a passport in respect of the child had been obtained from the Department of External Affairs.

29.93 This part of the draft response was not included in the actual response issued. A handwritten note relating to the above letter stated:

I think that it would be better not to convey officially the information regarding children going to U.S.A. but the Inspector of Boarded out Children might write to the Children’s Officer stating that she understood that there was some
misunderstanding about the matter in certain areas, including Donegal, and giving the information in the lines of this draft.

29.94 In February 1959, the secretary, Donegal County Council sent a report to the Department of Health regarding children in Stranorlar county home. He acknowledged that 20 children were living in the institution during Miss Reidy’s inspection but stated that all but eight had been transferred elsewhere: five were boarded out and the others were taken by relatives. The secretary stated that eleven other children had been admitted to the home in the intervening period. Most were there for short stays because their mothers were incapacitated or in hospital and the others were either mentally or physically compromised and awaiting placement in specialist institutions.

29.95 In October 1959, Miss Reidy inspected Stranorlar. There was one single mother and six children there at the time. Three of the children were ‘illegitimate’: an infant girl accompanied by her mother; a three-year-old unaccompanied boy ‘suitable for boarding out’ and a two-year-old girl with deformed feet waiting admission to Our Lady’s Hospital, Crumlin. All three ‘legitimate’ children were unaccompanied. Miss Reidy concluded by stating that the standard of childcare in the institution ‘is not as good as it is in the majority of County Homes’. She noted that 56 children had been discharged since June 1958. Their exit pathways were as follows: Home with parent or relative, 58%; boarded out, 13%; placed for adoption, 12%; transferred to an ‘approved school’, 10% and transferred to a special hospital/institution, 7%.

29.96 Miss Reidy next inspected Stranorlar in October 1960. There was only one single mother and her ten-month-old infant living there. The woman was on the ‘paid staff’ of the hospital. A 21-month-old girl recorded in Miss Reidy’s previous inspection was still there unaccompanied and awaiting placement in a foster home. Two other children were described as ‘congenitally abnormal’ four-year-old twins awaiting admission to a ‘special institution’. Miss Reidy observed:

Since my last inspection of the 29th October 1959, five unmarried mothers were delivered in the institution (one stillbirth - a multiple birth). There were no neonatal or infant deaths. Midwifery is discontinued here now. The children had been moved from the maternity block to the main building. They are in what was originally the children’s nursery before they transferred to the maternity block. This nursery is a large room with a large window facing
south east. The window, however, is very high and the children would not get much sunshine. At the time of inspection - between 3 and 4 in the afternoon - the unit was very untidy. Matron’s excuse was that they had the Stations of the Cross that day and it had disorganized normal routine. I had discussions with the County Secretary, the M.O. to the institution, Dr Mulryan, and the Children’s Officer, Miss McElwaine.

29.97 Miss Reidy reported that 25 children were discharged from the home between 1 November 1959 and 31 October 1960, as follows: Taken home by parent or other relative, 52%; placed for adoption, 16%; transferred to an ‘approved school’, 16%; boarded out, 8%; transferred to a ‘special institution’, 4% and transferred to ‘a new foster home’, 4%.

Anecdotal evidence

29.98 The HSE provided the Commission with a draft booklet about Stranorlar county home. The booklet was compiled in the 1990s and contained interviews with former staff members and a woman who had lived in the home as an unmarried mother. In the introduction, a former matron of the institution, when it was known as St Joseph’s Hospital, wrote:

I was acutely aware of the legacy of the County Home, some of which transferred negatively to the newer St Joseph’s Hospital when built. When I say negatively, I should explain that this was because of the difficult conditions and hard times, which had been so much a part of the County Home experience, and this could not be shaken off easily. The County Home was envisaged as a ‘no hope’ or ‘last resort’ place and did not sit well with anyone who remembered it. Nor should it I suppose...Many who passed through the County Home had no one to care for them in their time of need and sadly some remained there until their dying day only to be buried in the unmarked graveyard behind what is now St Joseph’s Hospital.

Extracts from an interview with ‘Fran’

29.99 I went into the County Home [Stranorlar] in 1951 or 1952 when I was 16 years old. I was expecting a child. I did not mind going at the time because my own people did not want me. In those days it was a crime for anything like that to be wrong with you, so I was actually glad to get away. To me it was home, it was a roof and a bite of meat and when I was in that situation you were happy to get that. I had a
tough upbringing and it did not hit me hard but if you were from a well to do family and had plenty, it would have been tough.

29.100 You were given chores so you knew what you had to do and you were told you would be going to the laundry and at that time there were big tin baths and all the dirty nappies and all the dirty sheets from the hospital. My job was sluicing them at a quarter to seven in the morning under the cold tap outside before breakfast. Breakfast consisted of porridge, tea in an enamel mug and bread. Then off you went to the laundry and you washed clothes in big baths, and they were put into machines, two old fashioned type machines and one old fashioned spinner. There were dryers in the back where the clothes were dried.

29.101 Any of the girls who had children went up to the nursery, fed the children, changed them and put them to bed. My job in the morning was to help the nurses to put up the babies bottles and make the cots. I might get up at 6.30 am. I went to bed around 10 pm at night. In the morning, before you went to the laundry, you went to get your bucket and scrubber, cloth and Licel and went off to the body of the house where you scrubbed the wards on your knees. The floors were scrubbed three days a week. When the wards were done the bathrooms and toilets had to be scrubbed. On Wednesdays, large wooden commodes were carried downstairs to the yard and washed. It was different batches of girls for different things, you knew your routine and you got on with it.

29.102 We were generally happy I suppose. We used to have a good laugh. There would be great excitement when one of the girls would go off to have her baby and you were dying to know what it was. When a new girl came in you were dying to find out all about her. I used to listen to the wireless and dance to it. I was mad about dancing. Every Saturday night when Céilí House was on the wireless we danced with the nurses. So it was things like that we used to look forward to. The nurses were very nice.

29.103 One day I was scrubbing a dormitory and I was getting pains. I told one of the sisters and she told me ‘Oh scrub away, you’ll be grand, it will help you’. So, I scrubbed until I could scrub no longer. They took me up to the nursery and put me into a big bath. I was in the nursery all evening. The baby died but I never got to see where it was buried. That was me. I could go free, but I would not go home.
because I was treated so badly there, so I was kept on as a staff member in the home. I worked in the hospital and was getting a wee bit of money.

29.104 In my estimation, they were good to the patients in the home but the facilities weren’t there for them…It was sad when the wee babies were put on these wee pots and they would have been sitting on them for hours and they were fed with spoons by some of the girls. What used to sicken me the most was that when big gentry would come in to adopt a baby…They would never have picked my child if he had been in there. If he had lived, I would never have let him be taken away. I always said I would have stayed in until he was man big before I would have let him away. But I suppose at the end of the day, what was for girls? And that is the way it was in those days, which did not make it right but that just was the way it was…The mothers at that stage did not have much choice. They had to stay in the home until the child was boarded out. Often their parents did not want them home, to have nothing to do with them. The mothers would work and then be put on the staff and get a wee bit of money to keep their child and there was so much taken off them for their keep. There were some children there until they were nine or ten years old; ones that would never have been adopted. I wouldn’t run down the home. It was home to so many people and times were very hard for everybody.

**Extract from an interview with ‘Kitty’ (presumed to be an ex staff member)**

29.105 There was a big eight or nine foot gate at the entrance. The ambulance driver’s house was on the right next to a vegetable garden tended by an old inmate. Then there was the Stranorlar Registrar’s Births, Deaths and Marriages office. Through the front porch the porter’s quarters were on the right and across from it was the County engineer’s office. The County Medical Officer was housed there also. Up a staircase was the Board of Assistance boardroom, county council offices and the chief clerk’s office.

29.106 The women would have scrubbed the floors, worked in the laundry and in the kitchen. The men looked after the potatoes and the donkey and cart. The donkey and cart would have taken coffins up to the graveyard. A carpenter was employed to make coffins. The council men would have dug the grave. A new cemetery was opened in the 1950s. There were plenty of rats around. The only entertainment the patients had was the Strabane Brass Band who came up the Sunday after Christmas and entertained them. That was all the entertainment they had - once a year.
Extract from an interview with ‘Josie’; staff member 1938-43

29.107 In 1938, it was quite grim, but there was terrible poverty in the area, and nobody expected a lot. The young unmarried mothers and the wives of travelling people had their babies there. The unmarried mothers came in quite early in their pregnancy, they had to work, to do tasks, scrub floors and other little bits and bobs. They had no very heavy tasks, but it kept them going and gave them something to do and when their children arrived there was a night nursery and a day nursery. The day nursery was a long hut where the kiddies could play when they were old enough to do so. Others went to school if they were not boarded out. They went to school in Stranorlar. It was tough on the mothers when the children were taken away eventually and boarded out. It was always sad because the mother could have been there for five or six years with the child and she grew to love it and it was an awful break to lose a child at that stage.

29.108 There were only two nurses and the nuns. We were paid six pounds, thirteen shillings and four pence, which was the going rate. We were always on the move and at that time we only had electric light until midnight so after that when we were laying out the dead or delivering a new baby, you did it by candlelight. I can’t remember anybody being refused entry into the home - it was the place for them or otherwise they would have been on the side of the roads and in those days a lot of people did sleep on the side of the roads. Dr Gormley and the senior nurse kept the register and the books were filled in as each birth or death came in. Dr Gormley would sail in singing. A grand old soul. He had a wonderful way with them.

Extract from an interview with ‘Maura’; staff member 1958

29.109 There was no heating, only a log fire. A couple of domestics worked in the home, mainly unmarried mothers…The unmarried mothers did most of the work. At that time, it was the destitute and unmarried mothers that made up the County Home and those creatures they scrubbed floors until they actually went into labour…The men and women were always kept completely separate. When the women went over to scrub the men’s side one of us had to go to supervise to make sure there was no hanky panky. A Stranorlar resident bought two televisions for the home and that was just great. We really did appreciate that.
Extract from interview with Sr Stanislaus; staff member, 1940s

29.110 Looking back the conditions were atrocious. Sr Ignatius became Matron in 1944. Now she certainly did a lot to try and improve the conditions there. I remember we would have up to 60 kids and about 26 cots for them. The babies would be in the cots during the day. Their mothers would take them up to the top nursery to sleep with them by night. Now the big kids were put into the cots at night and in the morning had to sit on the floor to make room for the babies. The Army hut was the only place that the kids had to go during the day. There were no proper nappies for the children. When Sr Ignatius took over, she gave me four nappies for each child. I thought that was the most wonderful day. There were no training potties or anything until the nursery was rehoused in the old infirmary. I got the carpenter to make seats with holes in them so that we were able to start training those kids.

29.111 Some of the unmarried mothers might have been in three or four months before the baby would have been born depending on what had happened at home. If they had been put out [of their home] or if they were working, they would have to leave their employment. Some of them may not have come in until about a week before they were due. If their parents took them home, they had to take the baby with them, but if not, the girls would have to wait until their child was boarded out or placed with foster parents, which would have been two or three years. There was no such thing as adoption. The children had no toys and they craved attention. I begged and made six pounds and we used the money to buy a rocking horse for the children. I begged another six pounds to buy a pedal horse for the older children. But you know those kids, I could have kept them quiet all day by telling them that if they were bold, they would not get a ride on the horse.

29.112 But I also remember one thing about unmarried mothers. When I first went there, until the baby was born, they had to wear a shawl going to mass. I thought that was the hardest thing and people outside used to come into mass and they all knew how many pregnant girls were in the County Home and that used to kill me… There was a stigma about the County Home clothes. They were rough looking and only a certain make…I got the seamstress to make a skirt for each of the girls who were pregnant. They could wear their own clothes after the baby was born.
Chapter 29 A: Stranorlar Statistical analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission's analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

Through the institutional records, the Commission identified 1,646 single expectant women and unmarried mothers who were admitted to Stranorlar County home in the years 1921 to 1964. Information relating to date of admission was available for 1,639 women (99.6% of admissions). In the period 1921 to 1931, 36 women on average were admitted annually.
However, admissions increased from 41 in 1931 to 59 in 1932 and for the intervening decade 50 women on average entered the home annually. The busiest period was between 1942 and 1948; 402 women (one in four of all admissions) entered the home in those seven years. Admissions peaked in 1948 when 71 women entered the home. Admissions began a fairly steady decline thereafter, falling from 49 admissions in 1949 to seven in 1960. In 1950, the Department of Health had directed that unmarried mothers should not be maintained in county homes. In Stranorlar, however, it is clear that relatively large numbers of women continued to be admitted throughout the 1950s and some women were still being admitted there as late as 1964.

Analysis by decade shows that more unmarried mothers (33.19%) were admitted to Stranorlar in the 1940s than any other decade followed by the 1930s (29.71%); 1920s (19.16%); 1950s (16.66%) and the 1960s (1.28%).

**Age on admission**

Information relating to age on admission was available for 1,630 women (92% of admissions). Ages ranged from 13 to 53 years. Most women (75%) were between 18 and 29 years old; 19% were 30 years and older and 6% were 17 years and younger; 2.7% of
admissions were between 13 and 16 years old. The mode of age on admission was 21 years although this varied from 20 years in the 1920s to 22 years in the 1960s. Average age on admission was 24 years although this increased to 25 years in the 1940s and 1950s.

**Previous pregnancy**

Information relating to previous pregnancy was available for 242 (14.7% of admissions). The Commission considered this sample to be too small from which to draw any conclusions.

**Occupation**

Information relating to occupation was available for 1,546 women (93.9% of admissions). Most women (99.48%) were recorded as a domestic servant or other unskilled worker; five women were recorded as a teacher/nurse/civil servant or other skilled worker; two were unemployed and one was working in the family home.
Marital status
Information relating to marital status was available for 1,642 women (99.8% of admissions). Most women (97.9%) were single women and the remaining women were either separated or widowed.

Previous address by county

Information relating to previous address by county was available for 1,643 women (99.8% of admissions). The institutional records show that most women (98.5%) gave an address in Donegal as their previous residence. Small numbers of women gave addresses in Sligo (11); Tyrone (5); Cork (4); Derry (3) and Antrim (1).

Religion
Information relating to religious denomination was available for 1,577 women (95.8% of admissions). Most women (98%) are recorded as Roman Catholic and the remaining 2% as either Church of Ireland or Presbyterian.
Information relating to length of stay was available for 1,627 women (98.8% of admissions). Women admitted to Stranorlar in the years 1922 to 1932 spent the longest periods in the home. This ranged between 463 days on average for women admitted in 1922 to 151 days for those admitted in 1931. Average length of stay decreased steadily from 266 days on average in the 1920s to 215 in the 1930s, 180 in the 1940s and 154 days in the 1950s. The apparent increase in length of stay in the 1960s is skewed by the very small number of admissions - the spike in 1962 relates to one woman admitted with her child that year (the only admission) and who stayed in the institution for 902 days.

The institutional records show that in the 1920s, single expectant women generally entered Stranorlar 47 days before giving birth; by the 1950s women generally entered 33 days before giving birth.
The available information shows that, in the 1920s, the majority of women (65.16%) left Stranorlar within six months of giving birth - over one in four had left within 50 days; 17.77% remained in the home for between six and 12 months and 8.01% for between 13 and 24 months. The remaining 9.06% of women remained in Stranorlar for periods of between two and four years. In the 1930s, the proportion of women who left Stranorlar within six months of giving birth increased to 74.23% - close to one in three had left within 50 days; the proportion who remained for between six and 12 months increased slightly to 11.93% and the proportion who remained between 13 and 24 months declined slightly to 6.42%. The proportion of women who remained in Stranorlar for more than two years after giving birth declined slightly to 7.34% - these women remained in the home for between two and five years. In the 1940s, the proportion of women who left Stranorlar within six months of giving birth increased to 77.65%, the proportion who left within 50 days, however, had decreased to 27.85%; around one in ten women remained for between six and 12 months; 7.32% for between 13 and 24 months and 4.88% remained for between two and three years. In the 1950s, most women (79.46%) left within six months of giving birth although the proportion of women who left within 50 days had further reduced to 15.42%; around one in ten remained
for between 13 and 24 months and 5.93% remained for between two and three years. In the 1960s all women bar four left Stranorlar within six months of giving birth - one in four left within 50 days. One woman left after seven months, one after 22 months and two women remained for more than two years.

Outcomes
Information relating to outcome was available for 1,610 women (97.8% of admissions). The majority of single expectant women (79.6%) admitted to Stranorlar stayed and gave birth there; 13.3% were admitted with their babies having given birth elsewhere and 7.1% left before the birth and did not return.

Birth details
Information relating to birth details was available for 1,502 women (91.3% of women). The available records show that 98.07% of single women admitted to Stranorlar delivered living infants; 1.86% delivered stillborn infants and one woman suffered a miscarriage.

Exit pathways
Information relating to exit pathways was available for 259 women (15.7% of admissions). The available information shows that most women were discharged to the family home/other private address (52.12%) or transferred to hospital (36.29%). The institutional registers record 20 instances where women were transferred to a Good Shepherd Convent, mostly Derry - most were recorded as having had multiple pregnancies.

Maternal deaths
Through the institutional records, the Commission identified 20 deaths among women admitted to Stranorlar county home: representing a mortality rate of 1.2%. The majority of deaths occurred in Stranorlar - five occurred in external hospitals. Twelve deaths were not associated with pregnancy or childbirth - they were, in the main, due to tuberculosis and typhoid. Two deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy - both resulted in cardiac failure. Six deaths were directly associated with pregnancy and childbirth. Direct obstetric deaths were due to puerperal sepsis, eclampsia, phlebitis and
peritonitis. Adhering to WHO guidelines the maternal mortality rate in Stranorlar county home was 0.48%.¹

Children: Admissions

Through the institutional records, the Commission identified 1,777 ‘illegitimate’ children who were either born in or admitted to Stranorlar. Information relating to date of birth/admission was available for all children. Births/admissions increased from 19 in 1921 to 61 in 1925 and generally remained within the 40-60 range from 1925 to 1943; an average of 49 births/admissions were recorded annually in this period. The busiest period for child births/admissions was in the years 1944 to 1948. Almost one in five of all births/admissions were recorded in those five years and peaked in 1948 when 80 births/admissions were recorded. Births/admissions declined steadily from a high of 80 in 1948 to just four in 1960. Although the Department of Health had advised against maintaining ‘illegitimate’ children in county homes in 1950 they were still being admitted to Stranorlar in 1964. Most ‘illegitimate’ children admitted after 1960 had physical disabilities and were subsequently transferred to

¹ Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. https://www.who.int/healthinfo/statistics/indmaternalmortality/en/
specialist institutions. Analysis by decade shows that more children (33.15%) were admitted to Stranorlar in the 1940s than any other decade followed by the 1930s (28.42%); the 1920s (19.98%) and the 1950s (17.16%) - 23 children were born/admitted in the 1960s.

The institutional records show that the majority of children (82.9%) were either born in the home or admitted accompanied by their mother; 10.2% were admitted unaccompanied and 6.9% were accompanying children admitted with their mother.

Length of stay

Information relating to length of stay was available for 1,646 children (92.6% of births/admissions). Average length of stay was longest for children born/admitted in 1923 (342 days); 1957 (323 days); 1961 (317 days) and 1962 (314 days). A small number of children were admitted in Stranorlar in the years 1957, 1961 and 1962 and the average length of stay in those years may be distorted by the presence of long-stay children with physical disabilities. Length of stay varied widely from an average of 342 days for children born/admitted in 1923 to 101 days for those born/admitted in 1942. Length of stay for children born/admitted in the years 1943 to 1951 appear to have been particularly long - children born/admitted in those years could expect to spent 227 days on average in the
home, which was longer than the average stay for children born/admitted in the 1920s and 1930s.

The available records show that the majority of children (62.89%) left Stranorlar on the same day as their mother; 24.4% were discharged before their mother and 12.71% remained in Stranorlar for a period unaccompanied after their mothers had left.

Exit pathways

Information relating to exit pathways was available for 787 children (44.3% of births/admissions). The available information shows that the majority of children (57.05%) left Stranorlar with their mother or another family member; 27.45% were boarded out; 9.53% transferred to other institutions - mostly to a Nazareth House in Derry, Belfast or Donegal; 4.19% were placed at nurse; 1.27% were legally adopted (post 1952) and 0.51% were informally adopted (pre 1953). The most common exit pathway among unaccompanied children was boarding out followed by transfer to a specialist hospital, industrial school or Nazareth House. One child was placed for foreign adoption in the USA.
Through the institutional records, the Commission identified 343 child deaths associated with Stranorlar county home. This includes children who died in the institution, children who were born/admitted to the institution but died elsewhere and children who were never admitted to the institution but whose mothers were resident there prior to their birth. The Commission located GRO death records for 339 children (98.8% of child deaths). Although child mortality in Stranorlar was relatively low in the early 1920s, child deaths increased from five in 1922 and 1923 to 19 in 1925. Mortality decreased in the late 1920s but peaked in 1930 when 22 deaths were notified. The 1930s was the worst decade for child deaths in Stranorlar - annual child deaths were highest on two occasions in that decade, in 1930 (22) and 1932 (18) but had decreased to four in 1937. Mortality began a staggered increase from 1938 and peaked in 1944 and 1947 when 17 and 15 deaths were notified respectively; 89.5% of child deaths in Stranorlar occurred before 1948. Mortality decreased significantly from 15 deaths in 1947 to two deaths in 1948. After a small spike in the years 1950-52, mortality fell to an average of two deaths annually and no child deaths were notified in the years 1957-63.
Place of death

Information relating to place of death was available for 339 children (98.8% of child deaths). The available records show that the majority of child deaths (98.23%) occurred in Stranorlar county home; four children died after transfer to hospital and two died in private residences.

Age at death

Information relating to age at death was available for all children. The institutional records show that most children (86.8%) died in infancy as follows: perinatal (0-7 days) 16.62%; neonatal (8-28 days) 15.16% and infant (29-365 days) 55.1%; 11.95% of deaths occurred in children aged between one and four years and 1.17% were aged five years and older. The available information shows that 75% of children were accompanied by their mother at the time of death and 25% were unaccompanied.
Information relating to cause of death was available for 339 children (98.8% of child deaths). The leading cause of death (60.47%) was respiratory infections - mainly acute bronchitis, bronchopneumonia and capillary bronchitis; 11.8% were notified as being due to non-specific causes such as congenital debility and prematurity; 10.62% were notified as icterus neonatorum and a range of other, mainly one off, causes including whooping cough and injury at birth; 3.83% were notified as congenital syphilis; 2.65% as malabsorption - mainly marasmus; 2.36% as tuberculosis; 2.36% as convulsions; 1.77% as haemorrhage and 1.47% as congenital heart disease. Small numbers of deaths were notified as influenza (2); spina bifida (2); measles (2); diphtheria (1); meningitis/encephalitis (1) and gastroenteritis (1).
The infant mortality rate in Stranorlar was highest in the period 1925 to 1935. The peak rate of infant mortality was in 1925 when a rate of 41.67% was recorded. It should be noted that relatively low infant mortality rates were recorded in this period also - the rate was 13.16% in 1927. The infant mortality rate decreased from 32.65% in 1935 to 7.89% in 1937, the rate increased, however, from 1938 (24.39%) and remained relatively high until 1947 (23.4%) - close to one in four infants born in those years died in infancy. The infant mortality rate fell dramatically from 23.4% in 1947 to 2.82% in 1948. From 1948 to 1956, the infant mortality rate fluctuated between 17.5% in 1951 to 0% in 1953. From 1957 to 1964 just one infant death was recorded - that infant died following transfer to another hospital.

Infant mortality was calculated as follows: (Living children born in the year who died before the age of one)/(All living children born that year).
Chapter 30: Thomastown County Home

Introduction

30.1 The Thomastown union workhouse was built in 1854 on an eight acre site north east of Thomastown, Co Kilkenny. The design followed the standard workhouse plan as designed by architect George Wilkinson. The entrance block was a long single storey building with a central arch. The main accommodation block had the master’s quarters at the centre, with male and female wards to each side. A utility block containing a bakehouse and washhouse were located at the rear with ‘privies’ in each yard. A central spine contained the chapel and dining hall that linked to an infirmary at the west of the site.\(^1\) In the 1870s, the Congregation of the Sisters of St John of God took over the running of a number of workhouses in south east Ireland.\(^2\) The Thomastown Board of Guardian records show that the congregation took over nursing duties at the Thomastown workhouse in 1888.

30.2 In 1923, the County Scheme Order, Kilkenny No. 1, 1923 made provision for the Thomastown workhouse to be the Kilkenny county home. The scheme provided that Thomastown county home would admit and maintain the following people who were eligible for indoor relief - ‘aged and infirm persons, chronic invalids, children, expectant unmarried mothers, harmless lunatics and idiots’.\(^3\)

Sources

Institutional records

30.3 The former Thomastown county home is now St Columba’s Hospital and is a public nursing home. It houses a range of material from the period when it was a county home which catered for unmarried mothers. This material includes:

- Combined Indoor Relief Registers 1919-72 (26 volumes). This collection is largely intact apart from two missing volumes covering the periods October 1930-April 1932 and March 1938-December 1939.
- Record of Maternity Hospital 1959-65 (1 volume).
- Record of Births 1919-65 (1 volume).
- Record of Deaths 1919-62 (1 volume).

• Half yearly Return of Children in the County Home 1938-61 (1 volume).

Kilkenny local authority records

30.4 The Kilkenny Board of Health Minutes November 1921-July 1925 and July 1925-June 1927 (two volumes) are held in St Luke’s Hospital, Kilkenny.

30.5 The following are held in Kilkenny county library:
• Letter Books for the years 1922-38. The first three collections have survived on carbon paper and have faded to an extent that they are largely illegible. These files contain correspondence about boarded out children between the Department of Local Government and Public Health (DLGPH) and the Kilkenny board of health. The Commission checked the names of all children mentioned against the Thomastown records, the majority of whom were recorded there.
• Manager’s Orders, public assistance section, 2 April 1942-25 March 1970 (27 volumes).
• Minute Book, Social Service Committee (later Ladies Social Service Committee) 19 April 1926-21 February 1941.
• Kilkenny local authority statistical return in tabulated form of people receiving assistance 4 April 1953-1 March 1958.

Department of Health

30.6 File INACT/INA/0/430483 contains the reports by the departmental inspectors.

The Women

30.7 In the period 1920-1972, the registers record almost 60,000 admissions. The Commission identified the admissions of 75 married maternity cases, 970 single expectant women and unmarried mothers and 1,241 ‘illegitimate’ children. In 1926, the Kilkenny board of health deemed the practice of admitting pregnant married women to Thomastown county home as ‘contrary to the working of the Scheme’ and married pregnant women remain largely absent from the records thereafter. The board resolved that maternity services at Kilkenny central hospital ‘should be at the disposal of every poor married woman in the county’. It is clear that the Kilkenny board actively segregated pregnant married and single women.
and limited access to maternity services on the basis of marital status. Married women had exclusive access to maternity services in Kilkenny central hospital; unmarried women from all parts of Kilkenny, and from parts of Waterford that came under Kilkenny boards of assistance, had to travel to Thomastown county home for maternity and institutional care.

30.8 Admissions of single pregnant women to Thomastown county home were highest in the years 1920 to 1923 and fell by around 50% thereafter. This decline is most probably associated with the opening of Bessborough in 1922. Kilkenny was one of the first local authorities to engage with the Congregation of the Sacred Hearts of Jesus and Mary to provide institutional care in Bessborough for single pregnant women from the county. A further fall in admissions to Thomastown county home can be identified after 1930 and this is almost certainly related to the opening of Sean Ross in 1931. Over 750 single pregnant women from Kilkenny sought admission to either Bessborough or Sean Ross during the period under review. Admissions to Thomastown spiked during the war years and were particularly high between 1944 and 1946. This increase corresponded directly with the temporary closure of Bessborough to public patients and the temporary suspension of admissions to Sean Ross due to severe overcrowding. Admissions of single pregnant women to Thomastown declined steadily between 1946 and 1960.

Mothers working in the home

30.9 In July 1923, the matron of the Thomastown county home asked the board of health what action she could take against unmarried mothers who left the institution without permission. The board informed her that she was to ‘threaten women with confinement’ if they did not comply with the rules of the home. There is no evidence to suggest that the matron took such action against any woman. The matron also complained that some unmarried mothers refused to undertake work in the institution. The board discussed the matter with their solicitor and enquired if legal proceedings could be taken against such women. It is not clear how this matter was resolved but there is no evidence that legal proceedings were taken against any woman for refusing to undertake work in the county home.

30.10 In March 1925, the Kilkenny board of health was involved in discussions with the Wexford, Waterford and Carlow boards about opening an inter-county mother and baby home in Wexford. It was proposed to open an institution ‘along the lines of Bessborough’ in a disused workhouse in New Ross. The plan was that all women
admitted to the institution would be employed in industries such as mattress covering and shirt making to supply other institutions in the participating counties. The Kilkenny board agreed that unmarried mothers were ‘a neglected class of the community’ and that a central home specially designed for them would be a better alternative to Thomastown county home.\(^4\) This plan did not come to fruition and the Kilkenny board subsequently made its own arrangements with the authorities in Bessborough.

**Maternal mortality**

30.11 The institutional records examined by the Commission show that there were three deaths among single pregnant women and unmarried mothers admitted to the home; this represents 0.31% of all such admissions. All three deaths occurred in the institution during 1922. The women were aged 15, 25 and 40 years respectively at the time of death. These deaths do not appear to be childbirth related; the causes of death were given as influenza, heart disease and tuberculosis.

**The Children**

30.12 A total of 1,241 children covered by the Commission’s Terms of Reference entered Thomastown county home. The institutional registers record 764 births there; all related to ‘illegitimate’ children. 77.8% of children were either born in the home or admitted there with their mother soon after birth; 11.7% were older siblings accompanied by their mother and 10.6% were admitted unaccompanied. Many unaccompanied children were transferred from Bessborough and Sean Ross for boarding out.

**Children’s exit pathways**

30.13 The Unmarried Mothers Register records exit pathways for 176 children born in the county home in the years 1931-61 as follows: 101 (57%) went home to live with their mother and/or grandparent; 55 (31%) were boarded out; 14 (8%) were sent to industrial schools; five (3%) were sent to Sean Ross (with mother) and one child was informally adopted.

30.14 The Unmarried Mothers Register also record details relating to 141 single women with two or more children. These entries show that 54% of unmarried mothers

---

\(^4\) *Kilkenny people*, 4 April 1925.
admitted to Thomastown experienced the death of at least one child; 28% of infant and child deaths recorded occurred outside the institution. It should be noted that Kilkenny County Council did not employ dedicated infant protection visitors (see Chapter 1) and the superintendent assistance officer for Kilkenny regularly remonstrated with the board of assistance that assistance officers were not qualified to medically assess children in foster homes. Assistance officers were responsible only for boarded out children in the care of Kilkenny County Council. Infant and child fatalities recorded in the Unmarried Mothers Register appear to have occurred, in the main, among unregistered children placed at nurse, or in the family home. In 1935, the Kilkenny Board appointed an NSPCC inspector to follow up on single women and their infants when discharged from Thomastown and to establish the intended destination of mother and child.

30.15 There were numerous institutional and local authority health records available for the period 1942-52. Analysis of the county home Indoor Registers, Unmarried Mother’s Register, Death Register and Kilkenny county managers’ orders for this period show that 380 children were either born in or admitted to Thomastown county home. Associated exit pathways were noted in 214 cases. It was possible to determine that 32% of children were boarded out; 24% remained in the county home; 23% died; 12% went home with their mother or grandmother; 2% were sent to industrial schools and 2% transferred to Sean Ross with their mother in this period. Although the managers’ orders recorded that 61 women were admitted to Sean Ross from Kilkenny during this period, just three had transferred from Thomastown county home. The managers’ orders also show that about 4% of children were placed at nurse directly from the institution during this period.

30.16 No discharge pathways were recorded for roughly 44% of children discharged from Thomastown in the period 1942-52. These children did not subsequently appear in public assistance authority records and it must be reasonable to assert that they also left the institution with their mothers and were either living at home or placed at nurse in the community under a private arrangement. This figure is broadly in line with the figure of 45% of children recorded as being ‘at home’ in the Unmarried Mothers Register.

30.17 The Kilkenny board of health expressed concern at the ‘extraordinarily low number of registered children at nurse’ in the county. Three women were found to have unregistered nurse children in their care during the period under review. The
women were issued with a warning and instructed to register the children in their care with the board. However, the board did not prosecute the women under the Children Acts 1908-34. It is likely that perennial overcrowding in the county home nursery, and the acute shortage of ‘suitable’ foster homes in Kilkenny, deterred local assistance officers from pursuing these cases with any vigour.

Infant Mortality

30.18 A Register of Deaths for Thomastown county home covers the years 1919-62 - all entries correlated with deaths independently identified by the Commission in the institution’s Indoor Registers. Of the 764 live births attributed to single women, 140 infants subsequently died. In most cases, the stated cause of death was ‘inanition’. Other recorded causes of death include congenital asthenia, congenital debility, congenital heart disease, convulsion, gastric ulcer, gastro enteritis, meningitis, pneumonia, premature birth, septicaemia, tuberculosis, umbilical haemorrhage, umbilical sepsis, marasmus, and one case of a fractured skull. It is interesting to note that just two infant deaths due to measles were recorded in the institution in the years 1919-62, a period when this particular disease took a heavy toll on child life. Other rampant and frequently fatal childhood diseases such as pertussis (whooping cough) and diphtheria are almost completely absent from the county home death records. Of the 477 children admitted to the home after birth, 37 subsequently died. The institutional records suggest that 177 children born in or admitted to Thomastown subsequently died. The Commission has located GRO death records for 169 children.

30.19 The institutional medical officer reported that in the six months April to September 1922, 28 infants were born at Thomastown county home and 19 subsequently died - resulting in an infant mortality rate of 68%. This does not fully accord with the institutional records analysed by the Commission. The institutional records show that 22 infants were born in this six month period and nine subsequently died (an equally unacceptable mortality rate of 41%). Notwithstanding this, it is the case that 1922 was the worst year for infant mortality in Thomastown - 20 children born/admitted that year subsequently died. The high infant mortality was, according to the institutional medical officer, due to ‘careless and indifferent mothering’ and because ‘mothers are not sufficiently careful in giving the infants nourishment’.

5 This is defined as ‘severe weakness and wasting as occurs from lack of food, defect in assimilation, or neoplastic disease’: www.irishhealth.com.
30.20 However, an inspection undertaken by a local government inspector found that the nursery section of the institution was overcrowded (35 women and 35 infants), understaffed, and was ‘the worst part of the Institution’. The inspector noted that lavatory accommodation was insufficient and insanitary and that one midwife cared for all women and children as well as attending to maternity cases. The inspector reported that infants were removed from the nursery at night and placed in an unheated dormitory ‘passing through an open yard on each occasion’. Bed clothes for unmarried mother were described as ‘wretched and scanty’. Regarding infant mortality in the institution the inspector advised the board of health:

That careless and indifferent mothering by some of the younger women militates against the healthy development of the offspring.

That the passage of the children to and from their dormitories through the open yard in inclement weather subjects them to serious chills.

That as these children were not having sugar in their bottles in the period covered by my report they were possibly being deprived of an important food element (Decided that sugar be given).

That the covering of the beds occupied by unmarried mothers is too wretchedly scanty to afford the necessary winter warmth (Decided that when blankets are light or worn on any of the beds, that some extra single blanket be given in winter time).

That little woollen shirts for the babies instead of the calico ones would be beneficial. (Decided that these be given)

Where it appears to the medical officer and the midwife, after a reasonable period of observation after birth that a child who is not developing on breast feeding, bottle feeding might be resorted to.

A baby scale to weigh up to two years should be provided for the nursery.

The question of heating the sleeping quarters to be considered

The change from ‘Hospital;’ to ‘Hall’ diet at the end of confinement should be gradual rather than sudden.

30.21 The inspector also recommended that the board of health employ an additional nurse with midwifery qualifications. The board refused to do so and instructed the matron to ask ‘the nuns’ to supervise the nursery and to utilise the services of unmarried mothers living in the home to assist them. The DLGPH advised the board that infant mortality in the home was ‘alarmingly high’ and that it was considered ‘absolutely essential’ to provide an additional nurse with maternity qualifications as recommended by their inspector. The matron informed the board
that every nun in the home was ‘fully and arduously engaged the whole working day’ and none had capacity to supervise the nursery. The DLGPH asked the institutional medical officer to report on the matter and instructed the matron to ‘report any mother neglecting her child’.

30.22 In March 1922, the Kilkenny board of health discussed staffing arrangements in Thomastown county home. The board stated that four nursing sisters were working in the home, none of whom were trained in midwifery, and ‘had more work than they were able to do’ looking after infectious and chronic cases. The board heard that the midwife in the institution was not a permanent official and was paid 15s for every maternity case she attended. They decided to employ a permanent qualified midwife who would also act as assistant matron in the home.\(^6\) An advertisement for the position asked that candidates should have ‘full midwifery qualifications and possess a knowledge of child welfare’. Salary was £45 per year, with rations and an apartment in the county home.\(^7\)

**Living conditions**

30.23 In October 1925, a local government inspection of Thomastown county home found that 58 children, aged from new-born to over three years old, were sleeping in 32 cots. Having failed to secure suitable foster homes for the children, DLGPH Inspector Miss Fitzgerald-Kenny advised the Kilkenny board of health to consider the transfer of ‘suitable women’ from Thomastown county home to Bessborough. Miss Fitzgerald-Kenny told the board that the case of unmarried mothers was ‘very pathetic’ and that it was up to them to see that they could make a fresh start in life. She told the board that there was a woman in Thomastown county home with four illegitimate children and that the woman’s oldest daughter had been admitted to the home ‘with a second illegitimate child’. She stated

> It was desirable that first offenders should be removed from such an environment as the county home provided, and placed in a home where their characters would be formed on the right lines and where they would be fitted for the battle of life. Those girls as a rule were mentally defective and required religious upbringing. What advantage was it to anybody to keep those girls and their children in such a place as the county home?...Taking everything into consideration I do not think that the board could do anything

---

\(^7\) *Kilkenny people*, 1 April 1922.

8
better for these girls - the first offenders - than to send them to the home in Cork.\(^8\)

30.24 The Kilkenny board initially sent four ‘first time offenders’ and their infants to Bessborough. The Mother Superior advised the board that the women were ‘doing fine’ in Bessborough and that she had space for 20 more. In January 1926, the DLGPH approved Bessborough as an extern institution under the *Kilkenny County Scheme Order 1923*. Following an inspection by Miss Fitzgerald-Kenny, in April 1926 a further ten women and their infants were transferred to Bessborough. They travelled to Waterford and on to Cork by train accompanied by a nurse.

30.25 The mother of one woman contacted Bessborough and indicated that she wished to take her daughter and her child home. The board agreed to pay the cost of transport. In another instance the father of a woman transferred to Bessborough requested to have his daughter returned home. The superintendent assistance officer for Kilkenny reported unfavourably on the man and his home and advised the board that it would be inadvisable to allow the woman to return to her family home. In August 1926, the Mother Superior in Bessborough asked the Kilkenny board what she should do with a woman maintained by the Kilkenny board if her child died in Bessborough. The superior suggested that she would keep such women at Bessborough for two years where they would be trained to secure employment. The Kilkenny board approved of this suggestion once they were not expected to continue to pay for a woman’s maintenance after her baby had died.

30.26 In August 1926, the DLGPH instructed the Kilkenny board that all mothers of ‘illegitimate’ children were required to contribute to the cost of their children’s maintenance when boarded out from Thomastown county home. The board advised the DLGPH that they had located some women whose children had been boarded out and assessed their capacity to contribute to their child’s maintenance based on their income. The board stated that, although most women were willing to contribute to the cost of their child’s maintenance, few were earning enough to do so.

30.27 In 1927, the *Report of the Commission on the Relief of the Sick and Destitute Poor* stated that, when they inspected Thomastown, there were 38 unmarried mothers living there; eight were ‘first offenders’. The report said that the water supply to the

---

\(^8\) Kilkenny people, 31 October 1925.
institution was ‘bad’ and that bathing and sanitary accommodation there was ‘very
bad’. Furthermore, the standard of comfort in the home was ‘poor’ and that little
effort was made ‘to brighten the lives of the aged and infirm’ or to ‘reform those
who through moral weakness’, were obliged to seek shelter there. The report
noted that a maternity department attached to the home had insufficient
accommodation to cater for the number of women seeking admission.

30.28 In June 1928, the Kilkenny board of health advertised for people living in Kilkenny
to consider taking children from Thomastown county home under the local
authority boarding out scheme. The rates of pay were stated as 6s per week and
£3 annual clothing allowance for each child up to 10 years of age and 3s per week
and £3 annual clothing allowance for children aged 10-15 years. Applications were
to be sent to the Superintendent Assistance Officer.\

30.29 The Kilkenny board of health reported that on 31 March 1929, 35 unmarrie
d mothers and their children were living in Thomastown county home. Twenty four
of the children were aged under five years and 11 were five years or older. The
board reported that 52 children were on the county boarded out register on that
date and noted that the ‘class of life’ from which they generally came was
‘Domestic servants’. In the twelve months to 31 March 1929, 15 children were
removed from the boarded out register: five were returned to Thomastown county
home by foster parents; three were ‘adopted’ by their foster parents; two were
claimed by their mothers; two were placed in the Good Shepherd Convent,
Waterford (an industrial school) and nine were admitted to hospital.

30.30 In 1932, a member of the Kilkenny Social Services Committee reported that a 15
year old boarded-out girl had given birth to a premature child. A man lodging in the
foster parents’ home was named as the putative father of the child. A Garda
Superintendent reportedly took the case in hand with a view to prosecution but
informed the board of health that there was no point in bringing the case to court
as there was ‘no corroborative evidence’. The girl was subsequently admitted to
Thomastown county home. Her age on admission to the county home was
recorded as 13 years and not 15 years as reported by the Social Services

---

9 Kilkenny people, 9 June 1928.
10 In 1926, DLGPH Inspector, Miss Fitzgerald-Kenny set up a women’s Social Service Committee, with the Duchess of Desart
   as President, to visit boarded out children in their districts and to inspect the homes of prospective foster parents.
Committee. She was subsequently transferred to Sean Ross where she stayed for one year.

30.31 In 1932 The DLGPH inspector Miss Fitzgerald-Kenny took statements from single pregnant women who sought indoor relief in Thomastown county home.

**Statement of Miss S:**
Miss S went to service in 1931. She has been keeping company and walking out with Mr H and she did not keep company with other men. She states that Mr H is responsible for her present condition. When made aware of the state of affairs her father interviewed Mr H who admitted responsibility and agreed to marry the girl. Both parents and the girl state that Mr H called to their home and arranged to marry the girl in Dec 1931. Her father subsequently received a letter from Mr H from England saying he cannot make up his mind to marry his daughter.

**Statement of Miss L:**
I reside in Kilkenny with my mother. I am about 30 years of age. I am expecting to become a mother about May next. A man named Mr D is responsible for my present condition. He used to meet me on the road in the evenings when I was coming from the shop. Mr D used to be watching for me to pass. He induced me to cross over a ditch on the roadside more than once. Some people around knew that Mr D was watching me to pass the road at different times, but I cannot prove it, only what I heard. Mr D worked at the time in the shop, but I do not know where he is at present. I believe Mr D is a widower. He told me his wife had died and he had four children. (Miss L was subsequently admitted to Sean Ross)

**Statement of Miss F, aged 22:**
In the County Home, Thomastown for 5 weeks. Baby expected end of November. Putative father is Mr M. She worked in Knocktopher for about 9 months. Mr M works for the County Council on roads. The girl met him and kept company with him about one month after entering service at Knocktopher. No promise of marriage, no correspondence. Her employers knew of them keeping company. She never kept company with anybody else. She wrote to Mr M asking him to meet her in Kilkenny in August and he did so. She is not willing to go to Court but will do so if compelled.
**Statement of Miss M, aged 24:**

Worked in Kilkenny for 3 years. In the County Home about one month. Baby expected about February 1931. Name of putative father Mr R, a baker; wages unknown. Kept company since December 1929. Never kept company with anyone else. Never corresponded with Mr R. Her employer knew of herself and Mr R keeping company. Nobody else ever saw her in company. No promise of marriage. Will give evidence but is not anxious to go to Court.

**Statement of Miss D:**

I wish to report that there is a girl named Miss D an Unmarried Mother and her child at present in the County Home. She states Mr R is the father of her child. I have been making inquiries regarding her case and there are two witnesses willing to give information as to Mr R keeping company with the girl. The Board's solicitor states he believes there is a possibility of the Board being able to procure conviction against the putative father under the Affiliation Orders Act.

30.32 A fatal altercation between ‘inmates’ of Thomastown county home occurred in June 1932. A 60 year old man took umbrage with a fellow inmate who had taken his job looking after the institution’s horse and cart and subsequently killed him during the course of a fight.\(^{11}\) Later that year a boarded-out boy was charged with stealing a sum of money. The court applied the *Probation of Offenders Act 1907* and ordered his return to Thomastown county home.\(^{12}\)

30.33 In April 1935, the DLGPH asked the Kilkenny board of health to provide a list of children suitable for boarding out from Thomastown county home. The board responded that they found it difficult to get suitable foster homes and that several foster homes ‘obtained after great difficulty’ had been rejected by the department. The DLGPH instructed the Kilkenny board to notify the local NSPCC inspector of all ‘illegitimate’ children who were discharged from Thomastown county home with their mothers so that he could gather information regarding the intended destination of both mother and child. The board of health advertised for foster parents to board out children from Thomastown in February 1936.\(^{13}\)

\(^{12}\) *Munster Express*, 11 November 1932.

\(^{13}\) *Kilkenny people*, 8 February 1936.
An 18 month old girl fell to her death in April 1942. The child was sitting on a ledge in the home when she fell through an unfastened window. She fell 30 feet and fractured her skull. The institutional records show that the child had been born to a single woman in Thomastown in 1940. At the inquest, the woman told the jury that she was in the habit of sitting her child on the window ledge and did not realise that the window was unfastened.\textsuperscript{14} The coroner asked one of the nursing sisters giving evidence if women were allowed to bring their children around Thomastown county home with them. The sister replied

Inmates were not allowed to take children with them around the house. They might sleep with the children but they were supposed to leave them in the nursery in the morning. They might take them around the grounds but they were not supposed to take them around the dormitories. It was usual for mothers to take their children away with them. They had to ask permission to remove them from the nursery.

The sister explained that if the child had ‘died in the ordinary course’ the mother could leave the institution immediately - otherwise she would have to stay for three years. She said that arrangements were being made for the woman to leave the home ‘her mother had decided to take her out’. The coroner told the jury that they should consider whether the child’s death was accidental, or not. He stated

In an institution of that sort they all knew that there was a certain mental effect which must affect people in the place and for that reason there was a big responsibility on the people in charge to take precautions that such accidents would not happen.

The foreman of the jury said that there was not very much to consider - the jury returned a verdict of accidental death.

At a murder trial in June 1944, Dr Edith Lane told the court that she had confirmed a young woman’s pregnancy and made arrangements for her admission to Thomastown county home. The woman did not want to be admitted to Thomastown as she had given birth to an ‘illegitimate’ child there previously. She asked to be admitted to Sean Ross. That home was closed to new admissions due to overcrowding and so agreed to go to Thomastown. Some weeks later the woman’s sister told Dr Lane that the woman had given birth in Regina Coeli,

\textsuperscript{14} Kilkenny people, 4 April 1942.
Dublin, but the child had died soon after. However, a Garda subsequently found the remains of a baby boy wrapped in a bundle of clothes and he was identified as the woman’s child. The woman and her sister were charged with the child’s murder. They told the court that the woman had gone into labour on the way to Thomastown, that the child was stillborn and they buried the body. The woman subsequently confessed to strangling her baby so that her father and her neighbours would not find out about it.  

30.38 A visiting committee’s report on Thomastown county home was discussed at a Kilkenny County Council meeting in February 1945. The report stated that 60 or 70 men were in the dining hall at the time of the visit and that the ration was ‘meagre’ and consisted of ‘about three potatoes, a little green cabbage and home cured bacon’. The committee criticised the quality of the meat being served stating that ‘it was large lumps of fat that in any home would be diverted to the offal for dogs and pigs’. In the female dining room, they encountered ‘12 or 14 unmarried mothers with their babies’. They stated:

The same state of affairs evidently existed there as there was not a pick of food visible, except potato skins and the relics of the pig. Conditions in this section did not at all appear to be ideal. The fire was at its lowest ebb with no apparent fresh supply of fuel…the floor was littered with straw.

30.39 In November 1945, Kilkenny county council asked the county surveyor, Mr J C Coffey, to report on Thomastown county home. Mr Coffey reported that the institution had one vertical boiler which served the kitchen, eight baths, laundry and drying rooms. He noted that the boiler’s capacity was inadequate to serve the institution and that when dinner was being cooked there was little heat available for other purposes. He noted that the baths in particular were seldom supplied with hot water. He reported that there was no central heating in the home and that dormitories and wards were heated by small open fires. He recommended that central heating should be installed and that cooking arrangements, which he described as ‘also bad’, should be overhauled.

30.40 Mr Coffey conducted another survey of Thomastown county home in November 1946. He again drew attention to the primitive nature of the heating and cooking arrangements and highlighted the ‘totally insufficient’ sanitary arrangements in the

15 Nationalist and Leinster Times, 24 June 1944.
16 Kilkenny people, 10 February 1945.
Institution. At the time of this inspection, 250 men, women and children had eight baths, eight W.Cs and 16 wash-hand basins available to them. In addition, he noted that all washing in the institution was done by hand and that the laundry was not equipped with disinfecting or sterilising equipment. He reported that the labour ward in the institution had no electric sockets, no heating and no sanitary equipment.

30.41 In February 1949, the Department of Health sent an engineer to assess the necessity for improvements to the county home recommended by Mr Coffey and to consider the expenditure involved. The departmental inspector advised that the proposal to install a central heating system should be ‘deferred, if not abandoned’ on the basis that few county homes had central heating and that institutions such as sanatoria and regional hospitals should take priority over county homes. In May 1949, the Department of Health advised Kilkenny County Council that it did not object to the proposed refurbishments at Thomastown county home but stated that the department was not in a position to contribute financially to the proposed works. It is clear from a report on Thomastown county home undertaken by the DLGPH inspector Miss Alice Litster in 1952 that no refurbishments had been undertaken and that the institution remained without central heating and without adequate lavatory and bathing facilities.

30.42 Miss Litster inspected the nurseries at Thomastown county home in February 1952. She interviewed unmarried mothers and examined records relating to births, admissions and deaths of ‘illegitimate’ infants. At the time of inspection, 14 mothers and 45 children aged from new-born to 15 years were living in the home. Miss Litster reported that one of the nurseries was ‘a good room with polished floors’ with four cots and two beds for adults. The room was occupied only by one eleven-year-old girl. Miss Litster reported that a second nursery housed 20 ‘motherless children’. Two adults slept in the room to attend to them at night. She noted that infants who were accompanied by their mothers slept in the same bed with them at night. She described this nursery as a large room heated by an open fire. She observed that women sat in front of the open fire and that clothes were drying on a fire guard. She noted that the room was ‘stuffy and squalid’ and that the atmosphere was ‘charged with odours associated with humanity cramped for space’. Miss Litster noted that there was no lavatory accommodation in the nurseries and that chamber pots were available for the children. She also noted that 17 of the children were ‘illegitimate’ and the remaining three were extramarital
children born to a woman who lived outside the institution caring for her other children.

30.43 Miss Litster reported that a third nursery was a dark room used at night to house ‘motherless children’. She noted that a cupboard containing milk, bread, bottles and other articles was not in a clean condition. Older children were housed in an outside shelter heated by a turf burning stove. Most of the older children had been placed at nurse by their mothers and subsequently sent to the county home as their mothers had stopped paying maintenance for them. Miss Litster described other children as being either physically or mentally disabled.

30.44 The children’s diet was recorded as follows:

- **Breakfast**: Porridge with milk; eggs about three days a week. Smaller children are started with a little yoke and increased until a whole egg can be taken. Bread and butter with milky tea.
- **Lunch**: ‘Goody’ (bread, milk and sugar)
- **Dinner**: 1 pm. Soup, (made of meat with addition of vegetables, onions, carrots etc., as in season, thickened with barley or lentils, sometimes with addition of Bovril) given either separately or poured over potatoes and vegetables. Mashed potatoes and vegetables, a little minced meat. Pudding is given every day, generally cornflour, sometimes rice. Rhubarb and apples are given when available. Otherwise, except for very occasional orange, no fruit. Amount of milk given is regulated by appetite. Bread and milk is given in the afternoon.
- **Tea**: Eggs may be given at this meal. Bread and butter and milky tea.

30.45 Miss Litster noted that children living in the home ‘appeared to be well-nourished, robust and on the whole in good health’. She drew attention to the ‘large number’ of children aged two years and over who were living there and recommended that they should be boarded out as soon as possible. She also highlighted cases where ‘illegitimate’ children had been placed at nurse from the home by their mothers only to be readmitted to the institution unaccompanied ‘suffering from the effects of neglect’. She noted that some of these children were admitted with broken limbs and others in a condition described as ‘dying from neglect’.

30.46 The unmarried mothers were housed in a dormitory at the top of the building. Miss Litster described a long, narrow room with floorboards, clean, fresh and bright with
ten windows. She noted that each bed had a chair beside it and that the room had a large communal wardrobe. The room had an electric light, but no heating. There was no sanitary accommodation attached to the dormitory and women were supplied with ‘night pails’. Washing facilities for the women were provided on the ground floor. Miss Litster noted that the dormitory could accommodate 24 women and was ‘clean and comfortable’. At the time of her visit there were just two single expectant women in the home. One was ‘a crippled girl with T.B.’ who had been admitted from Sean Ross. She reported that in the period April 1951 to February 1952, 13 infants were born in the home and a further five were admitted after birth. Two infant deaths were recorded during this period. Causes of death were given as congenital debility and whooping cough.

30.47 Miss Litster reported that work incidental to the running of the home was undertaken by resident unmarried mothers. The Department of Health asked the Kilkenny board why unmarried mothers remained in Thomastown instead of being transferred to Sean Ross. The reply was that the women were required in the county home to carry out work there. In July 1953, the matron notified the Kilkenny public assistance authority that the number of unmarried mothers in the home had reduced to six and that she had no one to put to work in the institution. She advised the authority that she had employed eight women to take up duties formerly undertaken by unmarried mothers.

30.48 The Department of Health next inspected Thomastown in August 1958. The inspector, Miss Reidy, reported that four children aged between four and 16 years were living in the home. All four children were described as ‘mental defectives’. Miss Reidy did not refer to unmarried mothers in her 1958 report.

30.49 Miss Reidy again inspected Thomastown in March 1960. At the time of inspection four unmarried mothers and 14 children were living in the home. She noted that eight of the children were ‘illegitimate’. She noted that one ‘mentally defective’ ‘illegitimate’ boy, who she had examined on her previous visit, had deteriorated considerably and had become ‘distressing to look at’. She noted that the boy was on a waiting list for admission to a special institution. Her report concluded by stating that children living in the home were ‘adequately cared for’.

30.50 Miss Reidy next inspected Thomastown in February 1962. At the time of inspection seven expectant and unmarried mothers and ten children were living in
the home. Three women and their children had remained in the home since her inspection two years earlier. All other children were in the home unaccompanied. She noted that one child had been admitted from Sean Ross to allow his parents to make arrangements for marriage. However, both parents subsequently disappeared leaving the child abandoned. Miss Reidy reported that three children died in the institution in the period since her last inspection. She noted that the overall standard of care in the home was 'quite satisfactory'. In April 1963, Miss Reidy reported that two unmarried women and three children were living in the home. One woman and her infant had been admitted from Sean Ross. She again noted that the standard of care was 'satisfactory'. When Miss Reidy again inspected Thomastown, in February 1965, she reported that there were no unmarried mothers or children living there.

**Burials**

30.51 A groundsman at St Columba’s Hospital, Thomastown (formerly Thomastown county home) told the Commission that he has been employed at the institution since around 1986. He said that, in or around 1990, the matron of the institution, asked him and another employee to incinerate institutional records. He said that these records included burial registers relating to people who died in the institution and were buried onsite. He believed that the burial registers related to the period when the institution operated as Thomastown county home. Shortly after this, groundsmen were put to work renovating the institutional graveyard located in an adjacent field. The groundsman identified the location of the graveyard on a map. The Commission had previously identified this location lying to the east of St Columba’s Hospital as a potential institutional graveyard. He said that the graveyard, known locally as the ‘Shankyard graveyard’ had been neglected for some years and was in a state of disrepair. He stated that ‘several loads of topsoil’ were put down on the graves and that the site was levelled and grassed. The Commission visited the graveyard in 2019 and found the site to be well-maintained. A single cross with the inscription ‘Remembering those who died’ marks the site as a former graveyard. The graveyard was in operation from 1854 to 1978. The Commission considers it likely that children who died in Thomastown county home were buried there.
Chapter 30 A: Thomastown county home Statistical analysis

The statistical analysis provided here is based on the institutional records examined by the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

Thomastown Total Mothers Admitted per Year
From the institutional records, the Commission identified 970 single expectant women and unmarried mothers who were admitted to Thomastown county home in the years 1920 to 1966. Information relating to date of admission was available for 909 women (93.7% of admissions). The busiest period was between 1920 and 1930 - almost half of all women admitted to Thomastown were recorded in those 11 years. From 1931 to 1943, 13 women on average were admitted annually. Admissions increased dramatically in 1944 and 1945 - 78 women were admitted during those two years. This increase in admissions coincided with restricted admission practices in Bessborough and Sean Ross. Admissions began a staggered decrease, thereafter, falling from 33 in 1946 to just three women in 1960. Although the Department of Health had advised against maintaining unmarried mothers in county homes in 1950 they were still being admitted to Thomastown as late as 1966.

**Age on admission**

![Thomastown Mothers Age on Admission](image)

Information relating to age on admission was available for 908 women (93.6% of admissions). Ages ranged from 13 to 62 years. Most women (70.5%) were aged between 18 and 29 years; 24.7% were 30 years and older and 4.8% were 17 years and younger. The
available information shows that 2.09% of admissions were aged between 13 and 16 years. The mode of age on admission was 22 years - this increased to 30 years in the 1940s and 1950s. Average age on admission was 25 years; this increased to 28 years in the 1950s. The increase in average age on admission in the 1940s and 1950s suggests that more women on second or subsequent pregnancies were admitted in those decades.

### Previous address by county

![Thomastown Mothers Previous Address By County](chart.png)

Information relating to previous address by county was available for 958 women (98.76% of admissions). The vast majority of women (94.26%) gave a previous address in Kilkenny; 1.46% gave an address in Waterford; 1.46% in Wexford and 1.15% in Tipperary. The remaining 1.67% gave addresses in Westmeath, Galway, Dublin, Carlow, Laois, Limerick, Longford, Cork and Offaly.
Occupation
Information relating to occupation was available for 235 women (24.2% of admissions). The available information shows all women were either working in the family home or on the family farm or were employed as domestic servants.

Length of stay

Information relating to length of stay was available for 563 women (58% of admissions). The available information shows women admitted to the home between 1922 and 1940 spent an average of 118 days there. This fluctuated between 192 days on average for women admitted in 1933 to 34 days for those admitted in 1937. Length of stay increased sharply for women admitted in 1941; women admitted that year spent 411 days on average in the home. For women admitted between 1943 and 1948 average length of stay had fallen to 106 days but increased to 348 days for those admitted in 1949. Length of stay began a staggered decrease thereafter falling from 269 days for women admitted in 1953 to 49 days for those admitted in 1959.¹

¹ The relatively long length of stay shown for 1921 and 1960-65 are distorted by the small number of women admitted to the home in those years.
In the 1920s women typically entered Thomastown 60 days before giving birth - by the 1950s this had reduced to 34 days.

![Thomastown Mothers Length of Stay After Birth](chart)

The available information shows that, in the 1920s, the majority of women (60.6%) left Thomastown within 50 days of giving birth and 89.6% had left within six months; 7.3% remained for between six and 12 months and 2.1% remained for between 13 and 24 months; two women remained for a little over two years. In the 1930s, 70.1% of women left within 50 days of giving birth and 87% had left within six months; 5.2% remained for between six and 12 months and 6.5% remained for between 13 and 24 months; one woman remained for just over two years. In the 1940s, 57.8% of women left within 50 days of giving birth and 81.7% left within six months; 9.4% remained for between six and twelve months and 5.6% remained for between 13 and 24 months; six women remained for between two and three years. In the 1950s, half of all women left within 50 days of giving birth and 79.3% had left within six months; 8.7% remained for between six and 12 months and the proportion of women who remained for periods of between 13 and 24 months had increased to 10.9%; one woman remained for almost four years. In the 1960s, 61.1% of women left within 50
days of giving birth and almost 90% had left within six months; two women remained for between 13 and 24 months.

**Outcome**
Information relating to outcome was available for 968 women (99.8% of admissions). The institutional records show that 75.6% of women admitted stayed and gave birth in the home; 24.2% were admitted with their baby having given birth elsewhere - some were transferred from Bessborough and Sean Ross.

**Maternal deaths**
Through the institutional records, the Commission identified three deaths among women admitted to Thomastown county home: representing a mortality rate of 0.31%. All three deaths occurred in Thomastown. One death was due to heart disease and was not associated with pregnancy and childbirth. Two deaths were indirect obstetric deaths in the sense that they were conditions that developed during pregnancy, were aggravated by the physiological effects of pregnancy - they were confinement related influenza and tuberculosis. No deaths were directly associated with pregnancy and childbirth. Adhering to WHO guidelines the maternal mortality rate in Thomastown county home was 0.2%.

**Exit pathways**
Information relating to exit pathways was available for 115 women (11.9% of admissions). The available information shows that women returned to the family home or transferred to another institution under the Commission’s remit.

---

2 Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. [https://www.who.int/healthinfo/statistics/indmaternalmortality/en/](https://www.who.int/healthinfo/statistics/indmaternalmortality/en/)
Through the institutional records, the Commission identified 1,241 ‘illegitimate’ children who were admitted to Thomastown county home in the years 1920 to 1966. Information relating to date of admission was available for 1,235 children (99.5% of admissions). The 1920s was the busiest period for child births/admissions; 41.5% of all births/admissions were recorded in that decade and 51 children on average entered the home annually. Births/admissions declined substantially in the years 1930 to 1943; 19 children on average entered the home annually in those years. Births/admissions increased dramatically from 16 in 1943 to 53 in 1944 and 64 in 1945. Births/admissions remained relatively high in 1946 - when 58 children were recorded - but numbers began a staggered decrease thereafter, falling to 19 births/admissions in 1949 and to five in 1960. Although the Department of Health had recommended in 1950 that ‘illegitimate’ should not be maintained in county homes they were still being admitted to Thomastown up to 1966; from 1960 to 1966, 22 illegitimate children were born in or admitted to Thomastown.
Information relating to status on admission was available for all children. The institutional records show that the majority of children (77.8%) were either born in Thomastown or admitted with their mother; 11.7% were older siblings admitted with their mother and 10.6% of children were admitted to Thomastown unaccompanied - many unaccompanied children were admitted from Bessborough and Sean Ross prior to being boarded out.
Length of stay

Information relating to length of stay was available for 553 children (44.6% of births/admissions). Although births/admissions were highest in the 1920s, length of stay for children admitted to Thomastown in that decade was shorter than children admitted in subsequent decades. Average length of stay for children born/admitted in the 1920s was 97 days, as compared with 224 days for children born/admitted in the 1930s. Average length of stay appears to have been particularly long for children born/admitted to the home in 1935 (769 days) and 1941 (536 days). The available information shows that most children were discharged on the same day as their mother; 19% left before their mother and 6% of children born in the home or admitted with their mother remained there unaccompanied for a period after their mother had left.

Exit pathways

Information relating to exit pathways was available for 201 children (16.2% of admissions). The available information shows that children either left the home with their mother or another family member, or were boarded out. The available records show that two children were placed for foreign adoption in the USA.
Through the institutional records, the Commission identified 177 child deaths associated with Thomastown county home. The Commission located GRO death records for 169 children (95.5% of child deaths). Information relating to date of death was available for 175 children (98.9% of child deaths). Most child deaths associated with Thomastown (52%) were notified before 1930. From 1930 to 1943, three child deaths on average were notified annually. Child mortality increased in the years 1945 to 1947; 26 deaths were notified in that period. From 1948 to 1961, 19 child deaths were notified; no child deaths were notified in six of those years. 92.6% of all child deaths in Thomastown occurred before 1950.

### Place of death

Information relating to place of death was available for 169 children (95.5% of child deaths). The available information shows that the majority of child deaths (90.96%) occurred in Thomastown county home. A small number of deaths occurred in Bessborough (4); Cork District Hospital (1); other hospital (1) and in another county home. One death was recorded in a private residence. The Commission located burial records for the children who died in Bessborough and in Cork District Hospital - all five were buried in St Joseph’s Cemetery, Cork.
Information relating to age on death was available for 174 children (98.3% of child deaths). The available information shows that the majority of children (85.64%) died in infancy as follows: perinatal (0-7 days) 12.64%; neonatal (8-28 days) 12.64%; infant (29-365 days) 60.36%; 14.36% of children were aged between one and six years at the time of death. The available information shows that 72% of children were accompanied by their mother at the time of death and 28% were unaccompanied.
Information relating to cause of death was available for 169 children (95.5% of child deaths). The leading notified cause of death were non-specific - mainly inanition (failure to thrive),\(^3\) congenital debility and one case of a fractured skull - and were responsible for 57.99% of child deaths in Thomastown; 11.83% were notified as being due to tuberculosis; 10.65% were notified as being due to respiratory infections - mainly bronchopneumonia; 5.92% were due to gastroenteritis; 4.14% were notified as malabsorption - mainly marasmus and malnutrition; 2.37% were notified as other, mainly one off, causes such as whooping cough, burn and syncope and 1.78% were notified as being due to convulsions. Small numbers of deaths were notified as being due to haemorrhage (2); congenital heart disease (2); meningitis/encephalitis (2) and spina bifida. One death was notified as a generalized infection (umbilical sepsis) and one as measles.

\(^3\) The term ‘inanition’ was not cited as a cause of death after 1937.
Infant mortality

The available information shows that the infant mortality rate in Thomastown was highest in the 1920s and peaked in 1927 when a rate of 30% was recorded. Taking the 1920s as a whole, over one in five children born in that decade died in infancy. Although a rate of 26.67% was recorded in 1935, the average infant mortality rate in the 1930s was approximately 11%. In the 1940s the infant mortality rate ranged from between 0% in 1941 to 26.09% in 1947; the average rate in that decade was 15.4%. By 1952, however, the infant mortality rate had fallen to 7.69% and no infant deaths were notified for children born in 1953 and 1954. Infant mortality rates thereafter are distorted by the small number of births/admissions and the small number of infant deaths - the infant mortality rate of 50%, recorded in 1961, relates to two births and one death.

---

Infant mortality was calculated as follows: (Living children born in the year who died before the age of 1)/(All living children born in the year).
Chapter 31: Discrimination

Introduction

31.1 The Commission’s Terms of Reference require an examination of the extent to which any group of residents of the mother and baby homes under investigation may have systematically been treated differently ‘on any grounds [religion, race, traveller identity or disability]’. The fact that mother and baby homes existed is evidence of discrimination against women. For much of the period covered by the Commission, women as a group and regardless of age or class were systematically discriminated against in relation to employment, family law, and social welfare, solely because they were female.

31.2 The chapters on the individual institutions include a number of references to discrimination issues. In particular, the issue of religion is addressed in the relevant chapters. This chapter provides a more detailed examination of the institutional records of the two largest mother and baby homes - Pelletstown and Bessborough - and the evidence that they present with respect to race and disability. These two homes were selected because of their size and their longevity. Pelletstown opened in 1919 and Bessborough opened in 1922. They were each still in operation in 1998. They account for over half of the children in mother and baby homes.

31.3 The Commission has discovered very little information about Travellers probably because there were very few ‘illegitimate’ births among Travellers. The report of the Commission on Itinerancy (1963) stated that ‘Early marriage is often insisted upon by parents’: three-quarters of Traveller men were married before the age of 25, and almost 40% of women married before the age of 18. They claimed that ‘Parents of young persons usually insist upon the marriage of the young persons when courtship first commences’. A number of Traveller children who were born to married couples were admitted to Pelletstown, Tuam and county homes (see the relevant institutional chapters). Some of the Traveller children in Pelletstown were there because they had intellectual or physical disabilities. It is possible that Traveller children were resident in other institutions but they are not identified as such in the institutional records.

1 Report of the Commission on Itinerancy (1963), paras, 17-19; https://www.lenu.ie/handle/10147/324231
31.4 The Commission examined the institutional records of Pelletstown and Bessborough with a view to determining if race or the mental and/or physical conditions/disabilities of the mother and/or the child affected the outcome for the child, especially if it prevented adoption or fostering.

31.5 The history of Pelletstown and a detailed description of the institutional records are given in Chapter 13. This chapter is based on the information provided on the mothers’ medical charts and related ante-natal and puerperal documents; correspondence with psychiatric hospitals, especially from the 1960s onward; bi-daily reports from Eglinton House; children’s medical charts including detailed medical reports for the duration of the child’s stay, which may span years; IQ testing reports; reports from and correspondence with maternity hospitals and/or children’s hospitals; psychological and developmental assessments from the Child Study Centre; correspondence with the Adoption Board; and miscellaneous files.

31.6 The social worker reports, which commence in the late 1960s, were of particular interest. There were several social workers attached to Pelletstown and their notes give a sense of the woman’s circumstances and they appear to have the child’s interest in mind. The reports from Eglinton House, starting in 1986, are very detailed, as there was much greater social worker involvement with the mothers and children at that stage.

31.7 The history of Bessborough and a detailed account of its institutional records are given in Chapter 18.

31.8 The Commission identified all references in the institutional records to potential areas of discrimination. A detailed analysis was conducted of the references to race, mental disability, physical disability and of the information about a mother or a child’s physical or mental health. Such references and information was available for about 1,335 women and children in Pelletstown and 727 women and children in Bessborough.

31.9 For the early period under investigation (1920s-1950s) it is impossible to know from the records if a condition was medically verified. There was a lack of understanding of mental illness and intellectual disability, and also a loose labelling
of people who were deemed ‘slow’, ‘mental’ or ‘handicapped’. When a condition was noted on a medical chart or appeared in correspondence between medical practitioners, it was deemed to be ‘medically verified’ for the Commission’s purposes. When it appeared in a social worker’s report, or on an admission card, it was considered as unverified.

Race
Background
31.10 The population of Ireland was overwhelmingly white and of European ethnicity until the closing years of the 20th century. The 1961 census volume that enumerated birthplaces of those born outside the State gave separate statistics only for Northern Ireland, Britain, France, Germany, Italy, the Netherlands and the USA; those born elsewhere were classified as ‘other’ - a total of 8,514 men and women or 0.3% of the population. In 1991 those born outside the EU and the USA were still classified as ‘other’, and the number was 23,293 people - 0.66% of the population; almost half of which - 10,561 - lived in the greater Dublin area. The absence of people of non-European ethnicity in the Irish population meant that children or unmarried mothers from a different racial background were conspicuous and there was a lack of knowledge and understanding about their culture, religion and ethnicity. In a number of cases the father of a child is described as African, or Asian, which may reflect a lack of knowledge on the part of the child’s mother or a department inspector.

31.11 The number of mixed race children born to unmarried mothers was much smaller than the number with a disability; however, there are occasional references to these children in inspectors’ reports. The reference is generally brief, part of a general description, which is often given of the children; for example, ‘J is big for her age and looks well. Nice-looking girl but father is Jamaican’. The inspectors’ reports display a cautious attitude to the prospect of mixed-race children being adopted, as in ‘The fact that T is half coloured could affect her chances of adoption’, or a note that a foster mother, was keen to adopt ‘the little coloured boy’, but the inspector asked, ‘but will it work out?’.\footnote{Department of Health, RM/ARC/0/489320.}  \footnote{Department of Health, RM/ARC/0/489694; Department of Health, RM/ARC/0/489322.}
31.12 There are references to children of mixed race in the records of St Anne’s Adoption Society (an adoption society in Cork). In 1956 St Anne’s was contacted by a social worker from Southwark Catholic Rescue Society, asking for their assistance.

We have a number of babies where the mother is Irish and the putative father is slightly coloured. Where the child is coloured, adoption is practically impossible. There are cases where the child is not coloured, and shows no oriental features. The putative fathers in the latter cases are usually Greek or Cypriot and the child is usually very handsome. Occasionally the putative father is the product of one white and one slightly coloured parent. I should be most grateful to know whether you think you would be able to accept and place any of the babies with no trace of colour. I would of course let you have photographs, and we would of course have to wait until the child was several months old. Do not be afraid to refuse as I know how adopters react to these on occasion.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 17.}

31.13 The reply from St Anne’s is not available. However, in 1962, in response to a similar query from the Crusade of Rescue, Fr James Good of St Anne’s Adoption Society replied, ‘I am afraid the answer there is that where there is any question of blood other than north European there would be very little likelihood of our placing such a child’. He thought that some mixed race children were being adopted in Dublin, but he feared that they would struggle to be accepted in the south, ‘there are still so very few coloured people here that they still excite admiration’.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 3.}

31.14 In 1968 the \textit{Sunday Independent} reported that some would-be adoptive parents had been told that there were ‘only coloured children’ available. The article reported that ‘apart from coloured children’, almost every eligible child found a new home in 1967. It quoted Lady Valerie Goulding, who was involved in services for children with disabilities, as saying that ‘you are looked at sideways if you have a coloured baby with you’. According to this article approximately six ‘coloured’ children were adopted every year but there was a backlog of 20 such children ‘causing a big headache for various organisations dealing with child adoption’. This article also referred to children who were not adopted ‘usually because of some physical deformity or defect’.\footnote{\textit{Sunday Independent}, 28 Jan. 1968.}
31.15 Trans-racial adoption was controversial. According to Barbara Melosh, in the United States, the adoption of African-American children by white parents was unknown before the 1950s. In 1968 there were 733 such adoptions, which was 1% of ‘stranger’, that is non-family adoptions; at their peak in 1971 they only accounted for 2% to 3% of the total. In 1972 the National Association of Black Social Workers issued a statement denouncing the adoption or fostering of black children by white families.\footnote{Barbara Melosh, *Strangers and kin. The American way of adoption* (Harvard, 2004), pp 159, 197.} At this time many adoptions, not just in Ireland, sought to ‘match’ children with the adoptive parents - seeking similar colouring. Mixed race children presented a slightly different question - which racial or ethnic group should adoptive parents come from? Given the tiny number of Irish residents of non-European origin, the only potential adoptive parents in Ireland were couples of Irish or European ethnicity.

**Race - Pelletstown**

31.16 Race is mentioned in respect of 237 residents in Pelletstown. The recording of a child’s race is not in itself considered racist, even today.

31.17 There were only two references to race in the 1940s: one in 1941 and one in 1949. In 1941 the child was described as ‘half caste’ and was in various industrial schools between 1945 and 1958, and was then discharged to employment. The putative father of the 1949 child was ‘said to be a Pole’. This child was discharged to ‘adoptive parents’.

31.18 There were 30 references to race in the 1950s. Where information is available on the putative fathers, their national origins were indicated as follows: three were described as Nigerian, two as Trinidadian, two as African, and four as Indian. Twelve children were described as ‘coloured’ and three were described as ‘half-caste’. The 30 children include four unaccompanied children (including twins).

31.19 A parent’s racial background is mentioned in 123 children’s files in the 1960s. Where information is available on the putative fathers, their national origins have been indicated as mostly Nigeria (17), India (11), Africa (10, including South Africa), with other origins noted.

31.20 Four mothers were described as ‘coloured’. One mother was described as ‘half caste’ in 1966; one mother as ‘sallow’ in 1967; one mother is described as half
caste African in 1968, and her child was deemed fit for adoption provided the adopters were informed. Overwhelmingly the ‘coloured’, ‘half-caste’ children are certified fit for adoption. The 123 children include 20 unaccompanied children. One mother was described as ‘Student - Nigerian’.

31.21 In the 1970s there were 48 children whose parents’ racial background is mentioned. Where information is available on the putative fathers, their national origins have been indicated as India (7), Nigeria (4), South Africa (3), Zambia (3), with other origins noted. The term ‘negro’ appears on at least three occasions (1972, 1975, 1979), and the term ‘mixed-race’ appears for the first time. Five mothers were described as ‘coloured’. One mother was described as ‘a Nigerian half caste reared in Institution’. The putative father of a child born to a ‘Nigerian girl’ was also Nigerian, one of two children born that decade with two Nigerian parents. One mother in 1977 was described as ‘half coloured’. The 48 children include seven unaccompanied children.

31.22 There were 17 children in the 1980s whose parent’s racial background is mentioned. One mother was described as coming ‘from a mixed racial background…with an Indo-European appearance’. Another description reads: ‘half caste baby. Mother is black’. One mother was Iranian. The term ‘half caste’ was still used. The 17 cases include four unaccompanied children; the parents of one of these children were both Iranian.

31.23 In the 1990s, China and Africa were the two main regions of origin (five China, three Africa). One mother was born in Taiwan; another was described as ‘coloured’. Six of the 17 children were unaccompanied.

31.24 The Pelletstown records record the following exit pathways for the children concerned:

- 112 were placed for adoption (some were fostered temporarily, one later died);
- 22 were boarded out (10 were subsequently adopted);
- 86 were not placed for adoption; 44 of these are described as leaving Pelletstown with a parent or another family member;
- 40 were sent to an institution; five of these children were subsequently adopted and two children died.
There is no information in the institutional records about the outcome for 17 of these children. However, the Commission has established from other records that one was subsequently adopted and one subsequently died.

31.25 Out of the 237, 128 (54%) were ultimately placed for adoption. However, only 92 adoptions have been confirmed by the official records. This does not necessarily mean that the remaining children were not adopted - it simply means that the Commission was not able to establish this from the records available. There is also the possibility that other children were subsequently adopted but this is not recorded in the available files.

31.26 The decision as to whether a child was fit for adoption was made by a doctor attached to Pelletstown. Most of the time, this was a straight-forward procedure. The record of a child born in Pelletstown in 1964 is representative of the way children were described on their medical records and certified fit: ‘Nigerian. Coloured child’, signed fit for adoption in 1964 and adopted the same year. The following child, born in 1966, is also typical: ‘Healthy coloured infant’, certified fit for adoption, and adopted in 1968. In most cases references to colour are factual: ‘normal healthy male child (half-caste)’, certified fit for adoption in 1967. However, occasionally race appears to influence the decision, as in the following examples, all from 1959.

Coloured child. Healthy. Medically fit for adoption but owing to colour this would be difficult.

Healthy. Half caste child. On account of above will be unfit for adoption. Boarding out (this child was, however, adopted).

Healthy. Coloured child. Unfit for adoption on account of colour only.

31.27 The father of the third child was described as ‘African’. It also appears that prospective adoptive parents were notified of a child’s parentage. The following is an example from 1959, again written by a doctor: ‘Coloured child. Healthy. Fit for adoption or BO if parents are aware…Mother German. Father African’. In 1966: ‘Normal healthy half-caste (Chinese) baby’, certified fit for adoption, ‘provided parents are aware of parentage’. 1977: ‘Adoptive parents to be told mother is a half caste’. The perceived necessity to disclose parentage may have stemmed from the expectations of the prospective adopters: on one occasion in 1965 it is stated clearly that the prospective adopters did not want a child who was not white: ‘Normal healthy male baby…Father - Spaniard…Adoptive parents to be told about
nationality as they will not take half caste...Infant normal European colour’. Disclosure of parentage appears to have been standard procedure, as it was among the requirements for children presenting for placement to St Louise Adoption Society: ‘If this child is for St. Louise Adoption Society then the placement meeting will need to know nationality of P[utative]F[ather]’ (1980 example).

31.28 Among the administrative forms available for the later decades is the ‘quarterly review 1980 - resident children’, which specifically inquires as to why children were in Pelletstown. Among the reasons listed is this specific reference: ‘mixed-race child - difficulty in finding adoptive home’, which implies that there were difficulties in placing such children.

31.29 The Pelletstown institutional records reveal that people’s knowledge of geography and ethnicity was not precise. On a 1965 admission card, a putative father is described as ‘Zamlran studying adm.’, which could indicate he was from Zambia (misspelt), or perhaps from Mali (which has a region named Zamlara), or from Nigeria (which has a region named Zamfara). ‘African’ is sometimes used as an umbrella term to describe black putative fathers and children. A 1964 example is representative: ‘putative father African’; the child is described as a ‘coloured infant’, certified fit for adoption. The following is an example from 1965: ‘putative father: [name] - African’. The child was described as ‘coloured child - African’. In the latter case a cross reference of sources indicates that the putative father was from Zambia. The following example is from 1972: the child was first described as ‘coloured ?Indian father’ on the mother’s medical charts; a more detailed social report indicates that he was from South Africa. Another example from 1974 shows that within the same document (the child’s medical chart) a child is described as a ‘half caste (Asian) infant’ and the putative father as ‘a coloured South African’. (In apartheid South Africa, Indians were classified as ‘coloured’.)

31.30 It appears that there was little understanding of religion outside of Christianity. In one case ‘Hindu’ and ‘Muslim’ were used interchangeably.

31.31 Where information is available, the putative fathers appear to have been either medical students (11 occurrences), engineering trainees with Aer Lingus (three occurrences in the 1970s/1980s), or other students (law, administration or English for example).
CHAPTER 31 DISCRIMINATION

31.32 The term ‘negro’ appears in Pelletstown records on at least four occasions (1972, 1975, 1979 and 1982); the earliest occurrence available of the term ‘mixed-race’ in Pelletstown is in 1977. It was used alongside ‘half caste’. These terms were in regular use and generally regarded as acceptable at the time. The term ‘black’ to describe a parent is not used until 1982 (with one more occurrence in 1983).

31.33 While there is no direct evidence of different treatment or institutionalised racism in the records, a number of sources suggest that individuals may have had a negative bias. When the Department of Health inspector visited Pelletstown on 25 February 1960, she referred to ‘coloured babies’, and noted that they were ‘difficult to rear and inclined to be bronchitic in the first year of life’. For the later period, when social reports are available, the attitudes of staff within the institution can be glimpsed. For example in 1973 a social worker wrote:

PF...a medical student from Nigeria. He knew of the pregnancy...Her last child was also a half-caste although not by the same pf. I asked why she was having a baby every year and why she thought she was so attracted to dark men. She says she goes out with Irish men but prefers - Indians and Nigroes [sic]. She just loses control of herself and ends up sleeping with them...Asked several questions about adoption and if there would be difficulty placing [child] because she was coloured. Some of the nurses were telling her that these children often had to be moved from institution to institution before they got a home.

31.34 An example from 1975, again based on a social worker’s report, seems to indicate that ‘mixed race’ children were not treated differently within the institution:

C wants to have her baby adopted... She has been worrying terribly that the child’s adoption will be impeded because of his colour. At present he is not at all coloured looking, though C is aware that he may well get darker as he grows older. We talked for a long time about this, and I reassured C that there was no reason why he should be held up and that he should be brought up at the adoption meeting at the same time as other babies of the same age.

31.35 Race does not seem to have been a significant factor in preventing adoption. There were families in Ireland who specifically sought to adopt ‘mixed race’ children. This is an example from 1975: ‘Sr A said there was a possible home for

---

8 There is an earlier occurrence in 1960 in Castlepollard.
the baby...Apparently a family with 3 other coloured children (adopted) are looking for another child’.

31.36 However this picture emerging from the records that ‘mixed race’ children were not treated differently is at odds with the evidence provided to the Commission by a small number of witnesses who describe racism within the home (allegations of derogatory terms, child put with severely disabled children who would not be adopted, insinuation that woman was a thief and a prostitute, separation from child) - see Chapter 13. The Commission has no doubt that there was casual, unthinking racism on the part of some people but the evidence suggests that the future of mixed race children was considered in the same way as the future of all children in Pelletstown.

31.37 The index cards which recorded information about pregnant women who were repatriated to Ireland (see Chapter 7) also contain some information regarding race in Pelletstown. In 1961, a woman was admitted upon returning from England, ‘expecting [a] coloured baby’. The Mother Superior in Pelletstown wrote to the department inquiring if the Health Authority would maintain her. The reply ‘They [Pelletstown] have succeeded in placing some coloured children’. This child was adopted.

**Race - Bessborough**

31.38 Race is mentioned in respect of 38 women and children in Bessborough. The racial origins of one child was noted in the 1920s: the putative father was described as Greek. In the 1930s, the racial origins of two children were noted: one putative father was described as coloured and from South Africa, the other was described as Spanish. There were no references to race in the 1940s or the 1950s. In the 1960s, there were 13 children whose race was mentioned; there were 14 children in the 1970s; eight in the 1980s and one in the 1990s.

31.39 Twenty-three of the 38 children were placed for adoption (two were fostered initially and 15 were later confirmed adopted); six went to ‘parents or other family members’ (and may well have been subsequently adopted); one was boarded out and later adopted informally; one went to another institution and was subsequently adopted. Two of the six whose exit pathways are not recorded in the institutional records were subsequently placed for adoption; there is no information available about the remaining four.
Out of the 38 children, 27 children (71%) were ultimately placed for adoption or informally adopted. The Commission has been able to confirm, from official external records, that 19 of the 27 were in fact adopted.

The Adoption Board appears to have been concerned about placing mixed-race children with adopting parents, though the records indicate that a number of adoptive parents wanted ‘mixed race’ children. One letter from the Adoption Board to the Sacred Heart adoption society, Bessborough, stated: ‘As the couple live in an isolated rural area, the Board expressed reservations about the desirability of placing a mixed race child with them’. Another letter stated: ‘As the natural mother of the child placed with [adoptive parents] is of mixed racial background, the Board wishes to have a social report on her’. The Sacred Heart adoption society told the Adoption Board that the mother ‘was born in England. Her mother was British and natural father was of Turkish origin... [the child] is slightly sallow in complexion. The [adoptive parents] were aware of the fact that he was a child of mixed race but stated that ‘it would be difficult to detect it’. They are of the opinion that he will have no problems in their rural environment’. A letter from the foster mother/adoptive mother said: ‘We don’t really notice his colour now so it’s no problem at all for us. I just hope he will be happy’. They had adopted other children.

Witnesses to the Commission

Professor Bryan Fanning, a professor of migration and social policy at University College Dublin, told the Commission that legislation around racism in the Irish context is very underdeveloped. He said that we have a law against incitement to hatred and an Equal Status Act.

He told the Commission that ‘in the Irish case I don’t know that you could basically see what happens in Ireland as distinct from the rest of the English speaking or white European world either. Those sort of ideas about white people and others were as imbedded in Ireland as they were in Cornwall or Devon. It just happens in our country we didn’t have a large black population.’ He said that, in his experience, black children were problematic to the system and the stories he had heard from them suggest that they had experienced racism as children and that it had impacted on their lives.
Many of the witnesses who came to the Commission spent much of their young lives in institutions other than mother and baby homes. They recounted specific instances of racial discrimination in those institutions and expressed disappointment that their experiences did not feature more prominently in the Ryan Report. Some also recounted the racial abuse they had suffered within the community, particularly in Dublin communities, when growing up. The Commission’s remit does not extend to examining the experiences recounted by some of the witnesses in relation to other areas of their lives and their time in institutions other than mother and baby homes.

Many of those who came to the Commission had spent most of their lives in the UK. Many had gone on to achieve high academic qualifications there but said such opportunities would not have been afforded them in Ireland. One young witness did comment that when he first went to London and took a bus journey, he could not believe there were people like himself on the bus.

One woman, now in her sixties, who had spent the best part of her first 17 years in various institutions, stated that she suffered from eating disorders right through her life and also suffered from severe depression which had been medically verified. She said her time in Pelletstown contributed to her ill health. She was particularly aggrieved that she was boarded out from Pelletstown at age four to an elderly couple in the 1950s who treated her very cruelly. As the couple are now deceased it was not possible to put this evidence to them. The records do show that she was removed from their care due to the foster mother’s ill health.

Having accessed her records later, she discovered that a medical assessment had stated that great care should be taken if she was to be boarded out and she should not be placed with an elderly couple.

A male mixed race witness told the Commission that, when he sought information about his time in Pelletstown, he discovered that his mother’s consent to his adoption had been mislaid and this led to him being deprived of a potential family who had a serious interest in adopting him. In this case the Commission was able to interview the potential adoptive mother. She told the Commission that she had been told by the Daughters of Charity that his mother did not sign the final adoption papers.
31.49 A married couple told the Commission of their interaction with Pelletstown when they sought to adopt two mixed race baby girls who were unrelated. The adopting mother said they had been extremely well cared for and she had no problem leaving letters for their respective mothers about their adoption.

31.50 Another mixed race child said she had no memory of her time in Pelletstown as she was adopted, happily, at six months old. Her complaint related to the difficulty in tracing her birth mother and father. When she did succeed, she found her birthmother had died and details of the country from which her father came was wrongly given to her adopting parents. This was very disappointing, as her adopting parents had made a real effort to educate her in regard to what they believed was her birth father’s country of origin.

31.51 Documentary evidence received by the Commission gives some information about mixed race couples and their children. One entry describes an Irish woman who married a Nigerian man in 1958. She joined him in Nigeria and found that he already had four wives. She described him as being ‘very cruel’ to her. Another entry from 1964 refers to a woman who had been living with a ‘coloured’ man. She had a daughter who was also described as ‘coloured’. On seeing that her child was mixed race, her parents refused to allow her to stay with them.

31.52 In October 2014 the Oireachtas Joint Committee on Justice, Defence and Equality heard from a delegation of mixed race Irish people about their experiences in Irish institutions. The Committee asked if group members were availing of supports that were available to survivors of institutional abuse, for example, redress and the services available from Caranua the organisation set up to provide additional supports for those who had received redress. The delegation did acknowledge that some members were receiving support but were of the view that such supports were not adequate.

**Mental illness and intellectual disability**

**Background**

31.53 In the early 20th century it was widely believed that many unmarried mothers were ‘feeble-minded’; they were often seen as naïve, innocent and trusting ‘girls’ who were vulnerable to male sexual predators and therefore in need of protection; it was believed that some women should be kept in institutions to protect them from
sexual promiscuity (see Chapter 9). This belief was widespread; it was not confined to Ireland. In Britain a significant number of unmarried mothers were confined in mental hospitals; in Ireland many of these women were confined in Magdalen Asylums; (little is known about the prevalence of unmarried mothers in mental hospitals in Ireland). As the number of psychologists and professional social workers expanded internationally during the 20th century, this analysis was refined. In the 1940s and 1950s a number of social scientists suggested that many unmarried mothers suffered personality disorders that predisposed them to extramarital pregnancies. This analysis appears to have been less evident in Ireland probably because of the slow development of psychology and social work services.

31.54 Pregnancy and childbirth had long been associated with mental illness. ‘Puerperal insanity’ was widely diagnosed in Victorian times. In 1966 the Commission of Inquiry on Mental Illness stated that ‘Maternity patients require special consideration as their condition tends to intensify psychiatric problems and they are frequently catered for in special hospitals where psychiatrists are not as readily available as in general hospitals’. It recommended that psychiatric clinics should be provided in all maternity hospitals, noting that they would be invaluable in dealing with such problems as:

- the many marital difficulties which come to light when patients attend maternity hospitals;
- difficulties which arise in the early months of pregnancy such as rejection of pregnancy and anticipatory difficulties;
- puerperal psychosis;
- the minor, but relatively common emotional disturbances seen in post-natal cases.

31.55 The report does not distinguish between married and unmarried mothers but the mental health problems identified above could apply to unmarried mothers. In 1958 a letter in the British Medical Journal described a small study, carried out in St Patrick’s mental hospital in Dublin over a five-year period, into psychoses associated with pregnancy. The correspondent claimed that he had been

---

9 ‘Mental’ hospital was the legally correct term until 2001 when the Mental Treatment Act 1945 was replaced by the Mental Health Act 2001. They tended to be described as ‘psychiatric’ hospitals from about the 1960s onwards.
11 The Commission of Inquiry on Mental Illness was established in 1961 and reported in 1966: para. 143: https://www.lenus.ie/handle/10147/45630
12 This was (and remains) a private psychiatric hospital. It was founded in 1745.
surprised at the ‘considerable role’ that stress played as a factor in these illnesses: ‘the most malignant form of stress appeared to be that arising from parental opposition to the marriage, and especially if that resulted in an estrangement from the patient’s mother with consequent loss of the latter’s interest and affection’. It would appear that all the cases studied were married women; there was undoubtedly much greater prospect of parental opposition and estrangement among unmarried mothers. Pregnancy was widely seen as potentially increasing the risks of mental illness, however the only mother and baby home that appears to have had regular visits from a psychiatrist in the 1950s was the small Magdalen Asylum (Denny House - see Chapter 23). Matron’s notes dating from the 1950s record regular visits and consultations with a psychiatrist who was attached to the Rotunda hospital. Pelletstown had regular visits from a psychiatrist at least from the 1960s onwards (see Chapter 13).

31.56 In modern times the first attempt at scientifically studying intellectual disabilities was in France in the early 1800s, with the idea that people could learn, progress and integrate rather than be left in asylums. In Ireland there were no specific provisions for people with intellectual disabilities, who were kept in asylums along with people with mental illnesses, until Henry Hutchinson Stewart opened an asylum for children in 1869. The ‘Stewart Institution for Idiots’ in Lucan, which had a Protestant ethos, had a large adult population; it also catered for 12 pupils. In 1922, it was the only institution catering for people with intellectual disabilities in the Irish Free State. Children and adults with intellectual disabilities were accommodated in Irish workhouses before 1920 and they continued to be found in county homes for many decades after independence; they were officially classified as ‘lunatics’ or ‘idiots’. Some of the unmarried mothers who were long-term residents of county homes had an intellectual disability. The Irish health and care system did not provide special institutions for children or adults with an intellectual disability: it arranged for their admission to residential centres (schools, hospitals and homes) run by voluntary organisations, mostly religious orders. A number of such institutions were established after independence, starting with St Vincent’s, Cabra in the mid-1920s (see Chapter 2) but for many years there was a severe

shortage of services and institutional places for children with intellectual disabilities.

31.57 The first attempt to measure intellectual ability was the Binet score in 1904. Ireland was slow in developing diagnostic and community services for intellectual disability. Child guidance clinics were established in Britain in the 1920s following a US model and by 1945 there were almost 100 clinics; there was no such clinic in Ireland at that time. The *Mental Treatment Act 1945*, which reformed Victorian legislation, anticipated the establishment of psychiatric services for children, but the Irish state preferred to leave the initiative in establishing a child guidance clinic to the Catholic Church - avoiding potential church-state conflict and reducing the cost to the state. A child guidance clinic, run by the Hospitaller Order of St John of God opened in 1955; a second clinic opened in Dublin’s Mater Hospital in 1962. The first recommendation of the Commission of Inquiry on Mental Handicap 1965 was that

> There should be a clear obligation on each Health Authority to make available for its area a diagnostic, assessment and advisory service so that mental handicap can be diagnosed and assessed and that help and advice for the mentally handicapped and their families can be provided from the earliest possible date.

31.58 The commission noted that, until 1957, the services available for those with an intellectual disability were almost entirely residential. A number of non-residential schools had opened in recent years; many were initiated by parent groups. By the 1960s there was a growing determination to support care in the community and within the family.

31.59 From the 1940s the reports of Department of Local Government and Public Health/Department of Health inspections of boarded-out children and children in county homes, Tuam and Pelletstown contain references to children with physical and intellectual disabilities. There are references to children who had contracted polio and as a result had suffered long-term handicap while being boarded out. Some of these children were seriously disabled and, having spent time in a specialist hospital, such as Baldoyle, they were placed in long-term institutional

---

It was not uncommon for boarded-out children, or children who had been placed at nurse, to be sent to the county home if a foster mother determined that they had an intellectual or a physical disability. The inspectors reported cases of boarded-out children who were assessed in the St John of God clinic; they frequently recommended that a child in foster care should undergo an IQ test. There are references to children who had been seen by a psychiatrist and children who were awaiting places in specialist institutions.

31.60 There was a shortage of places for children in specialist institutions and local authorities frequently had to contact several in their efforts to find a place. In 1963 the department was pressing the Waterford health authority to remove a mentally-handicapped boy from the county home; the health authority explained that there were 20 children in their area seeking admission to homes for ‘mentally-deficient’ children. They had contacted as many as ten institutions seeking to place one particular child. Two children who were severely mentally disabled were sent to an industrial school when Tuam closed in 1961 and were still there in 1964 in spite of extensive efforts by the Sister in charge of the industrial school to find more suitable accommodation - see Chapter 15. In 1971 the Department of Health noted that a young child, who was born in Bessborough with both physical and intellectual disabilities, was being sent to the county home because there was no alternative place available. This explains why many children with disabilities – including children of married parents - were kept in Pelletstown until they could be accepted elsewhere; there was nowhere else to accommodate them (see below).

31.61 Some of the inspection reports and the records in the mother and baby homes employ terms that would be regarded as inappropriate, even offensive, today. Terminology has evolved over time, in accordance with medical advances and societal changes, and during the earlier decades of the Commission’s investigation, degrees of intellectual disability were classified as ‘idiot’, ‘imbeciles’, and at the milder end of the spectrum, ‘feebleminded’. The English physician John Langdon Down, recognised as the first to describe Down’s syndrome in the 1860s, used the terms ‘mongoloid idiot’ or ‘Mongol’. The designation ‘Mongol’ reflects the racial classifications prevalent at the time. These terms were replaced by ‘mentally defective’ and ‘mentally deficient’. ‘Educationally sub-normal’ and

---

20 Biography of John Langdon Down from the American National Centre for Biotechnology Information, https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5130304/
‘retarded’ were also in use in the first half of the 20th century. These were replaced by ‘severe’, ‘moderate’ and ‘mild’ mental handicap. In 1954 the World Health Organisation highlighted the lack of standardisation in classifications and terminology relating to intellectual disability. From 1960 ‘mongolism’ became outdated and politically incorrect and it was replaced with ‘Down’s syndrome’ officially in 1965, though it is used in the report of the 1965 Commission of Inquiry on Mental Handicap. Nowadays the preferred description is Down Syndrome. Some of these terms were used concurrently yet the evolution is visible in the records examined by the Commission.

31.62 The lack of knowledge and expertise in relation to intellectual disability and physical illnesses meant that some arbitrary and inappropriate decisions were made with respect to placing children. In 1954, in response to a query from the Department of Health as to why a particular three-year-old girl had been sent to an industrial school, a local authority official reported that the local medical officer had determined that she was ‘not eligible - owing to the fact that her mother is a mental hospital patient’. When this official asked the doctor whether there was any other reason why this girl should not be boarded out, the medical officer stated that she was ‘highly strung and emotionally unstable and in my opinion it would not be advisable to change her present environment, at least until she is some years older’. There is a disconcerting report from 1962 of a boarded-out child who was a haemophiliac, ‘and as the Brothers in his school felt that they could not be responsible for him’, he had been sent to a special school, although he was ‘of normal intelligence’. In 1959 the department wrote in very forthright terms to the Waterford health authority in relation to a girl who had been moved between foster homes without the minister’s permission and was then sent to an industrial school. The local authority claimed that she was ‘mentally subnormal’; the department inspector who had met this girl on several occasions disputed this diagnosis and went on to state that ‘an industrial school is no place for a subnormal child’. The inspector demanded that she be examined by a ‘mental specialist’, and if there was no evidence of ‘retardation’ she should be boarded out; if not she should be sent to a specialist institution. The medical examination did not confirm an intellectual disability.

CHAPTER 31 DISCRIMINATION

31.63 The emergence of adoption as the long-term outcome for many children of unmarried mothers resulted in greater attention being paid to the health of a child who was being placed for adoption and the medical history of the mother. Some children were described as 'unadoptable'. In 1957 Fr Good of St Anne’s Adoption Society, which placed the English-born children of Irish unmarried mothers (see Chapter 7), told an English priest who was involved in sending children to St Anne’s that ‘To be fair to our adopters they do not expect a perfect child but they do expect a frank report on the child’s medical history. Paralysis, squint, serious hernia, low blood count and mental defect will frighten off the most charitable adopters.’ In 1963, St Anne’s drew up a memorandum on 'unadoptable children'.

We have had considerable difficulty in making arrangements for unadoptable children. While every effort is made to prevent such children coming to us in the first instance, we have no control over the medical examination performed in England and many defects have been brought to light by Dr [...] in his examination of the children in the nursery.

The English societies are generally very slow to accept such children back. They say their accommodation is quite overcrowded and that in any case these are Irish children, and that therefore the responsibility should rest on the Irish authorities.

We have found the various county managers reluctant to accept responsibility for unadoptable children. Our first success in this matter in recent times has been the acceptance in principle of three such children by Mayo County Council. They are expected to travel soon.

31.64 Because of the number of ‘unadoptable babies’ occupying accommodation in the nursery, St Anne’s could not accept any more children from England at this time.\textsuperscript{26}

31.65 Dr Declan Meagher, master of Holles Street maternity hospital, presented a paper in 1970 on the experiences of 400 unmarried mothers who gave birth there. He spoke about the discrimination against ‘illegitimate’ children who were handicapped:

the child whose parents may have a history of mental illness or epilepsy, or whatever else, even though he himself is normal, may not be deemed fit for adoption. Equally the handicapped child, whether his handicap be a physical deformity or whether there is reason to suspect mental handicap, may not be

\textsuperscript{25} Cork Diocesan Archives, St Anne’s Adoption Society.
\textsuperscript{26} Cork Diocesan Archives, St Anne’s Adoption Society.
placed for adoption. So the tragedy is that children who are handicapped in one way are now rewarded with the further handicap of having to be brought up in an institutional setting and are denied the adoption which might compensate for these defects.

31.66 He described this as ‘another example of the thinking, so prevalent in this country and in other countries, which regards the child’s needs, whether they are physical, material or emotional, as secondary and those of the parents as primary to which all other considerations must be subordinate’.

In 1974 the psychiatrist, Dr Dermot Walsh, told a conference that he was often asked in the case of girls whom I have seen for psychiatric reasons at any time during the pregnancy or afterwards, whether their psychiatric condition is one that is transmittable. The implications of this of course is that if the mother has suffered from some psychiatric illness then it is felt that this automatically debars the child from being placed for adoption and presumably he will go for foster care instead. All this despite the fact that nothing is known of the mental health of the father.

31.67 He emphasised that only a small proportion of psychiatric illness had a genetic basis, nevertheless, in the case of handicapped children whether their handicap be mental, psychiatric or physical, the general rule seems to be that these should not be placed for adoption despite the fact that these are the children that clearly need the best possible adoptive home...The contrary opinion is one that would condemn a child, already handicapped, though no fault of his own, to the vicissitudes of institutional life and compound his handicap further by denying him the benefits of adoption...if I interpret the climate correctly it seems to me that adoptive parents are consulted as to their requirements in the case of adoption, and if a child is handicapped or of another race then they are informed beforehand and so they have the right of refusal if there is an expectation that the child would be handicapped, or otherwise ‘undesirable’.

27 Dermot Walsh (ed.), The unmarried mother in the Irish community. A report on the national conference on community services for the unmarried parent (Kilkenny, 1972), pp 15-21, gives a synopsis of Dr Meagher’s paper.
28 Cherish, Conference on the unmarried parent and child in Irish society, October 1974, p. 36.
CHAPTER 31 DISCRIMINATION

31.68 In 1978 the title of the annual conference of the Federation of Services for Unmarried Parents and their Children (see Chapter 12) was ‘Finding parents for special needs children’. The conference determined that adoption practices in Ireland ‘appear to discriminate against children with “special needs”’. It recommended that there should be further research into this topic; steps should be taken to increase the number of children with special needs who were ‘able to enjoy a full family life through adoption’; structures should be put in place to promote the adoption of children with special needs and to provide support to parents who adopted these children. Following this conference the federation carried out a pilot study of residential institutions in the Eastern and North Eastern Health Board regions. They identified 32 residential institutions, with children aged from six months to 12 years. Of the 858 children in these institutions, they determined that 188 were parentless: almost half of the 188 were the children of married couples who had no meaningful contact with their parents, 93 were ‘illegitimate’, four were extra-marital births. Three-quarters of the 93 ‘illegitimate’ children had been in institutional care from birth; 60 ‘illegitimate’ children, two-thirds of the total, were deemed not fit for adoption or fosterage because of physical or intellectual disabilities. In the remaining cases the mother would not consent to adoption and many of these mothers also opposed foster care.

Women with intellectual disability and/or mental health issues

31.69 The Adoption Act 1952 introduced legal adoption to Ireland (see Chapter 32). The issue of the mother’s consent to adoption was particularly important in the case of women with intellectual disabilities or mental illness. The Adoption Board had the power to ‘dispense with consent of any person if the Board is satisfied that that person is incapable by reason of mental infirmity of giving consent or cannot be found’. It was also required to ‘satisfy itself that every person whose consent is necessary and has not been dispensed with has given consent and understands the nature and effect of the consent and of the adoption order’. Adoption societies were required to ensure that those giving consent understood what they were signing. It should be noted that adoption societies were not involved in all adoptions as children could be placed for adoption by their mothers or third parties. In these cases, the Adoption Board had to satisfy itself that the consent was valid before it would make an Adoption Order.

29 Department of Health, CCP/INA/0/482259.
30 Department of Health, CCP/INA/0/482721; No date on report but 1979 on the basis of other documents.
Evidence from the institutional records suggests that efforts were made to establish the mother’s capacity to give consent. A 1974 report from a psychiatrist in St Ita’s, Portrane stated: ‘Mother...has been admitted to the above hospital on two occasions since August 1971 suffering from a schizophrenic illness...[mother], who is at present in hospital here, consents to the adoption of her baby and in my opinion is capable at present of forming a valid wish in this matter’.

An example from 1981 concerns a mother with an intellectual disability but the procedure is the same as in the case of mental illness. A letter from the Adoption Board stated that ‘since the n/m [natural mother] is mentally retarded it is the Board’s standard practice to obtain medical evidence stating that the natural mother was or was not capable of understanding the nature and effect of her consent and of the adoption’. This woman’s doctor wrote that: ‘she is mildly mentally handicapped and is not, in my opinion, capable of understanding the full meaning and significance of adoption and would not be capable of giving full consent re: same’. The child was adopted.

The Commission has identified 941 institutional records of women in Pelletstown and Bessborough where it is recorded that they had a mental illness or intellectual disability. The largest number, 309, are described as having an intellectual disability; 263 women were recorded as suffering from depression, anxiety and nerves; 161 had a serious mental condition such as schizophrenia; 88 women had a previous psychiatric condition. Fifty women were recorded as having attempted suicide, or taken an overdose of drugs, and 70 were recorded as addicts. Addiction becomes more prevalent towards the end of the period under review. There were 18 women in the 1980s and 38 in the 1990s who were recorded as being addicts, at a time when the total number of women in these homes had fallen significantly. This probably reflects the availability of harder drugs from the 1970s onward, with a shift from alcohol to crack and heroin (at least 14 women were recorded as having heroin/crack addiction in the 1980s and 1990s in Pelletstown).

The records indicate a greater awareness of maternal mental illness and intellectual disability from the 1960s. Only six of the 263 women who were recorded as suffering from depression, anxiety and nerves were resident before 1960. This rose to 30 in the 1960s, 101 in the 1970s, 78 in the 1980s and 48 during the 1990s.
Women in Pelletstown

31.74 There was information about the mental health of 608 women in the Pelletstown institutional records. Only 29 of these relate to the years from 1922-59. There is information on 76 women in the 1960s, 241 in the 1970s, 133 in the 1980s and 129 in the 1990s.

31.75 The information was medically verified for 388 of the 608 women. The recorded outcomes for the children of these mothers were:

- 155 were placed for adoption (95 of these adoptions are confirmed by external records);
- 19 were boarded out (11 were subsequently adopted);
- 136 were not placed for adoption; most were described as going to parent/family (at least nine of these children were subsequently adopted);
- The outcome is not known for 78 children; 42 of the mothers concerned left prior to the birth.

31.76 The following are examples of maternal mental disability preventing or delaying adoption. In the 1940s the records tend to be brief. At the time ‘backward’ was an accepted term and indicated a mild degree of intellectual disability (as opposed to ‘idiot’ which referred to a more profound degree of handicap). A record from 1947 relating to a child whose mother had an intellectual disability stated that: ‘No prospects of any adoption. Mentally this girl is backward’. The child was discharged in 1952 to St Philomena’s in Stillorgan (see Chapter 2). In an example from 1948, it is clearly stated on the mother’s admission card: ‘No prospects of getting baby adopted or anything definite done for child. Mother mentally backward’. This child died in St Kevin’s Hospital but, had it lived, it would probably have been placed in an industrial school or children’s home.

31.77 A 1950s file states: ‘IQ will need rechecking when older. Postpone adoption or boarding out … ?M[entally]D[eficient] Not fit, yet, for discharge…needs further stimulation…mother was backward…could be BO [boarded out] with carefully chosen F. [foster] parents’. This file was signed by a doctor. Some months later the doctor determined that this child was ‘fit for adoption now’ and the child was discharged to adoptive parents.
31.78 In 1959 a file records: ‘Owing to mother’s history (MD) child is fit for boarding out, not for adoption’; later that year: ‘Physically healthy child. Mother reported to be epileptic. Fit for adoption if parents to be are aware of history’. ‘IQ tested July 1960 - mentally low average’. April 1961: child ‘aged 2 years...although she is retarded I would suggest boarding her out as the resulting stimulation would be of benefit’. This child was legally adopted.

31.79 An example from the early 1970s shows how terminology had changed, and also that Magdalen laundries were now regarded as places of residential care. A Pelletstown doctor wrote:

Family history bad. Mother has been 5 times in mental homes, certified as high grade mental defective and suffers from depression. 5 previous pregnancies. Cousin is father of child. This child will not be fit for adoption but may be boarded out.

31.80 A report from a county medical officer stated:

This girl [the mother] has been in and out of St. Patrick’s Hospital on several occasions during the past 10 years. As she has no relative sufficiently interested in her to commit her to the Mental Hospital, the Hospital was unable to retain her even though they would like to have done so. She was a voluntary patient and therefore could leave whenever she felt like it ... I can see no prospect of [the woman] being able to rear this child any more than the other children who are in Institutions, or boarded out. The best thing would be if she could be persuaded to enter an Institution such as the Magdalen Home.

31.81 A month later, a letter from a consultant psychiatrist in St Patrick’s Hospital stated:

she has had five admissions to Mental Hospital. She has been diagnosed as a high grade mental defective. She also suffers from depressive symptoms … Patient's mental symptoms do not warrant detention in Mental Hospital. It is her repeated pregnancies that often precipitate an admission. Patient is at risk until she becomes menopausal. She would benefit from Institutional care.

The woman was hoping to keep her child. Adoption papers are included in the file but the child was discharged to a children’s home.

31 See the McAleese Report p. 509.
32 Admission to mental hospitals was governed by the Mental Treatment Act 1945 which distinguished between patients who were committed to mental hospitals and those who were voluntarily admitted.
The following are examples from the mid-1970s. In a letter from a children’s officer, the mother ‘is said to be very retarded’. The child was deemed ‘not suitable for adoption on account of maternal history’. The child was discharged to a children’s home. ‘Very bad family history of mental sub-normality. History of maternal sub-normality. Grand-aunt also sub-normal’. ‘Not suitable for adoption see family history’. Yet this woman’s first three children were adopted. This child went to a children’s home.

In the late 1970s, mother ‘attended school in Temple Hill Blackrock for backward reading and writing’. The child’s ‘reason of admission’ to Pelletstown was ‘for adoption’, which was planned through St Louise’s Adoption Society. The child’s exit pathway, at four years old, was to ‘St. Vincent’s Centre’; ‘In view of maternal history, fit for boarding out only? 5 sibs. of mother mentally sub-normal’.

However, in 1980 a mother’s intellectual disability does not seem to have prevented adoption: ‘Girl mildly mentally handicapped. Unusual family history…epileptic…nothing relevant other than epilepsy and fact that girl attended St. Mark’s (Mild H. School). Home environment poor…herself illeg’. This child was adopted after a delay.

The following are examples of mental illnesses/conditions in mothers, how they were perceived by medical professionals, and how they affected the outcome for the child, if at all. In the 1950s, a paediatrician wrote on the child’s medical history card that ‘mother has twice been in mental Home. Child is healthy but owing to maternal history will not be fit for adoption…fit for B. Out’. However this child was adopted some years later, in the 1960s.

An example from the 1960s indicates that adoption was sometimes seen as the best option for the child due to the mother’s condition. The mother was admitted to Grangegorman. The chief medical superintendent reported that ‘on admission, she was stated to be an irresponsible psychopathic personality who recently had developed auditory hallucinations. She was later stated to be schizophrenic. Her stay in hospital has been punctuated by much aggressive behaviour…I think that direct adoption would be of much benefit to her child’. This child was boarded out.

In the early 1970s a consultant psychiatrist in a mental hospital wrote that: ‘The above named was a patient here…She suffers from a schizophrenic illness...The
local District Nurse described the home conditions as very bad...She was obviously of very limited intelligence’. Following reception of this medical opinion, a paediatrician noted: ‘Mother has a low IQ. Family history of mental illness very bad. Baby only fit for Boarding out’. This child was adopted.

31.88 In the 1970s, psychiatrists were not systematically advising against a child being adopted. A mother had ‘spent 6 weeks in St. Brendan’s [dates]. Had shock treatment 5 times’. A senior psychiatrist in another mental hospital wrote to Pelletstown explaining that the mother ‘is suffering from a schizophrenic illness for nearly a decade. As you know the part played by heredity in the genesis of this disease is a complex one and one would hesitate to down a baby’s chance of adoption on this ground. I suppose that the prospective parents will be informed and the final decision left to them’. However a paediatrician noted that ‘in view of maternal history of schizophrenia infant is fit for boarding out only’. The child was discharged to St Joseph’s, Kilkenny the following year and was later adopted as were this woman’s two older children.

31.89 In the mid-1980s a woman was on antipsychotic drugs while in Pelletstown. ‘She was diagnosed schizophrenic 10 years ago but refused medicine at the time...she is incapable of minding the child alone...She herself wants to keep the baby’. She was discharged before her child. The ‘reason of admission’ on the child’s card is ‘pending foster care’, and the ‘other particulars’ section indicates that the mother was ‘schizophrenic, not able to care for baby’. The child was discharged to foster parents through the Eastern Health Board.

31.90 By the 1980s and 1990s the social context had changed and women were being supported to keep their children but at times it was deemed in the best interest of the child to be placed in foster care. There are some women whose history of mental illness, substance abuse, or disadvantaged social background warranted intervention by the Eastern Health Board. In the 1990s, a woman who had been diagnosed as schizophrenic deteriorated into an episode of paranoia and obsession. As she would not go to hospital voluntarily she was committed to Grangegorman. The child was taken into care by the EHB and was placed with a foster family.

31.91 Also in the 1990s, a woman was admitted with her new born child. Notes described her on arrival as ‘paranoid schizophrenic...seems a nice girl. Was a
patient in...Is quite stable at present'. Over the following weeks the woman displayed paranoid symptoms which increased as she refused her medication. The Sister in charge noted ‘I really feel that [woman] is not able mentally for all the responsibility of caring for [child] and we are putting pressures on her that she cannot cope with’. As she deteriorated a doctor on duty was called and recommended her transfer to a psychiatric hospital as she was dangerous to herself and others around her. She was involuntarily removed to a psychiatric hospital. The child was taken into care by the EHB as the mother ‘had gone missing’ from the psychiatric hospital ‘and was not agreeing to voluntary foster care and was not well mentally’. Her child was taken into foster care. This woman had two other children who were in long term foster care.

31.92 There are several instances, all in the 1960s, where a psychiatrist expressed concerns that a child might inherit mental illness. Three of these letters were written by the same psychiatrist. The first child was born in Grangegorman, where the mother was a patient, and was admitted unaccompanied to Pelletstown. A letter to the paediatrician in Pelletstown stated that the mother was ‘weak-minded and suffers from epilepsy. In my opinion it is likely that in this case, the child will in some degree inherit the mother’s mental condition’. The child was deemed ‘not fit for adoption’ in view of this report and was boarded out. However less than a month later, another doctor judged the child to be ‘suitable for adoption’.

31.93 In the case of another child, also born in Grangegorman and admitted unaccompanied to Pelletstown, the psychiatrist noted that the mother ‘was suffering from weakmindness and psychopathic tendencies. It is probable that the child will inherit her mother’s mental condition’. This child was boarded out. In the third case, the child was born in Pelletstown and the mother went to Grangegorman following her discharge. The language in the note from the psychiatrist is virtually identical to the previous case: mother ‘is suffering from weakmindness and psychopathic tendencies. It is probable that the child will inherit her mother’s mental condition’. The child was discharged to Holy Angels, Glenmaroon. Another report, also in the 1960s, by the same psychiatrist indicated that the mother, a patient in Grangegorman, was ‘suffering from depression and had made a suicide attempt...It is my opinion that there is a strong possibility of the likelihood of the baby inheriting the mother’s mental abnormality and I accordingly believe that the child is not...suitable for adoption but would be suitable for boarding out with a family’. The paediatrician’s notes read: ‘In view of maternal
history of being in St. Brendan’s...child is fit only for Boarding Out’. The outcome for the child was nonetheless not affected as it was adopted.

31.94 Not all psychiatrists were quick to draw such conclusions; some acknowledged that there was a lack of understanding of mental illness. In 1966, a report by a psychiatrist indicated that a mother was admitted here [Grangegorman] on [date], and discharged on [date]. She appears to have been suffering from a depressive state which to a great extent was reactive to environmental stress and her condition cleared up well with therapy. In her case there seems no reason to anticipate that her child is likely to be adversely affected. As you know it is extremely difficult to forecast whether or not a particular individual is likely to pass on psychiatric abnormalities to their offspring as so many factors operate in their genesis and I would like to emphasise that the above are very rough observations and amount to little more than intelligent guesswork.

The child was adopted.

31.95 The Adoption Board and adoption societies sometimes inquired about mothers’ mental health. In the 1970s a child was admitted to Pelletstown unaccompanied because the mother was admitted to a psychiatric hospital. The paediatrician wrote that it was a ‘normally developed half caste baby. Physically healthy but in view of maternal psychiatric history child will be fit for boarding out only’. This child was discharged through St Louise’s Adoption Society for boarding out and was subsequently adopted.

31.96 A psychiatrist wrote to a medical officer at Pelletstown stating that when the mother was first admitted she was acutely psychotic, but it was also noticed that she was moderately mentally handicapped...She was eventually discharged from the clinic…but continued to attend as a day patient/out-patient until her readmission to the unit on [date] of this year. She has remained with us since. This girl is severely disabled. In my opinion, she would be totally unable to look after her baby and, I think, it would be highly irresponsible to consider allowing her to do so. Her prognosis, owing to the nature of her problem, must remain extremely poor.

31.97 In a follow-up letter the psychiatrist wrote:
this girl is quite severely disabled by a moderately serious degree of mental handicap, and superimposed on this she has more recently developed a Schizophrenic Psychosis...One, of course, cannot say with certainty that the baby will have adopted any of his mother's proclivities, but it is generally accepted that, if one parent of the union suffers from schizophrenia, there is a 1 in 7 chance of the offspring developing schizophrenia subsequently, and it is generally accepted now that, if not the disease itself, the predisposition to develop schizophrenia is genetically transmittable. So, taking into account all factors, including the above mentioned, I would have thought that the dice is rather heavily loaded against this child. However, I would like to stress again that one cannot predict with certainty how any human being is going to develop, but I would consider this child quite a high risk.

31.98 As the foster parents wanted to adopt the child, the Adoption Board wrote to the secretary of St Louise Adoption Society: ‘the Adoption Board would be grateful if you would forward an up-to-date medical report on the child. As it is understood that the natural mother has a history of mental illness, the Board would like to have a prognosis as to the risk of inheritance to the child’. The paediatrician’s answer was clear and succinct: the child ‘was clinically healthy, but in view of the risk of inheritance of schizophrenia...it was considered safer to have baby boarded out’. In a follow-up letter the paediatrician informed the Adoption Board that ‘neither the consultant psychiatrist nor myself consider this child suitable for adoption in view of the very bad mother’s history’. In a further letter two years later, the paediatrician noted that the mother had never been a patient in Pelletstown,

Since we had no contact whatever with the mother and do not know her whereabouts, it is impossible to give an up-to-date assessment as regards the risk figure of inheritance, it is not possible to give an accurate assessment without knowing the father’s history...I can only state that this...child was perfectly healthy when last examined by me, but the risk of his inheriting psychophrenia [sic] during adolescence or early adult life must not be overlooked.

Other records confirm that the child was adopted.

31.99 In another example which spans a 15 year-period from the 1960s to the mid-1970s, further light is thrown on the process of investigation by the Adoption Board and on the limitations imposed by the lack of knowledge concerning mental illness. The story begins with a letter from the secretary of the Adoption Board to the
secretary of St Louise’s Adoption Society: ‘With reference to the above application the Board would be glad to have an up-to-date psychiatric report on the child’s natural mother: it is understood that she had a nervous breakdown during pregnancy’. The reply stated that there was ‘no evidence of breakdown during pregnancy...Social worker had recent contact in connection with signing of consent forms and [mother] showed no evidence of any psychiatric condition’. St Louise’s placement committee decided against asking the mother ‘to submit to psychiatric examination in relation to an episode which occurred in 1960’. A letter from a psychiatrist to Pelletstown indicated that: ‘she was a patient in...1960 suffering from a schizophrenic episode...She was treated...In August 1966 our psychiatric social worker...was requested for a report from the Catholic Protection and Rescue Society’. This report stated that ‘in the light of present medical knowledge it is quite impossible to say whether this kind of illness would be transmitted or not’. The child was adopted.

31.100 There are many cases where the mother’s mental condition did not prevent adoption. The cases from the 1930s and 1940s have been omitted as there is too little information available to be conclusive. In only two cases, both discussed above, was it stated in so many words that the child would not be adopted due to the mother’s condition. By the 1980s and 1990s, more women were enabled to keep their children and it is more difficult to determine whether a mental condition was affecting the outcome for the child.

31.101 In 1954, a mother was discharged from Pelletstown ‘to St. Kevin’s Hospital. Patient - mental’. The child was adopted. In the 1960s, a letter from a psychiatrist in Grangegorman stated: mother ‘was admitted to this hospital...During this period her baby was born in St Kevin’s Hospital. From her clinical notes it appears that she was suffering from a depressive illness which responded satisfactorily to treatment...she appears to have been mildly mentally handicapped. Apart from her intellectual subnormality which, I suppose, carries some risk of a similar low level of intelligence in her child, there does not appear to be any likelihood of mental illness being inherited’. This woman’s file also contains a letter from a psychiatrist stating that she was capable of giving her consent to adoption, and a letter from her giving same. The child was discharged to adopters.

31.102 Also in the 1960s, a letter from another psychiatrist at Grangegorman stated: mother ‘was admitted here...On admission she was depressed and withdrawn.
Her depressive episode, which was precipitated by the birth of her baby in July 1966, responded quickly to treatment and she was discharged...The patient is educationally sub-normal but it is not possible to predict if the child would inherit this from the mother'. The child was adopted.

31.103 In the 1970s, notes on a mother’s medical charts indicate that ‘5 years ago patient attended...for psychiatric treatment approx. 5 months...In April she was taken in for 1 month and given ECT’. Some months later a letter from Holles Street explained that ‘she has a reactive depression diagnosed by [the hospital’s visiting psychiatrist] as being due to her unmarried state’. Her child was adopted.

31.104 As these examples reveal, a high of proportion of women experienced mental distress due to their pregnancy; their condition was recognised as being circumstantial, and therefore not a transmittable condition. It is quite likely that before the 1960s cases of ‘hysteria’, of women being described as ‘mental’, were in fact temporary conditions brought about by the situation women were experiencing but they were not recognised as such.

31.105 More serious cases of mental illness did not always prevent adoption. In the 1970s, a mother had ‘psychiatric history’ and was discharged to Grangegorman. A letter from a psychiatrist in another mental hospital, stated: ‘She has been having psychiatric treatment here since 1971’. A Pelletstown doctor noted ‘normal healthy infant but in view of maternal history baby may only be boarded out’. Three years later ‘notes from Dr X and St. Brendan’s [were] sent as requested to Adoption Board’. However a letter from a Pelletstown doctor to the Adoption Board stated that: ‘this baby was not certified as fit for adoption due to mother’s history of schizophrenia’. Yet a psychiatrist in Grangegorman reported that he ‘found no evidence of schizophrenic symptomatology in her...Rather I did feel that she suffered from a personality disorder the hereditability of which is low’. Another report gave a diagnosis of ‘acute schizophrenia’ and ‘diagnosis: schizo-affective’. She was also treated with electroconvulsive therapy (ECT) on three occasions. The child was, however, adopted.

31.106 There are a few examples where Pelletstown was opposed to a mother raising her child due to her condition and other factors. In the 1970s, a mother was admitted from a psychiatric hospital. A Pelletstown medical officer wrote: ‘mother is a chronic schizophrenic...who has recently had an acute episode’, ‘awaiting report
Some years later when the child was approximately four years old, a consultant psychiatrist recommended that Pelletstown keep the child as the mother was ‘a vulnerable personality in terms of susceptibility to schizophrenic breakdown’ and a range of other circumstances such as poor living conditions. A Pelletstown medical officer stated that

I feel that very careful consideration must be given to the placement of this child. His mother - a “recurring” schizophrenic who has married a [man] who believes in structures in handling children rather than affection and gentleness which the child psychiatrist recommends. I feel the child would be better in a foster home but in the event of mother taking child careful supervision must be maintained.

A recent developmental assessment, carried out by the Child Study Centre, stated that the child’s behaviour was ‘compatible with his relative deprivation in the fields of emotion, sensation and experience...he needs...a great deal of affection and attention’. The child was discharged to a children’s home.

In an example from the 1980s, it also appears that the child’s safety was the deciding factor. A paediatrician noted that the mother was ‘clearly psychotic’ and he asked that she be seen by a psychiatrist before being discharged. The psychiatrist confirmed that this mother was a ‘paranoid schizophrenic’ and she was discharged to a mental hospital. Pelletstown informed a consultant psychiatrist at this hospital that

it was immediately apparent that she was psychotic. This was confirmed by Dr.[...], Consultant Psychiatrist...we had her on a variety of agents: - Valium, Stellazine, Disipal, Anatensol, to cope with her paranoid views etc. She was safely delivered of a male infant...but she is not capable of minding him nor of deciding on his future. We have retained the baby here.

A second paediatrician confirmed that the child was ‘Not fit for discharge - mother not to be given baby’. A few months later ‘forms [were] signed for fostering’. When the mother was discharged from the mental hospital back to Pelletstown, a paediatrician noted ‘mother has not yet given consent to adoption’. This doctor was not aware that a consultant psychiatrist had written that ‘I am of the opinion that she is now completely well and is capable of caring for her baby’. Shortly after this letter was written, mother and child were discharged from Pelletstown together; the paediatrician quoted above wrote
this mother was permitted to take this baby out against the repeated advice of medical staff. Mr [...], Children’s Section [EHB] was personally informed on my anxiety on behalf of the child. I feel any mishaps, physical, emotional or psychological that may happen to this child must be the responsibility of the Children’s Section.

**Women in Bessborough**

31.110 References to mental health or mental disability were found in the institutional records of 332 women in Bessborough. Of these, 100 had a condition that was medically verified. The institutional records show the outcome for the children of these 100 women was:

- 38 children were placed for adoption,
- two were boarded out (both were subsequently adopted).
- The immediate outcome for 24 children is not known; 14 of the mothers left prior to birth; other records show that one child was placed for adoption and one died outside Bessborough.
- 20 children went to ‘parent/other family member’ (one was subsequently placed for adoption),
- 11 went to ‘other institutions’ (two were subsequently placed for adoption).
- Five children died in Bessborough.

31.111 So, 44 of the 100 were placed for adoption; the Commission has been able to confirm 34 actual adoptions from external records.

31.112 At times the mother’s condition delayed or prevented adoption. In the 1970s a psychiatrist attached to a mental hospital wrote:

> This young woman has been under my care for the past 2 years for treatment for manic depressive psychosis. I discontinued all medication as soon as I learned she was pregnant, but I was forced to resume it after 18 weeks when she was becoming severely depressed...In view of the home situation and also in view of the fact that her own prognosis from a psychiatric point of view is poor, I strongly advised her to have the baby adopted or fostered out.

The outcome for the child is not known as the mother left prior to the birth.

31.113 In the 1990s, a mother was described as ‘mildly mentally handicapped’. At a paediatric appointment, the doctor ‘believed [child] was normal. He said however
that he could not guarantee his adopters that [child] will be of normal intelligence'.
The ‘pre-placement history of baby’ indicates that he was ‘provisionally matched
since last November on three occasions with prospective adopters. For a variety
of reasons, none of the matching resulted in the placement of [child]. The
concerns of the couples related more to [child]'s genealogical background rather
than to [child] himself, e.g. mother is mildly handicapped and is of a travelling
background’. It seems that the child was adopted by his foster parents.

31.114 The following letter from a Sister in Bessborough to a psychiatrist in a men-
thospital sheds light on the attitude of the personnel regarding patients with
intellectual disabilities and/or mental illnesses:

We are indeed sorry to send [woman] back to…and would like to have been
of more help but...she is very unsuitable for here. We do cater for a number
of mentally handicapped patients and have a fair share of psychiatric patients
throughout the year, but owing to the fear which [woman] has projected into
the girls (we are anxious especially for the young 14 and 17 year old girls
studying for exams, who complain that they cannot sleep at night because of
[woman]'s wandering into their rooms) and the anxiety about fire. [woman],
like most of the patients here, has a single carpeted room and her smoking
habits in the room are a cause for constant anxiety. Other than this we found
her quite acceptable and manageable and really no problem at all. I feel sad
she must return to the locked ward when really she is not suitable either for
there. I do wish we could offer an alternative. I hope we will someday open a
maternity unit exclusively for women like [woman] to give them all the help
and protection that they need.

Children with disabilities

31.115 A total of 325 children in Pelletstown are recorded as having a physical disability;
153 children had an intellectual disability and 65 had both. The Commission is
including all references whether or not they are medically verified. There is much
more information available about children with disabilities in Pelletstown than about
similar children in Bessborough. This is because Pelletstown was often used as a
place to send children with disabilities and very ill children when there was no other
suitable accommodation.

31.116 Of the 21,454 children who were resident in Pelletstown between 1922 and 1998,
1,642, (7.65%) are recorded as ‘legitimate’. Of the 153 children with an intellectual
disability, 54 (35.29%) were ‘legitimate’ and 82 (53.59%) were unaccompanied. All the ‘legitimate’ children were unaccompanied, which means that 65.85% of the unaccompanied children with a disability were ‘legitimate’.

31.117 The majority of the children who are recorded as having an intellectual disability (71%) were in Pelletstown between 1960 and 1990. This reflects both improved diagnosis and improved medical treatment which resulted in a higher rate of survival among children who were born with a disability.

31.118 The Pelletstown institutional records indicate that just under half of the 153 children who are recorded as having an intellectual disability (74) were discharged to an institution; 24 were discharged to their parent(s) or a family member - most of these children were ‘legitimate’; 22 were placed for adoption; six were boarded out or placed at nurse, 10 children died and no information is available about 17 children. The following is a breakdown by decade.

31.119 In the 1930s, there were four children recorded as having an intellectual disability. They were all discharged to St Vincent’s, Cabra. The boys for whom there is information were later transferred to St Augustine’s Colony, the girl remained in Cabra. Their condition is unverified.

31.120 There were 19 children in the 1940s who, while their condition was unverified, were mainly described as ‘mentally deficient’. The only child among them who was discharged to parents was ‘legitimate’. He was subsequently admitted to an institution for mentally handicapped people and seems to have remained there for the rest of his life. The others were all discharged to children’s homes: 11 were discharged to Lota, Glanmire (all on the same day in 1948), four were discharged to St Vincent’s, Cabra and three were discharged to St Philomena’s, Stillorgan.

31.121 Of the 21 children who are recorded as having an intellectual disability in the 1950s, 14 were unaccompanied (11 of these were ‘legitimate’). Eleven children were discharged to children’s homes: two to the Stewart Institute, four to St Vincent’s, four to Glenmaroon and one to St. Philomena’s. One child was discharged to adoptive parents. Two children died in Pelletstown (both ‘legitimate’ and unaccompanied). Three were discharged to ‘parents/other family member’ (two were ‘legitimate’ and unaccompanied). Four were discharged to psychiatric hospitals (two to St Ita’s, Portrane and two to Grangegorman).
There were 48 children recorded as having an intellectual disability in the 1960s. Four were discharged to adoptive parents or adoption societies. Four were boarded out. Eight went to children’s homes (one to Lota, one to Daughters of Charity, Drogheda (an industrial school), three to St Vincent’s, one to the Stewart Institute, one to Beaufort, Killarney and one to Glenmaroon. Four were discharged to a psychiatric hospital (all to St Ita’s, Portrane); five were discharged to hospitals (three to St Mary’s Baldoyle, two to St Kevin’s Hospital); 11 were discharged to ‘parents’ (ten were unaccompanied ‘legitimate’ children). No information is available about eight of the children. Four died (all were unaccompanied, two were ‘legitimate’).

In the 1970s, there were 51 children recorded as having an intellectual disability. Twelve were placed for adoption; 14 went to children’s homes (four to St Vincent’s, two to St Mary’s, Delvin, one to St Raphael’s, Celbridge, three to Cregg House for intellectually disabled children in Sligo, one to St Patrick’s school for learning disabilities in Kilkenny, one to Tivoli road nursery, one to Sunshine Home, Stillorgan and one to St John’s, Ballinamore. One was discharged to a hostel. Six were discharged to a hospital (one to St Mary’s, Baldoyle, two to St Ita’s, Portrane, two to Cherry Orchard and one to St James’s). One went to the National Association for Cerebral Palsy in Bray. Eight were discharged to ‘parents’ (six were unaccompanied and ‘legitimate’). The outcome for six of the children is not known. Three died in Pelletstown (two were unaccompanied, all were ‘illegitimate’).

Ten children are recorded as having an intellectual disability in the 1980s. Three were discharged to adoption societies. One went to a children’s home. One was discharged to foster parents. The immediate exit pathway for three is not known but it is known that two of them subsequently died. One child died in Pelletstown. All the children who died were ‘illegitimate’ and unaccompanied.

There were no children with an intellectual disability recorded in the 1990s.

As already noted, the term ‘Mongol’ was in use for about a century until it was replaced with ‘Down’s syndrome’ officially in 1965. While the symptoms had been well-described since the mid-nineteenth century, the chromosomal

---

abnormality was not discovered until 1965. Intelligence Quotient testing existed from the 1910s; it became available in the late 1950s in Pelletstown. Initially the testing was conducted by a visiting doctor; in later years it was performed at the Child Study Centre which opened in the early 1970s at 214 Navan Road.

31.127 The Pelletstown records indicate that in the 1930s and 1940s all the ‘mentally deficient’ children were institutionalised. Children stayed in Pelletstown until the age of five, then went to St Vincent’s Home in Cabra, a few years later to St Augustine’s, Blackrock and finally to St Raphael’s Celbridge. This pattern seems to follow the recommendations laid out in the 1939 study by Dr Louis S Clifford, *Investigation into the Incidence of Mental Deficiency amongst Dublin School Children*. Under the heading ‘Institutional Provisions’ he recommended that children should be sent to Cabra until the age of 13 for boys and 16 for girls, when ‘males over 13 years should be sent to St. Augustine’s Colony, and females over 16 years to a Senior Colony’.

31.128 In the later decades it appears that children with intellectual disabilities were less likely to be adopted but they could be fostered if their condition was not too demanding or requiring too much medical assistance. Fostering was often seen as desirable as it offered the stimulation children could not receive in an institution such as Pelletstown.

31.129 An example from the early 1960s shows that fostering and adoption were considered. Notes by a paediatrician read: ‘backward in speech and appears to have some retardation mentally. For IQ testing. Unfit for adoption or BO at present’. Later notes indicate that the child was deemed ‘inattentive and indistinct in speech - IQ 50. For education in St. Vincent’s’. The child was discharged ‘to Holy Angels Mentally Deficient Home School Glenmaroon’.

31.130 More extensive documentation is available from the 1970s. Children were fostered but foster parents could be quick to return a child if they believed it had Down Syndrome. One child’s medical charts indicate congenital abnormalities, including a cleft palate (later repaired) and a systolic murmur. A paediatrician noted that the child ‘could be boarded out provided foster parents are fully aware of risks - foster parents to be interviewed by Dr. […] or myself. Clinically there is very poor head

[34](http://www.tara.tcd.ie/bitstream/handle/2262/5122/jssisiVolXVI29_48.pdf?sequence=1&isAllowed=y).
control. Odd shaped ears’. This child was boarded out in 1974 but returned within a fortnight: ‘Baby re-admitted to St. Patrick’s because foster parents were told baby was a Down by Dr’. In 1977 a Pelletstown paediatrician related the episode to a psychiatrist: ‘In March ‘74 a couple anxious to help a slow child took her at their own request on a boarding out basis. A week later a doctor friend from Dublin told them she was a mongol baby and of course she was returned forthwith. In view of this we had no option other than doing Karotyping [sic]. Chromosomal studies as expected were normal’. There was also a letter from a paediatrician who saw her in Stamullen and he queried her chromosomal studies. The Pelletstown paediatricians never believed that this child had Down syndrome. ‘She was thought to be developmentally slow and not fit for adoption’.

31.131 In the late 1960s, a child was returned by prospective adoptive parents. The child was ‘placed for adoption per St. Louise’s Adoption Society in 1968, but they were not satisfied with the child. [A paediatrician] examined the child in St. Kevin’s and suggested the child be admitted to St. Patrick’s Home’. Notes from this time are unequivocal. The first adoptive mother ‘was reluctant to keep baby...she considers him retarded. Admit to St. Patrick’s Home. Other adoption to be arranged’. On admission to Pelletstown the child’s medical notes read: ‘Admitted from adoptive parents ??Mentally slow’. An assessment carried out in 1971 estimated the child’s ‘intelligence at average. He is well suited to adoption or boarding’. The second adoptive ‘parents have been told his IQ may be slightly below average. Very much improved. Physically well developed and obviously very happy. Vocabulary excellent but speech still somewhat indistinct. Has started school and likes it’. A letter from a Pelletstown medical officer to the Adoption Board states: ‘I feel his initial backwardness was due to environmental conditions’.

31.132 Pelletstown was a place where children with intellectual disabilities were placed before they could be accepted in specialised institutions, usually around the age of five. The lack of places in specialised institutions was a recurrent problem, with long waiting lists. These could be years long, and children remained in Pelletstown ‘pending a vacancy’ in other more suitable institutions.

31.133 According to one child’s file, he was ‘awaiting admission to Glanmire’. An IQ testing report when the child was four years old states that ‘This boy maintains a

35 Karyotyping is a process that examines chromosomes; it is used to diagnose Down Syndrome.
friendly smiling attitude but is apathetic and incapable of assisting in testing by reason of his low intelligence to a full extent. His mental age is 2 years 7 months and his intelligence quotient is about 56. His vocabulary is restricted and his concentration is defective. He requires special education and his name is on the waiting list for the Brothers of Charity School, Glanmire’. A letter from the Brother Superior insisted that they were taking him on a trial basis only, 'if he does not prove suitable for the school here he will have to be discharged'. Transport there was organised by the Cork Health Authority. It seems that children could not be admitted before the age of six and that admission was according to strict criteria. The child was sent to Lota in Glanmire, after at least two years on the waiting list.

31.134 As institutions for children with intellectual disabilities were constantly at capacity, children were often discharged to St Ita’s, Portrane, an adult psychiatric hospital. The 45th recommendation in the report of the Commission of Inquiry on Mental Handicap 1965 specifically stated that ‘the accommodation in district mental hospitals of mentally handicapped children is to be discontinued’. It appears that by the late 1960s/early 1970s, St Ita’s had developed a unit specifically dedicated to mentally handicapped children.

31.135 The following are examples of children who were sent to St Ita’s. An assessment report in 1968 on a two-year-old child stated that: ‘This little mongol can not sit, stand or speak. He has the usual characteristics such as playfulness etc. He is very low grade and should be placed on the waiting list for St. Vincent’s, Navan Road’. He was discharged to St Ita’s Portrane some months later.

31.136 The medical notes of a child in the 1970s indicated that he was ‘making no progress…To be on waiting list for John of God’s’. An unsigned letter from the same year indicated that the child ‘is very retarded and requires care at a school for such children’. A developmental assessment report from the Child Study Centre in 1974 confirmed that ‘Prediction is not accurate, but he will most probably remain severely mentally handicapped and need constant care and attention for life’. Despite recommendations that the child should go to a special school, he was discharged to St Ita’s in 1975 (aged nearly six).

31.137 A ‘legitimate’ child was placed in Pelletstown in 1968. ‘Reason of Admission: Mongol. Very retarded mentally. Mother unable to cope with child, who has become very difficult over the past months’. The child was discharged six months later to St Ita’s (aged five).

31.138 In another case, the parents of a ‘legitimate’ unaccompanied child with an intellectual disability were keen to have him admitted to St Ita’s. The child was admitted to Pelletstown aged two years ‘from: Home address. Reason of admission: Mentally retarded’; he was discharged to St Kevin’s five months later. The child was ‘very retarded mentally and does not sit up or take notice. The child’s parents are very anxious to have him admitted to St. Ita’s and are negotiating with Dr. […]’. He is also on the list for admission to the Stewart Institute.

31.139 Another ‘legitimate’ child born in 1959 was admitted aged one year. A paediatrician’s notes indicate that the child was a ‘low grade mentally defective child’. The mother, at least during the first year the child was in Pelletstown, seems to have been ‘anxious to take child home’. The child was discharged to St Ita’s in 1966 (aged about seven years old).

31.140 An example from the 1970s is representative of the difficulties that institutions faced. This ‘legitimate’ child was admitted to Pelletstown aged six months. ‘Reason of admission: Down’s Syndrome. Congenital heart has to be tube fed’. She was discharged about 17 months later to her parents, once she could be bottle fed. A social worker’s report, undated but written while the child was in Pelletstown, makes it clear that the policy was not to keep children in the institution if there were better options. She noted that the child ‘will probably need institutional care at a later stage and she is on the waiting list for Stewart’s Hospital, Palmerstown, and also for St. Vincent’s Navan Road. In the meantime, there is nothing to be gained by...keeping her in an institution and depriving her of family life’. The Child Study Centre conducted a developmental assessment when this child was aged 16 months; it highlighted the lack of specialised institutions that could cater for babies. At birth ‘she was noticed to have Down’s Syndrome...and not sucking. Because she was not sucking and had to be tube fed, she was kept in the Maternity Hospital for 5 months and then transferred to St. Patrick’s [Pelletstown]...because no other hospital would take her or keep her’. The child psychologist deplored the lack of social stimulation imposed on the child as the
parents were disinclined to take her back: ‘She will probably remain for life severely mentally handicapped, but she has more potential than she shows. The cause of her mental handicap is partly the Down’s syndrome...partly stunted growth...due to the feeding problems, and partly her sensori-motor and social deprivation. The latter are preventable’. He stated, ‘the sad fact is that there seems to be no hospital or institution that has sufficient staff to provide these basic necessities of all babies and infants for long periods. As far as I know the institutions for the mentally handicapped, having little experience of babies, would be reluctant to take [child] yet, but if she does not go home, she will need permanent admission to, for example St. Vincent’s Navan Road’. A month later, Stewart’s Hospital informed a Pelletstown medical officer that ‘we have placed her name on our waiting list but prospects of early admission are not good. I presume you have applied also to St. Patrick’s in Kilkenny, which might be a better bet’. 37

31.141 The parents’ local doctor wrote to a Sister in Pelletstown a couple of months later, stating that the mother’s ‘emotional make up was never able to take strain and when this infant was born it was the straw to the camels’ back. I seriously think that having this child at home will not help Mrs […] at all and will damage all the work that has been put into the baby over the past 14/12 months. Can something not be done to expedite a cot in another institution for both their sakes’. A Pelletstown paediatrician echoed earlier calls for the child to be with her family: ‘the child is now feeding normally and as she is legitimate and has parents and siblings we feel she would do better at home for a few years until she has to be admitted to Residential Schooling’.

31.142 It is very clear that, as specialised institutions were already stretched to capacity and were reluctant to take babies, they were retained in or sent to Pelletstown. A number of children with intellectual disabilities were then sent to St Ita’s, which appears to have been one of the only places open to them.

31.143 The various health professionals and social workers involved with the children in Pelletstown and in other institutions working in partnership with Pelletstown noted the effect of institutionalisation on the children. In some cases it seems that the lack of stimulation inherent to life in an institution was often the cause of, or a significant contributor to, a child’s ‘retardation’.

37 St Patrick’s, Kells Road, Kilkenny, under the control of the Irish Sisters of Charity, catered for moderately and severely mentally handicapped children of both sexes. It opened in 1966.
31.144 In the late 1960s, a paediatrician was advocating the placement of a child with an intellectual disability with a family. On her admission card this child was described as ‘mentally retarded’. A child psychologist stated that the child ‘requires stimulating’ and six months later ‘because of her recent improvement I would suggest that transfer to St. Mary’s, Ballydoyle would be of advantage’. However some months later notes indicate that ‘Dr […] feels the child should not be transferred to Ballydoyle’. This doctor explained: ‘There is a possibility of a foster home for a retarded child. This little one would greatly benefit by home conditions - and her intelligence could be re-assessed in 12 months’.

31.145 A psychological report from the Child Study Centre in the 1980s in relation to a child who was almost five years and fostered also recognised the inappropriateness of institutional upbringing: ‘cognitive testing indicates that [child] is currently functioning in the higher range of mild mental handicap...he would seem to... [be] currently functioning as a very, very slow learner’. He was ‘described by his foster mother...as an insecure boy, which is probably being contributed to by living most of his early life in an institution’.

31.146 There are 32 mentions of children having intellectual disabilities in Bessborough. The following are examples. A child with a relatively low IQ: ‘[19]62 - [Child] seen by psychiatrist - I.Q. 66’ - this child was discharged with its mother.

31.147 In an example from the 1970s the baby had several physical handicaps and was initially diagnosed as premature and ‘mentally retarded’. A doctor in St Finbarr's wrote to Dr Sutton in Bessborough: 'Diagnostic: multiple congenital abnormalities'; but noted that ‘chromosome count normal’. A document from St Finbarr's clearly stated ‘NB: not for adoption’ and repeated the diagnosis of ‘congenital abnormalities’, ‘prematurity’, ‘mild hydrocephalus?’, ‘syndrome'. A doctor from the Cork Spastic Clinic wrote that the baby ‘is now obviously hydrocephalic'. Later a doctor from St Finbarr's wrote to Bessborough: ‘this little fellow with multiple anomalies is really unchanged. The hydrocephaly however, is arrested...I don't think anything more practical can be done for this little fellow, and I think arrangements should be made for his accommodation in a home for the severely handicapped’. This child was discharged to foster parents.

31.148 Sometimes a note was made, such as ‘protruding tongue - retarded?’ and upon investigation the child proved not to have a disability. A child in the 1980s had a
The baby was examined and the question was raised whether it had ‘mild Down's Syndrome’. A letter to a paediatrician at Cork Regional Hospital: ‘I saw this infant for hips check on [date] and was asked to pass her as fit for adoption (?) Dr [...], who normally does this work, is away at present. I felt her facial appearance and protruding tongue were suggestive of a mild Down's Syndrome and withheld passing her pending your opinion and chromosome check’. The consultant’s report concluded the child was ‘normal’ and she was adopted.

31.149 The information available is sparse and often not medically verified. For example, in the 1950s a child stayed two years longer than its mother. ‘Baby has put on weight, able to sit up but no inclination to walk - very backward baby’. The child was discharged to St Francis and St Mary of the Angels, Beaufort, a residential home for children with physical and intellectual disabilities, aged about seven.

31.150 In the 1960s, a child was nursed out by Cork Health Authority. It was ‘Placed without reward for legal adoption’ but ‘child was mentally retarded - removed from custody of Mr and Mrs [...] on [date]’. The child then was admitted to ‘Midleton Nursing Home Co. Cork’ and from there ‘No adoption - discharged to COPE Foundation’.

31.151 In another 1960s example, the mother’s condition had an impact on the child’s chance of adoption. Her ‘condition on reception’ was recorded as ‘epileptic - low mentality’. The baby was deemed to have a ‘low mentality’. A paediatrician wrote to the doctor in Bessborough: ‘the child is of course very backward. I could not find any definite abnormal physical signs which would account for this except that the back of her head was rather flat and that the middle segments of her little fingers are very short. It is just possible that she might be some sort of a Mosaic Mongol’. This paediatrician arranged for a chromosome count in St Finbarr’s (just the blood taking - the karyotyping itself was done in UCD), and concluded the letter: ‘I think it is most unlikely that this child will ever be fit for adoption’. In a further letter the same paediatrician gave the results: ‘there is...no evidence of mongolism. However, I think there is no doubt that the infant is considerably retarded. I understand that her mother was mentally deficient also’. The child was discharged to a children’s home in Foynes, Limerick. Further files indicate that this child spent her entire life in the residential care of the Brothers of Charity in Foynes and she was diagnosed with a severe learning disability.
31.152 Many of the children with special needs were transferred between multiple institutions. A deaf child in the 1940s spent time in a mental hospital and in schools for the ‘mentally deficient’. He was discharged from Pelletstown to St Vincent’s, Cabra aged four. He then was admitted to St Teresa’s, Stamullen aged 11. In 1956 he was transferred to St Raphael’s Celbridge and in 1957 he was transferred briefly to the District Mental Hospital, Carlow, before going to Grangegorman Mental Hospital, where he remained until 1958 when he was transferred to St Kevin’s Hospital and discharged within a fortnight. Interestingly in this case there does not appear to have been a long waiting list for the most appropriate institution, as ‘Sr. M, Cabra, applied to have [child] sent to the Deaf and Dumb Institution’ in July 1946 and he was admitted within a fortnight.

31.153 In 1948 a child in Bessborough, aged nearly four, was boarded out and returned eight months later to Cork County Home by the foster mother ‘as child never spoke a word while she had her’. The child was admitted to St Vincent’s Home, Cabra in 1950 and transferred to the Catholic Institute for the Deaf and Dumb in 1952.

**Children with physical disabilities**

31.154 There were 324 children with a physical disability (verified and unverified) in Pelletstown, and less than 15% of these children were recorded in the decades before 1960. Yet again this suggests both a failure to diagnose or record physical disabilities and the much improved survival prospects of children with physical disabilities. Almost half of these children, 47% were in Pelletstown during the 1970s.

31.155 The same pattern is evident for Bessborough where a total of 148 children with a physical disability (verified and unverified) were recorded; 16% of these children were in Bessborough from the 1920s to 1960; the number peaked during the 1970s when there were 58 children, almost 40% of the total.

31.156 As far as can be ascertained from the records available to the Commission, the Pelletstown staff gave the children the medical attention they needed, be it physiotherapy (very frequently), speech therapy, plastic surgery, medication for a range of ailments and conditions, tests, hearing aids, glasses, callipers,

38 Probably St Mary’s School for Hearing Impaired Children, Cabra.
CHAPTER 31 DISCRIMINATION

wheelchairs. Children were transferred to relevant hospitals when necessary including to England.

31.157 It seems that the most up-to-date medical practices were applied (on one occasion a scientific paper was cited in reference to a Down syndrome child reacting to medication). This is especially true for the later period under investigation as the records are more extensive. Extensive medical reports were kept, sometimes close to 300 pages, if the child remained in Pelletstown for several years. Incidents were reported, for example a child knocking his teeth in his cot, a girl falling over her bike and breaking a leg, some children burning themselves on hot pipes, children falling out of their cots, and the procedures undertaken afterwards. The Pelletstown staff relied on a network of health professional outside the home: a plastic surgeon in Dr Steeven’s Hospital; an eye specialist in Jervis Street Hospital; an ear specialist and child psychologists.

31.158 A proportion of physically handicapped and/or sick children were ‘legitimate’. It seems that they were sent to Pelletstown for palliative care awaiting death as their condition was acute and the parents could not cope. Tube feeding was a recurrent reason for admission.

31.159 The following are examples of how the child’s physical condition affected a placement opportunity and what steps were taken by the home and/or the health authorities to address the children’s conditions.

31.160 In 1937, a ‘child was at nurse with Mrs […, address], was returned to Dublin Union suffering from Congenital Debility. Mother paying for its maintenance’. In 1941 he was discharged to a children’s home.

31.161 A child born in 1939 was discharged to St Vincent’s, Cabra in 1943. In 1948 he was transferred to St. Augustine’s Colony. While there he was treated for a squint: ‘account submitted from St. Augustine’s Colony, amount £25 for operation for severe squint in respect of this boy’. He was later transferred to St Theresa’s, Stamullen in 1954 and in 1955 to St Raphael’s Special School in Kildare.

31.162 An unaccompanied child was admitted to Pelletstown in 1958 aged four and a half months. The child’s card indicates: ‘Unfit for fostering or B. Out - Blind’. A paediatrician noted: ‘Mental defective child. Very defective vision. Glasses
ordered but it would be impossible for her to wear them’. It seems that her visual impairment was addressed as it was not mentioned in a child psychologist’s report of 1961. When the child was three years old, the child psychologist assessed that ‘her mental age is not 2 years. I would estimate her intelligence quotient at about 45. She requires education at St. Vincent’s, Navan road’. She was discharged to Holy Angels, Glenmaroon in 1962.

31.163 As far as adoption was concerned, it was the same process for a child with physical problems as for a mother suffering from mental health problems: the Adoption Board was contacted and reports were sent.

31.164 Conditions such as ‘club foot’ were usually repaired easily and did not impair a child’s chance of adoption. The medical charts of a child born in 1974 indicated that he had ‘bilateral Talipes, coloured infant’. When aged about three weeks he had a Plaster of Paris on for his ‘very marked Talipes’ on his right foot. A letter from a doctor in St James’s Hospital reads: ‘I saw this child here today and the calcaneo-valgus deformity is well corrected at this stage. There is a slight degree of valgus involving the forefoot which is hardly noticeable and I do not think that there is any bar to the child being adopted at this stage’. In the following month he was transferred to an adoption society.

31.165 In 1976, in response to the question on a Catholic Protection and Rescue Society of Ireland medical report ‘Do you know of any physical or mental defect which would [make] the child unsuitable for adoption?’ a paediatrician noted: ‘Has a sp[ina] bifida occulta’. The child’s medical charts likewise indicated that ‘muscular control very poor…protruding tongue…At present level of doubt if baby will be fit for adoption’, and ‘in view of abnormal EEG and sp[ina] bifida baby is fit for boarding out only’. This child was discharged the same year to a foster family. In 1977, the records state that ‘family wishes to adopt knowing full medical history. Want to change from B/O to adoption’, and in 1978 the child was certified fit: ‘Now 2 years…Mother knows about abnormal EEG and sp[ina] bifida occulta and still wants to adopt…fit for adoption’. By this time the spina bifida was deemed to be ‘of no medical significance, as bladder control is now present’, however she had an abnormal EEG pattern’. The foster parents were ‘aware of the medical facts and are most anxious to adopt her. It is my opinion that [child] is fit for adoption and would benefit by placement with the family who have given her so much love and security’. 
31.166 The following tends to confirm that all the care that could reasonably be given to children resident in the home was given. The child, a little girl, remained in Pelletstown for nine years. The Pelletstown staff had difficulties placing children who were outgrowing the home and the paediatrician explored all avenues for the welfare of the child. The child was born in Pelletstown in 1975. When she was three years old, a medical officer tried to have her accepted in St Mary’s Auxiliary Hospital in Baldoyle. The child had been on a waiting list for Baldoyle for at least a year, again highlighting the lack of facilities available. She remained in Pelletstown. The staff hoped to place the child in a special home near her mother. This attempt to place the child near relatives reflects the broader shift towards a more community and family based care model for children with intellectual disabilities in Ireland from the mid-1960s. In 1982, when this child was seven years old, a Pelletstown doctor contacted a specialist children’s home in provincial Ireland: ‘We have to close down our unit for bigger children here at the end of November and she will have to be transferred to a unit with small handicapped infants and this is most unsuitable for her’. The Pelletstown doctor explained: ‘I feel that [child] is better placed where there would be some relatives to visit her’. However a consultant psychologist reported that the child’s mother ‘had little or no interest in [child]…in view of this I do not feel that it would be in the child’s interest to be near her mother. [Child] seems to have been rejected by her family. I can offer no better specialised care for [child] than she could obtain in Dublin. I do, therefore, not propose to accept her as a patient in X Hospital. However, in the future should [mother] change her mind and develop relationship again with her daughter I would be willing to review the situation’.

31.167 Some months later the Pelletstown medical officer wrote to the secretary of the Parents and Friends Association of the Mentally Handicapped in the area where the above children’s home was located:

She is a child who is timid, nervous, and has been wrongly placed most of her life. She is too severely handicapped i.e. wheelchair for admission to school and too mentally handicapped for physically handicapped school like Baldoyle. Therefore she has not had adequate stimulation or a chance to develop her potential. She can say several words and is encouraged by staff and occasional visits from speech therapist to do so. She makes all her wants known and is a gentle sensitive girl who is crying out for attention and stimulation. Given the proper environment she should make progress quickly. She had 20 minutes from the Montessori teacher when we had one and [child]
looked forward to this very much...In summary [child] is an illegitimate Spina bifida girl with IQ within range of lower moderate to severe who has not had adequate opportunities to develop her inherent potential. In a small intimate group [child] should be a popular little girl as she is affectionate and timid, but has a will of her own and shows interest in all that surrounds her.

It seems that the child was discharged there.

31.168 A ‘legitimate’ child who was born in the 1980s was abandoned by his parents and left in Eglinton House. Notes in his medical charts summarise his situation: ‘Child of…couple who have completely rejected him & he is now in the care of E.H.B. Parents 1st cousins. 3 children in their family...One has died with a diagnosis of toxoplasmosis and microcephaly at 6 years. Mother cared for him at home - is depressed and unable to cope with this baby’. This child’s diagnosis was similar: ‘Microcephalic - seizures only partially controlled...Seizures are probably secondary to toxoplasmosis’. The child was blind, and his ‘blindness [was] due to brain malfunction’. He was made a ward of court. A detailed report from social workers explained that ‘no abnormalities had been observed by Holles Street on completion of a scan of mother and child...The mother totally rejected [child] at birth and continued to do so...It was made very clear that under no circumstances were the family prepared to take [child]...They felt that they had already gone through the birth and death of one child...It was thus, after consultation with our legal advisors that [child] was placed in Voluntary Care of the Health Board...There is a great deal of sympathy and anxiety for [child] in obtaining a family to care for him, despite his various handicaps. There is a general consensus that we would hope that a family placement be found for [child] rather than institutional care for this baby’. He was discharged to a foster family in 1990.

31.169 A surgeon in Dr Steeven’s Hospital operated on children with common conditions such as cleft palates, squints and harelips, but also with more complicated problems such as missing outer ears requiring reconstruction. In the 1960s a child was born with a protruding lower lip. She had a lip shave operation in Dr Steeven’s Hospital which was very successful and was subsequently declared fit for adoption.

31.170 Another child had ‘6 toes on one foot - 6 fingers - extra digit on right hand will need surgical removal’. The ‘Supernumerary finger and toe [were] removed’ in St Kevin’s in November 1968.
Conclusion

31.171 In conclusion, the question whether race, mental and/or physical conditions/disabilities of the mother and/or the child affected the outcome for the child, especially if it prevented adoption or fostering, can be answered in the affirmative. However this answer must be carefully qualified, as there does not appear to have been systematic discrimination.

31.172 The records available to the Commission, in the 275 cases of race across Pelletstown and Bessborough between 1922 and 1998, indicate that 154, 56% were ‘placed for adoption’. Race does not seem to have been a significant factor in preventing adoption, but there were occasions when it was a factor as the examples above show. There were families in Ireland who specifically sought to adopt ‘mixed race’ children, but also some who specifically did not want children who were not white. It would appear that religion and disability were more of a problem than race. While there is no direct evidence of different treatment or institutionalised racism in the Pelletstown records, a number of sources imply that individuals may have had a negative bias. Interviews conducted by the Commission, which reflect the views and experiences of people who have been in the home as mothers and/or as children, tend to describe institutionalised racism in clear terms.

31.173 Likewise, maternal mental illness or intellectual disability did in some cases prevent or delay adoption, but there is no pattern of systematic discrimination. Adoption was sometimes seen as the best outcome for the child due to the mother's condition. Psychiatrists were not systematically advising against adoption and they acknowledged that there was a lack of understanding of mental illness. There are many cases for which the mother’s condition did not prevent adoption. In the 1930s and 1940s, too little information is available to be conclusive, but it is likely that the majority of ‘illegitimate’ children would have been committed to industrial schools regardless of their mothers’ mental condition. The Adoption Board and adoption societies inquired about mothers’ mental health, with an increased interest in the possibility of a child inheriting a mental condition in the 1960s. The proportion of women experiencing distress due to their pregnancy as unmarried women then also became recognised as being contingent, and therefore not a transmittable condition.
CHAPTER 31 DISCRIMINATION

31.174 The rise in the number of mothers who are recorded with intellectual disabilities or a history of mental illness from the 1960s suggests that there were many such cases among the women in mother and baby homes in the earlier decades that were not recognised or treated. This would also have applied to married women at that time but the incidence of mental illness during pregnancy was almost certainly greater among women who were unmarried. Changes in societal perception of legitimacy, but also of mental illness and mental disability, occurred for the most part in the early 1970s; unmarried mothers were granted an allowance in 1973, which in itself was an acknowledgement of their existence; and as far as the mentally ill and intellectually disabled are concerned, there was a shift away from long term institutionalisation towards inclusion in the communities and outpatient services. In the 1980s and 1990s the situation in Ireland had changed further in this direction, and as unmarried women were generally enabled to keep their children, it becomes harder to determine whether a mental condition was affecting the outcome for the child. While the social context had changed and women were better supported to keep their children, at times it was deemed in the best interest of the child to be placed in foster care. There are some cases in the Pelletstown records of women whose history of mental illness, substance abuse, or disadvantaged social background warranted an intervention from the EHB.

31.175 Of note is the large proportion (65%) of unaccompanied ‘legitimate’ children with intellectual disabilities placed in Pelletstown; ‘legitimate’ children constituted 35% of all children with intellectual disabilities in Pelletstown. A proportion of ‘legitimate’ physically handicapped and/or sick children was sent to Pelletstown for palliative care or abandoned there. Pelletstown was a place where children with intellectual and physical disabilities were placed before they could be accepted in specialised institutions. The lack of places in such institutions was a recurrent problem. Waiting lists were long. Children remained in Pelletstown ‘pending a vacancy’. As institutions for children with intellectual disabilities were constantly at capacity, children were often discharged to the public psychiatric hospital in Portrane, St Ita’s, sometimes as young as two years old. For the later period children with intellectual and physical disabilities could be fostered if their condition was not too constraining. Fostering was often seen as desirable as it offered the stimulation children could not receive in an institution. As far as can be ascertained from the records available to the Commission, the Pelletstown staff gave the children the medical attention they needed.
31.176 In summary, physical and intellectual disabilities did affect the outcome for some children, but there appears to have been no systematic or large scale discrimination in either Pelletstown or Bessborough. It is notable that no submissions were made to the Commission either by individuals or groups on the issue of disability or mental illness in the homes so the voice of those affected residents has not been heard.
Chapter 32: Adoption

Introduction

32.1 The Commission’s Terms of Reference require it to examine the exit pathways of children who did not remain in the care of their parents in the institutions under investigation. In particular, the Commission is mandated to identify:

- the extent to which the child’s welfare and protection were considered in practices relating to their placement in Ireland or abroad;
- the extent of participation of mothers in relevant decisions, including
  (i) the procedures that were in place to obtain consent from mothers in respect of adoption, and
  (ii) whether these procedures were adequate for the purpose of ensuring such consent was full, free and informed; and
- the practices and procedures for placement of children where there was cooperation with another person or persons in arranging this placement, this to include where an intermediary organisation arranged a subsequent placement.

32.2 Adoption, whether informal prior to 1953, or legal from 1953, or foreign, was a very significant exit pathway for children in the institutions being investigated. In this chapter, the Commission examines how these forms of adoption were organised and implemented and assesses these practices from the point of view of the Terms of Reference.

32.3 It should be noted that industrial schools and other orphanages were also significant exit pathways for children in the institutions under investigation. Children as young as two were placed in industrial schools by the public assistance/health authorities. There are also examples of mothers applying to the courts to have their children placed in industrial schools in order that they could leave the mother and baby home - see Chapter 19. The Commission has no doubt that, whatever the shortcomings of the legal adoption system, it was preferable to placing children in industrial schools or to boarding out or placing at nurse.

32.4 In order to try to meet the requirements in the Terms of Reference, the Commission collected such information as is available on the operation of informal ‘adoptions’; examined the law on adoption and the issues which have been
litigated; reviewed the literature on adoption practices and procedures in Ireland and, to a lesser extent, in other countries; examined the institutional records of the institutions under investigation, the records of the Department of Health and the Department of Foreign Affairs (in relation to foreign adoptions); interviewed birth mothers; and interviewed representatives of adoption societies, social workers who were or are engaged in adoption and former members of the Adoption Board (An Bord Uchtála).

32.5 The Commission has not conducted a comprehensive review of adoptions. It is concerned only with the placement of children from the institutions under investigation and with the specific issues identified in the Terms of Reference. However, the law on adoption and adoption practices do not distinguish between these children and all others placed for adoption.

A: Pre 1953: informal ‘adoption’

32.6 Prior to the introduction of legal adoption in Ireland, the word ‘adoption’ was often used to describe informal and non-legally binding arrangements whereby families took responsibility for children. These informal ‘adoptions’ did not confer any rights or responsibilities on the child or the foster parents. When formal legal adoption became available in Ireland (1 January 1953), a number of the first adoption orders were made in respect of children who had been informally adopted.

32.7 The institutions under investigation had very little involvement in informal ‘adoption’. While many of the children had been born in these institutions, their placement in foster care was usually organised by the public assistance/health authorities or the mother or her family or a charitable society and not by the institutions. The institutional records contain very little information about the role of the birth mothers in the placement of children for boarding out. In some cases, the mothers had left the institutions and boarding out was organised by the public assistance authorities or charitable organisations; in other cases, the mothers left the institution with their children and then placed them privately or with the public assistance authorities or charitable organisations for boarding out.
