Executive Summary

The story of mother and baby homes in Ireland is complex and its nuances cannot easily be captured in a summary. The Commission’s Terms of Reference cover the period 1922 - 1998, a span of 76 years. There was great change in that period: massive improvements in living conditions and changes in attitudes to religion and morals. The experience of women and children in the 1920s was vastly different from the experience in the 1990s regardless of where they lived. The institutions under investigation changed considerably over the period: the two largest institutions were in operation for the entire period but they were very different institutions in 1998 than they were in 1922.

Ireland was a cold harsh environment for many, probably the majority, of its residents during the earlier half of the period under remit. It was especially cold and harsh for women. All women suffered serious discrimination. Women who gave birth outside marriage were subject to particularly harsh treatment. Responsibility for that harsh treatment rests mainly with the fathers of their children and their own immediate families. It was supported by, contributed to, and condoned by, the institutions of the State and the Churches. However, it must be acknowledged that the institutions under investigation provided a refuge - a harsh refuge in some cases - when the families provided no refuge at all.

Improvements in society generally and in the institutions came gradually. Significant changes included the introduction of free post-primary education in the 1960s and the changes consequent on membership of the then EEC from 1973. 1973 also saw the introduction of the Unmarried Mother’s Allowance; this was the first time a direct State payment was available to assist an unmarried woman to rear her child in the community.
A: The people

1. There were about 56,000 unmarried mothers and about 57,000 children in the mother and baby homes and county homes investigated by the Commission. The greatest number of admissions was in the 1960s and early 1970s. It is likely that there were a further 25,000 unmarried mothers and a larger number of children in the county homes which were not investigated; admissions to county homes were largely pre-1960. While mother and baby homes were not a peculiarly Irish phenomenon, the proportion of Irish unmarried mothers who were admitted to mother and baby homes or county homes in the twentieth century was probably the highest in the world.

The women

2. The women who were admitted to mother and baby homes ranged in age from 12 years old to women in their forties. However, 80% were aged between 18 and 29 years and this was remarkably consistent across the larger mother and baby homes. 5,616 women, 11.4% of the total for whom information about their age is available, were under 18 years of age. The Commission has not seen evidence that the Gardaí were routinely notified about pregnancies in under-age women.

3. The number of admissions among women under 18 rose sharply in the early 1960s and it remained at a high level for the next two decades. While Pelletstown, followed by Bessborough accounted for the largest number of admissions of women under 18 years of age, Dunboyne was the mother and baby home with the highest proportion of women under 18 years - 23.4% of total admissions.

4. Some pregnancies were the result of rape; some women had mental health problems, some had an intellectual disability. However, the majority were indistinguishable from most Irish women of their time. The only difference between the women in mother and baby homes and their sisters, class-mates and work companions was that they became pregnant while unmarried. Their lives were blighted by pregnancy outside marriage, and the responses of the father of their child, their immediate families and the wider community.

5. Women were admitted to mother and baby homes and county homes because they failed to secure the support of their family and the father of their child. They were forced to leave home, and seek a place where they could stay without having
to pay. Many were destitute. Women who feared the consequences of their pregnancy becoming known to their family and neighbours entered mother and baby homes to protect their privacy. Some travelled to Britain, for the same reason.

6. Ireland appears to be the only country where large numbers of unmarried pregnant women left their native country. However, it must be acknowledged that many of their fellow citizens also emigrated.

7. The profiles of the women in mother and baby homes changed over the decades, mirroring changes in Irish women’s lives. In the early decades most women who were admitted were domestic servants or farm workers or they were carrying out unpaid domestic work in their family home. In later years, however, many of the women were clerical workers, civil servants, professional women and schoolgirls or third-level students.

8. There is no evidence that women were forced to enter mother and baby homes by the church or State authorities. Most women had no alternative. Many pregnant single women contacted the Department of Local Government and Public Health (DLGPH), later the Department of Health, their local health authority, or a Catholic charity seeking assistance because they had nowhere to go and no money. Women were brought to mother and baby homes by their parents or other family members without being consulted as to their destination.

9. The overwhelming majority of women and children were maintained in the institutions by their local health authority but there were some who were ‘private patients’ and were paid for by themselves or family members. In many cases, they were cut off from the world and some were assigned a ‘house name’. The mother and baby homes gave women some assurance that their secret would be protected.

The children

10. The vast majority of children in the institutions were ‘illegitimate’ and, because of this, suffered discrimination for most of their lives. (This was true of all ‘illegitimate’ children). The vast majority of children born in the institutions have no memory of their time there but some stayed in the institutions after their mothers left and a small number were in institutions until the age of seven.
11. Before the availability of legal adoption (from 1953), children who left the institutions usually ended up in other institutions such as industrial schools or were boarded out or nursed out. After legal adoption became available, it gradually became the most likely outcome. There can be no doubt that legal adoption was a vastly better outcome than the alternatives previously available.

12. The very high rate of infant mortality (first year of life) in Irish mother and baby homes is probably the most disquieting feature of these institutions. The death rate among ‘illegitimate’ children was always considerably higher than that among ‘legitimate’ children but it was higher still in mother and baby homes: in the years 1945-46, the death rate among infants in mother and baby homes was almost twice that of the national average for ‘illegitimate’ children. A total of about 9,000 children died in the institutions under investigation - about 15% of all the children who were in the institutions. In the years before 1960 mother and baby homes did not save the lives of ‘illegitimate’ children; in fact, they appear to have significantly reduced their prospects of survival. The very high mortality rates were known to local and national authorities at the time and were recorded in official publications.

**B. The institutions**

13. There were different types of institutions with different governance, financial arrangements and practices. Some were owned and run by the local health authorities - the county homes, Pelletstown, Tuam and Kilrush. Others were owned and run by religious orders, for example, the three homes run by the Congregation of the Sacred Hearts of Jesus and Mary - Bessborough, Sean Ross, Castlepollard (the Sacred Heart homes). They are often described as ‘extern’ homes or ‘special’ homes. Regina Coeli hostel was run by the Legion of Mary and it differed from the other large homes in that it aimed to keep mothers and children together. The Bethany Home was founded by a Protestant evangelical group.

14. Some of the institutions were in very poor physical condition. Living conditions in Irish homes were generally poor before the 1960s; however, poor sanitary conditions in congregated settings have much more serious consequences than in individual homes. County homes, Kilrush and Tuam had appalling physical conditions. Conditions in the other mother and baby homes were considerably better and improved over time; in particular, conditions in Dunboyne were very
good. The Commission has not seen any evidence of major shortcomings in any of the homes or flatlets that were operating in the 1970s-1990s.

**Treatment in the institutions**

15. The women and children should not have been in the institutions. The conditions were regimented and institutional especially in the larger institutions and particularly before the 1970s but there is no evidence of the sort of gross abuse that occurred in industrial schools. There are a small number of complaints of physical abuse. The women worked but they were generally doing the sort of work that they would have done at home; women in the county homes did arduous work for which they should have been paid and there are a few other examples where this is also the case.

16. Many of the women did suffer emotional abuse and were often subject to denigration and derogatory remarks. It appears that there was little kindness shown to them and this was particularly the case when they were giving birth. The large institutions were regimented and they were inadequately staffed until the later decades. The atmosphere appears to have been cold and seemingly uncaring. They offered little sympathy or counselling to women who may have been rejected by their family and by the father of their child. There were no qualified social workers, or counsellors attached to these homes until at least the 1970s, and until that time, there is no evidence that women were given opportunities to discuss the circumstances of their pregnancy or future options for their child. Women were dissuaded from sharing their stories with their fellow residents, because of concerns to protect their privacy though such conversations might have offered some comfort at a traumatic time. Conditions improved in all respects in the later decades.

17. Many of the women found childbirth to be a traumatic experience. The overwhelming majority were first-time mothers and they were probably uninformed about childbirth. First-time childbirth can be frightening for any woman; it was undoubtedly worse for women whose pregnancy had devastated their normal life and resulted in their removal from home, family and friends. The trauma of childbirth must have been especially difficult for the many women who had no prospect of keeping their child. However, the hostile comments were not restricted to mother and baby homes. Letters written in the 1970s to Cherish describe hostile comments made by neighbours to women and their families. Women who
were transferred from a mother and baby home to maternity hospitals to give birth, for medical reasons, were subjected to unfriendly comments by fellow-patients and their visitors.

18. Mother and baby homes were greatly superior to the county homes where, until the 1960s, many unmarried mothers and their children were resident. Conditions in the county homes were generally very poor; this, of course, was also true for the other residents who were mainly older people and people with disabilities. The women in county homes have been largely forgotten. They included women on a second or subsequent pregnancy and women from the poorest families. County homes admitted women with special needs, mental health problems, venereal disease or a criminal conviction, who would be rejected by a number of mother and baby homes. They also accommodated children who had special needs, including the children of married families. The accommodation and care given to these children in county homes was grossly inadequate; some of the descriptions are extremely distressing.

19. Until 1973 when the Unmarried Mother’s Allowance was introduced, most women had no realistic prospect of keeping their child unless they were assisted by their family. Regina Coeli hostel was the only institution that supported women who wished to raise their child. There is evidence that women who became pregnant after 1973 were not always aware of this State support and they continued to face pressure from family and perhaps from the staff in a mother and baby home to place their children for adoption.

**Regulation of mother and baby homes**

20. The county homes, successors to the pre-independence workhouses, were owned and controlled by local authorities. They were responsible for running costs, maintenance, and major improvements. Money came from the local rates - a tax on property. The staff in county homes were local authority employees, though most of the domestic work was done by residents who were unpaid: the majority were unmarried mothers. The DLGPH, later the Department of Health regulated many aspects of the county homes including diets, and county homes were subject to regular inspections by the department.

21. As noted earlier there were two distinct types of mother and baby homes: Pelletstown, Kilrush and Tuam were established by local authorities, and they were
EXECUTIVE SUMMARY

owned and under the control of local authorities. Dunboyne, which opened in 1955, was established and equipped by a group of local authorities. It was leased to the Good Shepherd Sisters who were responsible for its day-to-day running. The three Sacred Heart homes and Bethany and Denny were privately owned and controlled. Most women and children in the Sacred Heart homes were maintained by local authorities. Denny received public funding, as did Bethany from the 1940s. The Regina Coeli hostel, run by the Legion of Mary did not receive regular public funding.

22. Overall responsibility for the homes owned by a local authority rested with the local authority. They were responsible for the upkeep, improvements and oversight. The Dublin Union and its successor organisations visited Pelletstown regularly, and there is evidence that they exercised oversight. The Daughters of Charity, who ran Pelletstown were salaried local authority employees, as were the lay nurses and other staff. Food and supplies were bought and paid for by the local authority. When the Sisters of Mercy ran Kilrush, most of the Sisters were local authority employees, who received a salary; the lay staff was paid by the local authority.

23. When the Children’s Home was in Glenamaddy the Bon Secours Sisters who ran the home were salaried local authority employees; the Sisters had previously run the Glenamaddy workhouse on a similar basis. When the Children’s Home relocated to Tuam the Sisters were no longer treated as local authority employees and they did not receive a salary. Staff in Tuam were recruited and paid by the Sisters, from the capitation payment that they received from the Galway and Mayo local authorities, though much of the work was carried out unpaid by the mothers. The Galway local authority held regular meetings in the Children’s Home; however, it is unclear whether these were used to conduct inspections. The Superior in Tuam kept the county manager informed about the women and children in the home, and he was involved in making decisions about their future, including specifying that some women should be sent to a Magdalen laundry. There is evidence that the Department of Health was confused as to the status and ownership of Tuam.

24. The remaining mother and baby homes were private institutions, so governance was a matter for the religious congregation or the charity that owned the institution. In the 1920s there was regular communication between the South Cork health
authority and the Superior in Bessborough. There does not appear to have been any legal basis for this, other than the recognition that the Cork authority was maintaining most of the women and children in Bessborough. There is no evidence of comparable communication between the other private mother and baby homes and a local authority.

The respective roles of local and national government

25. Bessborough opened without any apparent involvement by the DLGPH. An application to the Hospitals Commission for funding to construct a maternity hospital in Bessborough led to inspections and more frequent contact with the department and the Hospitals Commission in relation to the building tender and the requirements of this mother and baby home. Sean Ross, Castlepollard, and Pelletstown also secured major funding from the Hospitals Commission, which though technically independent, worked closely with the DLGPH. The Hospitals Commission inspected the homes, commenting on facilities and matters that required improvement. They acted in a similar manner in the case of all institutions that they funded.

26. Some oversight was exercised by national and local government but there was no clear policy on oversight and no clear demarcation between the roles of national and local government. The women inspectors in the Department of Local Government and Public Health/Department of Health tried valiantly to have conditions improved. This is especially true of Miss Alice Litster¹ who was an inspector from 1922 to 1957. While the department inspectors were thorough in carrying out inspections and were constantly seeking improvements, the responsibility to actually do anything rested mainly with the local authorities.

27. The Registration of Maternity Homes Act 1934 gave the DLGPH/Department of Health the authority to inspect all places where women gave birth, or received nursing care following a birth. All maternity homes were required to register, and registration was the responsibility of the local authority. The inspections conducted under the 1934 Act enabled the DLGPH/Department of Health to visit the private mother and baby homes and to recommend improvements. However, there was a lack of clarity in the legislation. Did the powers of inspection extend to the entire mother and baby home, including the nurseries that accommodated babies, who

¹ Her name is very frequently misspelled, even by her colleagues, as Lister.
were older than one month and the mothers’ dormitories and living space, or was it confined to the maternity unit? In practice, the departmental inspectors inspected all aspects of the homes.

28. The power to initiate prosecutions for infringements of the 1934 Act rested with the local authority and the penalties were generally light. (No mother and baby home was ever prosecuted). In the early 1940s when successive inspections carried out by the DLGPH revealed major shortcomings in Bessborough, the only power open to the department was to withdraw ministerial approval for local authorities to maintain women and children in Bessborough. They could not order the closure of the home, which continued to admit private patients, many of whose children died. The county Cork health authority had the power to close Bessborough but there is no indication that it considered doing so.

29. Registration certificates issued by local authorities under the 1934 Act stipulated the maximum number of beds, but this was often exceeded, and the numbers specified on the certificates were greater than numbers determined by a DLGPH buildings inspector. However, the department did not set maximum occupancy figures for mother and baby homes until the 1940s, some years after the Act came into force. These were not statutorily binding and were not enforced in either the local authority homes or the private mother and baby homes because they would have resulted in a massive reduction in capacity.

30. Although the DLGPH/Department of Health received regular inspection reports on mother and baby homes, which were often critical of conditions, the evidence suggests that the department preferred to use persuasion, not compulsion to implement improvements. The department’s main interest appears to have been the occupancy figures, and the rising cost of maintaining women and children in these homes.

**Influence of religion and religious organisations**

31. Local authorities often deferred to the views of the religious orders that ran mother and baby homes or to the views of the diocesan bishop. Galway county council acceded to the demands of the Sisters of Bon Secours that children should remain in the Children’s Home until the ages of five (boys) and seven (girls), despite the fact that this contravened the wishes of the DLGPH/Department of Health. When
EXECUTIVE SUMMARY

Mayo county council decided to remove children from Tuam at an earlier age, the Sisters threatened not to admit Mayo children in future and the local authority conceded their demands. Clare county council consulted the bishop of Killaloe about future arrangements for unmarried mothers when they decided to close Kilrush; he advised that women should be sent to Sean Ross.

32. There is no evidence that the Catholic hierarchy played a role in the day-to-day running of mother and baby homes. A religious congregation who wished to open any establishment in a diocese - such as a school, novitiate, or a mother and baby home - required the permission of the diocesan bishop. The Congregation of the Sacred Hearts of Jesus and Mary made several attempts to open a mother and baby home in Dublin, but the archbishop of Dublin did not grant approval. In the 1940s, the bishop of Cork, Dr Cohalan, claimed that he had had regular dealings with the DLGPH when Bessborough was being established but the Commission has seen no evidence to support this claim. In 1924 he asked the Congregation of the Sacred Hearts to admit pregnant women to Bessborough but they were reluctant to do so. In 1928 he ‘almost insisted’ that Bessborough should provide maternity services. A small maternity unit was opened in 1930; whether this was in response to Bishop Cohalan’s request is unclear. By the early 1940s the inspectors of boarded out children in the DLGPH were becoming concerned about the well-being of children born to private patients in Bessborough and they sought information about their whereabouts when they left Bessborough. Dr Cohalan declared that providing such information would be a breach of canon law. When the DLGPH sought a change of Superior in Bessborough because of the appallingly-high death rate, he denounced this request. The replacement of the Bessborough Superior was delayed for four years after the department requested it, and many infants died during that time. It seems probable that the bishop’s intervention was elicited by the congregation.

33. The Galway county manager kept the archbishop of Tuam and the bishop of Galway informed about plans to move the Children’s Home from Tuam, to the outskirts of Galway in the late 1950s. The archbishop described the proposal as ‘undesirable in every way’; he claimed that the proposed new location was close to a busy road. ‘Anyone who has experience of the workings of a Home for unmarried mothers will tell you that such a Home must be in a place that is quiet, remote and surrounded by high boundary walls … In many cases they are on the look-out to get in touch with men, and some of them cannot repress their
excitement even when a man comes to the Home to deliver a message … Many of these unmarried mothers are anxious to get off without delay. The only thing that prevents their leaving is the strict supervision and boundary walls … in some cases it has been known that attempts were made from outside to get at the inmates'. Although the archbishop objected to Tuam being closed, he was overruled by the Minister for Health. When the Department of Health proposed to transform Sean Ross into a home for children with special needs in the 1960s, the bishop of Killaloe rejected the proposal. His intervention resulted in a number of visits to the bishop, by senior civil servants, and deferential letters from ministers. The closure of Sean Ross was delayed for several years, until the bishop had died, and his successor gave his approval.

34. In 1928 the DLGPH refused to sanction the appointment of a Sister of Mercy as matron in Kilrush - a local authority mother and baby home - because she was not a qualified nurse, and the congregation left Kilrush as a consequence. The Registration of Maternity Homes Act 1934 did not give the department or the local authority the power to refuse to sanction the appointment of a matron in Bessborough because she lacked the appropriate qualifications, though all maternity homes were required to employ one or more qualified midwives. Staffing by religious sisters in Bessborough and other private homes was determined by the congregation.

Finances

35. The capitation payments for women and children in the mother and baby homes were financed from the rates paid to the local authorities. In 1947, the health services generally started to be partially financed from national taxation. It seems to be at this stage that the mother and baby homes started to be required to provide audited accounts to the Department of Health. These accounts were then used to determine whether an increase in the capitation payments was merited.

36. The Commission has not seen any evidence that the religious orders who ran the mother and baby homes made a profit from so doing. At various times, it is clear that they struggled to make ends meet and their members were not always paid for their work. This was a particular problem when occupancy levels fell and women stayed for shorter periods. Payments by local authorities were not always on time.
37. The capitation rates, while they were not overly generous, and often failed to keep pace with inflation, were considerably more generous that the social welfare payments available to an adult and a child living in the community.

38. Under the institutional assistance regulations, the women in the homes (or, if they were under 16, their parents) could have been charged for their stay in the homes but this does not appear to have happened in most of the larger institutions. Residents in county homes were charged if they had an income.

C: What was different about Ireland

39. The Commission is not aware of any comprehensive international study that is comparable to this report. However, it is probable that the proportion of Irish unmarried mothers who were in mother and baby homes was the highest in the world. In 1967 the number of babies who were adopted in Ireland was equal to 97% of the ‘illegitimate’ births; this was the highest in the world. Large numbers of Irish women continued to give birth in mother and baby homes in the 1970s, though by that time most mother and baby homes in other countries had closed.

Concept of illegitimacy

40. ‘Illegitimacy’ was widely regretted and disowned in most countries in the early and mid-twentieth century so in that respect Ireland was not unique. Few single women had the financial resources to raise a child without the support of their family or the father of their child. The proportion of Irish men who acknowledged paternity was low. In the German state of Westphalia one-third of the fathers of ‘illegitimate’ children born in 1929 voluntarily acknowledged their paternity. Few Irish men contributed to the maintenance of their ‘illegitimate’ child or acknowledged their existence. For the first half of the century many would have been unable to do so because they were farm labourers or unpaid workers on family farms or in family businesses. While mothers had the right to apply for maintenance under the Illegitimate Children (Affiliation) Orders Act 1930, it generally proved impossible to secure the necessary evidence.

Responsibility of fathers

41. In the past when a single woman was known to be pregnant the most common response in all countries was to try and arrange a marriage between the woman and the father of her child. In the early and mid-twentieth century the Irish
marriage rate was the lowest in the western world and there is an extensive literature in fiction and non-fiction about the reluctance of Irish bachelors to marry. Chapter 8 relates the stories of women who became pregnant by a long-term boyfriend who refused to marry and often disappeared on hearing of the woman’s pregnancy. In other cases the man or the woman’s parents opposed their marrying because of difference in social background or religion. In the light of Ireland’s low marriage rate and late age of marriage, it seems possible the proportion of men who married their pregnant girlfriend may have been lower than elsewhere.

**Woman’s parents**

42. In the past, if a single woman gave birth and there was no prospect of marriage, a common outcome was that the mother’s family provided a home for her child who was raised either by grandparent(s) or by her/his mother with the support of her family. This child might remain with grandparents when the mother married, or might live with the mother and her husband, who might not be the father. There are many contemporary accounts throughout this report of Irish parents who were willing to welcome their daughter back into the family home following the birth but were not prepared to accept her child. There are various reasons why Irish parents may have been less willing to welcome an ‘illegitimate’ grandchild into their home than elsewhere. Irish families were large; in 1960 Irish marital fertility, that is, the number of children born in a marriage, was the highest in the developed world despite the fact that couples married at a late age. Many families were poor and living in overcrowded homes so an additional child would have put them under pressure. Such a child would have been especially unwelcome in a farm house where the marriage of the inheriting son depended on clearing the home of non-inheriting siblings.

43. There is also the question of a family’s standing in the community. Many Irish marriages until the 1960s involved an element of match-making and a dowry and these processes were reliant on a family’s respectability. An ‘illegitimate’ birth could destroy the marriage prospects, not just for the woman who had given birth, but for her siblings, hence the pressures to keep it a secret by sending her to a mother and baby home. Many women who concealed their pregnancy from parents or family members were conscious of such attitudes. Pressure to keep their pregnancy a secret added to a woman’s trauma.
44. The dominance of the family farm and family business and the slow pace of economic development meant that Irish men and women in their late teens and early twenties were more likely to be dependent on their parents than their counterparts elsewhere. Land inheritance was important with farms passing from father to son. Agricultural concerns with breeding and lineage appear to have applied to marriage partners and children. When legal adoption was introduced in 1953, the take-up was slowest among the farming community. The rural values of respectability and family standing also existed in cities and towns, though to a lesser extent.

**Fleeing to Britain**

45. Many pregnant women fled to Britain, to protect this secrecy, only to face the prospect of being returned to Ireland against their wishes. There is no other known instance where substantial numbers of pregnant single women fled their country, though it was common elsewhere for women to move from their home place, generally to a city, in search of anonymity. British Catholic charities put considerable pressure on the Irish Hierarchy and on the government to repatriate the women. Some of the treatment meted out to these women, who were commonly described as PFIs, pregnant from Ireland, was inhumane and occasionally it placed them at medical risk. British authorities also returned children born there to Irish women, sometimes approaching the woman’s family who might be unaware of the child’s existence, asking them to take the child. The Department of Health and local authorities appear to have co-operated with these practices. The bishop of Cork, Dr Lucey, established an adoption society to place children born to Irish women in Britain with Irish adoptive parents.

**Church and State attitudes**

46. The Catholic church did not invent Irish attitudes to prudent marriages or family respectability; however, it reinforced them through church teachings that emphasised the importance of pre-marital purity and the sexual dangers associated with dance halls, immodest dress, mixed bathing and other sources of ‘temptation’. In the 1920s, the Irish Free State was a newly-independent nation which was determined to show the world that it was different; part of that difference related to the capacity to withstand the undesirable aspects of modernity, including sexual licence and alien cultures. There was a strong alignment of views between church and State, resulting in legislation against contraception, divorce, censorship of cinema and publications that was bolstered by church sermons denouncing...
sexual immorality and the evils of modern society. Priests who denounced a man or woman who was responsible for an extra-marital pregnancy were reinforcing wider social concerns with family lineage and the respectability of a community. It should be noted that, while there is evidence of such denunciations, they were not as common as is sometimes suggested.

**Infant mortality**

47. Although the first report of the registrar general of the Irish Free State highlighted the appalling excess mortality of children born to unmarried mothers and subsequent DLGPH reports noted the fact, there is little evidence that politicians or the public were concerned about these children. No publicity was given to the fact that in some years during the 1930s and 1940s, over 40% of 'illegitimate' children were dying before their first birthday in mother and baby homes. The high level of infant mortality in the Tuam Children's Home did not feature at meetings of Galway county council, though Tuam was under the control of the local authority and it held meetings in the Children's Home. The Bethany management board could describe health in the home as ‘excellent’, despite the minutes of the same meeting recording the deaths of a number of children. In wartime Birmingham the local authority introduced targeted measures to reduce infant mortality among 'illegitimate' infants and the death rate fell below the average for all infants in the municipality. But such action required public acknowledgement that these children existed and a commitment to promoting their well-being. There is little evidence of similar concerns within Irish society; the children of Irish unmarried mothers were hidden from the public gaze. Infant mortality in general remained high in Ireland until the late 1940s, especially in the inner cities, yet there was no national outcry about this, except among a small number of medical professionals.

**Distinctive features of Irish institutions**

48. Mother and baby homes were not unique to Ireland; in fact, Ireland was a latecomer but they did remain in existence for longer than other countries. Some features were distinctive. Irish homes were much larger. Scottish mother and baby homes ranged in size from 18 to 30 beds; in 1969 the modal size of the 22 mother and baby homes in the Netherlands was between ten and 19 places for mother and baby. British homes in the late 1960s accommodated an average of 13 women. The average number of women in Sean Ross and Castletpollard in the early 1950s was 140 or higher and the large size inevitably meant that Irish mother and baby homes were impersonal and highly regimented. It was common practice
for mother and baby homes in other countries to require that women remain for a designated period following the birth of their child - because it was believed that women who parted with their child very shortly after birth were at danger of a second pregnancy. But only in Ireland was it widely stated that women should remain for two years (in practice, as is set out below, relatively few stayed for two years).

**Religious involvement**

Most mother and baby homes in other countries were run by religious organisations and the religious salvation of mothers and children was central to their mission. In nineteenth-century Ireland there was intense competition between religious denominations to save the souls of orphaned, abandoned and destitute children including the children of unmarried mothers and this continued into the twentieth century. There were a number of charities whose mission was to ‘rescue’ Catholic children and bring them up as Protestants. Many Catholic charities such as St Patrick’s Guild, the Catholic Protection and Rescue Society of Ireland, the Rotunda Girls’ Aid Society and the Catholic Women’s Aid Society (based in Cork) were established to counteract this. Such denominational rivalry was not unique to Ireland but it appears to have persisted for a longer time than elsewhere; it impacted on Irish mother and baby homes until the 1940s. The main motivation behind the British and Irish Catholic charities who were involved in repatriating Irish women from Britain, either pregnant or with their new-born infant, was to prevent these children being ‘lost’ to Catholicism through adoption into Protestant families. Concerns, however-far-fetched, that state-regulated adoption would result in Catholic children being adopted by parents of a different religion were a factor in delaying the introduction of legal adoption in Ireland until 1952. Ireland was the second-last country in western Europe to legislate for adoption. The Netherlands, where religious divisions were deeply entrenched, introduced legal adoption in 1956.

**D: A brief chronological narrative**

As already stated, mother and baby homes were not unique to Ireland; they were established later in Ireland than in other places. There were many Magdalen institutions and ‘rescue’ homes in nineteenth-century Ireland but they did not admit pregnant women or unmarried mothers who were accompanied by a child.
Magdalen Asylum/Denny House was an exception. By 1900 mother and baby homes were found in all English-speaking countries, and similar institutions existed in Germany, the Netherlands and elsewhere. They were generally founded by religious communities/charities and the early homes were run by Protestant charities. Catholics appear to have been slow to establish mother and baby homes, perhaps because members of female religious orders were precluded from involvement with childbirth.

51. The stated primary mission of these homes was to promote reform and repentance though they also rescued destitute women from homelessness and life on the streets. It was widely believed that many first-time unmarried mothers became prostitutes and went on to give birth to additional 'illegitimate' children. If first-time mothers spent time in homes cut off from the world, carrying out domestic duties, being trained for future employment in domestic work, caring for their child, and spending time in prayer and other religious experiences, it was believed that they would avoid that danger.

52. The first proposal for mother and baby homes in Ireland came in the 1907 Vice-Regal Commission on the Irish Poor Law. At the time the workhouses were the only institutions providing for unmarried mothers. The Vice-Regal Commission suggested that unmarried mothers and their children should no longer be accommodated in workhouses but in dedicated mother and baby homes. These homes should be owned and run by religious organisations; alternatively they should be established by local authorities, who would place them under the control of a religious community. This became the template that was implemented by the Irish Free State.

53. The years of World War I and the immediate aftermath were marked by a rise in the rate of 'illegitimate' births in Ireland and elsewhere, though the rate of 'illegitimate' births in Ireland was among the lowest in Europe. The number of 'illegitimate' births rose slightly during the 1920s and 1930s and it increased more sharply during the years 1940-46 when it reached a peak. It fell quite sharply in the late 1940s and this decline continued until 1960 when the rate was 37% of the 1946 figure. The number of 'illegitimate' births began to rise after 1961 and continued to rise for the remainder of the century.
The chart shows the total number of ‘illegitimate’ births by year as recorded by the General Register Office (in blue) and the total number associated with mother and baby homes (in red). In the 1920s, 1930s and 1940s, less than one-third of ‘illegitimate’ births were associated with mother and baby homes. The proportion rose steadily during the 1950s even though the number of ‘illegitimate’ births fell sharply in this decade. In 1961, and in 1965, a majority of ‘illegitimate’ births were to women in mother and baby homes. Admissions remained high throughout the 1970s, though they accounted for a steadily declining proportion of ‘illegitimate’ births.
55. Mother and baby homes were established as part of the reforms to the poor law that were instituted after independence. The stated policy of the government was that unmarried mothers and their children should not remain in county homes (which were the successors to the workhouse), yet there were 450 unmarried mothers in county homes in March 1950. The number fell sharply over the next decade.

56. The motivation behind the creation of mother and baby homes was not clearly articulated, other than the fact that it removed the mothers and children from the county homes. It was believed that dedicated mother and baby homes could ‘reform’ first-time mothers, and prevent subsequent pregnancies. There was a strong opinion that first-time mothers should not come into contact with the mothers of more than one child who might be found in a county home. A DLGPH inspector suggested that mother and baby homes would reduce the incidence of infanticide and the number of women who were forced to resort to private nursing homes where they were financially exploited and their children placed, for a fee, in unsuitable foster homes. The first report of the registrar general of the Irish Free State had highlighted the fact that infant mortality among ‘illegitimate’ children was five times the national average, and while ‘illegitimate’ children in other countries
also suffered from excess infant mortality, no other country recorded such a high disparity.

57. Pelletstown was established as a mother and baby home in 1919. It was an integral part of the Dublin Union. It was owned and governed by the local health authority - the Dublin Board of Guardians initially and then its successors in title, ultimately the Eastern Health Board. A different model of mother and baby home was established in Bessborough in 1922. It was a private institution, owned and run by the Congregation of the Sacred Hearts of Jesus and Mary; it was purchased and equipped without public funding. The South Cork health authority transferred mothers and children to Bessborough and they paid the congregation a capitation rate for their care. This arrangement was implemented in 1922, at a time when a provisional government was in the process of creating the administrative systems for the new Irish Free State and fighting a civil war. There is no evidence that any member of government or an embryonic government department was consulted about this arrangement. But given that health and welfare services were the responsibility of local authorities, there is nothing untoward in that. The Bessborough model, where a local authority paid a capitation rate to a private mother and baby home, became the funding model which remained in place until the end of the twentieth century. The Bethany Home was founded in 1922 by a Protestant evangelical group. However, it did not seek public funding at that time.

58. During the 1920s two further local authority owned mother and baby homes opened - Kilrush and Tuam (which was initially based in Glenamaddy). Neither of these was exclusively a mother and baby home; they also housed unaccompanied children and Tuam housed homeless families. The three local authority homes were staffed by religious sisters. This was consistent with the practice in Irish workhouses before independence where many of the matrons and nursing staff were religious sisters.

59. A number of developments in the early 1930s ensured that the expansion of mother and baby homes took place in institutions that were privately-owned. The Department of Local Government and Public Health (DLGPH) asked the Congregation of the Sacred Hearts of Jesus and Mary to establish a second home. The senior inspector, Mrs Crofts, assisted the congregation in identifying a suitable location. In the early weeks of 1932, the Minister for Local Government and Public Health allocated money to Bessborough for capital improvements from the
Hospitals Trust Fund that was at his discretionary disposal. The *Public Hospitals Act 1933* listed mother and baby homes among the institutions that were eligible to apply for hospitals sweepstake money in future. When Pelletstown, Bessborough and Glenamaddy opened women were not admitted until after the birth of their child; Kilrush was the exception. By the mid-1930s however, most women entered a mother and baby home in the final stages of pregnancy and gave birth there. Capital funding from the Hospitals Trust Fund made it possible to construct and equip the maternity units and carry out other improvements to mother and baby homes.

60. The number of women entering mother and baby homes rose steadily in the 1930s. In the 1920s women who were maintained by a local authority had first to enter a county home before being transferred to Bessborough. By the end of the decade women were admitted directly removing the association with poor law institutions. The introduction of maternity services resulted in increased admissions and Bessborough began to admit private patients. Despite the opening of Sean Ross in 1931 and Castlepollard in 1935, both run by the Congregation of the Sacred Hearts, mother and baby homes were overcrowded by the mid-1930s.

61. Maternity units were added to mother and baby homes because unmarried mothers were not welcome in county hospitals. Galway county council determined that unmarried mothers should be excluded from the Central Hospital in Galway because their presence deterred ‘respectable’ married women from giving birth in the hospital. Unmarried mothers in Kilkenny were excluded from the county hospital and sent, regardless of distance, to give birth in the county home in Thomastown. However the Dublin maternity hospitals admitted unmarried women and appear to have given them similar care to married mothers.

62. The introduction of maternity units in mother and baby homes increased their medical/nursing responsibilities. The *Registration of Maternity Homes Act 1934* gave local authorities authority to license, inspect and regulate all hospitals and nursing homes where women gave birth or were cared for with their child following the birth. It also gave the DLGPH the right to inspect these institutions. This was the first time that a government department secured a role in overseeing privately-owned mother and baby homes. By 1939 a department inspector was expressing concern about the high rate of infant mortality in these homes. Infant mortality
rates peaked in most homes during the early and mid-1940s, coinciding with a national peak in infant mortality. 75% of the children born in Bessborough in 1943 died within the first year of life; 62% of children born that year in the Bethany Home died. The high rate of infant mortality raised serious questions about mother and baby homes: the large size, unqualified staff and inadequate staffing, poor management, and the limitations on the local and national authorities' willingness and capacity to implement reforms.

63. There is no evidence that unmarried mothers were ever discussed at Cabinet during the first 50 years after independence. Responsibility for unmarried mothers and their children was seen as resting with the local authorities. As described above, the relative roles and powers of the DLGPH and the local health authorities were never sufficiently clarified. In the late 1930s and the 1940s, DLGPH ministers and staff were aware of the major shortcomings in the mother and baby homes most especially the high rate of infant mortality. By the mid-1940s, ministers and senior department officials were involved in planning major reforms to health and welfare services; these reforms resulted in the establishment of separate Departments of Health and Social Welfare, and the drafting of a mother and child scheme. Yet with the exception of memoranda written by Miss Litster and submissions by the Joint Committee of Women's Societies and Social Workers, proposing alternative arrangements for supporting unmarried mothers and their children, there is no indication that consideration was given to effecting major changes to the existing provisions. Infant mortality fell sharply in the late 1940s in the mother and baby homes and nationally. This may have removed the motivation for major reforms, which would have involved fraught negotiations with religious congregations and members of the Catholic Hierarchy. There is no evidence of public concern being expressed about conditions in mother and baby homes or about the appalling mortality among the children born in these homes even though many of the facts were in the public domain.

64. The introduction of legal adoption from 1953 removed one of the underlying problems facing Irish mother and baby homes - the long-term future of the children. By the 1960s most women placed their child for adoption and left a mother and baby home within a few months of giving birth. In 1967 the number of babies adopted was 97% of the number of ‘illegitimate’ births. These statistics dispel any myth that the 1960s brought major changes in family or societal attitudes or practices towards ‘illegitimacy’.
65. There was little public discussion about unmarried mothers or mother and baby homes before the 1960s. Stories began to appear in newspapers and magazines in the 1960s. In the late 1960s, Ally began to provide family placements for pregnant single women, as an alternative to mother and baby homes. The 1970 Kilkenny Conference on the Unmarried Parent indicated that change was underway. Cherish was founded in 1972 as a support organisation for unmarried mothers which was run by the mothers. It provided both practical and psychological supports for women especially those who wished to raise their child. A growing number of single women no longer concealed their pregnancy and were determined to raise their child, though the difficulties that unmarried mothers continued to face in the 1970s and 1980s cannot be understated. By the 1970s however the Catholic church was more sympathetic towards unmarried mothers than in earlier times, because a growing number of single Irish pregnant women were opting to have abortions in Britain.

66. The introduction of Unmarried Mother's Allowance in 1973 passed without comment by any TD in Dáil Éireann, other than the Parliamentary Secretary to the Minister for Health and Social Welfare, Frank Cluskey who was introducing the legislation, and it attracted no attention in local or national newspapers. This silence suggests public uncertainty about the appropriate response - an unwillingness to either praise or criticise this new welfare payment. It was not until the tragic death of Ann Lovett in 1984 that there is evidence of extensive public commentary on unmarried motherhood, and serious questioning of Irish attitudes. Ireland was not unique in the 1970s or 1980s in its ambivalence towards single parents and the merits of providing them with state benefits; public criticism in Ireland was probably less vehement than among right-wing groups elsewhere. The enactment of the 8th Amendment to the Constitution in 1983, which guaranteed the right to life of the unborn, and the widespread attention given to the large numbers of single Irish women travelling to England for abortions, may have resulted in more tolerant attitudes.

67. The number of births to unmarried mothers doubled between 1971 and 1980. In 1980 a total of 552 babies were born to women who were in mother and baby homes. This figure was higher than the 498 born in these homes in 1950 or the 456 babies born in 1960. The numbers only began to fall in the 1980s. Mother and baby homes closed, down-sized, or were replaced by flatlets and hostels. In 1971, the number of adoption orders was 71% of the number of ‘illegitimate’ births;
by 1980 this had fallen to 37%, and to less than 9% by 1990. By the late 1990s most adoption orders in Ireland were family adoptions, or adoptions of foreign-born children.

68. By the 1970s unmarried mothers and their children in other western European countries were viewed as part of a wider cohort of one-parent families. The continuing compartmentalisation of unmarried mothers in Ireland - which lasted until the end of the century - reflected the constitutional prohibition on divorce and a failure to recognise broader categories of single parenthood, such as extra-marital births to married or deserted women, and births to married women who were divorced or separated. The status of ‘illegitimacy’ was not abolished until 1987. A married woman, who gave birth to an extra-marital child, faced particularly difficult circumstances. The Adoption Act 1952 applied only to ‘illegitimate’ children and orphans; unless a woman's husband testified that he was not the father, extra-marital children could not be adopted. Some were transferred to Nazareth Home in Fahan, Donegal from where they were sent to Northern Ireland where such adoptions were legal.

69. The women in mother and baby homes in the closing decades of the century remained for a much shorter time; they were generally free to come and go as they pleased, to meet friends or family, including boyfriends or spend weekends away, and visitors were encouraged. Almost all the work was carried out by paid staff. There was a transition from institutional care to supported accommodation in flatlets where women were encouraged to be independent. The first of these developments, Miss Carr’s Flatlets opened in 1972. Women in Dunboyne were tutored for State examinations; this enabled them to continue with their education at a time when most schools either excluded pregnant students and new mothers or certainly did not encourage them to attend. Women in Bessborough attended state-funded training courses. Denny House assisted women in learning to care for their child; it supported women with mental illness or addiction problems and women with difficult personal or family circumstances. The Commission believes that the flatlets and homes that survived in the 1980s and 1990s provided important supports for single mothers, who had specific medical or social needs that could not be met within the community, because of continuing prejudice or hostility on the part of families and the wider society.
E: The distinctive features of the institutions

70. As already stated, even though there was a lot in common between the institutions under investigation, there were also distinct differences. The following provides a very brief summary of the distinctive elements of each institution:

Dublin Union/St Patrick’s Navan Road/Pelletstown/Eglinton House 1919 - 1998

71. **The people:** 15,382 women and 18,829 children; it was not exclusively a mother and baby home as it also housed unaccompanied children; 5,888 children entered unaccompanied and many others stayed after their mother left. Initially, the unaccompanied children were foundlings and children who were abandoned, neglected or homeless. Later, it also admitted children with serious physical or intellectual disabilities and children who discharged from hospital with untreatable conditions. Many of the unaccompanied children were the children of married couples.

72. Before 1935, women were admitted to the Dublin Union and gave birth there before being transferred to Pelletstown. A maternity hospital opened in Pelletstown in 1935 and women entered directly. It was not restricted to first-time mothers; almost 30% of the women for whom this information is available were pregnant for a second or subsequent time.

73. **Length of stay:** The length of stay for mothers changed considerably over time but, apart from a few years in the 1940s, the average was always less than a year and less than six months from the early 1960s onwards.

74. **Premises/Living conditions:** Pelletstown itself was an institutional building with large dormitories and large children’s nurseries. Although improvements were gradually carried out, facilities were inadequate. In 1950 there were only four lavatories for 140 resident women. In 1966, women were sleeping in dormitories with 52 and 30 beds respectively that offered no privacy although plans were underway to divide them into cubicles. It closed in 1985. Eglinton House was a large house which catered for about 15 mothers and children and had good facilities.
EXECUTIVE SUMMARY

75. **Governance:** It was owned and financed by the Dublin Board of Guardians and its successors - ultimately the Eastern Health Board. It was run by the Daughters of Charity who were salaried local authority employees as were the lay nurses and other staff.

76. **Infant Deaths:** 3,615 children died; 78% of deaths occurred between 1920 and 1942. Pelletstown is unique in not recording a peak in mortality during the 1940s despite the record infant mortality in Dublin city during these years. In the years 1943-45 infant mortality in Pelletstown was 14.8%, which was substantially lower than other mother and baby homes. Some of the children who were in Pelletstown were there because they were seriously ill and there nothing further could be done for them in the children’s hospitals.

77. **Burials:** The burials of the children who died are properly recorded in Glasnevin Cemetery.

**Belmont Flatlets 1980- 2001**

78. This was not a traditional mother and baby home but rather hostel type short-term accommodation for a small number of women and children, about nine or ten at any one time. It was opened by the Daughters of Charity who ran Pelletstown and was financially supported by the Eastern Health Board. The women lived independently but did get support from social workers and public health nurses.

**Children’s Home Tuam (originally Glenamaddy) 1921- 1961**

79. **The People:** 2,219 women and 3,251 children; it was not exclusively a mother and baby home as it also accommodated unaccompanied children of married couples and widow(ers) whose parent was unable to care for them and married women or widows with children who were homeless or destitute. There were always large numbers of unaccompanied children; in 1943 there was an average of 258 resident children and 53 mothers. Almost all the women and children were from Galway and Mayo.

80. Before 1935, when a maternity unit was opened in Tuam, women gave birth in the Central Hospital in Galway. Medical care was provided by a local dispensary doctor, who was in his late 80s when he retired in 1951, and a dispensary midwife. This was similar to the care available to a woman having a home birth.
81. **Length of stay:** Women remained in Tuam on average for less than a year. Some children remained up to the age of six or seven years.

82. **Premises:** Both Glenamaddy and Tuam were former workhouses and the physical conditions were dire. Galway county council failed to properly maintain, much less improve, the conditions. In 1959, Tuam’s physical condition was much worse than that of the county home in Loughrea even though conditions in county homes were generally much worse than in mother and baby homes.

83. **Governance:** it was owned and controlled by Galway county council, which made all the major decisions, and run on a day-to-day basis by the Sisters of Bon Secours who were not salaried employees. The local authority paid a capitation rate for mothers and children, and a salary to the chaplain, the attending medical officer and an external midwife; other staff costs were paid by the Sisters. The local authority was responsible for maintenance and improvements.

84. **Child deaths:** 978 children who were in Tuam or Glenamaddy died; 80% were under a year, and 67% were aged between one and six months. Three-quarters of the deaths happened in the 1930s and 1940s; the worst years were 1943-1947.

85. **Burials:** No register of burials was kept and it is likely that most of the children who died in Tuam are buried inappropriately in the grounds of the institution.

**Kilrush 1922 - 1932**

86. **The people:** The exact numbers are not known but the Commission estimates that there were between 300 and 400 unmarried mothers and a much larger number of children in the Clare County Nursery in Kilrush. It accommodated a number of unaccompanied children including children of school-going age.

87. **The premises:** It was a former workhouse and was even worse than Tuam. It had no running water, baths or indoor toilets.

88. **Governance:** It was owned and governed by Clare county council. From 1922 to 1928 it was run by the Congregation of the Sisters of Mercy, who had been employed in the former workhouse. They left when the Department of Local Government and Public Health refused to approve the appointment of a Mercy sister as matron because she lacked a nursing qualification. From 1928 until 1932
it was run by lay staff. All the lay staff were local authority employees as were three of the four religious sisters who were in the home in 1928.

89. **Child Deaths**: The numbers are not known but the medical officer described the death rate in 1927 as appalling.

**Bessborough 1922 - 1998**

90. **The people**: 9,768 women and 8,938 children; between 1933 and 1944, 30% of the women were private patients who were not financed by a local authority. The number of women admitted increased by 25% in the 1940s, when there was a sharp rise in ‘illegitimate’ births.

91. In 1930 Bessborough opened a small maternity unit. This was replaced in 1933 by a 26 bed maternity hospital which was funded by the Hospitals Trust. Admissions rose sharply following the opening of the maternity hospital. It was overcrowded in the 1940s; it failed to isolate infected cases and screen incoming patients.

92. **Length of stay**: The average length of stay varied very widely over time. The average is somewhat distorted by the fact that women whose children died left immediately after the death and private patients did not stay as long as public patients. The very lengthy stays were generally before the 1960s. Those admitted in 1950 stayed on average for about a year; this had decreased to nine months for those admitted in 1960 and to about three months for those admitted from 1970 onwards.

93. **Premises/Living conditions**: It was a large Georgian house initially on over 200 acres of land. Until the 1970s living conditions were basic and institutional but much better than county homes. Dormitories and nurseries were large and there was no privacy but it did have running water, bathrooms and central heating. The large dormitories were replaced by cubicles and bedrooms in the 1970s.

94. **Governance**: It was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary. It was financed by capitation payments from the local health authorities and received capital funding from the Hospitals Trust Fund. Some residents were private patients. In the 1940s in particular, there was a shortage of qualified nurses and midwives and the religious sister who was in charge was incompetent. Although it was closed to women and children who were supported
by local authorities in 1944, it continued to admit private patients and many of their children died. The evidence suggests that the Cork local health authorities did not properly monitor Bessborough and did not take appropriate action when it became aware of the very high rate of infant mortality. The bishop and the congregation resisted implementing the changes demanded by the DLGPH for some years.

95. **Child deaths**: 923 children who were associated with Bessborough died. In 1934, it had the highest recorded infant mortality rate among mother and baby homes. Infant mortality reached even higher levels in the early 1940s. In 1943 three out of every four children born in Bessborough died. Although only 9% of the babies were the children of private patients, they accounted for 21% of deaths. Private patients were leaving Bessborough without their child, shortly after giving birth, and it is evident that these children received inadequate care.

96. Infant mortality improved significantly from 1945. Private patients were no longer permitted to leave without their child; a visiting medical officer, a new matron and additional nursing staff were appointed; penicillin became available. More bathrooms and washrooms were provided. Overcrowding eased with the falling number of ‘illegitimate’ births in the late 1940s, and this continued into the 1950s.

97. **Burials**: Bessborough failed to keep a register of infant burials and the burial location of the majority of children who died there is still unknown.

**Sean Ross 1931 - 1969**

98. **The people**: 6,414 women and 6,079 children.

99. **Length of stay**: The length of stay varied considerably over time. It remained high (but generally less than two years on average) until the 1950s and shortened dramatically from 1961.

100. **Living conditions**: It was located in a large country house. The Hospitals Trust Fund provided capital funding for a dedicated maternity hospital and increased accommodation including a nursery block. However the buildings were not connected; access to the maternity hospital was through the farm yard. It became overcrowded shortly after it opened. The maternity unit lacked basic equipment. Other parts of the home were renovated in the early 1950s; they included a new recreation hall for mothers.
101. Sean Ross experienced several outbreaks of diphtheria during the 1930s and 1940s (this did not happen in other homes). Diphtheria was the leading cause of death in 1936 and 1937. Mothers and children were treated in the local authority fever hospital in Roscrea, which relied on Sean Ross mothers to carry out some of the nursing duties without payment. Many children who died became ill shortly after their mother returned from nursing duties in the fever hospital and it is probable that mothers transmitted the infection to their children. This pattern can be identified until 1945. In 1944 Sean Ross experienced a major epidemic of typhoid; on this occasion a fever unit was created within the home. The cause of the outbreak was not identified. Four women died of typhoid in Sean Ross, and three women who had been transferred to other hospitals also died. The appointment of a new medical officer appears to have resulted in improvements in health and mortality from 1945.

102. **Governance**: Like Bessborough, it was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary and it followed a similar model.

103. **Infant deaths**: A total of 1,090 of the 6,079 babies, who were born or admitted died; 79% of the deaths occurred between the years 1932 and 1947. The worst years were 1936 and 1942. Within two years of Sean Ross opening the congregation acknowledged that there was a ‘problem’ with the high rate of infant mortality, and they sent a Sister from Liverpool to investigate the cause.

104. **Burials**: Registers of burials were not maintained. There is a designated burial ground and the Commission has established that the coffined remains of some children under the age of one are buried there.

**Castlepollard 1935 - 1971**

105. **The people**: 4,972 women and 4,559 children.

106. **Length of stay**: The length of stay varied considerably over time. In the period 1947 to 1959 it was 304 days on average and decreased dramatically during the 1960s.

107. **Premises/living conditions**: It was located in a large period house at Castlepollard. A maternity hospital which was financed by the Hospitals Trust Fund was opened in 1942; it included accommodation for mothers and children.
By 1937 it was grossly overcrowded and the overcrowding worsened subsequently. By 1941, women and their older children were sleeping in unheated lofts above the stables some distance from the main house. There was one toilet for 44 women and no space to store clothing or personal belongings. Women had no space for recreation and there was no space in the nurseries for children to play.

108. Castlepollard continued to exceed the specified accommodation limits until the early 1950s. Although central heating was installed in the new hospital unit it was not used for some years because the home, which had its own generator, was supplying electricity to the town of Castlepollard. The town generating station was destroyed in 1941; this continued until 1948.

109. **Governance:** Like Bessborough, it was owned and run by the Congregation of the Sacred Hearts of Jesus and Mary and it followed a similar model.

110. **Infant deaths:** A total of 247 children died in Castlepollard; 60% of deaths were in the 1940s. The peak year was 1940 when the home was grossly overcrowded; mortality was also high in the years 1944-47 but it fell sharply thereafter. In the worst year, 1940, infant mortality in Castlepollard was 26%; this was approximately half the peak figure in Sean Ross, 50%, and one-third the peak mortality in Bessborough at 75%. Approximately 10% of Castlepollard mothers were private patients, but in contrast to Bessborough, the mortality of the infants of private patients were well below the average for the home, probably because the mothers were not permitted to leave without their child. The peaks in infant mortality occurred when the home was most overcrowded.

111. **Burials:** No register of burials was maintained but it seems likely that most of the children who died are buried in the designated burial ground.

**Regina Coeli 1930 - 1998**

112. **The people:** 5,631 mothers and 5,434 children; other women who are not within the Commission’s Terms of reference were also there. It was designed to provide accommodation for destitute and homeless women. It was not designed as a mother and baby home, but pregnant single women, and unmarried mothers with their children began to seek admission. Until the 1970s it was the only place that supported unmarried mothers who wished to raise their child. Women were
referred by social workers in Dublin maternity hospitals. The DLGPH used it as short-term emergency accommodation for pregnant women who had arrived from the country or from England pending their transfer to a mother and baby home. It did not distinguish between first-time mothers and women on a second or subsequent pregnancy. It accommodated women with mental illness, and women who had been involved with crime who might not have been accepted in the private mother and baby homes. Women who had the means to pay for a private nursing home were not admitted.

113. Women and children in Regina Coeli did not receive state support. Mothers were encouraged to work as servants in private homes and in nearby hospitals and other institutions. Most of the work in the hostel was carried out by volunteer members of the Legion, assisted by women who were not working externally. One of the core principles was that no services should be provided free of charge: women paid a modest sum for their meals and 1s a week for their children.

114. **Length of stay:** Some women stayed for only one or two nights. Many remained for several years, and others entered and left on several occasions. A woman who arrived in 1953 stayed for ten years with her two children. A woman who was admitted in 1955 gave birth to six children during the course of a 15-year stay.

115. **Governance:** It was run by the Legion of Mary which is a voluntary organisation. It got no regular State funding.

116. **Premises/Living conditions:** It was located in North Great Brunswick Street, in part of the former North Dublin Union workhouse. Most women gave birth in the nearby Rotunda hospital. It was never registered under the *Registration of Maternity Homes Act 1934*, even though it should have been. There were regular outbreaks of infectious disease among mothers and children. This was not surprising, given that Regina Coeli admitted destitute, often homeless women and children, and sanitary facilities were primitive. No efforts were made to isolate new arrivals until the mid-1940s. Public health doctors and nurses, visited the hostel, and temporary nurses were appointed to cope with outbreaks of infectious disease. It operated on the principle that all staff should be volunteers, so medical care was provided by the local dispensary doctor, which the Dublin medical officer of health regarded as unsatisfactory.
**Funding**: In 1950, the Hospitals Trust Fund provided funding to improve the accommodation for unmarried mothers and children. Most of the money was spent providing ‘family units’ for mothers with older children. These consisted of six cubicle bedrooms, each for a mother and her child(ren), plus a common room and an open fireplace for ‘cooking’ and nearby sanitary facilities. The plan was that five women would go out to work, and one mother would mind the children. However, this former workhouse required much greater investment; in 1956 a staircase collapsed injuring a Legion volunteer. In 1963 the hostel was condemned by Dublin Corporation as structurally unsafe. They recommended that it should close, with residents moving to a former sanatorium in county Dublin. Regina Coeli survived thanks to the support of Minister for Health Seán MacEntee; part of the building was demolished, residents were accommodated in chalets. A major reconstruction was eventually completed in the late 1970s, funded by the Eastern Health Board.

**Deaths**: A total of 734 children died; the peak in infant and child morality was in the early 1940s, coinciding with a peak in infant mortality in Dublin city; 68% of the children's deaths were in the 1940s; over 91% of deaths took place before 1950. A 1948 report claimed that infant mortality was three times the rate in Pelletstown and the hostel lacked ‘almost every proper facility in regard to both nursing and structure’.

**Burials**: The Commission has not investigated the burial arrangements as the children died in many different locations.

**Dunboyne 1955 - 1991**

**The people**: 3,156 mothers and 1,148 children; the children were almost all born in Holles Street hospital. It was initially designed for women on second or subsequent pregnancies but the vast majority were first-time mothers. By the late 1980s, 58% of the women were teenagers; roughly one-quarter were students. In 1980 it was designated as a centre for intermediate and leaving certificate exams. Classes were provided by a team of part-time teachers, who were paid by the local vocational education committee.

**Length of stay**: Like the other institutions, the length of stay varied over time. Women admitted to Dunboyne in the 1950s spent 383 day on average there; women admitted in the 1970s were there for 85 days on average. In later years,
some women did not return to Dunboyne after giving birth. At this time, children generally were placed with adoption societies or foster parents direct from the hospital and spent no time in Dunboyne.

122. **Premises/Living conditions**: It was located in Dunboyne Castle. The facilities were very good. It had adequate sanitary arrangements and central heating. It had better facilities than the average Irish home when it opened. An extension financed by the Sisters was opened in 1963. Women slept in shared bedrooms; there were ample bathrooms and wash-basins, all laundry other than personal clothing was sent to a commercial laundry. It had reception rooms for visitors, a television room, a smoking room, and a room with a record player. Although capitation payments were higher than in other homes, spending generally exceeded income.

123. **Governance**: It was bought and fitted out by a number of county councils of which Meath was the lead. It was leased to and run by the Sisters of the Good Shepherd. It was financed by capitation payments from the local authorities; these were always at a higher rate than was paid to the Sacred Heart homes.

124. **Child deaths**: A total of 37 children born to Dunboyne mothers died; two-thirds of the deaths were in a maternity hospital and the others were mainly in children’s hospitals.

**Bethany 1922 - 1971**

125. **The people**: 1,584 women and 1,376 children. Bethany was an amalgam of two charities, one providing for female ex-prisoners and a rescue home for women. Both charities were associated with the Church of Ireland but they admitted women of all religions. Bethany's main mission was as a mother and baby home but it continued to admit a number of women who were ‘rescued’ on the streets, and it was a place of custody for Protestant women, including women who had committed infanticide; 113 of the 1,584 women in Bethany were neither pregnant nor recent mothers. A total of 419 women, 27% of total admissions were Catholics. In the 1920s and 1930s they constituted over 45% of mothers. Bethany accepted women who were pregnant for a second time, provided that they had not been admitted on a previous pregnancy; 20% of the women were pregnant for a second or subsequent time, which may be an under-estimate because the data are incomplete. It ceased to take in Catholic women in 1940.
EXECUTIVE SUMMARY

126. **Length of stay**: The average length of stay was 154 days; this fluctuated between 300 days on average for women admitted in 1953 to 62 days on average for women admitted in 1969.

127. **Premises/Living conditions**: Initially it was located in Blackhall Place in the north-inner city. It moved to Orwell Road, Rathgar in 1933. The accommodation in Blackhall Place appears to have been inadequate. The Orwell Road premises was a 6,000 square feet detached house on an acre of grounds in Rathgar. Improvements were carried out including converting the adjoining stables. Initially this was used as a separate institution that accommodated older children; in the late 1930s it became the women's dormitory. In 1935 Bethany had four wards, with a total of 25 beds, but one four-bed ward constituted the maternity unit. There appear to have been ample baths and toilets.

128. It was consistently short-staffed, and very reliant on voluntary workers. Throughout its existence Bethany found it difficult to recruit and retain qualified midwives and nurses. Medical care was supplied on a voluntary basis by a visiting doctor who was voted an annual honorarium of £10. It is unclear how often he visited. In 1936, it was described as overcrowded and there was inadequate medical and nursing staff. The decision to no longer admit Catholic women meant that it was less over-crowded than the other mother and baby homes in the 1940s. Throughout most of the 1950s there were fewer than ten women resident at any time, and that trend continued in the 1960s. There was a high incidence of infectious disease, including gastro-enteritis.

129. **Governance**: It was run by a board of trustees, and governance was overseen by monthly meetings of the management board. Meetings opened with a ‘season of prayer’ and closed with a prayer. The Plymouth Brethren, an evangelical Protestant church founded in the nineteenth century, and the Irish Church Missions to the Roman Catholics, which sought to convert Roman Catholics to Protestantism, were prominent in the running of Bethany. Despite frequent protests to the contrary, those in charge often sought to convert the mothers to their beliefs.

130. Bethany did not seek or receive public funding in the 1920s or 1930s. The income came from investments, legacies, donations and proceeds of sales of work. Bethany sought financial support from the parents and local clergyman of the
women who were admitted, but it is unclear how much they were able or willing to pay. The home was in financial difficulties for most of its existence, though it often received short-term relief from a legacy or sales of stocks and shares. In 1944 Bethany applied to the DLGPH for financial assistance. In 1943 Monaghan county council secured permission from the DLGPH to maintain women and children in Bethany on a similar basis to women in the Sacred Heart homes but only a minority of Bethany women appear to have applied to their local authorities for maintenance. In 1949, the Department of Health informed Bethany that it was eligible for reimbursement under the expanded Maternity and Child Welfare scheme, which covered 50% of approved expenditure on maintaining mothers and children.

131. **Infant deaths**: A total of 262 children associated with Bethany died; 61% of child deaths occurred between 1937 and 1947.

132. **Burials**: The burials of Bethany children are properly recorded in Mount Jerome cemetery.

**Denny House (formerly the Magdalen Asylum) 1765 - 1994**

133. **The people**: 1,416 mothers and 1,134 children between 1922 and 1994. The largest number was in the 1980s. Before 1980, it admitted single Protestant women who were pregnant for the first time. In 1980, it started to admit women of all religions and separated, deserted, or recently widowed women and their children. The name was changed from the Magdalen Asylum to Denny House.

134. **Length of stay**: In the early years the average length of stay was less than one year; women admitted in 1959 spent 86 days on average there; this had decreased to 41 days for women admitted in 1983.

135. **Premises/living conditions**: It was originally in Leeson Street and moved to Eglinton Road in 1959. Religion had a prominent place - the matron conducted daily prayers; mothers were ‘churched’; there were bible classes, hymn-singing sessions and a chaplain paid regular visits. In the 1960s a chapel was erected beside the new residence in Donnybrook.

136. There is no indication that Denny House was overcrowded at any time, in contrast to other mother and baby homes. The small numbers meant that Denny House
was less regimented than other homes; in the 1950s women went shopping, to the cinema, the Gaiety pantomime, and religious services. Denny House was also much better staffed than other homes, though women were expected to carry out some domestic chores.

137. From 1980 Denny accommodated women who needed support in parenting their child; mothers and babies awaiting longer-term accommodation; women who were sorting out their relationship with their parents or the father of their child, and women with addiction or mental health issues. A voluntary social worker and Eastern Health Board social workers supported the women.

138. **Governance:** The Magdalen Asylum was overseen by guardians and governesses. The guardians and associate guardians/governesses included the Church of Ireland archbishop of Dublin and on occasion his wife, plus prominent Dublin doctors, including leading paediatricians and gynaecologists. It received funding under the Maternity and Child Welfare scheme which covered 50% of the cost of maintaining mothers and children. It was also funded by endowments, proceeds of charity sermons and fund-raising by members of the Mothers’ Union and Church of Ireland parishes. Women appear to have made a contribution towards their maintenance, or their local parish made a contribution. In the 1950s a number of women were maintained by their local authority, and from the 1970s it secured funding from the Eastern Health Board.

139. **Infant Deaths:** A total of 55 children died. Infant mortality was consistently lower than other mother and baby homes; mortality peaked in the years 1930-36. The small numbers resident was a factor in the low mortality; women were screened before admission and breast-feeding was almost universal.

**Miss Carr’s Flatlets 1972 - present**

140. **The people:** Approximately 180 mothers and 200 children in the period 1972-1998; it is still in operation. It was not a traditional mother and baby home. It provided hostel-type supported accommodation that aimed to enable unmarried mothers and deserted wives to raise their children. The goal was to encourage families to move to long-term independent housing.

141. **Length of stay:** The average stay was approximately one year.
**EXECUTIVE SUMMARY**

142. **Premises/Living conditions:** There were nine flatlets in a large house. The residents were expected to be self-supporting; many of the mothers would have qualified for Unmarried Mother’s Allowance. Residents could avail of the nursery in Miss Carr’s Children’s Home at a cost of £3 a week.

143. **Governance:** It was established by Miss Carr’s Children’s Home, a long-established Protestant children’s home. Miss Carr’s purchased a nearby house, having borrowed the necessary money, and they sought financial assistance from the Eastern Health Board. The Department of Health eventually approved this application on condition that the flatlets would be non-denominational. It was a private institution, run by a general committee.

**The Castle 1982 - 2006**

144. **The people:** 329 women and 64 accompanying children between 1982 and 1998. It was not a traditional mother and baby home but rather a supported hostel for women and children, designed to give women an opportunity to decide on their future and that of their babies.

145. Most women were referred by health boards or by CURA. They were from every part of Ireland, including Northern Ireland. Some had professional qualifications, some were students/schoolgirls; some had intellectual disabilities or mental health problems, and a number had deficient parenting skills. The babies were born in maternity hospitals - the majority in Letterkenny and Altnagelvin in Derry. Sometimes the babies came to the Caste with their mothers but more frequently, they went to St Mura’s or to foster parents while their mothers made decisions about their future. Five babies died in the hospitals shortly after birth.

146. **Governance:** It was established, funded and governed by the North Western Health Board (NWHB) and the Catholic dioceses of Raphoe and Derry. The staff were employed by the NWHB.

147. **Premises/Living conditions:** The women had individual bedrooms with sufficient space for a child. Eating and living areas were communal, though women could cook if they wished. The women were visited regularly by social workers from the health board and CURA. People came and went as they pleased. Families and boyfriends visited and women frequently went away for weekends.
St Gerard's 1919 - 1939

148. **The people:** The Commission knows very little about St Gerard’s because it was unable to access its institutional records. It is likely that there were about 200 mothers and the same number of children there.

149. **Governance:** It was run by St Patrick’s Guild, a charity founded in 1911 to assist unmarried Catholic mothers by placing their children with Catholic families in order to prevent them being converted to Protestantism. St Patrick’s Guild was also associated with Temple Hill Children’s Hospital.

The County Homes

150. The county homes that were investigated by the Commission had many common features. They were located in former workhouses and they were under the control of the local authority. The day-to-day running of the county homes was largely carried out by religious orders. Unmarried mothers and their children constituted a minority of residents - the majority of residents were older or infirm people, or suffering from physical or mental disability or a mental illness. The physical conditions were generally very poor. The unmarried mothers often carried out the difficult work of looking after some of the other residents and, in general, they were not paid for this.

Cork County Home 1921 - 1960

151. **The people:** 2,318 unmarried mothers and 2,408 children between 1921 and 1960. A number of the children were unaccompanied. Many had transferred from Bessborough prior to being boarded out by the local authority, others were sent to the county home by foster parents when the money paid by the child’s mother had been exhausted, or when a foster family was no longer able or willing to keep a child. The nursery in the county home was overcrowded for most of the time; many children were of school-going age.

152. During the 1920s some women gave birth in the county home and were transferred to Bessborough with their child. Admissions of unmarried mothers peaked in 1926, and fell sharply from 1934, following the opening of a modern maternity unit in Bessborough. Admissions rose again from 1939 and remained high until 1948; ‘illegitimate’ births rose significantly in 1945 when Bessborough was closed to public patients.
In a number of cases where the children of women who had given birth in the county home were boarded out, their mothers remained in the home working as wardsmaids or kitchen staff, however in contrast to many other county homes they were paid.

**The conditions:** In the 1920s the living conditions in this and all county homes were appalling. In 1921 the women ate their meals squatting on the floor. Most heating was by open fire. The food was often adulterated or unfit for consumption. Milk was watered and meat was of poor quality. No major improvements were carried out until the 1950s.

There are several reports of unmarried mothers being assaulted by ‘inmates’ who were drunk or suffering from mental illness. One woman, who had given birth to two babies, became pregnant apparently by a male ‘inmate’; she was sent to a Magdalen laundry. A number of women ‘absconded’ leaving their baby behind; although the Gardaí were contacted, they do not appear to have returned the mothers.

Child deaths: 545 children died, 93% were under one year. The death rate was high during the early and mid-1940s, but fell sharply from 1948. The most common cause of death was gastro-enteritis. Infection control would have been extremely difficult in an overcrowded institution, with poor sanitary facilities, that admitted children of various ages.

**Stranorlar: 1922 - 1964**

The people: 1,646 unmarried mothers and 1,777 children. One-quarter of women were admitted between 1942 and 1948, a time when the number of ‘illegitimate’ births increased and mother and baby homes were overcrowded. The number of women admitted fell throughout the 1950s. 98% of the women were Catholics, the remainder were almost equally divided between Church of Ireland and Presbyterians.

The conditions: The conditions were very poor. In the early 1920s it was overcrowded and consideration was given to removing unmarried mothers and their infants to a disused workhouse in Ballyshannon. Water and sanitary services were inadequate with only two flush toilets. Most residents had to use outdoor
toilets that were described as ‘bad and rather revolting’. There was no hot water in the operating theatre. Given these conditions it is not surprising that there were several outbreaks of typhoid. The diet was dominated by bread and tea, but the Minister for Local Government determined that it was too generous and the county home was informed that residents should receive three meals a day not four.

159. In 1935 the local medical officer discontinued admissions to the labour ward because it lacked a bathroom and running water. An inspection in the 1940s reported that there were no facilities to bathe children and arrangements for washing and drying clothing were poor. During the day children spent much of their time in a ‘hut’. The first major improvements commenced in 1949. They included installing washing and sanitary facilities in the children's ward and a wash-hand basin in the labour ward. In 1952 the former fever hospital was renovated to accommodate unmarried mothers and their children.

160. Most of the work was carried out by the unmarried mothers, who were unpaid. The mothers of older children lived and slept in the main section of the county home and they could only see their children on Sundays; the administration believed that more frequent visits disrupted the routine and upset the children. In 1954 when plans were being drawn up to remove unmarried mothers and children from the county home, the matron objected that she would be unable to find replacement workers.

161. **Child deaths**: 343 ‘illegitimate’ children who were in Stranorlar died in infancy or early childhood. The death rate peaked in 1930 with an infant mortality rate of 42%; deaths were also high in the 1940s. Over 60% of deaths were attributed to pneumonia or bronchitis.

**Thomastown 1922 - 1960**

162. **The people**: 970 pregnant women and 1,241 children. A number of the children were unaccompanied. In March 1960 there were 14 children in Thomastown, eight were ‘illegitimate’. In 1963 there were two unmarried mothers and three children in the county home and there was an unmarried woman and her child in the home in 1966.

163. **The conditions**: Living conditions were very poor. The nursery section was described as the worst part of the institution. In 1925, 58 infants were sleeping in
32 cots. There were no significant improvements for several decades. In 1946 there were only eight baths, 16 WC and 16 wash-hand basins for 250 men, women and children and the baths seldom had hot water. All the laundry was done by hand; there were no disinfecting facilities and there were no electric sockets, no heating and no sanitary equipment in the labour ward. In 1949 the Department of Health decided to defer installing central heating, in order to give priority to county hospitals and sanatoria.

Most of the domestic work was carried out by the unmarried mothers, without payment, and some women were not sent to Sean Ross or Bessborough because they were needed in the county home.

Child deaths: 177 ‘illegitimate’ children who were in Thomastown died in infancy or early childhood; 54% of the mothers who were in Thomastown experienced the death of at least one child; more than a quarter of these deaths happened outside the county home. Most of the older children had been placed at nurse by their mothers and were sent to the county home when payments ceased or the lump sum was exhausted; some of the nurse children who were admitted had broken bones. A DLGPH inspector described others as ‘dying from neglect’.

F: Terms of Reference

The Terms of Reference require the Commission to address specific issues. Because of different availability of information and different practices in the institutions, it is difficult to provide summarised assessments. The following is an attempt to do so.

Entry Pathways

The information on the entry paths of mothers is incomplete. There is no information about 99% of the mothers admitted to Sean Ross, over 98% of the mothers admitted to Castlepollard and over 97% of the mothers who were admitted to Bethany. Women who were admitted to the county homes would have either approached a local assistance officer or arrived at the county home without advance notice.

The overwhelming majority of women in mother and baby homes were maintained by their local authority and they had to secure prior approval from the local
authority before they were admitted. In the 1920s, women who were admitted to Bessborough or to Pelletstown had first to enter the county home, or in the case of Pelletstown, the Dublin Union. Women were also transferred to Bessborough from other county homes following similar procedures. By the end of that decade women from the South Cork Health district were being admitted to Bessborough without entering the county home, if their admission was approved by a dispensary doctor, local official/councillor, or a priest, and though information is limited, this probably applied to women from other health areas.

168. Securing the sanction of a local authority to pay for her upkeep required that a woman or somebody acting on her behalf would contact local officials. Given the secrecy that surrounded the pregnancies of single women, and the low levels of mass education in Ireland at the time, many women or their families may not have known how to do this. There were no advice centres at this time. It was only at the end of the 1960s that the Department of Health approved a short leaflet informing pregnant single women where they could seek assistance.

169. In the 1940s and 1950s, if a woman had fled to England and had been repatriated, or had been working in Dublin, she might face difficulties in securing financial support from the local authority where she had formerly lived. County managers often disputed whether a particular woman should be maintained; local authorities disputed her address, how long she had been absent from the country. One of the most intrusive queries asked whether the infant had been conceived in county Kilkenny or in Laois. There was an element of discretion in a county manager’s decision. Some local authorities carried out intrusive investigations into a woman’s circumstances - or more specifically whether her family could afford to contribute to the cost of her maintenance in a mother and baby home. These investigations could seriously jeopardise her privacy, perhaps making her pregnancy known, not just to her immediate family but more widely.

170. Many distressed pregnant women travelled to Dublin seeking assistance and organisations such as the CPRSI often directed women to a mother and baby home, and they assisted her in securing financial support from her local authority, but at times it proved difficult to find a place in overcrowded mother and baby homes. Between the 1940s and the early 1960s more than 3,000 unmarried mothers contacted the Custom House - headquarters of the DLGPH, and later the Department of Health - seeking assistance, and the women inspectors had to
make several phone calls on their behalf - determining whether there was space in a particular home, which the woman was willing to enter, and securing the support of a local authority to maintain her. The woman had some choice as to which home provided that this was a first pregnancy and she was not a native of Galway or Mayo. Most women preferred to enter a home that was distant from her county of origin. Women who were natives of Galway or Mayo would be maintained only in Tuam. Some county managers insisted on admitting first-time mothers to the county home in order to ensure there was sufficient unpaid labour. There are several reports of women, who were given short-term accommodation in Regina Coeli and wished to remain there, rather than enter a mother and baby home, because they could smoke, make tea and come and go from the hostel.

171. In 1961 the CPRSI (the first port of call for many pregnant single women) reached an agreement with the City and County Managers’ Association that they could make arrangements for women to be admitted to mother and baby homes without first having to contact the local authority to agree liability. The CPRSI was rightly enraged when officials in County Louth reneged on this arrangement and contacted the families of two pregnant women to check whether they could contribute to their maintenance. By the end of the decade mother and baby homes and some local authorities had agreed that a woman’s name would not be recorded by the local authority; she would be given a number, and her identity would only be known to one person - commonly a social worker. This practice continued in later decades.

172. Women who were admitted as private patients could bypass these arrangements, though little information is available about their referral pathways. It is probable that doctors and clergy were involved.

173. The Commission has information about the referral pathway for 71% of the women who were in Denny House. The most common route was ‘religious’, presumably a clergyman. In the years 1920-59, two thirds of the women for whom information is available were referred by a clergyman. In the 1980s and 1990s 52% of referrals were by social workers with the balance coming from hospitals, voluntary organisations and the health boards.

174. The available statistics suggest that in the years 1920-60, clergy played a less important role in referring women to Bessborough than they did in Denny House.
In Bessborough, for the years 1922-60, the information that survives shows that one-third of the women were referred by a board of assistance. A further 19% were referred by a scheduled institution - this refers to institutions that are within the Commission’s terms of reference; most of these women came from the Cork County Home or the Thomastown County Home; 15% were referred, and probably transferred from another county home, 13% were referred by their family, only 6% were referred by a priest or religious sister.

175. Referral pathways changed somewhat, following the introduction of legal adoption and the expansion in the number of social workers. From 1960 to 1998, information is available for almost 75% of the women admitted to Bessborough. The local authority/health boards accounted for almost 40% of referrals; 27% were referred by an adoption society, 13% by a social worker who was not attached to an adoption society, and 7% were referred by a voluntary organisation - the majority of these were referred by CURA, which was established in 1977 by the Catholic hierarchy to support women in crisis pregnancies. A total of 199 women are recorded as having self-referred, a sign of changing times.

176. Dunboyne is the only other mother and baby home for which substantial information about referrals is available. Dunboyne opened after the introduction of legal adoption and the most common referral pathway was an adoption society - 37% of the women. Over two-thirds of these referrals were from the CPRSI, with St Anne’s Adoption Society in Cork accounting for 14%. However, one-third of the Dunboyne women were referred by a local authority/health authority and 13% by a voluntary organisation, which was usually CURA; 62 Dunboyne women self-referred. In the 1980s, over 40% of the referrals were by an adoption society, 20% from voluntary organisations, mainly CURA, and 25% by public assistance authorities.

Mothers’ exit pathways  
177. The surviving information relating to the mothers’ exit pathways is also incomplete. Information is available for 59% of Bessborough women, 45% of the mothers who were in Castlepollard and almost 92% of the mothers who were in Sean Ross. A majority of the women in these three institutions are recorded as discharged to their home or to a private address. A total of 203 mothers from these three homes were recorded as going to a Sacred Heart placement, that is, work arranged by the
congregation. Given that the three homes accommodated over 21,000 women, the proportion is tiny; a further 1,984 women are recorded as being discharged to a situation or employment, that is, to a specific address or occupation, probably some form of domestic or institutional service; 1,280 of these women were in Sean Ross. These ‘situations’ may also have been arranged by the mother and baby home.

178. There is information on the exit pathways for 62% of the women who were in Bethany. The majority are recorded as going home or to a private address; 28% of those recorded went to a ‘situation or employment’, which may have been arranged by the Bethany authorities, though that is not stated. The destinations for Pelletstown women were not dissimilar with 26% going to a ‘situation or employment’. The Pelletstown records show that the Sister in charge was frequently approached by people who were seeking domestic staff. Information about their geographical destination - whether they remained in Ireland or emigrated - is extremely limited and therefore does not bear analysis.

**Magdalen laundries, Good Shepherd Convents**

179. It has been suggested that many of the women in mother and baby homes were sent to Magdalen laundries when they were discharged. The McAleese report records that 313 women were sent to Magdalen laundries by mother and baby homes and adoption societies. An additional 349 women were sent from county and city homes though many of these were women who had not given birth. The institutional records analysed by the Commission record that 206 women who were in the three Sacred Heart homes were discharged to a Magdalen laundry or a Good Shepherd Convent. All except one of the 88 women from Bessborough, who were sent to a Magdalen laundry, were admitted before 1960. The number of women recorded as having been admitted to Magdalen laundries when they left the three Sacred Heart homes amounts to less than 1% of total admissions. For Pelletstown the figure is also less than 1%. A total of 20 women are recorded as transferring from Stranorlar to the Good Shepherd Convent in Derry; most of these women had multiple pregnancies. Given that there are only records relating to the exit pathways of 16% of Stranorlar mothers, this is probably an underestimate.

180. Information is available on the exit pathways for approximately 20% of the Tuam mothers. Fourteen women were discharged from Tuam directly to a Magdalen laundry. Institutional records relating to children who were in Tuam without their
mother show that a further 84 women were admitted to a Magdalen laundry at a later date. It is most likely that these women were on their second or subsequent pregnancy and, in line with Galway County Council policy, they were directed to enter a Magdalen laundry when they sought public assistance. In 13 other cases, children were admitted to Tuam unaccompanied while their mothers were admitted to a Magdalen laundry; these women had never been in the Tuam home. A further 22 women, all admitted to the Tuam home on second or subsequent pregnancies, were directed by Galway County Manager to seek admission to a Magdalen laundry; if they refused they were told to remove their child from the Tuam home. The Commission could not establish whether or not these women actually entered a Magdalen laundry. Four children born in or admitted to the Tuam home were subsequently admitted to a Magdalen laundry in their teens or in early adulthood.

181. Galway county council had a clear policy that women who gave birth to a second or subsequent child should be sent to a Magdalen laundry. The Commission has not seen evidence of a similar policy articulated by other local authorities. The more extensive evidence relating to Tuam (which exists because the children remained in Tuam for several years), suggests that many former residents of mother and baby homes were admitted to Magdalen laundries not directly from the mother and baby homes but at a later period in their lives, perhaps following the birth of a second child.

Length of Stay

182. It is commonly believed and has been widely stated on numerous occasions that women were required to remain in a mother and baby home for two years after the birth of their child. This was never a legal requirement although many women appear to have believed that it was. The motivation behind the two-year stay was both moral and pragmatic: a belief, that two years was sufficient time to ‘reform’ or ‘rehabilitate’ a woman. Many mother and baby homes in other countries required mothers to remain for a specified period but that was commonly for six or 12 months. In 1940 the length of stay in St Pelagia’s Home in London, which was run by the Congregation of the Sacred Hearts of Jesus and Mary was reduced to six months. The fear of being required to remain in a home for two years was cited as a factor prompting women to go to England or to approach Protestant charities. Statements to this effect were made by Department of Health inspectors and by the CPRSI; both had extensive contact with pregnant women, so these statements should be treated seriously.
183. The length of time that women stayed in Irish mother and baby homes was linked to the provision of a long-term placement for the children, and the fact that legal adoption was not introduced until 1953. Unmarried mothers were legally responsible for their children. A mother could not leave a mother and baby home or a county home without taking her child or until long-term arrangements had been made for the child. Local authorities were unwilling to take responsibility for the children of unmarried mothers until they were at least two years old, and often older. During the Emergency years there was a shortage of foster homes (possibly because the payments to foster parents were not adequate) so children and mothers had to remain. Some women were required to remain in a county home, working without pay, in return for their child being boarded out by the local authority. There is evidence that in counties Wexford and Meath (and perhaps other counties), women who sought to leave the county home were presented with their child, who had been removed from a foster home, and told that they were responsible for the child’s upkeep. Women in Tuam and Pelletstown were expected to stay for 12 months and there is evidence that a woman who wished to leave Tuam before that time was expected to pay for her child’s upkeep. The average stay for women in Stranorlar and in the Cork county home was under one year for all decades, though a small proportion of women remained for several years.

184. The expectation of a two-year stay was associated with the three Sacred Heart homes. The statistics on a mother’s length of stay are almost complete for the large mother and baby homes. They show that the two-year stay, which is widely cited as the norm, applied to only a minority of women. Less than 20% of the mothers in the three Sacred Heart homes remained for more than 700 days or approximately two years after giving birth. Overall, of the 46,671 women for whom the Commission has this information, less than 6% stayed for more than two years while 70% stayed for six months or less.

185. The small number of women who were admitted to Bessborough in the 1920s remained for an average of three years. Between 1929 and 1941, women on average remained for between 12 and 18 months. However this average conceals widespread variations in length of stay. A majority of women admitted in the 1930s left within six months of giving birth but almost a quarter (23%) remained for two years or longer. Bessborough had a substantial number of private patients who generally left without their baby within a couple of weeks of giving birth. Women
whose babies died left shortly afterwards and the appalling mortality in Bessborough in the early 1940s impacted significantly on the average length of stay. In the early 1940s, because of the number of private patients, and the high rate of infant mortality, the average length of stay for Bessborough mothers fell to six months. The contrast in length of stay between private and public patients continued in the 1950s, despite the ban on private patients leaving without their child. Private patients remained for an average of six weeks (before and after the birth); for public patients the figure was eleven months. With an increasing number of babies being adopted in the 1960s the length of stay for public patients fell sharply; by 1970 women remained for an average of one month after the birth.

186. There was also a wide variation in length of stay in Sean Ross. In the 1930s and 1940s, one-third of women left within 50 days of giving birth; by the 1950s over 40% left within 50 days. In the 1940s the average length of stay fluctuated between 300 and 400 days, and this continued into the 1950s; in 1955 the average stay for mothers was 369 days. It fell sharply in the late 1950s and throughout the 1960s. Private patients in Sean Ross also remained for a much shorter time than public patients; in the 1950s the figures were 65 days and 298 days respectively. Data for Castlepollard also show a major contrast between private and public patients; in the 1940s, they stayed for an average of 40 and 310 days respectively, and 31 and 297 in the 1950s. By the 1960s public patients were spending an average of four months in Castlepollard.

187. Between 1921 and 1950 women who were in Tuam/Glenamaddy remained for an average of 237 days; that increased in the 1950s to over 300 days. The increase probably reflects the fall in infant deaths; most women left almost immediately following the death of their child. Pelletstown, like Tuam did not retain women for two years. Between 1920 and 1942 the average length of stay fluctuated between 188 and 311 days. In 1943 and again in 1946 the average length of stay increased to 368 and 429 days respectively, for reasons that remain unclear. Between 1949 and 1958 women stayed for an average of 307 days. In the 1960s, as in other homes the average length of stay fell sharply.

188. Women who were admitted to Bethany remained for a shorter time; an average of 137 days in the 1920s, 155 in the 1930s and 164 days in the 1940s. The highest average length of stay, 212 days, was in the 1950s. The shorter stay for Bethany mothers compared with public patients in the Sacred Heart homes reflects the fact
that Bethany made arrangements for the placement of children; this was not the norm in the homes run by the Sacred Hearts congregation. Similar arrangements existed for the women who were in Denny House; however, their average length of stay was longer, except in the 1950s: 252 days on average in the 1920s, 194 in the 1930s, 231 in the 1940s and 144 in the 1950s. In the 1980s and 1990s when Denny House was caring for a very different cohort of mothers, the average stay was approximately two months.

189. Statistics on length of stay suggest that, despite frequent references to the two-year rule in the homes run by the Sacred Hearts congregation, and one year in Tuam and Pelletstown, there was no great difference in the average length of stay between the two types of mother and baby home. The average length of stay was much shorter in Bethany. Until the 1950s women remained in Denny for less time than in the Catholic mother and baby homes but longer than in Bethany.

190. The delay in introducing legal adoption explains why many Irish women spent such a long time in mother and baby homes. When adoption became widespread in the 1960s the average length of stay fell significantly and continued to fall in the 1970s. By the 1970s, mother and baby homes were conscious that a growing number of women were travelling to Britain for abortions, so they were under pressure to make life in a mother and baby home less onerous, including a shorter stay.

191. The statistics reveal a significant discrepancy between private and public patients. Private patients, or more probably their families, could afford to pay for a child to be placed at nurse, or as frequently happened in the 1940s, for the child to remain in Bessborough without their mother, under the auspices of the Catholic Women’s Aid Society. However a majority of public patients left mother and baby homes within a year of the birth of their child. This suggests that the women or their family made financial arrangements for the long-term care of their child. A number of witnesses spoke of the Sisters being paid a sum of money to buy a mother’s ‘release’; this money was used to place her child ‘at nurse’, generally through an intermediary charitable society.

192. The longest stays were among women who lacked financial and personal support from their family that would enable them to make arrangements for their child. A number of women who were admitted to Bessborough in the 1920s remained there
for the rest of their lives. A Good Shepherd Sister, who worked in Dunboyne in the early 1960s and gave evidence to the Commission, stated that the small number of women who remained for two years were women who had been raised in institutions, such as industrial schools, and lacked family support. A number of contemporary references suggest that women whose child was being adopted in the USA had to remain for a longer period because children were not sent to the USA for adoption until they were over one year old. By the 1960s mothers of children with special needs were also at risk of having to remain for a longer period, because it proved more difficult to place their child.

**Children length of stay and exit pathways**

193. There were a number of distinct categories of unaccompanied children in the mother and baby homes within the Commission's remit. Pelletstown and Tuam admitted homeless and abandoned children and children whose parent(s) were unable to care for them - perhaps because of an illness or imprisonment; 71% of unaccompanied children in Tuam, where there is evidence of the child's status, were ‘legitimate’. From the late 1950s, Pelletstown admitted substantial numbers of unaccompanied children who were suffering from serious illnesses. These children will be discussed below in the section on infant and child mortality and they will feature again in the section on discrimination.

194. A majority of children who were born in county homes left with their mother. However, county homes admitted children who were transferred from a mother and baby home preparatory to being boarded out. They also admitted children who had formerly been placed 'at nurse', that is, placed with a foster parent, either privately or by a charitable organisation, and had been brought to the county home when the money paid to the foster parent ceased, or the foster parent was no longer willing or able to care for the child. County homes also housed children who had been boarded out by a local authority, whose foster parents were no longer willing to keep the child or unable to do so - because of illness or death, and they also accommodated children with severe physical or intellectual disabilities, who were awaiting transfer to specialist institutions, and who might be children of married parents. Children who were found to have been neglected in either category of foster home also ended up in the county home. Such children were also admitted to Pelletstown and to Tuam. Some of these children were sent to industrial schools.
Almost half (47%) of the children in Bessborough were discharged on the same day as their mother; a further 27% were discharged before their mother; 21% remained in the home after their mother had left (many of these were the children of private patients); and 5% of children were admitted unaccompanied. Statistics for Sean Ross are similar, and again the distinction between the children of public and private patients is substantial. Over two thirds of the Sean Ross children were discharged on the same day as their mother; 28% left before their mother and only 6% remained in the home after their mother had left. In Castlepollard 59% of the children left on the same day as their mother, 32% were discharged before their mother had left, and 9% remained after their mother had left.

Although the children born to private patients were more likely to remain in Bessborough without their mother, they stayed for a much shorter time than the children of public patients. From the 1920s to the 1960s, publicly maintained children spent around three times longer in Bessborough than their private counterparts. The introduction of legal adoption reduced the distinction in length of stay between the children of public and private patients.

Children remained in Pelletstown and Tuam for longer periods than in the other homes, and they were more likely to remain without their mother. In the years 1943-56 children remained in Pelletstown for an average of 737 days. In the 1940s the average was 669 days; for the 1950s it had fallen to 530 - still substantially longer than the Sacred Heart homes. Just over half, 50.4% of Pelletstown children were discharged after their mother had left; 36% left on the same day.

Tuam children remained in the home for even longer periods than the children in Pelletstown, reflecting the deliberate delay in boarding them out, which was requested by the Sisters of Bon Secours, and facilitated by the Mayo and Galway local authorities. The average is potentially misleading; 20% of Tuam children remained for less than 50 days; they tended to be children who were admitted because of family circumstances, not children who were born in Tuam; 16.6% of children remained in Tuam for between five and ten years, and seven children were in Tuam for between ten and 15 years. The information is incomplete, but where it exists, it shows that 73% of children remained in Tuam after their mother had left. In 1950, Tuam mothers stayed for an average of 272 days; the average for a child born in or admitted to the home with their mother was 1,383 days.
Children whose mothers left Tuam in 1950 could expect to remain in the home unaccompanied for 1,111 days on average. Tuam was seriously out of line with the other homes.

199. The pattern was different again in Bethany, where 49% of children remained after their mother had left; 29% left on the same day as their mother, 22% left before their mother and 10% were unaccompanied children - often children who had been returned from a foster home; no information is available for the remaining children. The average length of stay for Bethany children was consistently under a year; the longest stay was in the 1940s, an average of 303 days. Children and mothers left Bethany earlier than they left the Sacred Heart homes. In Denny House the longest stay for children was in the 1920s when they spent an average of 200 days; in later decades the length of stay was six months or less. 67% of Denny children left on the same day as their mother but these statistics are skewed by the large number of admissions in the 1980s, when mothers and children generally left together and most mothers were planning to raise their child. A total of 204 children, 19% of the children who were in Denny House, were discharged before their mother and over 13% remained in the home for a period after their mothers’ discharge.

200. The Commission has information about the outcomes for 7,401, or 79% of the children who were in Bessborough. Almost 60% of the children who survived were legally adopted; 27% are recorded as having left with their mother or a member of her family; 7% were transferred to another institution such as a county home, specialist hospital or long-stay institution, or an industrial school and 6% were boarded out or placed at nurse directly from Bessborough; the remaining 1% were informally adopted, before 1953.

201. Before the availability of legal adoption, children leaving the institutions were often boarded out by the local authority. There is evidence that local authorities commonly selected foster families for boarded out children to meet the needs/wishes of the foster parent rather than those of the child. Children were boarded out in impoverished households, where the monthly fee was regarded as a source of household income, rather than money to provide for the child. Farmers and other self-employed people often treated a foster child as a source of unpaid labour and for that reason they preferred older children. Children were placed with older unmarried women, or in households consisting of an elderly brother and
sister, where there was little understanding of a child’s needs. Elderly women living alone regarded a foster child as a companion and an unpaid servant or carer. Some children were sent to remote parishes where the numbers on the national school roll were low, in the hope of preventing the loss of a teacher. Charities that placed children ‘at nurse’ also appear to have done so with the interests of the foster parent in mind, rather than those of the child.

202. The picture of foster care is not uniform; the files record stories of children who were placed with caring families where their needs were paramount; former foster children, now adult and working, who returned for holidays to their foster home. Many children who were placed at nurse or boarded out by local authorities were adopted by their foster parents when legal adoption was introduced. But others were grossly exploited, badly fed, kept from school, subjected to physical punishment, and hired out in their teens for less than the statutory rate, often unaware that they were free to leave their employer. By the 1950s many foster children continued at school beyond the statutory school leaving age of 14; they were maintained while in education, with school books, bicycles and other requirements, at a time when children living with their parents received no such assistance. Although the regulations preventing children being boarded out in towns and cities was removed in 1953, many children continued to be placed in remote rural homes, which reduced their chances of attending a vocational or secondary school.

203. Regulations relating to children who were boarded out by a local authority were determined by the DLGPH. Responsibility for inspections of boarded-out children and their homes was a matter for the assistance officers, who were predominantly men, and had no training for this role. Inspections were often perfunctory, and were unlikely to have included sleeping arrangements, bed clothes and children’s clothing. The DLGPH inspectors - all women - carried out thorough inspections of boarded-out children and children at nurse, at approximately two-year intervals. Their reports describe squalid living and sleeping conditions; children dressed in rags. Foster families were given regular clothing allowances, which was often spent on clothing for the foster mother or her children. They described children who were required to carry out heavy unpaid work in their foster home; children suffering from medical ailments and children who experienced discrimination at school because they were foster children.
204. The department inspectors were often critical of the governance and inspections carried out by the local authorities. They repeatedly demanded that greater care be taken in choosing foster homes, and they were equally critical of local authorities who defied the minister by sending children in their care to industrial schools. Their efforts were not without success, however other officials in the department appear to have been conscious of the tensions that existed between central and local authorities and they were reluctant to force these issues. The female inspectors campaigned for the appointment of dedicated children’s officers, whose sole role would be to oversee boarded-out children and children at nurse, with perhaps two adjoining counties sharing a children’s officer. But many local authorities continued to leave responsibility for inspecting foster children with assistance officers; others determined that inspections should be carried out by public health nurses, whose heavy workload left little time for inspecting foster children. In 1970 only seven of the 17 designated local authority children’s officers were qualified social workers.

205. As the number of children being placed for adoption increased from the mid-1950s, the number of children placed at nurse or boarded out by local authorities declined. By the end of the 1960s a majority of children being placed in foster homes were no longer the children of unmarried mothers, but children whose family circumstances meant that they could not be raised by their parent(s) and who needed either short-term or long-term care in a foster home.

206. The outcomes for children in mother and baby homes changed significantly from the late 1950s when legal adoption became common. For children who were in the Sacred Heart homes before 1960, the most common recorded outcome was that they left with their mother or a member of her family. This creates an impression that the child was brought to their mother’s family home and may have been raised in the family. However, the overwhelming majority of these children were placed ‘at nurse’, in foster homes, either privately by the woman or by her family, or through a charity such as the Catholic Women’s Aid Society. By the 1960s, however, 74% of children leaving Sean Ross were adopted, and the number who were recorded as having left with their mother had fallen to 19%, compared with almost 66% in the 1940s. Dunboyne opened in 1957, by which time adoption was becoming more common, and two-thirds of the children born to women who returned to Dunboyne following the birth of their child, are recorded as being placed for adoption.
207. Data on the outcomes for Pelletstown children are complicated by the number of children with special needs and the children of married couples. Nevertheless, legal adoption was the most common outcome; 41.7% of children left the institution via this route, almost 27% left with their mother or returned to the family home; 24.2% transferred to another institution; 5% were boarded out; 1.6% were nursed out and 0.5% were informally adopted (pre 1953). A higher proportion of Pelletstown children went to other institutions than happened in the Sacred Heart homes. This is partly due to the number of children with special needs, but regardless of this, it appears that in the years before adoption became widespread, more Pelletstown children went to institutions. From the mid-1930s older children who had not been boarded out were often sent to St Philomena’s, a children’s home that was also run by the Daughters of Charity; other children were transferred to industrial schools. Children in Pelletstown were placed directly with foster families; in the 1940s the department inspector recorded complaints that would-be foster parents were not given a choice of children when they visited the home.

208. The data available for Tuam show that 38% of the children were boarded out; 37% left with their mother or a family member (this included most of the ‘legitimate’ children), and over 20% transferred to other institutions. Tuam closed in 1961 when adoption was becoming the most common outcome; less than 4% of the children were legally adopted. These patterns did not change significantly over the lifetime of the Children’s Home.

209. There are clear distinctions between the outcomes for children in Protestant homes in the years before adoption became common. Denny and Bethany had close relationships with a number of children’s homes and with charities that placed children at nurse, which accounts for the fact that children and mothers spent less time in Bethany and Denny than children did in the Sacred Heart homes. The most common outcome for Bethany children was to be sent to another institution - generally a children’s home. This was the outcome for 28% of the children for whom this information is available; 22% left with their mother or a family member; 20% were placed for adoption; 19% were placed at nurse and 10% were informally adopted. In the 1950s and 1960s a majority of Bethany children were placed for adoption; the number who left with their mother or her family fell, as did the number of children placed at nurse. Nevertheless, in the 1950s, 20% of Bethany children went to another institution, as did almost one-third of the children born in the 1960s. It is probable that many of those children were later adopted. In Denny
Executive Summary

House the most common outcome before 1950 was that the children were nursed out; this was the outcome for a majority of the children for whom information is available. In the 1950s and 1960s a majority of the children were adopted; in the 1980s and 1990s a majority left with their mother or a family member.

Protestant children were less likely to be boarded out by a local authority although there are records of Protestant boarded-out children in counties with a substantial Protestant population such as Donegal. Protestant children were more likely to be sent to institutions than Catholic children but these statistics only relate to their immediate destination and many were boarded out or informally ‘adopted’ from these children’s homes. Many Catholic children, who were placed at nurse, left with their mother or were boarded out, and many of these children were sent to industrial schools at a later date.

In the years after 1970, adoption was the most common outcome for the children who were in Pelletstown, Dunboyne or Bessborough. This is consistent with the information on the women’s admission pathways; most were referred to these homes by an adoption society which suggests that there was an expectation of adoption before the baby was born. By the 1970s, alternatives were emerging to mother and baby homes; some women were remaining at home or at work during pregnancy, before giving birth in a maternity hospital. Some pregnant women were placed with a family through Ally and later CURA. Entering a mother and baby home often meant that the women, or perhaps their family was thinking seriously about adoption, and although the women had access to external social workers, the prevailing climate in these homes favoured adoption.

Living conditions

The living conditions in the institutions must be seen in the context of the living conditions in private homes. Conditions in private homes changed dramatically over the period covered by this report (1922-1998) with the introduction of electricity, running water, indoor flush toilets, bathrooms, washing machines, electric or gas cookers, refrigerators, central heating, and radio and television. Many rural homes were without electricity until the 1950s and even the 1960s. In 1961 only 12% of rural households had water on tap, which meant that 88% had no indoor toilets, fixed baths, hot water on tap or washing machines. Thousands of working-class families in Dublin, Cork and Limerick lived in grossly over-crowded tenements with a toilet in the backyard which might be shared by several families.
Families were large so many beds were shared by two or more children; bedrooms were not heated, and old coats were often substituted for blankets. Many unmarried mothers came from such homes, and the conditions in mother and baby homes should be evaluated with this in mind.

213. It is important also to distinguish between mother and baby homes and the county homes. The most accurate information about living conditions comes from the inspections carried out by the Department of Health inspectors, but these only begin in the late 1930s, and not all survive. The available evidence suggests that, while living conditions in the mother and baby homes were basic, there is no indication that they were inadequate by the standards of the time, except in Kilrush and Tuam. In the years up to and including the 1960s, women slept in dormitories that might not be heated. These dormitories were large with no curtains between beds; women had no privacy and often had to store their belongings in a suitcase under their bed. While the number of baths, toilets and access to hot water may appear inadequate by modern standards, many private homes lacked these facilities. The standard of heating was equal to, and perhaps superior to most Irish homes at this time, though heating appears to have been deficient during the years of World War II, (as it was in private homes), and it would have been extremely difficult to heat the large dormitories, babies’ nurseries and dining rooms.

214. When Bethany was located in Blackhall Place the facilities were poor. Conditions were much better when it moved to Rathgar. The home was well-provided with bathrooms, though as elsewhere, heating and clothes drying facilities were inadequate; the dormitories were overcrowded and from the late 1930s until the 1950s the mothers slept in an annexe to the main house, which apparently lacked sanitary facilities. In Sean Ross and Castlepollard some mothers slept in former stables and had to go outdoors to reach the dining room and other facilities.

215. Most institutions were located in large detached houses that underwent some improvements before being used as mother and baby homes. In the 1930s the three Sacred Heart homes and Pelletstown received substantial capital funding from the Hospitals Trust Fund for improvements. All the homes had running water and modern sanitary facilities including baths although the number would seem very inadequate by modern standards. The modern hospital at Castlepollard which opened in 1942, and accommodated mothers and children in addition to a maternity unit, had central heating (though it was not turned on much during the
war years) and modern sanitary facilities. Pelletstown, which opened in a former workhouse, underwent some improvements in the 1930s, though facilities were probably more spartan than in the Sacred Heart homes. Four toilets for 140 women, as reported in 1950, was seriously inadequate.

216. Comments about living conditions must take account of the fact that all the homes (with the exception of Denny House) were overcrowded from the mid-1930s until the 1950s. Extra beds and cots were squeezed into crowded dormitories and nurseries; women had cramped space in dining rooms, and overcrowding may have deprived women and children of sitting rooms and playrooms. It is unclear whether the women had access to sitting rooms or recreation space before the late 1940s. There are references in inspection reports dating from the early 1950s to providing these spaces, and references to children’s playrooms - which might suggest that these are new. Overcrowding eased in the 1950s. Concern with infectious diseases and infant mortality resulted in large dormitories and children’s nurseries being divided into smaller units; additional toilets and washing facilities were installed. However until the late 1960s the women continued to sleep in large dormitories without partitions or curtains. These were being installed in Pelletstown and Bessborough at the end of the decade. Reduced numbers meant that dormitories could be converted into shared bedrooms and women were given space to store personal belongings. From the beginning Dunboyne, which opened in 1957, had much better facilities than the other mother and baby homes. It was never as overcrowded as the others; women slept in shared bedrooms. From the beginning it had a recreation room and central heating. An extension built in the early 1960s included several recreation rooms, visitor rooms and ample bathrooms.

217. The conditions in Kilrush which was located in a former workhouse were appalling - no electricity, running water, or sanitary facilities. The cost of carrying out essential improvements was a factor in the decision to close this home. Conditions in Tuam were not dissimilar but it continued to function as a home for children and mothers, without major improvements, until it closed in 1961. The only part of the Children’s Home with adequate facilities was the small maternity unit, which appears to have had running water and sanitary facilities, and the laundry. The rest of this institution - which accommodated over 200 children - was lacking in the most basic sanitary facilities. In 1959 there were only two places, other than the laundry and the maternity unit, with hot water on tap; the toilets appear to have
been outdoors and they were probably dry closets. The children’s rooms - which were almost devoid of toys - were heated either by open fires or portable radiators that were filled with hot water. Mothers and children slept in traditional workhouse dormitories, and the building was at high risk of fire.

218. Conditions in the county homes were much worse than in any mother and baby home, with the exceptions of Kilrush and Tuam. In the mid-1920s most had no sanitation, perhaps no running water; heating, where available was by an open fire; food was cooked, badly, often in a different building, so it was cold and even more unpalatable when it reached the women. Many county homes had no place for children to play or space for the women to sit. In 1933 the women in the Waterford county home had to eat their meals in the dormitory. There is some evidence that the able-bodied women, who were mainly unmarried mothers, were allocated the worst accommodation, because they were not seen as ‘deserving’ unlike the elderly and infirm, and their quarters were the last to be improved. Improvements were carried out to mother and baby homes in the 1920s and 1930s, but there is no evidence of significant investment in county homes during these years - other than installing electric lights, and perhaps connecting the home to a town’s water and sewerage system. Most county homes continued to lack adequate sanitary facilities, running water, hot water on tap and heating other than open fires until the 1950s - sometimes the end of that decade.

219. Living conditions were poor in Regina Coeli; some parts of the building - a former workhouse - were structurally unsound and the self-contained ‘family-units’ for mothers and children - in groups of six - were probably cramped. Much of Regina Coeli appears to have been heated by open fires. Reports of children suffering burns from boiling water, suggest that it had to be carried some distance, as opposed to flowing from a convenient tap, but Regina Coeli compensated for poor living conditions by enabling mothers to raise their children and giving them the freedom to come and go, not just to work, but for social occasions.

220. From the 1970s provision for unmarried mothers and their babies was changing. With a growing number of women deciding to keep their children, there was a demand for flatlets, that offered women more privacy and enabled them to become more self-sufficient. Miss Carr’s Flatlets which opened in 1972 was the first of the newer mother and baby homes. It was followed by the Belmont Flatlets and The Castle. Women in Denny House in later years were free to go out for social
occasions and spend weekends away, likewise in The Castle and Eglinton House, which was the successor to Pelletstown. When the Good Shepherd Congregation decided to close Dunboyne, they did so in the knowledge that any modern mother and baby home should offer women greater privacy, their own flatlet, and the freedom to integrate into the wider community.

**Diet**

221. The Commission has not seen information about food in mother and baby homes until the 1940s. The DLGPH laid down dietary regulations for county homes - following the practice in workhouses; however, the diet was meagre. In the 1920s the Minister for Local Government and Public Health instructed the Donegal county home in Stranorlar to reduce the daily rations, with only three meals a day, rather than four and when the medical officer in Kilrush demanded an improved diet for the mothers to enable them to breastfeed their babies, the department claimed it contained excessive quantities of bread, potatoes and butter. This exchange suggests that the dietary scales in Pelletstown and Tuam may also have been subject to departmental regulations but the Commission has not seen evidence of this. There were no dietary regulations for mother and baby homes which were privately-owned.

222. There is some evidence that food in mother and baby homes may have been inadequate during the Emergency years. A diet served to mothers in Bessborough on a ‘fast’ day in 1943 appears to have been seriously deficient in protein but there is no information regarding the quantities. There is a reference in an inspector’s report on Castlepollard, at around this time, to the need to improve the mothers’ diet. There were widespread, sometimes, short-term shortages of basic food items during these years and these shortages would have had a greater impact on homes, such as Tuam, Pelletstown and Bethany, that did not have sufficient land to produce food and especially milk.

223. By the late 1940s the diets in county homes appear to have improved, and many of the homes were installing modern cookers. Inspection reports mention orange juice, fruit, and vitamin and mineral supplements suggesting that the professional dietician in the Department of Health was overseeing the children’s diets. However, there were also descriptions of food being cooked on open fires and of the children’s milk being stored in insanitary conditions and certainly not refrigerated. The quality of milk - which remains unknown - was critical at a time
when many cows were tubercular. There is also evidence that contractors often supplied county homes with spoiled meat and low quality bread and milk with little nutritional value.

224. Mother and baby homes - apart from Tuam - had better cooking and kitchen facilities, so they had better prospects of storing and preparing milk in hygienic conditions. The mothers’ diets that are described in inspection reports from the late 1940s appear to be adequate, if monotonous by modern standards. They were not dramatically different to the diet in an average Irish home during those years. Descriptions of Pelletstown and Bessborough from the 1970s indicate that women sat at tables of six. However many women may have disliked the fact that meals were at fixed times and they had no choice about their food.

**Work**

225. Work was regarded as part of the process of ‘rehabilitation’ for women in mother and baby homes - in Ireland and internationally. Domestic chores and related activities such as dress-making and laundry were viewed as giving women skills that would enable them to find work when they left. Until the 1970s women in mother and baby homes carried out most of the domestic chores, including laundry for the home, and most of the care of infants. Bessborough women worked in the greenhouses and produce was sold from a shop in Cork. During the war years women saved turf in Sean Ross, and there are rather disconcerting reports of women in Castlepollard and Sean Ross cutting timber. All the homes with adjoining land employed male farm workers and there is no evidence that women were responsible for the main work on the farm though they assisted at busy times such as hay-making and saving turf. An inspection report of Bessborough in 1941 noted that much of the work was carried out by former patients, who had remained in the home, some from the 1920s; they were not paid. With the exception of cutting timber the work carried out by the women in mother and baby homes was similar to the work undertaken by Irish women at this time - whether in their home, or as hired servants. Many Irish women worked in their home until they went into labour, and they resumed their domestic chores and farm duties within 1-2 weeks of giving birth, if not sooner. Women in mother and baby homes appear to have remained in the maternity unit for approximately two weeks following the birth of their child. The key consideration relating to the workload of women in mother and baby homes is the fact that there were a large number of healthy young women to share the work and at any time there was something approaching parity between
the number of women and children. A number of women have alleged that the mother and baby homes assigned useless work to them as punishment, but the Commission has not been able to verify or refute this.

226. The workload for the women in county homes was of a different magnitude to the mother and baby homes. Unmarried mothers were far outnumbered by children, including older children, and by elderly and incapacitated adults. Most county homes did not employ domestic staff so unmarried women were assigned onerous duties that were essential to the running of these homes. There are many contemporary statements by local officials or matrons insisting that unmarried mothers could not be removed from the county home, because there would be nobody to carry out this work. A lack of hot water and sanitary facilities, the old, dilapidated buildings, with stone staircases and corridors, made their work even more difficult and unpleasant. County homes accommodated adults and children with special needs who would have required extra assistance and personal care. Women continued to carry out unpaid work in some county homes until the early 1960s, despite a statement by the Minister of Health in 1952 that this was prohibited.

227. Women in Tuam also carried a much heavier workload than in other mother and baby homes. There was a much higher ratio of children to women; approximately six children to every mother, resulting in a heavy workload of child-care, laundry, cooking and cleaning. Tuam, like the county homes, had poor heating, washing, and sanitary facilities, which further added to the work.

228. Domestic duties in the surviving mother and baby homes became lighter with the introduction of washing machines and other labour-saving devices. By the 1970s with women remaining in mother and baby homes for a shorter time, most of the work was carried out by paid staff.

Infant Mortality

229. The high rate of infant mortality (first year of life) in Irish mother and baby homes is probably the most disquieting feature of these institutions. It is particularly disquieting that the high mortality rate was known to the authorities both local and national and was even described in public reports. As already stated, about 9,000
children died in the institutions under investigation - approximately 15% of all the children who were in the institutions.

230. In the years 1935-45, just under half of all deaths of ‘illegitimate’ infants, 48.7% occurred in the main mother and baby homes, yet these homes accounted for just over one-quarter, or 25.5% of ‘illegitimate’ births. The chance of a child born in a mother and baby home surviving until their first birthday, was just over half that of an ‘illegitimate’ child who was not in a mother and baby home. The adverse impact of mother and baby homes lessened in the next decade: in the years 1946-55, mother and baby homes accounted for 39.6% of deaths of ‘illegitimate’ children and 30.5% of births. By the 1960s infant mortality in mother and baby homes was equal to, or lower than the national rate for ‘illegitimate’ children.

231. It is possible that the ‘illegitimate’ children who were not born in mother and baby homes were born to women from more privileged backgrounds: women who had a healthier pregnancy, and healthier babies. Alternatively, the survival prospects of the ‘illegitimate’ children who were not born in mother and baby homes, may have been better, because women and infants were not in large overcrowded institutions where they were at acute risk of infection. The statistical analysis set out in Chapter 33A concluded that ‘Mortality rates in each of the institutions were very high in the period compared to the overall national rate of infant mortality. Even compared to other locations where infant mortality was relatively high among the general population, such as Dublin city, rates of infant deaths were substantially higher in these institutions’.

232. Most deaths occurred among children who were aged between one month and one year, which is classified as infant mortality. The rate of infant mortality in most mother and baby homes peaked in the early 1940s, at a time when infant mortality in Ireland and especially in urban areas rose decisively. In 1943 infant mortality reached its highest rate in Bessborough, Bethany and Tuam. It fell in the late 1940s, coinciding with a significant fall in the national and urban rates of infant mortality. Delaney and McGovern concluded that ‘the data exhibit a marked structural break in the late 1940s or early 1950s, indicating that mortality conditions in the homes had improved significantly during this period in particular’.

233. A number of features of infant mortality in the individual mother and baby homes are worthy of comment. While infant mortality rose in most mother and baby
homes during the 1940s, Pelletstown is an exception, and this is noteworthy given
the spike in infant mortality and infectious diseases in Dublin city during those
years. The Cork county home also avoided a spike in infant mortality during the
1940s despite the appalling mortality in Bessborough. Infant mortality in
Pelletstown was significantly higher than in Dublin city throughout the 1920s,
1930s and most of the 1940s, but in the early 1940s the graphs converge. The
lowest rate of infant mortality was in Denny House which was the smallest mother
and baby home, and most infants were breastfed.

234. The highest rate of infant mortality recorded in an Irish mother and baby home was
in Bessborough in 1943, when 75% of the children died before their first birthday.
The exceptionally high mortality among the children of private patients in
Bessborough is significant. They accounted for 9% of total admissions, and for
21% of infant mortality. Many of these children were unaccompanied when they
died; the fact that private patients were permitted to leave Bessborough without
their child appears to have been a major contributory cause of deaths. This
contrasts with Castlepollard, where private patients were not permitted to leave
without their child and the death rate among the children of private patients was
approximately one-third the average for the institution. Infant mortality in
Castlepollard was consistently lower than the other homes run by the Sacred
Hearts congregation. Part of the explanation may lie in the fact that from 1942
much of the accommodation was in a modern purpose-built hospital. While the
evidence is patchy Castlepollard may have had a higher incidence of
breastfeeding. Sean Ross had a much higher incidence of mortality from major
infectious diseases, such as diphtheria and typhoid, than any other mother and
baby home. The transfer of mothers to the local fever hospital where they worked
as unpaid nurses, and their return to Sean Ross, where they appear to have
transmitted infection to their child, was responsible for the loss of children’s lives.
The wide disparity in infant mortality between the Bessborough and Castlepollard,
which were run by the same religious congregation, and with a similar profile of
mothers, suggests that some deaths could have been prevented.

235. The Bessborough statistics suggest that infants who were in a mother and baby
home without their mother may have been at higher risk of death. This would
appear to have been a factor in Bethany, which recorded an infant mortality rate of
62% in 1943. During the course of Bethany’s history, 41% of the mothers were not
resident when their infant died. The comparable figure for Bessborough is 21%. In
Sean Ross and in Castlepollard, 93% of the children were accompanied by their mother when they died.

Statistics for Tuam and Pelletstown are complicated by the fact that both institutions admitted ‘legitimate’ children, including children with special needs. In Tuam, 45% of children were unaccompanied at the time of death. At least 11% of the children who died in Tuam were ‘legitimate’, and 20% of deaths were of children who were over one-year old. In the years 1942-47, when 305 children died in Tuam, 12% were unaccompanied at the time of death.

31% of the children who were admitted to Pelletstown were ‘unaccompanied’ and they account for almost 44% of deaths. In the 1920s a substantial number of these children were foundlings, who had been abandoned in Dublin city; they were generally in poor condition, and many died shortly after admission. From the late 1950s Pelletstown was increasingly used as a long-stay institution/hospice for children with serious and untreatable medical conditions such as spina bifida, or Down syndrome children with serious heart diseases and many of these children died. Almost one in five of deaths in Pelletstown were of children who were over one year.

The major identifiable causes of death were respiratory infections and gastroenteritis. Public attention has focused on marasmus, suggesting that it indicated that many children in mother and baby homes died because of wilful neglect. The term marasmus is best seen as indicating that a child was failing to thrive, but medical experts suggest that this was due to an underlying, undiagnosed medical condition.

There is no single explanation for the appalling level of infant mortality in Irish mother and baby homes. The children of unmarried mothers were at greater risk, because of stress, and a lack of ante-natal care. There are comments in various documents dating from before 1950, alleging that the children of unmarried mothers were inherently weak and therefore at greater risk of infection and death, arguments that implied that many of these children were doomed. Some doctors suggested that unmarried mothers were at greater risk of premature births, but such comments - at a time when there was no scientific way of determining prematurity - may reflect the fact their babies may have had low birth weights. Most women who were admitted to mother and baby homes in the early years
were poor, (the private patients were an exception); their diet during pregnancy would have lacked essential nutrients, and this may have been exacerbated by efforts to conceal their pregnancy. Many women were admitted in the final weeks of pregnancy, some arrived following the birth of their child, so they would not have received any ante-natal care.

240. During the 1930s, 1940s and 1950s all the mother and baby homes - with the exception of Denny House - were overcrowded on numerous occasions. Overcrowding probably contributed to excess infant mortality, yet mortality in an overcrowded Castlepollard was much lower than in Bessborough and Sean Ross. The large size of most of the homes - again Denny is an exception - the large infant nurseries, with cots crammed together - sometimes only one foot apart - served to spread infection. There was an absence of infection control; a failure to isolate mothers and children who were being admitted, until they were proven not to carry an infectious disease. The risks of infection were exceptionally high in Tuam, which admitted older children, who might be homeless. The practice of isolating new admissions became more widespread during the 1940s, in response to mortality spikes.

241. There would also appear to have been a failure to implement appropriate standards of hygiene in the homes and to educate mothers about this. It would have been extremely difficult to implement proper hygiene in Tuam, given the inadequate sanitary facilities and lack of running water and hot water, but there was no reason why this could not have been achieved in the other homes. However all the homes were lacking in trained staff, with the possible exception of Pelletstown. When mother and baby homes opened in the 1920s there appears to have been little emphasis on a medical/health-care role, and they were run by middle-class women - either religious sisters or religiously-minded laywomen - who often lacked professional training in nursing, midwifery or child-care. The exception was probably Pelletstown which appears to have employed many more trained nurses than the other homes, though fewer than would have been desirable. The absence of professional staff, combined with what must be acknowledged as a general indifference to the fate of the children who were born in mother and baby homes, contributed to the appalling levels of infant mortality. In October 1936 the Bethany matron informed the management committee that five infants had died in the previous month; four from heart failure. She went on to observe that the health ‘of all was good, except for one delicate baby’. While
minutes of local authority meetings in county Galway contain many references to Tuam, none refer to the health or mortality of the children. It is more difficult to analyse infant mortality in the county homes. The number of children in an individual home was relatively low, so the picture could be easily distorted by a small number of deaths. However, despite the appalling living conditions, in the 1930s and 1940s they may have posed less of a risk to ‘illegitimate’ infants than the better equipped mother and baby homes.

242. The sharp decline in the incidence of infant mortality - nationally, and in urban areas - from the late 1940s was due to a variety of factors: antibiotics, immunisation programmes, improved quality of milk, isolation, and better sanitation and housing. Most of these factors would have impacted on the mother and baby homes. There is evidence of additional bathrooms and toilets, and it is possible that overall hygiene practices may have improved. New medical officers were appointed to both Bessborough and Sean Ross.

Maternal Mortality

243. The Commission has identified 200 women who died when they were resident in mother and baby homes or the county homes that were investigated (including women who died in hospital). Some of these deaths occurred more than a year after the birth of a child, and therefore would not be regarded as maternal deaths within the definition employed by the GRO. They include four women who were admitted to Bessborough in the 1920s, and died in the 1950s, 1970s and 1980s (two deaths). The available information shows that up to 57% of the deaths were directly or indirectly associated with pregnancy. The highest number of deaths (including those not associated with childbirth) was in the 1930s. Maternal mortality in Ireland began to fall from the late 1930s, when it became known that sulphonamide was highly-effective in treating puerperal sepsis. The decline in mother and baby homes mirrored national trends; by the 1950s the rate was less than one-quarter of the 1920s figure. Mortality in mother and baby homes and county homes from causes that were directly or indirectly relating to childbirth was higher than the national figure: 1930s - 5.6 per 1,000 births, compared with 4.8 per 1,000 births. However, the excess mortality (which may be overstated) is much less than in the case of infant mortality. There is greater cause for concern in the high mortality of women before 1950 from causes that were unrelated to pregnancy, including infectious diseases. It seems probable that the factors that
contributed to the high rate of infant mortality were also responsible for mortality among the mothers from causes that were not related to childbirth.

244. Until the 1960s or the 1970s, the quality of maternity care in mother and baby homes was probably superior to that available to the majority of Irish women at the time. In the first half of the twentieth century most women gave birth at home, attended by a midwife, and sometimes by an untrained ‘handy woman’. They gave birth in houses without running water or proper sanitation, whereas all the mother and baby homes had newly-built or improved maternity units by the late 1930s, and a qualified midwife, though they may have lacked many of the facilities appropriate to a maternity hospital. In 1944 Sean Ross maternity unit did not have sterilising equipment. The facilities in the county homes, where many unmarried mothers were forced to give birth, were often primitive. In 1935 the local medical officer discontinued admissions to the labour ward in Stranorlar because it lacked a bathroom and access to running water.

245. From the mid-1940s women in Bessborough were attended by a qualified obstetrician, and there is evidence in the Bessborough institutional records of women receiving ante-natal care from that time, though many women were admitted to Bessborough and other homes very late in pregnancy. The resident doctor appointed to Sean Ross around this time was a former assistant master in the Coombe. The medical officer in Castlepollard appears to have been assiduous in referring complicated cases to a Dublin maternity hospital. Pelletstown had access to the maternity unit in St Kevin’s hospital and they had a visiting obstetrician on call, who was attached to the Coombe. There were few qualified obstetricians in Ireland outside the major cities until the 1970s. Painkillers were not widely used either in home or hospital births. There is no evidence that the women who gave birth in mother and baby homes were denied pain relief or other medical interventions that were available to a public patient who gave birth in a Dublin or Cork maternity unit. There is evidence of women in mother and baby homes being given pain relief, and being stitched following birth. All mother and baby homes, except Tuam, had one or more qualified midwives and a visiting doctor(s) on their staff. Staffing levels were inadequate in the earlier decades, so it is quite probable that women may have been left without qualified nursing care during the early stages of labour, especially at night. It is unclear whether the religious sisters normally carried out night duty.
**Post-mortem practices and procedures**

246. The Commission’s 5th Interim Report outlined its findings in relation to burials in a number of the institutions and its findings in relation to anatomical studies. In spite of serious further efforts, the Commission has not been able to establish where the majority of the Bessborough children are buried. Chapter 38 contains a report on burials in Sean Ross.

247. While the authorities in the homes kept quite comprehensive records of the arrivals and departures of the residents, a number failed to keep any records of the burials of children who died. The Congregation of the Sacred Hearts of Jesus and Mary are unable to identify where the children from Bessborough are buried; the Commission finds it very hard to believe that there is no one in that congregation who does not have some knowledge of the burial places of the children. Similarly, the Commission considers that there must be people in Tuam who know more about the burials there.

**Vaccine trials**

248. The Commission has identified a total of seven vaccine trials which took place in the institutions under investigation in the period 1934-1973 and has identified a number of the children involved. It is clear that there was not compliance with the relevant regulatory and ethical standards of the time as consent was not obtained from either the mothers of the children or their guardians and the necessary licences were not in place. There is no evidence of injury to the children involved as a result of the vaccines.

**Arrangements for children**

249. Until Unmarried Mother’s Allowance was introduced in 1973, unmarried mothers had little choice about the long-term outcomes for their children and after that date their choice might be limited by the attitudes of their family. Attitudes changed slowly and access to accommodation remained a serious difficulty until the 1980s. Before legal adoption was introduced, women whose family could afford to pay for her child to be placed at nurse could leave the home after a shorter stay but it is questionable whether they had much say in the decision to place their child at nurse. Poorer women were at the mercy of the local authority, who would determine when and where to board out their child, or send her/him to an institution. Some women in county homes had to work unpaid in return for their child being boarded out. There are reports of mothers refusing to permit their child...
to be boarded out, preferring that she/he be in a county home, or an industrial school, where the mother could visit and continue to hope that she might reclaim her child. Some women visited their children who had been boarded out or placed at nurse, but that relationship might prove difficult. Mothers might resent a child bonding with a foster parent, and there are also instances where mothers or a family member sought to reclaim a child when she/he was a teenager and capable of earning money.

**Adoption**

250. A comprehensive review of adoption did not form part of the Commission’s remit. The Commission has concentrated on carrying out a review of the evidence relating to consent and on foreign adoptions.

251. Prior to the introduction of legal adoption in Ireland in 1953, the word adoption was often used to describe informal and non-legally binding arrangements whereby families took responsibility for children. Informal adoptions were also common in other countries before legal adoption was introduced. They were generally organised by voluntary agencies, and with the exception of the Bethany Home, where 111 children, 10.4% of the total are recorded as informally adopted, they played a very minor role in the exit pathways for the children from the homes that were investigated by the Commission. Many foster parents, who engaged in informal adoptions, subsequently adopted the child following the introduction of legal adoption in 1953.

252. Ireland was late in introducing formal legal adoption. Once legal adoption came into effect in 1953, adoption became the most significant exit pathway for children in mother and baby homes. There is documentation to support the view that politicians and others considered that adoption would give an ‘illegitimate’ child a better life. The rights of the mother were recognised but greater emphasis was generally placed on the needs of the adoptive parents.

**Consent to legal adoption**

253. An adoption order could not be made without the consent of the child’s mother or guardian, or any person having charge of or control over the child. A mother was required to sign two distinct consents: an agreement to place a child for adoption, and a second, consent to the adoption order. The Adoption Board was required to satisfy itself, prior to making an adoption order, that the mother understood the
nature and effect of the consent and of the adoption order. A mother could withdraw her consent at any stage up to the making of the adoption order, though a number of legal cases suggest that mothers were not always aware of this.

254. The Commission has received evidence from some mothers who signed forms consenting to adoption because they had no alternative, because of family circumstances and/or insufficient means to support a baby. Some of this cohort of women are of the opinion that their consent was not full, free and informed. However, with the exception of a small number of legal cases, there is no evidence that this was their view at the time of the adoption. It is clear that for at least the first ten to 15 years of its operation, the Adoption Board did not have adequate resources to properly supervise adoption agencies or examine the consents given. The Commission is satisfied that, at least from the 1970s/1980s, there were adequate procedures in place for ensuring that a mother’s consent was full, free and informed.

**Foreign Adoptions**

255. Institutional and official external records examined by the Commission show that 1,638 children who were resident in the mother and baby homes and county homes under investigation were placed for foreign adoption. The vast majority, 1,427 were placed for adoption in the United States of America. The *Adoption Act 1952* did not regulate foreign adoptions.

256. There was no statutory regulation of foreign adoptions. The only informal supervision was in relation to the issuing of passports for the children to travel to the USA. Archbishop McQuaid and Fr Cecil Barrett, who strictly speaking had no right to be involved at all, were actively involved in trying to control foreign adoptions and did manage to have some standards applied. In the early 1950s they drew up protocols to be applied to applications for passports for children who were travelling abroad for the purpose of legal adoption. The protocol demanded documentary evidence of the adopting parents’ character and ability to provide for the spiritual and material welfare of the child. It demanded a home study report prepared by representatives of Catholic Charities or another organisation (in some states these were conducted by the state adoption authority). A list of requirements sent by Galway county council to would-be adopters, apparently dating from 1951, stipulated that the agency placing a child for adoption in the USA should be registered with the state authorities. It is clear from an examination of
the Department of External Affairs files that these rules were observed and exceptions were rarely made. A number of those who were rejected as adopters made representations to the Minister for External Affairs, and the Taoiseach, as did a number of priests based in the USA, but these were unsuccessful. The consular section of the US Embassy in Dublin issued visas enabling children to enter the United States; they also had requirements that would-be adopting parents had to meet before a visa would be issued.

Many allegations have been made that large sums of money were given to the institutions and agencies in Ireland that arranged foreign adoptions. Such allegations are impossible to prove and impossible to disprove. One person who was adopted in the USA in the 1950s provided the Commission with documentary evidence of the costs of his adoption. They included an airfare of $273, and a payment of $142 to Sean Ross, which included a contribution to the cost of the airfare of the adult who accompanied the child on the flight. Further costs incurred included payments for a home study report, medical reports and legal costs in finalising the adoption.

A number of witnesses to the Commission spoke about donations they believed were sent by their adoptive parents following their adoption in the USA. Such donations were not illegal and could not be described as unethical unless the adoptive parents were trying to adopt another child. The fact that the Daughters of Charity were advised by their director that money or gifts coming from America or elsewhere in relation to adoptions from Pelletstown could not be accepted, either as personal gifts or as donations to community works, indicates that donations were being made. The records of the Bethany Home contain a reference to a substantial donation by an American man who had adopted two Bethany children.

For the most part US adoption orders relating to these children were made by the Courts in the state where the Irish-born child was adopted. The Commission has examined a number of these orders and the supporting documentation and was impressed by the scrutiny taken by the US Courts to such applications. In many cases the Court appointed a guardian ad litem to represent the child’s interests.

Discrimination

Throughout most of the period covered by the Commission unmarried mothers and their children experienced widespread discrimination within Irish society. Many
county hospitals would not admit unmarried women to maternity wards until the 1960s, forcing them to give birth in ill-equipped, and often insanitary county homes. The large number of women who were admitted to mother and baby homes, and county homes, and the fact that mother and baby homes continued to exist until the end of the twentieth century is evidence of the discrimination shown towards unmarried mothers and their children in Irish society. The legal status of ‘illegitimacy’ survived until 1987.

Race and disability

261. Based on a study of Bessborough and Pelletstown, the two largest institutions and both of which survived until the 1990s, the Commission concluded that there was no evidence of discrimination in relation to decisions made about fostering or adoption of mixed race children or children with disabilities. However the decisions that were made with respect to placing these children took account of race or disability. Of the 275 children who were in Pelletstown and Bessborough where race is noted on their records, 56% were placed for adoption. A number of families specifically sought to adopt ‘mixed race’ children; other families requested children who were not ‘mixed race’.

262. It appears that race was a less important factor in decisions relating to adoption than religion or disability. A mother’s mental illness or a child’s intellectual disability prevented or delayed adoption in a number of cases where the experts believed that adoption was in the child’s best interests but there is no evidence of systematic discrimination. The understanding of mental illness and intellectual disability was limited in first half of the twentieth century, and that may have resulted in some children being sent to industrial schools, as opposed to being boarded out. The growing number of pregnant unmarried women who were recorded as suffering from mental illness from the 1960s onwards suggests that there were probably many women in mother and baby homes in earlier decades with undiagnosed and untreated mental illness.

263. One-third of the children with intellectual disabilities in Pelletstown were the children of married couples. The significant number of ‘legitimate’ children in Pelletstown with serious physical or intellectual disabilities indicates that discrimination/disadvantage could apply more generally to children, and adults with disabilities, regardless of their birth status. The Commission heard no
representations by or on behalf of people with disabilities who were probably the most badly affected by being in institutions.

Religion

264. The issue of discrimination on the basis of religion is complex. Mother and baby homes - not just in Ireland - were run by religious communities and, as noted earlier, the reform/salvation of mothers and children was central to their mission. The evidence presented above about the different mother and baby homes, their funding models, length of stay for mothers and children, and exit pathways for the children indicate that there were some differences between the homes that were run by Protestant charities and those that were controlled by the local government authorities such as Pelletstown and Tuam, or by Catholic religious congregations. However, these differences do not indicate that there was discrimination on the basis of religion.

265. There is no indication of religious discrimination in relation to funding. The South Cork board of health and public assistance entered an arrangement for unmarried mothers and their children to be transferred to Bessborough and maintained there at a capitation rate, which became the funding model for mother and baby homes that were not owned and operated by local authorities. They made a similar arrangement with the Braemar Home in Cork to admit Protestant women. Local authorities had to seek the approval of the Minister for Local Government and Public Health to maintain women and children in a particular home. When Sean Ross and Castlepollard were established it appears that local authorities in their region were contacted and informed about the homes. There is no indication that Bethany or Denny House sought to be included on such a list before the early 1940s; if they had, there is no reason to suggest that they would not have been included. When it was suggested to Bethany in the early 1940s, that they seek approval from the Dublin local authorities to admit Dublin women on this basis, Bethany claimed that Protestant women were reluctant to approach a local authority seeking maintenance.

266. Denny House secured funding from the Local Government Board of Ireland under the Maternity and Child Welfare Scheme and this funding was continued by DLGPH. The grants covered half of the cost of maintaining mother in the home for up to six weeks before the birth, and half the cost of maintaining mother and child
for up to one year after the birth. The only Catholic mother and baby home to receive similar funding was St Gerard's. Funding under the Maternity and Child Welfare Grants was eventually extended to Bethany in the late 1940s; the precise details are not recorded. From the mid-1940s a number of local authorities secured approval to maintain women in Bethany and Denny.

267. The institution that received the least money from central and local government was Regina Coeli, though it should be emphasised that they did not seek a capitation payment. Funding for mother and baby homes developed in an ad hoc manner; the majority of unmarried mothers were Catholics, and they entered institutions that were run by Catholic religious orders. Women were admitted to Pelletstown regardless of their religion; Protestant women were admitted to the Donegal and the Cork county homes, and it is probable that they were admitted to other county homes that have not been investigated by the Commission. There is no evidence of religious discrimination in these cases. When a Dublin Protestant did not wish his pregnant daughter to be admitted to a Dublin mother and baby home, in order to protect her privacy, the department arranged for her admission to Braemar.
Recommendations

1. The Commission's Terms of Reference provide that it may ‘include in its reports any recommendation that it considers appropriate, including recommendations in relation to relevant matters identified in the course of its investigation which it considers may warrant further investigation in the public interest’.

2. The two main issues raised by former residents of the institutions under investigation were what they perceive as deficiencies in the information and tracing systems and redress for what they consider to be the wrongs done to them in the institutions and/or by society generally. The Commission has decided to make recommendations on these two issues and on a small number of other issues.

Information and tracing

Personal information

3. Many of the former residents who came to the Commission were very critical of the information and tracing arrangements in place. There has been quite vitriolic criticism of the Child and Family Agency (Tusla) and its approach to providing information to adopted people. This criticism is unfair and misplaced. Tusla is implementing the law and has no choice about doing so. The problem is not with Tusla; it is with the law. Any other agency providing information and tracing services would be in the same position.

4. The law on access to adoption records is outlined in Chapter 36. Adopted people do not have a right to access their original birth certificate nor do they have the right to access information on their families of origin. Many adopted people have been able to access this information but others have been unable to do so.

5. It is clear to the Commission that many adopted people think there is considerably more information about them in institutional and other records than is actually the case. Having examined the available records closely, the Commission knows that the information is very limited in most cases. The quantity and quality of the available information is not, of course, relevant to the issue of whether or not there should be a right of access. The Commission is aware that this matter has been under consideration by a succession of governments since the 1990s. Attempts to legislate for this right have, so far, failed. The Commission understands that the Attorney General has advised that it was constitutionally unacceptable to allow
unrestricted access to birth information for adopted people. The current
government and Minister O’Gorman have committed to introducing such
legislation.

6. The Commission considers that there should be such a right even though it is
acutely conscious of the concerns expressed by some birth mothers about this. If,
as seems likely, a referendum is required to allow for the necessary legislation,
then one should be held.

7. Adopted people should have a right to their birth certificates and associated birth
information. A person’s right to his or her identity is an important human right and
should only be denied in very exceptional circumstances. Medical information and
adoption records compiled at the time of the adoption should also be available. A
mechanism could be put in place to allow a birth mother to argue that her privacy
rights are being eroded. This could be done through in-camera proceedings in the
Circuit Court. Both the birth parent(s) and the adopted person should have the
right to legal representation and legal aid should be provided for all parties if
required.

8. The Commission also considers that there should be a central repository of the
records of institutions and adoption societies so that information can be obtained
from one place. The Commission’s database of individuals compiled from the
institutional records of the various institutions could be expanded by adding further
records to it - see below for further recommendations on records.

Information about burials

9. The report by Dr Geoffrey Shannon entitled Human Rights issues at the former site
of the Mother and Baby Home, Tuam \(^1\) examines in detail the issue of the rights of
families to information about burials. There are no clear absolute rights. The
Commission understands the wishes of family members to know more.

10. The main problem with information about burials of children who died in mother
and baby homes is that, in many cases, there are no records. As already set out in
the Commission’s 5\(^{th}\) Interim Report and further elaborated in this report (Chapter
38), the Commission has not been able to find burial records for the majority of the
children who died in the institutions under investigation. (Pelletstown and Bethany

---

\(^1\) https://assets.gov.ie/25217/0abb576368b14e2081c447b417544fb2.pdf
RECOMMENDATIONS

are exceptions). The Commission finds it very difficult to understand the seeming inability of any member of the Congregation of the Sacred Hearts of Jesus and Mary to assist in locating the burial places of children who died in Bessborough. It also considers that there is likely to be more local information about the Tuam burials than has been forthcoming. The Commission made serious efforts to discover Department of Local Government documentation relating to the housing development on the site of the Tuam Children’s Home and has failed to discover such in the National Archives, despite the fact that documentation on many contemporaneous housing schemes is readily available there. The Commission notes that no progress has been made in relation to the site at Tuam where human remains were discovered in 2016. It does appreciate that the government is trying to establish an agency to deal with the matter. This delay underscores the enormous practical difficulties in establishing exactly who is buried there.

11. In cases where the mothers were in the homes when the child died, it is possible that they knew the burial arrangements or would have been told if they asked. It is arguable that no other family member is entitled to that information. It is clear to the Commission that a number of mothers whose children died in the institutions never spoke about this to other family members. Despite the fact that thousands of babies died, the Commission is aware of only a few mothers, who were not in the institution when the child died, who subsequently sought information on the burial locations of their children. At least one was given incorrect information - this was unforgiveable.

12. The Commission considers that a right to information of this nature should be confined to parents and siblings.

Redress

13. Redress can be financial or can be in the form of enhanced services. The Commission considers that services such as counselling and enhanced medical cards\(^2\) should be made available to those former residents who need them. It also wishes to make clear that many, probably most, former residents are managing their lives very well and it should not be assumed that they are in need of dedicated State support. A number of former residents have also expressed the view that an apology would be appropriate.

---

\(^2\) As provided for by the Health (Amendment) Act 1996.
14. Any decision on financial redress is a matter for government. The Commission recognises that it is not possible to provide financial redress for all the wrongs that occurred in the past (or, indeed, that are currently occurring). It is arguable, for example, that unmarried mothers, who were not in mother and baby homes and who reared their children without any financial assistance from the State, have as good a case for redress as unmarried mothers who were in mother and baby homes paid for by the State. Financial redress for past wrongs involves the present generation paying for the wrongs of earlier generations and it could be argued that this is unfair. However, while recognising that all wrongs cannot be put right and that some groups have received financial redress, the Commission considers that the State does have an obligation not to discriminate between people in similar situations.

15. Financial redress has been awarded in the past to a number of groups. If redress is being considered for former residents of mother and baby homes, the relevant comparable redress schemes are the Residential Institutions Redress Scheme (RIRS) (for the children) and the Magdalen laundries scheme (for the mothers).

**The Residential Institutions Redress Scheme**

16. The Residential Institutions Redress Scheme was the largest redress scheme provided by the Irish Government. It covered former residents of industrial schools and of a range of orphanages and hospitals. In order to get redress, former residents of the institutions covered by the RIRS had to prove that they were resident and then had to show that they had suffered physical, sexual, or emotional abuse resulting in injury to them. (The simple fact of residence was not sufficient to get redress.) By the end of 2016, 16,650 awards had been made. The average value of an award was €62,250, with the largest being €300,500. It is impossible to know how many people were theoretically eligible because the numbers in the various institutions are unknown as, inevitably, are the numbers who were still alive when the scheme was announced. There are still a small number of cases to be decided but the scheme was all but over by 2016 although the administration arrangements are still in place. These arrangements could be used or a different but equivalent scheme could be drawn up.

3 www.rirb.ie
The scheme has cost approximately €1.1 billion. Everyone who received an award from the RIRB was also eligible for funding from the Residential Institutions Statutory Fund (CARANUA). CARANUA is now winding down.

The Commission’s 2\textsuperscript{nd} Interim Report gives a detailed description of the development of the RIRS and pointed out that there were inconsistencies in the decisions to include/exclude some institutions. That report was completed in August 2016 and was based on information available to the Commission at the time. The information gathered subsequently does not change the Commission’s view about inconsistencies. It is now clear to the Commission that the group whose exclusion is most egregious is the former child residents of the Tuam home. Tuam was a local authority home and many children remained in residence until they were seven years or older. Tuam was similar in virtually all respects to Pelletstown and there is no basis for the exclusion of Tuam when Pelletstown was included. The same argument could be made about Kilrush but it is largely academic as it is unlikely that any of its former residents are still alive.

The children who were resident in the other mother and baby homes without their mothers also have a strong case for being considered for redress. As was pointed out in the 2\textsuperscript{nd} Interim report, the criterion for inclusion in the scheme was whether or not a public body had a regulatory or inspection function in respect of that institution. It is abundantly clear now that all the institutions investigated by the Commission meet this criterion.

\textit{Young mothers in the institutions}

The RIRS applied to children under the age of 18. This means that, if it were to be extended to the institutions under the Commission’s remit, a number of young mothers would be eligible.

\textit{Other institutions}

There may be other institutions not investigated by the Commission which were unfairly excluded from the scheme, for example, Westbank,\textsuperscript{4} to which attention was drawn in the 2\textsuperscript{nd} Interim Report.

\textsuperscript{4} Westbank/Mayil was an orphanage associated with the Bethany Home.
Was there abuse

22. The inclusion of institutions in the scheme was not based on knowledge of abuse within the institution so knowledge of abuse within the institutions ought not be a criterion. The Commission, however, considers that there is evidence of some abuse of children in a number of the institutions. The Commission has not heard any evidence of sexual abuse of child residents. It has heard some evidence of physical abuse which, while unacceptable, was minor in comparison to the evidence of physical abuse documented in the Ryan Report. There is evidence of emotional abuse; however, it would appear that the abuse suffered by, for example, former Tuam child residents, came, at least as much if not more, from local residents and other school going children as from the institution itself. The major abuse suffered by former Tuam child residents came when boarded out.

23. The Commission assessment in respect of each institution under its remit is as follows:

Pelletstown: this was included in the RIRS so no issue arises.

Belmont, Miss Carr’s, The Castle, Regina Coeli: children were not resident without their mothers so the question of redress does not arise.

Dunboyne: Logically former child residents should be eligible but the Commission has seen no evidence of any abuse in Dunboyne; babies stayed for such a short time (many did not stay there at all) that a claim of abuse would be virtually impossible to sustain. The young mothers who were there would also have difficulty establishing that there was abuse.

Tuam, Bessborough, Castlepollard, Sean Ross, Bethany, Denny: the former child residents should all be eligible. It seems to the Commission that those who spent very short periods in the institutions would find it very difficult to establish that they had been abused.

County homes: those children resident in county homes without their mothers should all be eligible. They include many ‘legitimate’ and ‘illegitimate’ children with disabilities who were in the county homes because there was no alternative institutional accommodation. Those children with disabilities who were in specialist homes for children with disabilities were included in the scheme. The Commission has not heard direct evidence of abuse of children in county homes but is aware that the sleeping arrangements were often inherently unsafe particularly for boys who often slept in adult wards and sometimes in the same bed as an adult.
The Magdalen laundries scheme

24. Subsequent to the publication of the McAleese Report, the Quirke report on the Establishment of an ex gratia Scheme and related matters for the benefit of those women who were admitted to and worked in the Magdalen Laundries was published in May 2013. It recommended the establishment of a Magdalen Restorative Justice Ex-Gratia Scheme. This scheme was initially for former residents of 12 Magdalen institutions - the ten investigated by McAleese and two others. In May 2018, the scheme was extended to women who worked in the laundries of the 12 institutions but who lived in one of the adjoining 14 institutions. Former residents of these 14 institutions were also eligible under the RIRS (see Chapter 2). By 18 September 2020, a total of €31.95 million had been paid to 803 applicants; 726 were from the original 12 institutions and 87 from the adjoining institutions. A small number of applications were still being processed and a number of awards are subject to review.5

25. The scheme provides for a general payment and a work payment; both are related to the length of residence. The full details are set out in the Quirke Report.6 Some relevant examples are:

<table>
<thead>
<tr>
<th>Length of residence</th>
<th>General payment</th>
<th>Work payment</th>

<td>€17,500</td>
<td>€9,000</td>
</tr>
<tr>
<td>2 years</td>
<td>€20,500</td>
<td>€12,000</td>
</tr>
</tbody>
</table>

Should a similar scheme apply to women in mother and baby homes?

26. The women who were resident in the Magdalen laundries received redress because they were considered to be incarcerated and because they did commercial work for no pay. The women who were in mother and baby homes were not in quite the same situation as the women in Magdalen laundries but there are some similarities.

27. The women in mother and baby homes should not have been there. They should have been at home with their families. However, the reality is that most had no choice - they were, or expected to be, rejected by their families and they needed a

5 http://justice.ie/en/JELR/Ex-Gratia%20Scheme%20FINAL.pdf/Files/Ex-Gratia%20Scheme%20FINAL.pdf
place to stay. Most were unable to provide for the baby. They were not ‘incarcerated’ in the strict meaning of the word but, in the earlier years at least, with some justification, they thought they were. They were always free to leave if they took their child; some did leave before the child was born and some left without their child. Most had no money and nowhere to go. The introduction of the Unmarried Mother’s Allowance in 1973 changed that. The Commission considers that women who entered mother and baby homes after 1973 do not have a case for financial redress.

28. It could be argued that women who had to stay for two years or more because alternative arrangements had not been made for their children could be regarded as ‘incarcerated’ in the same way as women in Magdalen laundries. It can also be argued that they did have responsibilities towards their children and the only way in which they could fulfil those responsibilities was by remaining in the institutions.

29. There is no doubt that women in mother and baby homes were subjected to emotional abuse but there is very little evidence of physical abuse and no evidence of sexual abuse.

30. Most women in mother and baby homes were not required to do commercial work. They were expected to work but this was generally work which they would have had to do if they were living at home, for example, cleaning their living quarters, doing their own laundry, cooking, carrying out farm work. It is probably the case that more intensive and more frequent cleaning was required in the institutions than would be required in a normal home. Some mother and baby homes had farms attached and the women worked on the farms. This work was no different from that carried out by women on farms all over the country. There is some evidence of women being required to carry out work that would be considered unsuitable for women, for example, there is evidence that women in Castlepollard may have been required to chop wood and a witness has said that he saw women in Sean Ross chopping wood.

31. There were groups of unmarried mothers who did carry out what might be termed ‘commercial work’.
Women in county homes: Women who were in county homes did not just look after themselves and their children. They also looked after other residents of the county homes; these other residents were older people, sick people, and people with disabilities, and they were carrying out unpaid work on behalf of local authorities. This was difficult, arduous work for which they ought to have been remunerated.

Women in Tuam: Mothers frequently left Tuam several years before their children. This meant that the remaining mothers had to care for their own child as well as a large number of other children. It is arguable that they should have been remunerated for this.

Women who worked outside the institutions without pay: There is evidence that some residents of Sean Ross worked in the local district hospital. This should have been remunerated.

32. The Commission recommends that these three groups be eligible for a redress scheme similar to the Magdalen scheme.

33. Women who spent lengthy periods (for example, in excess of six months) in mother and baby homes before 1974 should also be considered for redress along the lines of the Magdalen basic payment related to time spent. Six months has been selected as the cut-off date because it is the average length of time that women spent in mother and baby homes in other countries.

Other issues

The language of adoption

34. Some former residents and lobby groups have suggested that ‘adoption’ should be renamed ‘forced adoption’. The Commission does not agree. The Commission found very little evidence that children were forcibly taken from their mothers; it accepts that the mothers did not have much choice but that is not the same as ‘forced’ adoption. Mothers did have time after the initial placement for adoption to reassess the situation. The Commission has not come across the sort of practices in relation to adoption that were outlined in the Australian Senate Community Affairs References Committee Commonwealth Contribution to Former Forced Adoption Policies and Practices 2012. The principle reason why adoption

became so popular after it was formally introduced in 1953 was lack of family and community support for mothers who wished to keep their child. Its availability also meant that women did not have to stay as long in the institutions.

35. Most families adopted the child believing it to be in the best interest of the child and great care needs to be taken that such families (or their adoptive children) are not denigrated in any way and that the term ‘adoption’ should not be revised to portray that all, or even most, adoptions were forced or illegal. There is no doubt that the option of legal adoption was a vastly better outcome for the children involved that the previous informal adoption or nursed out arrangements and it resulted in fewer children spending their early lives in institutions.

Memorialisation

36. A number of initiatives can be included under this heading but ultimately it is a matter for the former residents as to what type of memorial they would like to see. The former residents of Bethany have a prominent memorial in Mount Jerome cemetery and it may be that others might like to follow that lead. Local authorities should be in a position to provide some funding for local memorialisation projects. The question of an all-Ireland memorial should be a matter for the various groups involved who should be consulted before any funding is made available for such a project. The government could consider earmarking a specific fund for current disadvantaged children (for example, children in direct provision, or children with special needs and naming it in honour of, say, the children who died in Tuam.

Education

37. As part of its contribution in the area of education the Commission liaised with students from Ballyfermot Senior College to compile a short video on the experiences of women and children who spent time in the institutions being investigated. This video forms part of the report being submitted and it is hoped that the Minister for Children, Equality, Disability Integration and Youth will engage with his counterpart in the Department of Education to have it made available to second level schools. The presentation is aimed at 14-16 year olds.

38. A number of scholarships should be created for further research in memory of all the children who died, with preference given to children from disadvantaged households.
Boarded out children

39. Some children who were boarded out were treated very badly and some were treated well. A small number have told the Commission that they inherited farms from their foster parents but they had to pay taxes for which birth children and adopted children were not liable. The Commission considers that an ex gratia payment could be made to compensate for this.

Recommendations about archives

40. The Commission’s Terms of Reference provide that ‘In order to assist public understanding the Commission should provide in its reports an outline of the archival and other sources of most relevance to these issues and the nature and extent of the records therein, together with the challenges and opportunities in exploiting these sources for the purpose of further historical research or examination’.

41. The sources used by the Commission are outlined in Part 5. The Commission has identified a number of ‘challenges and opportunities’ provided by these sources to enhance public understanding.

Institutional records

42. The principal source of information for this report was the institutional records of the various institutions. As is described in Part 5, these are mainly registers of details about the former residents. These details have been transcribed into the Commission’s electronic database of individuals. This database is being made available to the Child and Family Agency (Tusla) to assist with information and tracing. The bulk of the information in this database and in the original records on which it is based is sensitive personal information. In some cases, it is not even available to the individuals themselves. As stated above, the Commission considers that it should be available to the individuals.

Department of Health records

43. Apart from the institutional records of the individual institutions, the largest collection of files examined by the Commission was provided under discovery by the Department of Health in the form of digital copies (see Introduction). The originals are held by the Department of Health or its successor, the Department of Children, Equality, Disability, Integration and Youth. The overwhelming majority of
these files are over 30 years old. Under the terms of the National Archives Act 1986 they should be publicly available in the National Archives of Ireland (NAI). These files have been listed by the Commission’s archivist. The Commission recommends that digital copies, together with a descriptive list, be made available within six months to readers in the NAI.

44. Section 8 (c) of the 1986 Act provides for the withholding of files that:
   would or might cause distress or danger to living persons on the ground that
   they contain information about individuals, or would or might be likely to lead
to an action for damages for defamation.

45. Some files would need to be withheld or partly redacted in accordance with this
    section. However, this process should not be used to delay public access; files
    should be made available as they are cleared, and the work should be completed
    within 12 months.

46. Most of the files that would be withheld/redacted relate to inspections of boarded
    out children and children at nurse, and the files relating to women who contacted
    the DLGPH seeking assistance, including many files relating to women who had
    returned from England from the 1940s until 1961. The files on boarded out
    children contain important information about the children’s health, physical
    descriptions, comments about their personality, education, and their foster homes.
The files relating to the women contain details about their family and about the
    circumstances of the pregnancy. The Commission considers that these files
    should be used to create two databases, by name, one relating to the foster
    children and one relating to the women. They could be linked with the
    Commission’s electronic database of individuals where possible (many of the
    boarded out children were never in mother and baby homes so there would be no
    connection with the Commission’s database) but almost all of the women who
    made contact with the DLGPH were admitted to mother and baby homes that were
    investigated by the Commission. This information should be made available to the
    individuals or their immediate family under the normal Freedom of Information and
    data protection rules.

**Industrial school and adoption records**

47. The Commission’s electronic database of individuals could also be expanded by
    incorporating information collected by the Ryan Commission about the children in
industrial schools, records held by the Department of Education about industrial schools and records held by the Adoption Authority of Ireland. This would provide a more comprehensive picture of the longer-term outcomes for children born in mother and baby homes.

**Death registers**

48. Consideration should also be given to examining death registration records of the children who were born in mother and baby homes in the 1920s and the 1930s and who subsequently lived in the community or in institutions with a view to establishing their age at death and causes of death. In order to achieve a comprehensive picture it would be necessary to also check UK death registers. The purpose of this exercise would be to try to establish some of the long-term consequences of birth in mother and baby homes and being raised apart from one’s mother.

**Local authority records**

49. Access to the records of local authorities, which includes the records of county homes, is governed by Section 80 of the *Local Government Act 2001*, which states:

Subject to the other provisions of this section, it is a function of a local authority to make arrangements for the proper management, custody, care and conservation of local records and local archives and for inspection by the public of local archives.

50. The thirty-year rule applies, similar to national government archives, as do provisions for withholding access of files containing information about individuals. Virtually all of the local authority records used by the Commission are over 30 years old. We recommend that local authorities should examine their archives, with a view to identifying all material that is relevant to the issues investigated by this Commission, and they should make these files available to the public, subject to the requirement to withhold or redact some files.

**HSE records**

51. There are no regulations governing the preservation of, and access to, the HSE records or the records of its predecessors in title. The HSE was unable to find many of the records which would have assisted the Commission in finding out more about the institutions under investigation. This should be addressed by legislation requiring the
HSE and other State bodies (including, for example, the Child and Family Agency) to maintain records in broadly the same way as local authorities.

**Diocesan and religious order records**

52. Diocesan records and the records of the religious orders involved in the institutions are the property of the holders and they have the right to determine who gets access. The Commission was given voluntary access to every diocesan archive which was asked. Two of the religious orders provided extensive documentation under orders for discovery while others provided the limited documentation which they had available. The Commission would encourage relevant religious orders to make more documentation publicly available.

**General**

53. The Commission recommends that the Department of Children, Equality, Disability, Integration and Youth appoint a qualified archivist to draft a guide to the records that are of interest to those who have either a personal or academic interest in the history of women and children in residential institutions.
**Time Line**

**1765:** The Magdalen Asylum, later called Denny House, was founded.

**1902:** Mrs Dickie was appointed in March as the first woman inspector of boarded-out children; in November Miss Fitzgerald-Kenney was appointed to join her.

**1906:** The Vice-Regal Commission on Poor Law Reform in Ireland reported. It suggested that mother and baby homes should be established in Ireland to cater specifically for first time unmarried mothers, owned or managed by religious communities or philanthropic persons, or disused workhouses that were adapted for the purpose and would only accommodate single mothers and their children; these special homes should be managed by committees of contributory Boards of Guardians.

**1908:** The *Children Act* introduced regulations and inspections of boarded out children; local authorities were required to appoint infant protection officers to inspect homes where children were nursed out.

**1910:** The Nursery and Rescue Home and Rotunda Protestant Girls' Aid Society was established in Templeogue, Dublin, as a shelter home for Protestant women experiencing a 'first fall' pregnancy.

**1911:** Census.

**1916:** Introduction of the Maternity and Child Welfare Scheme.

**1918:** The *Midwives Act*, was designed to ensure that only registered midwives and other qualified persons attended women in childbirth; the North and South Dublin Unions merged to become the Dublin Union.

**1919:** Pelletstown (later called St Patrick's, Navan Road) opened as a mother and baby home.

**1920:** Denny House (then called the Magdalen Asylum) started to receive state funding; Sinn Féin gained control of most local authorities following elections.

**1921:** The Children's Home for children and unmarried mothers was established in the workhouse in Glenamaddy (it later moved to Tuam); by 1921; the Dublin/Leeson Street Magdalen Asylum/Home had been transformed into a mother and baby home, exclusively for Protestant women experiencing a 'first fall'; Miss Alice Litster was appointed an inspector in the Dáil Department of Local Government.

**1922:** Establishment of the Irish Free State; *Constitution of the Irish Free State (Saorstát Éireann) Act*; Bethany (in May) and Bessborough (in November) opened as mother and baby homes; the Nursery and Rescue Home and Rotunda Protestant Girls' Aid Society changed its work to the nursing out of children born to Protestant unmarried mothers and renamed itself the Nursery Rescue and Protestant Children's Aid Society; the Rotunda Hospital first introduced ante-natal care.
1923: The *Local Government (Temporary Provisions) Act* provided for the county schemes; Thomastown union workhouse becomes the Kilkenny county home; Miss Alice Litster was appointed temporary inspector of boarded-out children; The Irish Free State joined the League of Nations on 10 September.

1924: The Department of Local Government and Public Health (DLGPH) was established under the *Ministers and Secretaries Act 1924*; Boards of Health or Boards of Public Assistance were established; severe outbreak of measles in Pelletstown; severe outbreak of influenza in Bethany; original Declaration on the Rights of the Child was adopted by the League of Nations General Assembly on 26 November.

1925: The Children’s Home moved to the former workhouse in Tuam in June; the Commission on the Relief of the Sick and Destitute Poor, including the Insane Poor was established; the Shannon Scheme is approved.

1926: St Vincent's Home, Cabra, opened as a residential centre for children with intellectual disabilities.

1927: The Commission on the Relief of the Sick and Destitute Poor, including the Insane Poor published its report; the Electricity Supply Board was established; electric lighting was installed in the Tuam home.

1929: The DLGPH issued a circular to all boards of health and public assistance seeking information about the number of unmarried mothers in county homes; local authorities were asked to submit those statistics on a six-monthly basis.

1930: Bessborough maternity unit opened; a purpose designed admission register was introduced in Bessborough; Regina Coeli Hostel opened; The *Illegitimate Children (Affiliation Orders) Act* provided that putative fathers could be made liable for maintenance of their illegitimate child if paternity could be established; the Anglican Church withdrew its opposition to contraception for married couples; Pope Pius XI responded with the encyclical *Casti Connubii* published on 31 December.

1931: Sean Ross opened as mother and baby home; The *Legitimacy Act* provided that the child of an unmarried woman was ‘legitimate’ if the parents married within ten months of the birth; there was an agreement between Galway county council and Mayo county council to admit women and children from that county to Tuam;

1932: Kilrush closed; St Philomena’s opened; The *Therapeutic Substance Act* to regulate the manufacture, import and sale of therapeutic prophylactic and diagnostic substances was passed; Miss Alice Litster was appointed inspector of boarded out children.

1933: Unemployment Assistance was introduced; The *Public Hospitals Act 1933* listed mother and baby homes among the institutions that were eligible to apply for hospitals sweepstake money.
1934: The *Registration of Maternity Homes Act* provided that all maternity homes were required to register and became subject to inspection; The *Children Act* closed some gaps in the 1908 Act; Bethany moved to premises on Orwell Road; the Dublin municipal health authorities introduced an anti-diphtheria immunisation scheme in city schools (rolled out the following year).

1935: Pelletstown maternity unit opened; Tuam maternity unit opened; Castlepollard opened as mother and baby home; anti-diphtheria vaccine trial in Dublin Union on 24 children in January; Widows and Orphans Pensions were introduced.

1936: Work started to connect the Tuam home to the sewerage system; the papal prohibition on religious sisters engaging in midwifery or attending at births was removed; virulent outbreak of diphtheria in Sean Ross; antenatal clinic opened at the Rotunda; a routine anti-diphtheria immunisation scheme in county Waterford resulted in 24 children contracting tuberculosis.

1937: in April, a 12 year old died following the immunisation disaster of the previous year; Bunreacht na hÉireann replaces the constitution of the Irish Free State; BCG vaccination first introduced to Ireland by physician in St Ultan’s.

1938: Miss Alice Litster replaced Mrs Margaret Crofts as Inspector General of boarded out children in the DLGPH; Miss Kennedy O’Byrne and Miss Mary Murray were appointed inspectors of boarded out children.

1939: The *Public Assistance Act* was passed but did not come into effect until 1942; the government established a therapeutic substances advisory committee.

1940: The CPRSI assumed responsibility for the repatriation of Irish unmarried mothers; Emmanuel Home, a children’s home that accommodated many children who had previously been in Bethany, challenged the right of the DLGPH to carry out an inspection on the grounds that children placed there were not maintained for reward; John Charles McQuaid becomes archbishop of Dublin.

1941: *Children Act*; epidemic of gastro-enteritis in Dublin; new admission to Castlepollard ceased due to overcrowding; the government introduced a food allowance scheme for welfare recipients living in urban areas.

1942: New admissions to Castlepollard resumed and its maternity hospital, St Peter’s, opened; the *Public Assistance Act 1939* and the *County Management Act 1940* came into effect.

1943: the Joint Committee of Women’s Societies and Social Workers sent a memorandum to Government (and others) on the issue of children in institutions.

1944: St Clare’s Hospital was established as an infectious diseases hospital for children; the Joint Committee of Women’s Societies and Social Workers submitted a memorandum to the
DLGPH about unmarried mothers and their children; outbreak of typhoid in Sean Ross; Children’s Allowances were first introduced for the third and subsequent children in a family.

1945: Bessborough closed to new public patients; Sean Ross closed to new admissions; The Charter of the United Nations was signed on 26 June and came into force on 24 October.

1946: An isolation unit was opened in Pelletstown; Penicillin was first used to treat infants in Bessborough in April; Mary E. Murray was appointed Inspector of Boarded Out Children (north of the country); rural electrification began.

1947: The Health Act and the Health Services (Financial Provisions) Act were passed; Department of Local Government and Public Health was divided and a separate Department of Health was established; bread rationing was introduced; Nuremberg Code set standards relating to clinical trials conducted on human subjects.

1948: Miss Fedelma Clandillon was appointed Inspector of Barded Out Children (south of the country); Fianna Fáil government was defeated in February general election; Dr Noël Browne became Minister for Health in the subsequent coalition government; regulations were introduced providing the basis for nationwide programmes of immunisation against diphtheria, whooping cough and later polio; the Commission on Emigration and other Population Problems was established; The Universal Declaration of Human Rights was adopted by the United Nations General Assembly on 10 December.

1949: An inter-departmental committee on the reconstruction and replacement of county homes was established.

1951: The county homes interdepartmental committee submitted its report; The White Paper on the Reconstruction and Improvement of County Homes was published; Mother and Child welfare scheme was proposed by the Minister for Health Dr Noël Browne to improve maternal and infant health.

1952: The Adoption Act was passed; The Social Welfare Act, provided for maternity allowances; The Vital Statistics and Births, Deaths and Marriages Registration Act 1952 provided for a short form birth certificate.

1953: The Health Act provided for free maternity care for women and free medical care for infants up to six weeks old and it also made some changes to the public assistance laws - Maternity Allowance was introduced; the Adoption Act 1952 came into effect on 1 January 1953; the first children’s officer - the precursor of professional social worker in child care - was appointed; The European Convention on Human Right was adopted by the Council of Europe on 3 September.

1954: A new maternity unit opened in St Kevin’s; the Commission on Emigration and other Population Problems reported.
1955: Dunboyne opened as mother and baby home; a child guidance clinic, run by the Hospitaller Order of St John of God opened; Ireland became a member state of the United Nations, and accepted the obligations contained in the charter, on 14 December.

1956: Suez Canal crisis occurred, resulting in economic downturn; a staircase collapsed in Regina Coeli; there was an outbreak of polio in Cork; paediatrics was introduced to the final medical examination syllabus.

1957: Miss Margaret Reidy became mother and baby homes inspector; St Louise’s Adoption Society was established to deal with adoptions from Pelletstown; The Children (Amendment) Act was passed.

1959: The Magdalen Asylum (Denny House) moved to 83 Eglinton Road; The expanded declaration on the rights of the child was adopted by the United Nations General Assembly on 20 November.

1960: The Dublin, Cork, Limerick and Waterford health authorities were established; four-in-one (vaccine (Diphtheria, Tetanus, Pertussis, and Polio) vaccine trial started.

1961: Tuam Children’s Home closed; Census; the Commission of Inquiry on Mental Illness was established.

1962: The second Vatican Council started; Report of the Medical Research Council (UK) dealing with vaccine trials was published.

1963: Regina Coeli was condemned as unsafe; the contraceptive pill became available on prescription through the coded language of using it ‘as a means of regulating a woman’s menstrual cycle’; The Adoption Bill was passed; the report of the Commission on Itinerancy was published.

1964: The Guardianship of Infants Act clarified that an unmarried mother is automatically the guardian of her child; the play An Triail (On Trial) by Máire Ní Ghráda was first produced; unmarried mothers start to appear in the media; measles vaccine trial on 12 children in Sean Ross.

1965: The Succession Act was passed; the Commission of Inquiry on Mental Handicap published its report; the second Vatican council closed; the chromosomal abnormality in trisomy 21 was discovered; the term ‘mongolism’ was officially replaced with ‘Down’s syndrome’; suspected polio and suspected measles vaccine trials in Pelletstown; suspected measles vaccine trial in Bessborough; Quintuple vaccine trial in Pelletstown and Bessborough started in August (and concluded the following year).

1966: Census; free secondary education was announced; the Commission of Inquiry on Mental Illness reported; the National Drugs Advisory Board was established; The International Covenant on Civil and Political Rights was adopted by the United Nations General Assembly on 16 December.

1968: Measles vaccine trial in Pelletstown; milk trial in Bessborough and in Pelletstown; papal encyclical *Humanae Vitae* was issued; introduction of free school transport and grants for attending third-level institutions; the European Convention on the Adoption of Children was signed and ratified by Ireland on 25 January.

1969: Sean Ross closed; milk trial in Bessborough and in Pelletstown in April; a family planning clinic, the Fertility Guidance Company (later the Irish Family Planning Association) opened in Dublin (despite the prohibition on contraception); moon landing in July.

1970: The *Health Act* established the regional health boards; *Reformatory and Industrial Schools Systems Report* (commonly known as the Kennedy Report) was published; a national conference on the unmarried mother was held in Kilkenny; Miss Murray retired and Miss Clandillon had responsibility for boarded out children.

1971: Castlepollard closed; the changeover to decimal currency occurred; Census; Irish Association of Social Workers was established; St James’ Hospital was established as a result of the amalgamation of a number of different hospitals; Archbishop McQuaid resigned.

1972: Bethany Home closed; Miss Carr’s Flatlets opened; Cherish, an organisation for one-parent families, was founded.

1973: DTP vaccine trial in Pelletstown started; Ireland became a member of the European Economic Community; the Unmarried Mother’s Allowance was introduced; the report of the *Commission on the Status of Women* recommended significant reforms relating to women’s work, legal status and welfare entitlements; the ban on the employment of married women in the civil service was (partially) lifted; Britain’s National Council for the Unmarried Mother and her Child (NCUMC) changed its name to the National Council for One-Parent Families; Cherish became a limited company with Senator Mary Robinson as President; oil crisis; Ireland signed the International Covenant on Civil and Political Rights in October; The Convention on the elimination of all forms of discrimination against women was adopted by the United Nations General Assembly on 18 December.

1974: A High Court judgment determined that the proceeds of the sale of Bethany Home should be allocated to Denny House and to Miss Carr’s Children’s Home; vaccine trial in Pelletstown concluded; In *McGee v The Attorney General*, the Supreme Court ruled that married couples had a constitutional right to make private decisions regarding family planning; the *Anti-Discrimination (Pay) Act* was passed; Senator Mary Robinson had introduced the *Illegitimate Children (Maintenance and Succession) Bill* 1974.

1975: The High Court found that the requirement of uniformity of religion in the *Adoption Act 1952* amounted to discrimination on grounds of religious belief in breach of Article 44.2.3 of the Constitution.

1976: Comhairle na n-Ospidéal issued a discussion document on the *Development of Hospital Maternity Services* which recommended that in-patient maternity services should be

1988: the European Convention on the Legal Status of Children born out of Wedlock was signed and ratified by Ireland in October.

1989: the Convention on the Rights of the Child was adopted by the United Nations General Assembly on 20 November; Ireland ratified the International Covenant on Civil and Political Rights in December; The Convention against Torture and other cruel, inhuman or degrading treatment or punishment came into force on 26 June; the European Convention on the Legal Status of Children born out of Wedlock became binding in Ireland in January.

1990: Dunboyne began the process of closing; the Convention on the Rights of the Child came into force on 2 September and was signed by Ireland on 30 September.

1991: the Child Care Act was passed but much of it did not come into effect until 1996.

1992: Subsequent to the X case, the Supreme Court established the right to abortion if the pregnant woman’s life was at risk because of pregnancy; The Convention against Torture and other cruel, inhuman or degrading treatment or punishment was signed by Ireland on 28 September; the Convention on the Rights of the Child was ratified on 28 September.

1993: Bishop Eamon Casey resigned following the discovery that he was the father of a child; The Second Commission on the Status of Women reported; The Hague Convention on Intercountry Adoption concluded.

1994: Denny House closed; The Stillbirth Registration Act was passed.

1995: The constitutional ban on divorce was removed; a Commission on the Family was established.

1998: The Adoption Act was passed; the Commission on the Family published its report.
Introduction

2. The Government appointed Judge Yvonne Murphy as Chair of the Commission and Professor Mary E Daly and Dr William Duncan as members.

3. Under the 2004 Act, the Department of Children and Youth Affairs (DCYA)\(^1\) was the department responsible for overseeing administrative matters relating to the establishment of the Commission, for receiving its reports and for receiving its records when it has completed its work. Under the *Commission of Investigation (Mother and Baby Homes and certain related Matters) Records, and another Matter, Act 2020*, the database of individuals compiled by the Commission will also be transferred to the Child and Family Agency (Tusla).

4. Prior to the establishment of the Commission, a premises had been prepared by staff of the Department of Children and Youth Affairs under the direction of Ms Vera McGrath.

5. The Commission was initially given 18 months to complete the Social History and Confidential Committee sections of the report and three years to complete the entire report. This proved impossible to achieve and the Commission sought and was granted a number of extensions. The Commission issued a number of interim reports outlining its progress.\(^2\) Two of these Interim Reports outline some of the findings of the Commission and constitute part of this final report. These are the Second Interim Report\(^3\) dated 16 September 2016 which deals with, among other things, the Residential Institutions Redress Scheme and the Fifth Interim report\(^4\) dated 15 March 2019 which deals with burials.

6. The Commission was established because of concerns that had been raised about what happened in mother and baby homes. A particular catalyst was the discovery by Catherine Corless of the possible burial arrangements for children who died in

---

\(^1\) The name of that department was changed in October 2020 to the Department of Children, Equality, Disability, Integration and Youth.

\(^3\) [https://www.gov.ie/pdf/?file=https://assets.gov.ie/26424/d934467e5b0e46a5b4217e4a997af48.pdf#page=1](https://www.gov.ie/pdf/?file=https://assets.gov.ie/26424/d934467e5b0e46a5b4217e4a997af48.pdf#page=1)

\(^4\) [https://www.gov.ie/pdf/?file=https://assets.gov.ie/26901/6de0eb1f8c4647bda67985e2a4428e37.pdf#page=1](https://www.gov.ie/pdf/?file=https://assets.gov.ie/26901/6de0eb1f8c4647bda67985e2a4428e37.pdf#page=1)
the Tuam Children’s Home. The subsequent newspaper coverage of an incomplete HSE document which was thought to have described significant issues in Bessborough and Tuam added to the concerns. Ms Corless’s concerns were well established and have already been confirmed by the Commission. The treatment of the incomplete HSE document has resulted in a perception that what was reported was fact and these ‘facts’ have come to be accepted and further promulgated by media, members of the Houses of the Oireachtas, former residents and campaigning groups.

The task of any Commission of Investigation is to investigate the matters set out in its Terms of Reference. It must carry out its work in accordance with the 2004 Act and its Terms of Reference. It must look at all the available evidence and reach conclusions based on that evidence. It must be objective, rigorous and thorough. The conclusions it reaches may not always accord with the prevailing narrative.

How the Commission undertook its work

7. The initial focus of the Commission’s work was
   • to establish what records and information were available to enable it to fulfil the requirements of its Terms of Reference;
   • to investigate the Tuam site;
   • to establish the Confidential Committee and make arrangements for its hearings.

8. The Commission immediately began inquiries into the Tuam site. It held hearings with relevant experts, former residents and local people in June 2015. In October 2015, the physical investigation of the Tuam site began. The subsequent investigations and results are described in the Commission’s Fifth Interim Report.

9. The establishment and work of the Confidential Committee is described in Part 4 of this report.
Finding the relevant records

10. The Commission had prior approval from the DCYA to recruit a number of staff. It immediately started a recruitment process to recruit researchers, archivists and lawyers. Advertisements for researchers and archivists were placed in third level institutions and advertisements for lawyers were placed in third level institutions and in the premises of the Incorporated Law Society and the Bar Council. Historians with PH.D level qualifications and qualified archivists were recruited in June - September 2015 and a number of more junior researchers were also recruited. A panel of lawyers was drawn up and the Commission used their services as required.

11. In February 2015, the Commission met the Child and Family Agency (Tusla) to make arrangements for the institutional records held by Tusla to be made available to the Commission. The institutional records of Pelletstown were available on an electronic records management system and arrangements were made for Commission staff to have access to this system in order to compile the Commission’s database of individuals who had been resident in the various institutions.

12. Commission members and staff visited some of the Tusla offices where the institutional records were held in order to see the extent and nature of the records. Meetings were also held with relevant bodies including the Department of Health, the Department of Education and the General Register Office (GRO) in order to assess the availability of records. The National Archives of Ireland (NAI) agreed to allow a Commission archivist to work there for a period in order to establish what relevant records were available. The Commission’s archivist worked there for a year listing the various relevant departmental records. The Commission’s researchers then spent considerable time examining these records making notes and photocopying relevant material.

13. The Commission’s researchers also visited archives all around the country to try to establish what records were available. A decision had to be made about which county homes to investigate. Having established what records were available, the Commission decided, in April 2016, to investigate the following county homes

- St Kevin's Institution (Dublin Union)
- Stranorlar County Home, Co Donegal (St Joseph's)
14. This decision was largely based on the fact that these county homes had extant registers which could be analysed; the fact that they were two large and two small county homes was also a factor as was the fact that they are all in different regions of the country. At this stage, the Commission was not aware that the Dublin Union and one of the scheduled institutions, Pelletstown, were really one institution.

15. The Commission decided that the only way in which it could properly analyse the institutional records of the large institutions was to scan them and have them available on an electronic records management system. While making arrangements to carry out this process, the Commission was able to make progress in relation to other institutions. Original records from one of the smaller institutions, The Castle, were provided by their then holders, St Mura’s, and were photocopied by the Commission. The original records were returned (and are now held by Tusla). The details were transcribed into an Excel spreadsheet. This forms part of the Commission’s archives and is being transferred to both Tusla and the department. The relevant records of Regina Coeli were photocopied by the Commission in its premises. They were analysed and transcribed into a database which is being transferred to both Tusla and the department. Photocopies of Miss Carr’s Flatlets records were provided by the current staff in Miss Carr’s. These were transcribed into an Excel spreadsheet and are also being transferred to Tusla as well as to the department.

The database of individuals

16. The Commission was given departmental approval to employ a number of researchers and lawyers but it had to make a business case in order to engage an IT consultant. It then had to make a business case to go to tender for the scanning of documents. An IT consultant was engaged in May 2015. He prepared necessary documents for tendering for a scanning system. The tender was issued in November 2015 and the contract was awarded in February 2016. Scanning commenced in April 2016. The first records scanned were those of Bessborough where 303,946 pages were scanned; the records of Tuam, Sean Ross, Castlepollard, Dunboyne, all of which are held in Tusla offices were then scanned. The records of Bethany and Denny which are held in the PACT offices were then scanned. A small number of documents located in other places were also
scanned. In total, over 850,000 pages were scanned between February 2016 and November 2017. This information, together with the information from Pelletstown, was fed into the Commission’s database of individuals.

17. This database was designed to extract the information required to meet the Terms of Reference. All the relevant information which was available about the mothers and children was recorded. In some cases, information about the individuals was discovered in other official records and this was added to the database. For example, information about some children who left Bessborough was found in the Cork board of assistance boarded out files so this was added to the database.

18. The database of individuals contains the details of the former residents of Pelletstown/Dublin Union, Tuam, Bessborough, Sean Ross, Castlepollard, Bethany, Denny, Dunboyne, Cork county home, Stranorlar county home and Thomastown county home.

19. There is a separate database of residents of Regina Coeli. This is being transferred to Tusla as well as to the DCYA. The Commission does not have details of the residents of Kilrush, St Gerard’s or Belmont Flatlets.

The county homes

20. The Commission did not scan the county home records because it would have required the scanning of vast numbers of records which were not relevant to the Commission. In general, the records of the county homes contain information about all the people who entered the homes. Information about unmarried mothers and their children is often not separately available. The Commission’s researchers manually extracted the information about unmarried mothers and children and transcribed this into the database of individuals.

The nature of the records

21. The institutional records are described in detail in Part V and in the relevant chapters. They are mainly registers containing details of the former residents. Many of the institutional records which were received by the Commission were handwritten. They included formal bound register books completed in perfectly clear handwriting as well as scraps of paper with bits missing and scrawled writing. Some were very well preserved while others had deteriorated significantly and
some were illegible. The process of transcribing them into the database obviously took considerable time.

**The researchers’ database**

22. The Commission’s researchers visited almost every local authority archive and a number of diocesan archives throughout the country. They also visited archives in the UK and the USA. The researchers took detailed notes of relevant documents and, in some cases, took photocopies of relevant documents. These notes and documents were uploaded to what the Commission called its researchers’ database. This forms part of the Commission’s archives and is being transferred to the DCYA in electronic format.

**Discovery of documents**

23. Between 21 April 2015 and 31 July 2019, the Commission issued 21 requests for voluntary discovery under Section 10 (2) of the *Commissions of Investigation Act 2004*. These voluntary requests offer no guarantee that documents are produced or that they are of relevance.

24. These were issued to:

- Galway County Council x 3
- Department of Education and Skills
- St Mura’s Adoption Society
- GlaxoSmithKline
- Here2help (PACT)
- Regina Coeli Hostel
- Congregation of the Sisters of Mercy
- National Bureau of Criminal Investigation
- Tuam Diocesan Archives
- Cork and Ross Diocesan Archives
- Meath Diocesan Archives x 2
- Irish Episcopal Conference
- Congregation of Our Lady of Charity of the Good Shepherd
- Galway Diocesan Archives
- Cork City Council
- Carmelite Priory
- Cork City and Council Archives
Irish Church Missions

**Directions**

25. The Commission wishes to make it clear that the requirement to issue formal orders for discovery was not a result of unwillingness to provide documentation. It was because of the holders’ reasonable concern about the confidential and personal information they were being asked to transmit to the Commission.

26. Between 21 July 2015 and 21 January 2020 the Commission issued 39 directions under Section 16 (1) (e) (f) and (g) of the *Commissions of Investigation Act 2004*, to relevant parties, listed below. The bulk of the material received came from the Department of Health and the Department of Children and Youth Affairs.

- The Sisters of Bon Secours
- Carr’s Child and Family Service
- Tusla - the child and family agency x 9
- The Daughters of Charity of St Vincent de Paul
- Congregation of the Sacred Hearts of Jesus and Mary x 4
- Health Service Executive x 6
- Department of Health x 6
- Department of Children and Youth Affairs
- Glasnevin Trust
- Cork City Council
- Adoption Authority of Ireland x 2
- Departments of Health and of Children and Youth Affairs jointly x 6

27. The documents received as a result of these orders are described in the relevant chapters and in Part 5 of this report.

**Discovery of documents by the Department of Health/Department of Children and Youth Affairs**

28. The Commission wrote to the Department of Children and Youth Affairs (DCYA) on 25 August 2015 requesting all documents touching on its Terms of Reference. The department replied on 1 September stating that, because of the historical connection between the Department of Health and DCYA, they would take a joint approach to providing documents. Documents would be provided formally by way of sworn affidavits of discovery. On 30 September 2015, DCYA forwarded a small
number of documents about St Gerard’s, one of the homes within the Commission’s remit and about St Patrick’s Guild, an adoption society run by the Sisters of Charity. These amounted to 12 pages.

29. On 16 October 2015, the two departments jointly provided a preliminary spreadsheet of files which they considered might be relevant to the Commission. The spreadsheet identified 4,385 files considered by the departments to be relevant and 40,458 files of potential relevance. The numbers of pages in these files was not calculated. It was explained that the departments were arranging to have relevant files scanned. This involved a public procurement process.

30. The Commission became aware of the existence of files known as ‘The Clandillon Papers’. These were the files created, mostly but not exclusively, by Ms Fedelma Clandillon who had worked for many years as an Inspector of Boarded out Children for the Department of Health and its predecessor. She held files on many children who had been boarded out from the institutions within the Commission’s remit. The Commission issued a direction to produce these files on 10 February 2016 and they were delivered on 19 February 2016. The files consisted of 30,514 pages, many of which were handwritten, and some were in shorthand.

31. On 7 July 2016, the two departments advised that they would begin to make discovery on a phased basis beginning in September of that year.

32. Independently of this process, the Commission sought discovery of files which had been provided by the then Department of Health and Children to the Vaccine Trials Division of the Commission to Inquire into Child Abuse (CICA) in 2003. CICA did not complete its investigation into vaccine trials because of a court ruling and the files were returned in 2012. These files were delivered to this Commission by the Department of Health on 1 September 2016. The files consisted of 42,966 pages.

33. The Commission also sought a file described as ‘Children’s Home Tuam: Maintenance Charges’ which the Commission was aware was held by the Department of Health and this file was delivered on 9 January 2017. It consisted of 183 pages.

34. As no documents had been delivered in line with the departments’ commitment of 7 July 2016, the Commission identified what it considered to be the 83 most
relevant files and on 14 February 2017 issued a direction that these documents be produced. Seventy-five of the 83 files were produced on 10 March 2017. They consisted of 12,000 pages. The remaining eight files could not be located.

35. On 8 February 2018, the departments jointly wrote to the Commission with an updated list of relevant files. After analysing this list, the Commission issued a direction to produce a further 280 files. On 8 March 2018 these files were delivered. They consisted of 54,000 pages.

36. On 20 March 2018 the Commission issued a direction to the Department of Health to produce the archive of the ‘Interdepartmental Committee on the Magdalen Laundries’ (The McAleese Report) and this was delivered on 29 March 2018. It consisted of 246 pages.

37. On 29 May 2018 the departments wrote jointly to the Commission advising that they had found 612 previously uncategorised documents, of which 113 had been determined as being relevant to the Commission. The Commission analysed the schedule of documents and identified the ones it considered relevant. Directions for discovery were issued in respect of the relevant files and they were delivered in two tranches in June 2018. They consisted of 36,000 pages.

38. On 9 November 2018, the Departments provided an updated schedule of documents, 882 of which were not included in the previous lists. On 22 November 2018, the Commission issued a direction seeking discovery of the relevant documents from this new list and they were delivered to the Commission on 18 December 2018. They consisted of approximately 250,000 pages. Some of these pages had been included in the files previously discovered to the Commission, however, the duplicate files could not be identified without looking through each file individually.

39. In total, the Commission received more than 425,000 documents from the Department of Health and the Department of Children and Youth Affairs, the bulk of which were received after the initial time limit for the Commission’s report.

40. These documents were scanned by the Department of Health and delivered to the Commission in PDF format. The originals remain with the department. The older
documents, understandably, have a significant number of handwritten pages and handwritten comments on typed pages which make them quite difficult to decipher.

**Other records**

41. The Commission accessed records from a wide range of sources, for example, RTÉ. The Commission’s researchers searched newspapers and magazines for relevant material. They also visited a number of burial grounds to access records and, in some cases, to inspect the graves.

**One Family (Cherish)**

42. One Family (which was formerly Cherish) very kindly allowed the Commission access to its records. These were very helpful in providing information about unmarried mothers, the services available and attitudes to them from the 1970s onwards. The Commission did not keep any personal information from these files but did make a listing of them and made notes of relevant material for this report. This is on the researchers’ database.

**Witnesses to the Commission**

43. A total of 195 hearings were held by the Commission. They were as follows:

- Former residents 64
- Advocacy groups 30
- Sisters/Members of Congregations 16
- Experts (some experts gave evidence at more than one hearing) 14
- Social Workers 22
- Local Authority officials 13
- Government Officials 7
- Workers in the homes 6
- Family members 5
- Priests 3
- Gardaí 3
- Others 12

44. The others include people concerned about particular sites, people whose birth registrations were falsified and people who were aware of practices in particular institutions.
45. The Commission notes that there was no advocacy group representing people with disabilities so one of the most affected groups did not have their voices heard.

46. All hearings were held in private. Five individuals asked to have public hearings but the Commission did not consider that such hearings were necessary. One group requested a public hearing. When asked for reasons why, no reply was received. This group has put its submissions to the Commission into the public domain as have some of the individuals who sought public hearings.

47. The transcripts of these hearings form part of the Commission’s archives and will be transmitted to the DYCA.

**Hogan Lovell**

48. The Commission received 61 statements from Hogan Lovell, a firm of solicitors that assisted former residents. Of these 55 were within the Commission’s Terms of Reference. The Commission asked that these statements be made in the form of affidavits so that they could be used as evidence; 32 affidavits were provided.

**The HSE 2012 documents**

49. An incomplete HSE document from 2012 has been widely quoted and assumed by many to be accurate. The Commission had great difficulty in getting copies of this document even though it was frequently being quoted in the media and in other fora. The report allegedly dealt with practices in Bessborough and Tuam.

50. In December 2015, solicitors for the HSE told the Commission that the HSE was trying to find a copy of the Bessborough report. The Commission also sought a copy of the Tuam report which was allegedly an appendix to the report on Bessborough. In April 2016, the Commission was told that the HSE was still trying to find the copy of the report that had the Tuam appendix. In March 2017, the HSE were still looking for the Tuam report. The HSE solicitor told the Commission that the Tuam appendix probably did not exist. In June 2017 Commission heard evidence from some of the HSE staff involved in compiling the report.

51. In April 2018, the HSE delivered two folders of documents which included 41 drafts of the 2012 report. The alleged Tuam appendix never materialised.
It appears that, in October 2012 two documents described as a file note and a draft briefing paper were circulated among senior HSE staff. It seems that these were prepared for the purposes of the McAleese Report. These documents contained a number of allegations regarding Bessborough mother and baby home and the Tuam home.

Among the allegations was that there was a large archive of photographs and other documentation relating to children from the Tuam home sent for adoption to the USA. It was stated that there was already a database of up to 1,000 names but it was acknowledged that it was not yet clear whether all of these related to US adoptions. The file note stated that there was more than one letter to a parent or parents asking for money for an infant who had already been discharged or who had died.

The draft briefing paper claimed that most women who gave birth in Bessborough were discharged to a Magdalen institution. It claimed that there were two discharge dates sometimes separated by years. There was an allegation that the homes claimed monies from the Government for these mothers and/or children once they had left the home. It claimed that both Tuam and Bessborough charged a fee to both birth parents and to adoptive parents for the upkeep of their children.

The file note went on to speculate that children may have been kept in the homes for financial reasons. It also speculated that ‘trafficking’ of babies must have been facilitated by doctors, social workers and others, some of whom could still be working in the system.

The draft briefing paper noted in relation to Bessborough that ‘there are no death records whatsoever after 1953, concurrent with the introduction of adoption legislation in Ireland’. The implication appears to be that death records were falsified in order that children could be sent abroad illegally.

These documents made their way into the hands of a number of people including TDs, journalists and members of survivor groups. The details of the documents were repeated many times including during a Seanad debate of 17 May 2017. It appeared to be accepted by commentators and politicians that the allegations and suppositions made in these documents were statements of fact.
58. A journalist investigating mother and baby homes discussed these claims in several articles in a national newspaper and made the further claim that Bessborough authorities had over-reported infant deaths to the Department of Local Government and Public Health, as the number of deaths reported in the Bessborough Death Register was less than that in the returns to the department. The Commission has established that this was incorrect - see the Fifth Interim Report.

59. The caveats expressed by the author of the Bessborough report were not reported. The author noted that

- it was based on a ‘cursory’ glance at a sample of Bessborough records;
- the research was ‘not grounded in forensic analysis’;
- the conclusions were ‘purely conjecture’.

60. The Bessborough records had come into the possession of the HSE only about a year before the 2012 report was compiled. The report was compiled by a person who was seeing these records for the first time and had very little time to do any analysis so it is not surprising that unwarranted conclusions were reached. What is more surprising is that this incomplete document came into the public domain and that the allegations were accepted as fact by so many people.

61. The Commission examined the claims and hypotheses put forward in relation to Bessborough and these are addressed in the relevant chapter and in the Bessborough section of Part 5.

62. In relation to Tuam, the Commission took evidence from the official who had compiled the database referred to in the file note. This official has moved to a different area of work and so spoke from memory only.

**Evidence from official concerned**

63. In or around 2011 this official became aware of a number of boxes containing documents, some of which would be of assistance to social workers in dealing with tracing enquiries. The witness’s evidence was that there were roughly 25 boxes only one of which (and this was not a large box) related to children sent for adoption to the US. In relation to the reported ‘large archive of photographs, documentation and correspondence relating to children sent for adoption to the
USA’, the witness could only recollect finding two photographs which appeared to be passport photographs for children being adopted to the US. In relation to admissions or discharges to psychiatric institutions, this official could only recollect one such case which was recalled as being a woman who became pregnant in Ballinasloe Mental Hospital and was sent to the Tuam home.

64. The official also recalled that there were a few letters from either a bishop or a priest who wrote to the Tuam home saying that he knew of American couples who were suitable to adopt and enquiring as to whether there were any children available for adoption.

65. The witness recalled a few letters from the Sisters to mothers asking for money but she also recalled that both the county council and the Sisters were looking to find out who the birth fathers were in order to seek payment from them.

66. The witness had not noted how long babies stayed in the Tuam home so therefore was unable to comment on ‘the average duration of these babies’ stay in the home is yet unknown’. Her priority was to find documentation which would assist in the tracing process.

67. With respect to the allegation that there was ‘more than one letter asking for money for an infant who had been discharged or died’ the witness stated that she had no recollection of finding more than one letter if even one letter. The witness stated that she did not come across any evidence of trafficking of babies and in relation to the phrase ‘it must be that it was facilitated by adoptive social workers’ stated that ‘I don’t know what that is alluding to’. The witness had no memory of seeing evidence relating to nuns claiming for a dead baby. The witness had found no evidence of trafficking of babies. The witness did have a memory of reading a letter from a couple who had gone back to America with their adopted child saying that they would send money on to ‘the nuns’. The witness remarked ‘I certainly didn’t see any evidence of vast sums of money being passed over, you know parents being groomed to have children in order to … for prospective adoptive parents’.

68. In terms of the overall numbers of files relating to US adoption the witness said that rather than the 1,000 files quoted in the file note, there were 20 files at the most. (These were provided to the Commission as part of the Tuam institutional records).
69. The witness believed that the contents of the file note and the draft briefing paper were a consequence of miscommunication and misunderstanding.

**Structure of the report**

70. The report is divided into five sections as listed in the Contents. Each chapter is, to a large extent, standalone but there are many cross references. There is also some repetition between the Social History report and the reports on the individual institutions.

71. The Commission tried to be as objective, rigorous and thorough as it is possible to be. However, it recognises that the volume of material and the numbers of records analysed mean that it is highly likely that some mistakes were made.

**Costs**

72. The original allocation for the Commission’s work was €23 million. The expenditure to date (30 October 2020) by the Commission is approximately €11.5.

---

**Security**

The Commission was always acutely conscious of the fact that it had very sensitive personal information in its possession. It therefore, put in place a security system to ensure that this information would be protected. Everyone who worked for the Commission (including the Commissioners themselves) and self-employed contractors all signed confidentiality agreements.

Chapter 1: State Structures, Supports and Legislation

Introduction

1.1 The county homes and the main mother and baby homes were established, financed and regulated (to some extent) under poor law/public assistance/health legislation. Other arrangements for the care of children were governed by this legislation as well as by the Children Acts. The general legislation on local authority structures and powers also affected the operation of these institutions. The national and local, but particularly the local, administrative structures for the delivery of poor law, public assistance, health and related services changed a number of times over the period covered by this report (1922-1998). The different names used for the local health/public assistance authorities can be quite confusing. A particular feature of the structures as they changed was the interaction between national government and local government which, in the Commission’s view, led to confusion and lack of coordination about who was responsible. This chapter describes the development of these structures in so far as they are relevant to State involvement with single mothers and children.¹

1.2 This chapter also gives a brief overview of the laws which applied to children, residents in institutions and other issues relevant to this report. With the exception of the introduction of legal adoption in 1953 (see Chapter 32), there was very little change in the law relating to the care of children during the period 1922 - 1998.

1.3 The relevant authorities for the period covered by this report were as follows:

National government

Pre 1920: The Local Government Board Ireland had overall national responsibility for the poor law. (It was established in 1872).

1920-22: The Department of Local Government of Dáil Éireann encouraged the development of county schemes.

1922: The Department of Local Government of the Irish Free State (Saorstát Éireann) was established.

¹The descriptions given here cannot be regarded as comprehensive descriptions of all the legislation and practice; the aim is to explain how the State interacted with single mothers and their children. The various health authorities were responsible for general health services, mental health services, sanitary services and a number of other services. Their services for unmarried mothers and their children were a relatively minor aspect of their overall work.
June 1924: The Department of Local Government and Public Health was established under the *Ministers and Secretaries Act 1924*.  

1947: A separate Department of Health was established under the *Health (Transfer of Departmental Administration and Ministerial Functions) Order 1947*, which came into effect on 18 March 1947.

**Local government**

Boards of Guardians: until 1922/23 in most counties and 1931 in Dublin.

Boards of Health/Boards of Public Assistance: from 1922/3 until 1942.

Public Assistance Authorities from 1942 until 1953 in most counties and until 1960 in Cork, Dublin and Waterford.

Local authorities (county councils and county borough councils) from 1953 until 1970 in counties other than Cork, Dublin and Waterford (Limerick until 1960).

Health authorities in counties Dublin, Cork, Limerick and Waterford: 1960-70.

Regional Health Boards: 1970-98.

**Poor law**

1.4 The *Poor Relief (Ireland) Act 1838* introduced a system for the relief of the poor modelled on the existing English system. Poor relief was the responsibility of an elected board of guardians in each poor law union. By 1921, there were 127 poor law unions in the area that became the Free State. Each poor law union had a workhouse where ‘indoor relief’ was provided, that is, people had to live in the workhouse. Over the years, the boards of guardians were given further responsibilities, including the making of arrangements for the care of deaf, blind and other children with disabilities. ‘Outdoor relief’, that is, assistance for certain people outside of the workhouse, was introduced in 1847. It was administered by ‘Relieving Officers’. Among the potential beneficiaries were families who were unable to provide for themselves because they were unable to work and destitute poor widows having two or more dependent legitimate children. These groups could be provided with either indoor or outdoor relief. In 1862, the boards of guardians were given powers to arrange the boarding out of children - this was

---

4 These are listed in the *Report of the Commission on the Relief of the Sick and Destitute Poor* (1927); this report provides a summary of the poor law as it developed between 1838 and 1927: [https://lens.ie/handle/10147/238535](https://lens.ie/handle/10147/238535)

5 This title continued in general use long after it had been officially replaced by Assistance Officer (1923) and by Community Welfare Officer (1977).
described as placing the child ‘at nurse’. The age limit for boarding out was 15 in 1922.

1.5 Workhouses were built mainly in the early 1840s. They were all similar in design. They generally had separate wards for the main groups involved, that is older people (‘the elderly’); unmarried mothers and children; and people who had disabilities or psychiatric illnesses. They generally included a nursery and maternity ward and many had schools attached.

1.6 The Local Government Board Ireland which was established in 1872 (originally the Irish Poor Law Board established in 1847) had overall central responsibility for the administration of the poor law. Locally, it was administered by the elected boards of guardians. In 1898, the local government system of county councils, city councils and town commissioners was established. This did not change the poor law itself but the county and city councils took over responsibility for its financing and administration.

1.7 The report of the Vice-Regal Commission on Poor Law Reform in Ireland (1906) recommended replacing workhouses with separate institutions catering for ‘the elderly, the insane and unmarried mothers’.

**The county schemes**

1.8 Changes were made to the poor law arrangements in the period 1920 - 1922. During these years, a number of county councils, with the support of the Minister for Local Government of Dáil Éireann, began to introduce poor law schemes for their counties. These schemes mainly tried to ensure a move away from workhouses as the location for the relief of the poor and provided for the centralisation of administration under one authority in each county. There was considerable resistance to some of the changes as they involved the closure of...
local institutions including hospitals. The changes that were made in the 1920s were sometimes described as involving the ‘abolition’ of the poor law.

1.9 In fact, while changes were made, the poor law was not abolished. Significant parts remained in place until 1977 - see below. In practice, in the 1920s, a number of workhouses closed and others were designated as county homes or county hospitals. By 1927, 33 workhouses had been converted into county homes; 19 of these were used in part as hospitals. Nine workhouses had been converted into county hospitals and 32 into district or fever hospitals; 50, some of which had been partially or completely destroyed, were no longer in use. The role of the workhouses which became county homes did not change significantly for quite some time. Outdoor relief or home assistance as it was called from the early 1920s continued to operate in broadly the same way as it had before independence.

1.10 The *Local Government (Temporary Provisions) Act 1923* provided a legislative basis for the county schemes and gave power to the council of a county to which no existing scheme related to prepare a scheme and submit it to the Minister for Local Government. The minister had the power to confirm such schemes either without alteration or with such amendments, omissions, and additions as he deemed necessary, or to reject the scheme. The Act also contained a provision under which the council of a county and the council of an adjoining county borough, instead of preparing separate schemes, might prepare a joint scheme for the county and the county borough. Only two such schemes were prepared, one for Cork county and county borough and the other for Waterford county and county borough. The Cork scheme provided for the division of the county into three areas with separate administration for each area.

1.11 The councils of Dublin county and the county borough did not prepare either a joint scheme or separate schemes. Dublin county and city continued to have boards of guardians in each of the three poor law areas: Dublin Union, Rathdown and Balrothery. The *Poor Relief (Dublin) Act 1929* removed the restrictions on

---

9 Mary E. Daly: *The Buffer State, The Historical Roots of the Department of the Environment* (Dublin, 1997), pp 75-78.
10 See, for example, the speech of the Minister for Local Government (Ernest Blythe) when introducing the *Local Government (Temporary Provisions) Bill 1923* on 12 January 1923: ‘the existing Poor Law has been blown sky high’.
11 *Sick and Destitute Poor report* (1927).
12 Although it was described as temporary, it remained in force until 1942 when the *Public Assistance Act 1939* came into effect; it had been renewed annually between 1923 and 1941.
providing outdoor relief in the Dublin areas and provided for relief in or out of the workhouse. The *Local Government (Dublin) (Amendment) Act 1931* provided for the establishment of boards of assistance in the three Dublin areas.

1.12 The 1923 Act gave power to the Minister for Local Government to dissolve local authorities in certain circumstances and to appoint individuals to carry out the powers of that local authority. Between 1923 and 1925, 19 local authorities were dissolved; between 1925 and 1931, a further 17 were dissolved. These included Dublin and Cork corporations, the Dublin board of guardians (see Chapter 13) and all the boards of health in the Cork area. Generally a number of commissioners were appointed to carry out the functions of the dissolved boards. They had the same legal powers as the boards. (In order to avoid confusion, this report generally refers to the legal entity, that is, the board of guardians, board of health, county council even when the functions were being exercised by commissioners).

1.13 The county schemes varied somewhat from one county to another. In general, they provided for a board of health (to be appointed by the local authority) to be in charge of the poor law. In some cases the name of the entity was the board of public assistance. In Cork, there were three boards - the North Cork county board of health, the South Cork county board of public assistance and the West Cork county board of health. In 1927, they all became boards of public assistance.

1.14 The members of the boards of health/public assistance were generally county councillors and town councillors. Some had other members, for example, Clare board of health had a number of priests (see Chapter 16). Some boards established sub-committees to deal specifically with institutions and these also had non-councillor members including priests, for example, the sub-committee for Tuam (see Chapter 15).

1.15 Some county schemes made specific provision for unmarried mothers while others did not. Some provided that the county home would cater for unmarried mothers (for example, the Kerry county scheme). The Limerick county scheme provided that ‘unmarried mothers with their children to take their discharge from the different workhouses’ but did not provide for any alternative arrangements. The original

---

Galway county scheme provided for the establishment of a children’s home in Glenamaddy (see Chapter 15) and also specifically provided that unmarried mothers who were ‘first offenders’ would be ‘dealt with’ there while ‘old offenders’ were to be sent to the Magdalen Asylum. This was changed in 1923 with the reference to the Magdalen Asylum being removed.\(^{15}\)

These changes all left the law in a quite unclear state as was accepted by the Parliamentary Secretary to the Minister for Local Government and Public Health, Dr Ward, when he was introducing the *Public Assistance Bill 1939* - see below.

**Assistance officers**

The *County Boards of Health (Assistance) Order 1924* dealt with the administration of home assistance and the role of assistance officers.\(^{16}\) Home assistance (outdoor relief) was administered by assistance officers. They were frequently described as home assistance officers; they were formerly relieving officers. Under the regulations, widows with one child or more were not subject to all the restrictions on the payment of home assistance; there were no special provisions for unmarried mothers and children.

The assistance officers were supervised by superintendent assistance officers who were required to attend all meetings of the relevant board of health to ensure that the board’s decisions were carried out. The superintendent assistance officer was a new role which took over some of the duties formerly carried out by the Clerk of the Union particularly in relation to outdoor relief. Among other things, the superintendent assistance officer (or sometimes the assistance officer) examined applications for admission to county institutions, for example, county homes and institutions such as Pelletstown, Tuam and Kilrush. There were 312 assistance officers in June 1926.\(^{17}\)

**Boarded out children**

The assistance officers also dealt with boarded out children. These were the children who were boarded out by the local authorities and in respect of whom the

\(^{17}\) There were also 22 relieving officers in the three Dublin areas, *Sick and Destitute Poor report* (1927), p. 55.
local authorities paid maintenance. The assistance officers were responsible for selecting foster parents, handing over boarded out children to the foster parents, paying the maintenance to the foster parents and, if necessary, arranging for the vaccination of the children. They were obliged to visit the children once a month and report on their condition to the board of health. If the boarded out child died, the assistance officer was responsible for arranging the burial.

1.20 Under the County Boards of Health (Assistance) Order 1924, the board of health could not board out a child without the consent of the minister unless the child was an orphan or deserted; this meant that, in general, the children of unmarried mothers could be boarded out only with the minister’s consent. The maximum age for boarding out was 15. The child had to be boarded out within the board of health’s area. The child had to be:

properly and sufficiently nursed or boarded, and shall be suitably lodged and clothed, and kept clean in its person by being washed once at least every day, and at all times when necessary, and the clothes provided shall not be of such shape or colour as may denote connection with any institution, and no child shall be nursed or boarded out in any house unless there is a woman living there who is of full age and has experience in the management of children.

1.21 Foster parents had to sign a contract to do all of this and had to have a recommendation from a clergyman, peace commissioner, member of a board of health, or medical officer living in the neighbourhood who ‘may be willing to answer for his or her good conduct and respectability’. The dwelling of the proposed foster parent had to be ‘in a healthy situation’. The house had to have more than one room and allow for ‘the sexes being completely separated’. There had to be ‘a supply of pure and wholesome drinking water’ readily accessible at all times; good food and milk had to be ‘easily obtainable’ and there had to be a national school or other public school ‘situate at a convenient distance from the dwelling’. In general the maximum number of boarded out children in a house was two unless they were siblings or there were other special circumstances. Children could not be boarded out by the board of health in a house where there were children boarded out by some other body (for example, by one of the voluntary organisations). They could not be boarded out with anyone ‘who keeps any pig, cow, horse, donkey or other

---

such animal within the dwelling-house, or who keeps any manure-pit or accumulation of filth in dangerous proximity to the dwelling’. Boarding out was also prohibited in a licenced premises and was possible in a town or village only with the consent of the minister. Foster parents were invariably women.

1.22 Boards of health had the power to appoint ‘Ladies Committees’ to visit boarded out children but were not required to do so.

1.23 In practice, there was conflict between central and local government about the inspection of boarded out children. The Department of Local Government and Public Health inspectors and the local health/public assistance authorities frequently disagreed on the standards of care (see Chapter 11)

**County institutions**

1.24 The *County Boards of Health (General Regulations) Order 1924* set out the detailed rules about the operation of boards of health. Among other things, the regulations required the boards to ensure that county institutions were clean and well maintained. County institutions included county homes and institutions such as Kilrush (Chapter 16) Pelletstown (Chapter 13) and Tuam (Chapter 15). The boards were required to:

- once at least in every year and as often as may be necessary for cleanliness, cause all the rooms, wards, offices and privies of or belonging to any County Institution to be thoroughly cleaned and painted or limewashed and the cesspools to be emptied.

1.25 They were required to:

- keep in good and substantial repair the premises constituting any County Institution, and shall from time to time remedy without delay any such defect in the repair of such institution, its drainage warmth or ventilation, or in the furniture or fixtures thereof, as may tend to injure the health of the inmates.

1.26 There were detailed rules about the role of the matron of the county home including a requirement to ensure that residents who were capable of working were actually doing so. There was also a requirement to keep a matron’s journal. The regulations also covered the rules for admission to county institutions and the role of the porter.
1.27 The *Report of the Commission on the Relief of the Sick and Destitute Poor* (1927) concluded that the orders and regulations made by the Minister for Local Government and Public Health in relation to the operation of the boards of health meant that these boards were ‘as much, if not more, under the rigid control of the Minister for Local Government and Public Health as the Boards of Guardians were under the control of the Local Government Board, and that, therefore, very little initiative or freedom of action rests in the Boards of Health’.

1.28 The *Sick and Destitute Poor report* (1927) was very clear about the inadequacy of the county homes for all residents:

> We desire to state emphatically that in our opinion the County Homes are not fit and proper places for the reception of the various classes which we have found in them, and, therefore, in so far as the Schemes, either through omission to make provision for or through actual commission in bringing together these classes, have conduced to that state of affairs they must on that ground, if on no other, be deemed inadequate and unsatisfactory. We believe that it was originally intended that Homes should be reserved only for the reception of the aged and infirm poor and the chronic invalids, and that separate provision should be made for the other classes. This has not been done.

**Public Assistance Act 1939**

1.29 The *Public Assistance Bill 1939* was introduced because it was recognised that the various changes that had occurred in the period since independence had left the law ‘in a quite unclear state’ according to the Parliamentary Secretary at the Department of Local Government and Public Health, Dr Ward. It was also designed as a permanent replacement for the *Local Government (Temporary Provisions) Act 1923* which had been renewed annually since it came into effect.

1.30 Dr Ward said that one of the reasons for introducing it was ‘the great difficulty of interpreting the law under the present complicated code of enactments’. The *Poor Relief (Ireland) Act 1838* had been amended over 30 times (a list of amendments is included in the 1st Schedule to the 1939 Act; most of these were repealed by that Act) and so were difficult to follow. In his reply to the Dáil debate (probably unscripted), Dr Ward was more trenchant: ‘...the public assistance legislation operating in this country at the present time is in an absolutely chaotic condition.
and…it is almost beyond the wit of man to determine what is the public assistance legal code in certain respects at the present time.\textsuperscript{19}

1.31 In his 2\textsuperscript{nd} stage speech to the Dáil, Dr Ward described the purpose of the Bill as being ‘to consolidate the existing law relating to the relief of the poor by local authorities, amending it to suit present conditions, and repealing provisions considered obsolete or inapplicable in existing circumstances’. He said it contained ‘very little that is new in principle’. Senator Mrs Concannon in the debate on the Bill in the Seanad said: ‘It is full of delicate charity, and it preserves the human rights of the poor people, and especially of the children’.\textsuperscript{20}

1.32 The \textit{Public Assistance Act 1939} came into effect on 26 August 1942.\textsuperscript{21} The \textit{County Management Act 1940} and the \textit{Local Government Act 1941} came into effect on the same day and the three are interrelated. The \textit{County Management Act} set out the role and functions of county managers, delineated the respective roles of the elected members and the county manager and, among other things, introduced the ‘Managers Orders’ (Section 19). Decisions on, for example, paying for women admitted to mother and baby homes were made by such orders.

1.33 The following are the main provisions of the \textit{Public Assistance Act 1939} that are relevant to this report. As already stated, the Act did not significantly change the poor law but it did make it more coherent.

\textbf{Public assistance authorities}

1.34 The 1939 Act replaced the term ‘poor relief’ with ‘public assistance’. It provided that the administration of the law relating to public assistance would be subject to the general direction and control of the Minister for Local Government and Public Health. The areas of local administration did not change. Each board of health/public assistance district became a public assistance district and a public assistance authority (PAA) was appointed for each district. The PAA was either the local authority for the area or a board appointed jointly by two local authorities. In practice, this meant that the county council was the PAA for all counties other than Cork, Dublin, Limerick and Waterford.\textsuperscript{22} The South Cork board of public

\textsuperscript{19} Dáil Debates, 6 June 1939: https://www.oireachtas.ie/en/debates/debate/dail/1939-06-06/8/

\textsuperscript{20} https://www.oireachtas.ie/en/debates/debate/seanad/1939-07-06/12/

\textsuperscript{21} The \textit{Public Assistance Act}, 1939 (Date of Commencement) Order, 1942, SI 413/1942.

\textsuperscript{22} The \textit{Public Assistance (Names of Districts) Regulations 1942} (SI 312/1942) set out the public assistance districts.
assistance was appointed by Cork county council and Cork corporation. In Dublin city and county the existing areas of the former unions/boards of assistance became the public assistance authorities (the Dublin board of assistance, the Balrothery board of assistance and the Rathdown board of assistance). The local authorities and the PAA had separate administrations. Limerick city and Waterford city each had a PAA separate from the county PAA.

**District institutions**

1.35 Sections 31-38 of the *Public Assistance Act 1939* provided that the public assistance authorities could maintain district institutions - that is, homes, hospitals and other institutions - at such places as the minister directed. The minister had the power to order the PAA to, for example:

- restore, alter or enlarge any such institution;
- provide new, improved or additional drainage, ventilation, water supply, lighting, heating or any other service for any district institution;
- provide and maintain fixtures, fittings, furniture, surgical and medical appliances, and other conveniences.

1.36 County homes, Tuam and Pelletstown were all district institutions (Kilrush was closed in 1932). Clearly, the minister had the power to order, for example, Galway county council to carry out various works in Tuam but the Commission has not seen any evidence that this power was ever used.

**Other institutions**

1.37 Public assistance authorities had the power to maintain people who were eligible for public assistance in homes, hospitals or institutions other than district institutions. This was the legal basis for the maintenance of residents in mother and baby homes such as the Sacred Heart homes and Dunboyne. The minister had the power to make regulations requiring people assisted in this way to make payments towards their stay. The PAAs were obliged to pay for chaplains to these institutions.

---

23 In the Dáil 2nd stage debate on the Bill, the issue of which Cork local authority met most of the costs was raised – this was a fairly constant theme in all discussions about local government.
Work
1.38 The Act provided that people receiving public assistance could be required to carry out work ‘suitable to the sex, age, strength, and capacity of such person’. (This did not involve any change).

Public assistance authority and parental authority
1.39 The 1939 Act provided that the PAA could take over the guardianship of a child in certain circumstances. For example, this could happen if ‘illegitimate’ children under the age of 16 were orphaned or were deserted by their mothers. The PAA could become the guardian of children in these circumstances if the children were maintained by the PAA and if the mother was unfit to have control of the child (for example, because of mental deficiency or was in jail). In order to assume guardianship rights in these circumstances, the PAA had to pass a resolution to that effect. In practice, the PAAs seem to have rarely passed such resolutions.

Certified schools
1.40 In general, industrial schools were under the control of the Department of Education. They were often used as orphanages when no other suitable place could be found for children. The PAAs who were responsible for children in industrial schools did not have any role in regulating the industrial schools. The Public Assistance Act 1939 gave the Minister for Local Government and Public Health a role in inspecting and approving such schools. It provided that the managers of any school other than a national school or a reformatory could apply to be a certified school under the PAA. The minister could then appoint an inspector to report on the condition of the school. If satisfied with this report, the minister could certify that the school was fit for the reception of children sent under the Act and specify the total number of children for which it was fit. If subsequently dissatisfied, the minister could cancel the certification. The Act empowered the minister’s inspector to visit and inspect a certified school. Any PAA which sent a child to a certified school could also visit and inspect the school.

1.41 All industrial schools did not become certified schools under the Public Assistance Act 1939. Those industrial schools which catered for girls and young boys were generally certified (they are sometimes described as ‘convent industrial schools’). The Commission has not seen evidence that the powers of inspection provided by the 1939 Act were used either by the department or the local health authorities. The Ryan Report describes inspections by the Department of Education but does
not refer to any inspections by the Department of Health or the local health authorities. In a memorandum in 1969, a Department of Health inspector, Miss Murray, said that when Miss Litster, the General Inspector, retired in 1957, the Inspectors of Boarded Out Children were instructed not to visit institutions. These instructions had not been rescinded.

Law on children

1.42 The Public Assistance Act 1939 did not significantly change the law in relation to children. It did provide for an increase from 15 to 16 in the age at which a child could continue to be regarded as a dependant. It also prohibited the placing of a child under the age of 14 years at service or in a trade, calling or business (generally known as ‘hiring out’).

Liability to maintain children

1.43 The Public Assistance Act 1939 set out who was liable to maintain family members. The following were liable to maintain children, spouses and parents:

- Every man was liable to maintain his ‘legitimate’ children up to the age of 16 and every woman was liable to maintain her ‘legitimate’ and ‘illegitimate’ children up to age 16;
- Every married man was liable to maintain his wife and any ‘legitimate’ or ‘illegitimate’ children of his wife who were born before her marriage to him and who were under 16;
- Every married woman was liable to maintain her husband;
- All ‘legitimate’ people were liable to maintain their parents;
- All ‘illegitimate’ people were liable to maintain their mothers.\(^\text{24}\)

1.44 In family law proceedings, the liability to maintain all children was extended by the Family Law (Maintenance of Spouses and Children) Act 1976 to also cover children between the ages of 16 and 21 if they were in full time education and to all children who were unable to maintain themselves because of a physical or mental disability. The Family Law Act 1995 further extended this to all children under the age of 18 and those aged between 18 and 23 if in full time education.

\(^{24}\) The liability to maintain parents ended in 1977 when the Social Welfare (Supplementary Welfare Allowances) Act 1975 came into effect – see below.
1.45 The public assistance/health authorities could have required the parents of many of the young women who were resident in mother and baby homes to contribute towards their maintenance. There is some evidence that the Galway authorities did seek and receive some such contributions (see Chapter 15) but this does not seem to have happened in respect of the other institutions.

**Boarding out of children**

1.46 Section 48 of the *Public Assistance Act 1939* gave the PAA the power to place children at nurse, board out or send to a certified school or, if 14 or over, place at service or place in any suitable trade, calling, or business. If the PAA was the child’s guardian, this decision was made by the PAA. If not, as was the case with the vast majority of the children in mother and baby homes, such decisions had to have the approval of the minister. The minister could require the PAA to remove the child from any such placement.

1.47 The PAA had the power to support, maintain and provide education to a child with a disability in an institution established for the care of such children (The Act uses the term ‘defective children’).

**Placement in other institutions**

1.48 Section 3 of the *Pauper Children (Ireland) Act 1898* provided that children could be accommodated in places other than workhouses. Institutions could be certified for the reception of poor children under this Act. For example, St Philomena’s was certified for the reception of a number of children in 1932 - see Chapter 2. This Act was repealed by the *Public Assistance Act 1939* but was replaced by similar provisions.

1.49 Section 35 of the *Public Assistance Act 1939* provided that, subject to the consent of the minister, a PAA had the power to provide assistance in a home, hospital, or other institution not provided or maintained by the PAA. This was the legal basis for maintaining unmarried mothers and children in the ‘extern’ homes, for example, the Sacred Heart homes.

**Burials**

1.50 The Act gave the PAAs the power to provide for the burial of people who had been receiving public assistance (among others). This meant that they had the power to
arrange the burial of children who died in the mother and baby homes in their area. They did not have an obligation to do so.

**Health Acts 1947 and 1953**

1.51 Further changes to local health authority structures were made by the *Health Act 1947* and the *Health Act 1953*. Neither made any major changes to the institutional arrangements for unmarried mothers and their children but there were name changes and there were some minor changes to the public assistance law and some further detailed regulations.

**Maternity and infant welfare services**

1.52 The 1947 and 1953 Acts provided for improvements to maternity services; these did not distinguish between married and unmarried mothers. There was never any distinction between unmarried mothers and married mothers in relation to entitlement to maternity services. Similarly there was no distinction between ‘legitimate’ and ‘illegitimate’ children in relation to entitlement to infant welfare services. It is clear that some members of the health authorities thought that unmarried mothers should not be able to avail of the same maternity services as married mothers - see, in particular, Chapter 15; however, no legal distinction was made in respect of entitlement.

1.53 In 1953, there were about 1,100 hospital beds for maternity patients (excluding about 640 beds in private maternity homes). According to the Minister for Health:

> The number of births each year is about 63,000, so that if we take it that each bed can on average take 25 patients in a year, nearly 28,000 out of this 63,000 or 44 per cent can at present be accommodated for child birth in a hospital.\(^{25}\)

This meant that more than half of all births took place at home.

**Health authorities and public assistance authorities**

1.54 The *Health Acts of 1949 and 1953* did not change the administrative arrangements in Dublin, Cork and Waterford. In other areas the distinction between the health authority and the public assistance authority was largely removed. In effect the PAAs retained responsibility for the administration of home assistance while the

county councils and county borough councils were responsible for health and institutional services. PAAs remained responsible for home assistance until 1977.

1.55 The *Health Act 1947*\(^{26}\) transferred responsibility for all health services to county councils and county borough councils. It designated the local authorities (the county councils and the county borough councils) as the health authorities in all counties other than Cork, Dublin and Waterford. The institutions maintained by the PAAs became the responsibility of the county councils and county borough councils. After the enactment of the *Health Act 1953*, these local authorities were responsible for all the general health services. When the *Health Act 1953* was being discussed the Minister for Health said that it would be impracticable to simplify the administration in Cork, Dublin and Waterford.\(^{27}\) The local authorities in these areas were responsible for the services but the existing PAAs provided some of them on an agency basis.

1.56 The *Health Act 1953* repealed a number of sections of the *Public Assistance Act 1939*\(^{28}\) and replaced them with very similar provisions.

**Institutional assistance**

1.57 Section 54 of the *Health Act 1953* provided for institutional assistance. This became the legislative basis for the maintenance of unmarried mothers and their children in mother and baby homes. It provided that people who were unable to provide shelter and maintenance for themselves or their dependants would be eligible for ‘institutional assistance’. ‘Institutional assistance’ was defined as ‘shelter and maintenance in a county home or similar institution’.

1.58 The detailed rules for the implementation of institutional assistance were set out in the *Institutional Assistance Regulations 1954*.\(^{29}\) These rules came into effect on 1 August 1954. They provided that health authorities could provide institutional assistance in a county home or similar institution maintained by them or by making arrangements to provide this in other institutions. There were specific rules about admission to a county home or similar institution maintained by the health authority. Pelletstown (Chapter 13) and Tuam (Chapter 15) were in this category.

---

\(^{27}\) See 2\(^{nd}\) stage speech on the *Health Authorities Bill 1959* for an outline of some of the issues: Dáil reports, 4 November 1959.

\(^{28}\) Sections 21, 22, 31 to 38, 40 to 51, 79, 81 and 82.

These rules largely reflected the practices that were already in place. The regulations did not set out detailed rules about admission to other institutions. They did provide that people receiving institutional assistance in any institution could be required to make a contribution towards the cost. The health authorities could require people who had an income of more than 10s a week to make a contribution towards their maintenance. This was increased to £1 in 1965.  

1.59 The health authorities had the power to require that a person seeking institutional assistance undergo a medical examination. Recipients of institutional assistance were required to give notice of intention to leave the institution but there was no specified sanction for failure to do this. The minister had to approve the diet of people receiving institutional assistance.

**Boarding out of children**

1.60 Section 55 of the *Health Act 1953* dealt with the boarding out of children. The detailed regulations were set out in the *Boarding Out of Children Regulations 1954.*  

This came into effect on 1 August 1954. They did not make significant changes to the existing arrangements but the rules were made more explicit. An obligation was placed on the health authorities to not send a child to an approved school unless the child could not be ‘suitably and adequately assisted by being boarded out’. Health authorities were obliged to keep a register of boarded out children; this register had to be available for inspection by the Bishop of the diocese in which the child was boarded out and by ‘such other religious authority as the health authority may consider appropriate’. The regulation that children should not be boarded out in a town or city, unless with the minister’s consent, was repealed.

1.61 The boarded out children had to be inspected by an officer of the health authority at least once a month or at such longer intervals as the health authority, with the consent of the minister, decided. The health authority had to get monthly reports of the child’s school attendance or an explanation for non-attendance. Officers of the Department of Health were also entitled to inspect boarded out children and the houses in which they lived. The health authority could remove the child from the foster parents with the consent of the minister or the minister could order the removal of the child.

---

1.62 As legal adoption became available from 1953 (see Chapter 32), boarding out became a less important exit pathway for children in mother and baby homes.

**Health Authorities Act 1960**

1.63 The Cork, Dublin, Limerick and Waterford health authorities were established by the *Health Authorities Act 1960*.

1.64 Although the *Health Acts* of 1947 and 1953 had been described as rationalising local administration,\(^{32}\) there were still 19 different local/health authorities in Cork, Dublin, Limerick and Waterford. There were seven in Dublin including Dublin corporation, Dublin county council, the Dublin board of assistance, the Rathdown board of assistance and the Balrothery board of assistance.\(^{33}\) Cork had five including Cork corporation, Cork county council and the South Cork board of public assistance.\(^{34}\) Waterford had Waterford corporation, Waterford county council, the board of assistance and the joint mental hospital board. Limerick had Limerick corporation, Limerick county council and the joint mental hospital board.

1.65 The effect of the 1960 Act was to unify the health services in the four counties concerned and set up one health authority for each county. The health authorities were appointed by the local authorities and were largely composed of local authority members. Among other things, this meant the abolition of the three boards of assistance in Dublin.

1.66 The 19 bodies each had its own administrative staff. The proposed new arrangements were supported by the Dublin and Limerick local authorities but not by the Cork and Waterford authorities.

1.67 Home assistance continued to be provided under the *Public Assistance Act 1939*. The management of home assistance was transferred to the health authorities created under the 1960 Act.

---

\(^{32}\) See for example, Dáil Éireann; *Select Committee on the Health Services: Memorandum from the Department of Health* [https://www.lenuis.ie/bitstream/handle/10147/575039/helathservicescommittee.pdf?sequence=1&isAllowed=y](https://www.lenuis.ie/bitstream/handle/10147/575039/helathservicescommittee.pdf?sequence=1&isAllowed=y)

\(^{33}\) The others were the Grangegorman Mental Hospital Board and the Dublin Fever Hospital Board (the Dublin Fever Hospital was at Cherry Orchard).

\(^{34}\) The others were the Joint Mental Hospital Board and the Joint Sanatoria Board.
1.68 The Dublin city and county manager remained legally responsible for the executive functions of the Dublin health authority (DHA) but these functions were delegated to the chief executive officer of the DHA.

**Health Act 1970**

1.69 The *Health Act 1970* provided for the establishment of eight regional health boards. They took over the health functions of the local authorities.

**Regional health boards**

- Eastern Health Board: Dublin, Kildare and Wicklow
- Midland Health Board: Laois, Offaly, Longford, Westmeath
- Mid-Western health Board: Clare, Limerick, Tipperary North
- North-Eastern Health Board: Louth, Meath, Cavan and Monaghan
- North-Western Health Board: Donegal, Sligo, Leitrim
- South Eastern Health Board: Carlow, Kilkenny, Waterford, Wexford, Tipperary South
- Southern Health Board: Cork, Kerry

1.70 The Eastern Health Board took over the administration of the health services within its functional area from 1 April 1971. On 30 March 1971, the Dublin, Cork, Limerick and Waterford health authorities were dissolved.35

**Later changes**

1.71 Further structural changes were made after the period covered by the Commission. The *Health (Eastern Regional Health Authority) Act 1999* which came into effect in 2000 established three health boards within the existing Eastern Health Board area. The *Health Act 2004* which came into effect on 1 January 2005 abolished all the health boards and established the Health Service Executive (HSE).

**Funding of services, hospitals and institutions**

1.72 Initially institutional services, home assistance and health services were paid for by the ratepayers in the relevant local health/public assistance areas. The *Health Services (Financial Provisions) Act 1947* started the process whereby these

services were paid half by the local authorities and half by the State. In the 1970s, the State became responsible for all funding.

1.73 Capital funding was provided by the Hospitals Trust Fund and it also provided for the shortfall in voluntary hospitals. A number of the institutions being investigated by the Commission received funding from the Hospitals Trust Fund. It is not clear to this Commission why more of the institutions did not apply for funding from this source.

1.74 The use of the proceeds of sweepstakes for funding hospitals and institutions was initially governed by the Public Charitable Hospitals Acts 1930 - 1932. These were replaced by the Public Hospitals Act 1933 which, with some amendments not relevant to this report, remained in force until 1986/7.

1.75 The sweepstakes proved to be a very successful method of raising funds. It would appear that over £5 million was made available from sweepstakes in the period 1930-33 for spending on hospitals.36

1.76 The 1933 Act extended the definition of a hospital to include not only hospitals in the ordinarily understood sense, but also

- Institutions for the care and maintenance of expectant women or mothers with children who were less than five years old;37
- Institutions for the blind, deaf, dumb and mentally defective;
- The infirmary sections of county homes.

1.77 The sweepstakes were conducted by the Hospitals Trust which was a limited company. The proceeds were paid into the Hospitals Trust Fund. This was governed by trustees known initially as the National Hospital Trustees and from 1938 as the Hospitals Trust Board. The trustees were appointed by the Minister for Local Government and Public Health.

1.78 The 1933 Act set up the Hospitals Commission. Its members were appointed by the minister. Its function was to carry out investigations into the needs of hospitals;

---

36 2nd stage speech, Seanad, 21 June 1933; https://www.oireachtas.ie/en/debates/debate/seanad/1933-06-21/9/
37 A number of mother and baby homes received such funding – this is described in the chapters on the individual institutions.
to prepare schemes for improving and co-ordinating hospital facilities; and to advise the minister on applications for grants from the Hospitals Trust Fund.

1.79 The procedure was that a hospital could apply to the minister for a grant. This application was referred to the Hospitals Commission for investigation and report. The Hospitals Commission had the right to inspect hospitals (as defined under the Act) which applied for grants from the Hospitals Trust Fund and hospitals or institutions under the control of or assisted by local authorities. It could examine the premises, fittings and equipment and was entitled to get full information about the management and financial position of the hospital and ‘to see and examine all accounts of the receipts and expenditure of the governing body of such hospital…and also all or any books and other documents containing any record of such receipts and expenditure’. The minister made the decision; in so doing he was not bound by the Hospitals Commission report.

1.80 Grants could be made for a number of purposes including:

- the purchase of land or buildings;
- the construction of buildings;
- the reconstruction, extension, alteration or improvement of buildings;
- the purchase of hospital, nursing and other equipment;
- the payment of maintenance expenses;
- the discharge of debts.

1.81 The *Health Act 1970* dissolved the Hospitals Commission.

### Grants for maternity and related services

1.82 In 1916 the UK government introduced a programme of grants to local authorities and voluntary agencies in urban districts (including county boroughs), for health-visiting, maternity centres, midwifery facilities and day nurseries. In 1918 the sum of money provided was increased and the items covered were extended to include provision for the young children of widowed, deserted and unmarried mothers and Exchequer payments for health visitors. By 1920 this grant was providing financial support to a number of Dublin voluntary organisations that assisted unmarried mothers and their children, including the Magdalen Asylum (Denny House - see Chapter 23) and the Nursery Rescue and Protestant Children Aid Society. The grant covered half of the cost of boarding out these children up to the age of five,
which would reduce the amount of money that a single mother needed to provide, and half of the estimated costs of keeping mother and baby in the Dublin Magdalen Asylum. This scheme was continued after independence and some of the institutions being investigated by the Commission availed of this funding.

### Home assistance/income maintenance payments

1.83 Home assistance was the only weekly income maintenance payment available to an unmarried mother for most of the period covered by this investigation. A number of new income maintenance payments were introduced but not all were available to unmarried mothers.

1.84 Unemployment Assistance was introduced in 1933 but unmarried mothers with small children would generally not have qualified as they would not be considered to meet the availability for work criterion. Unmarried pregnant women may have qualified. Widows and Orphans Pensions, both contributory and non-contributory, were introduced in 1935 but, of course, unmarried mothers did not qualify. Children’s Allowances, which were paid monthly, were introduced in 1944 but initially applied only to the third child in a family. Maternity Allowance was introduced in 1952. This was payable for six weeks before and six weeks after the birth. Unmarried pregnant women and mothers qualified for this in the same way as married women; they were required to have a record of paid social insurance. Unmarried Mother’s Allowance was introduced in 1973; this was the first specific State payment available to unmarried mothers. It was renamed Lone Parent’s Allowance in 1990.

### Home assistance

1.85 Home assistance was governed by the Poor Law/Public Assistance legislation. It was administered by relieving officers (later assistance officers) employed by the board of guardians and their successors in title. In 1975, when the legislation to replace it was being discussed, it was being administered by 31 public assistance authorities or by health boards acting on their behalf, subject to the general direction and control of the Minister for Social Welfare, and was financed from the local rates.

1.86 A person was eligible for home assistance if she was unable to provide the necessaries of life for herself or her dependants. It was entirely discretionary.
There were considerable variations in how it was implemented by the different public assistance authorities. The Parliamentary Secretary at the Department of Social Welfare commented:

Surveys of the service have shown that because of major defects in its structure it operates in an arbitrary and far from satisfactory manner. There are major inequalities in regard to standards of eligibility and in regard to the amount of assistance given as between one authority and another. In some cases these inequalities exist even within the same authority in regard to the treatment of basic needs. Again, in the matter of supplementation there are wide differences in the treatment of similar cases.\(^\text{38}\)

The cost of home assistance was met entirely by the PAAs. This was one reason for the lack of uniformity in its implementation. The numbers in receipt of home assistance had been steadily declining as new social welfare schemes were introduced for specific groups: the numbers went from a weekly average of 75,000 in the 1940s to 30,000 in the 1970s.\(^\text{39}\) Some unmarried mothers received home assistance but, as it was discretionary and locally administered, there are no accurate figures for this.

Supplementary welfare allowance scheme

The **Social Welfare (Supplementary Welfare Allowances) Act 1975** came into effect on 1 July 1977. It provided for a new supplementary welfare allowance (SWA) scheme to replace home assistance. The SWA scheme was described by the Parliamentary Secretary at the Department of Social Welfare, Frank Cluskey, as removing the ‘last vestiges of the harsh and unfeeling Poor Law’.\(^\text{40}\) The new scheme was under the general control of the Minister for Social Welfare and was administered by the regional health boards. It was implemented by community welfare officers who were formerly assistance officers or superintendent assistance officers.\(^\text{41}\)

---

\(^{38}\) Frank Cluskey, 2\(^{nd}\) stage speech on the **Social Welfare (Supplementary Welfare Allowances) Bill**, Seanad, 10 December 1975: [https://www.oireachtas.ie/en/debates/debate/seanad/1975-12-10/6/](https://www.oireachtas.ie/en/debates/debate/seanad/1975-12-10/6/)

\(^{39}\) Ibid.

\(^{40}\) In his Seanad 2\(^{nd}\) stage speech, Cluskey said ‘In introducing this measure I am very conscious of the lessons of history which indicate, in the words of one recent commentator, that “since other attempts to bury the Poor Law, in Ireland and in Britain, have shown the truly remarkable ability of the Poor Law to survive death sentences, a really radical reform will be necessary”’.

\(^{41}\) Assistance officers and superintendent assistance officers had a wide range of responsibilities under other legislation. See **Annual Report of the Community Welfare Service** 1995, Eastern Health Board: [https://www.lenus.ie/bitstream/handle/10147/46249/979.pdf?sequence=1&isAllowed=y](https://www.lenus.ie/bitstream/handle/10147/46249/979.pdf?sequence=1&isAllowed=y)
The main feature of the SWA scheme was that it provided that people who had no income and did not qualify for any other social welfare benefit could get a basic weekly payment. In effect, every adult became entitled to a minimum income as of right. This feature was not of particular importance to unmarried mothers and their children because of the existence, since 1973, of the Unmarried Mother’s Allowance. It was important for pregnant women and there is evidence that residents in a number of mother and baby homes were in receipt of this payment before the birth of their child - see, for example, Chapters 24 and 26.

The SWA scheme had a number of other features which were particularly relevant to unmarried mothers. It provided that supplements could be paid to meet particular costs. A rent supplement could be payable if a person’s income after paying the rent fell below a certain level. The SWA scheme also provided for payments towards once off or emergency needs, for example, heating or special diets, and for assistance with the costs of clothing and footwear. These payments could be once off payments or weekly/monthly payments. Gradually, the supplements became the more important element of the scheme and, in particular, the rent supplement became a significant housing benefit.

It seems likely, but it is not possible to establish, that the availability of the rent supplement, and the other supplements to a lesser extent, assisted some unmarried mothers to decide to keep their children.

While it was hoped that the new scheme would be implemented in a uniform manner throughout the country, in practice, its discretionary elements were implemented differently in different health boards. In 1986, the Commission on Social Welfare expressed concern about the divergence in the interpretation and application of the discretionary sections of SWA between and within health boards. A review of the SWA scheme by the Combat Poverty Agency in 1991 noted that some community welfare officers were more generous than others in assisting claimants.

It is not possible to extract detailed information about the degree to which unmarried mothers availed of the supplements between 1977 and 1998 because statistics were not kept in a manner that allows for such analysis. Information
about the scheme was not centrally available until a computerised system was put in place in the mid-1990s.  

1.93 There is evidence that unmarried mothers did avail of the rent supplement and the exceptional/urgent needs payments especially assistance with electricity costs. The Commission is aware of anecdotal evidence that lone parents were assisted with the costs of furniture and kitchen equipment if they got either local authority housing or private rented accommodation.

1.94 A review of the scheme by the Combat Poverty Agency was published in 1991.\textsuperscript{43} It included an analysis of the information available about recipients in the late 1980s. For example, on the week ending 31 March 1990, there were 6,527 recipients of rent supplement; however, the report points out that this is probably a considerable underestimate of the numbers who were receiving rent supplement as it was often paid on a fortnightly or monthly basis. There were 18,761 recipients of the Unmarried Mother’s Allowance in 1990.

1.95 The report did not distinguish between unmarried mothers and other lone parents. Lone parents were significant recipients of rent supplement, assistance with electricity costs and clothing and footwear.

**Children Acts**

1.96 The *Children Act 1908* was the primary legislation governing the care of children in the period covered by the Commission. It was amended a number of times during this period. It remained in force until replaced by the *Child Care Act 1991* and the *Children Act 2001*.\textsuperscript{44} Its main provisions which are of relevance to the Commission’s remit are described here.

**Nursing out of children**

1.97 The Children Acts provided for controls on the nursing out of children for reward. Part 1 of the *Children Act 1908* provided that any person who undertook the nursing and maintenance of an infant under the age of seven, away from the

\textsuperscript{44} The *Child Care Act 1991* came into effect at various times between 1991 and 1996.
child’s parents or where the child had no parents, ‘for reward’ was obliged to notify the local authority in writing within 48 hours. If there were such arrangements in its area, the local authority was obliged to appoint infant protection visitors to inspect the children concerned and the premises where they lived.45 Alternatively, the local authority could appoint people to exercise the powers of infant protection visitors; in practice, many local authorities appointed relieving officers (officially called assistance officers after 1923) to exercise these powers. The infant protection visitor was to visit each child and inspect the premises in which the child lived.

1.98 Where children were placed at nurse by a philanthropic society, it was open to the local authority to authorise the society to exercise the powers of the infant protection visitor if it was satisfied that the interests of the infants were properly safeguarded; the societies were obliged to provide periodic reports to the local authority.

1.99 The minutes of the Dublin board of guardians show that, during the 1920s, the infant protection visitors were actively pursuing illegal arrangements for caring for children. The minutes record many instances of such prosecutions and the penalties imposed. These included fines and imprisonment. For example, fines of between 10s and £5 were imposed for failure to register and the woman also had to pay the costs involved.

1.100 People who accepted a nursed-out infant were obliged to inform the authorities within 48 hours if the child was removed from their care or if the child died.

1.101 The Children Act 1934 provided for changes to the 1908 Act which were recommended by the Commission on the Relief of the Sick and Destitute Poor, including the Insane Poor. In its August 1927 report, the commission pointed out that, while the provisions of Part I of the 1908 Act had, to some extent, brought baby farming under control, it did not go far enough.

1.102 The Minister for Local Government and Public Health had no functions under the infant life provisions of the 1908 Act. The 1934 Act provided that, in exercising

---

45 The Infant Life Protection Act 1879 provided for infant life protection visitors; some Boards of Guardians appointed relieving officers to this role.
these functions, the local authorities would be subject to the general regulation and control of the minister.

1.103 The requirement to inform the local authority arose only after the infant had been on the premises for 48 hours. This did not give local authorities any opportunity to assess the suitability of the proposed foster parents or to inspect the homes in advance in order to assess their suitability. This meant that, if the foster parents or the home were unsuitable, the only remedy was the removal of the child. There was ‘a great likelihood that the child will then become a charge on the rates, and the persons who should be responsible for it will escape their liabilities’. The 1934 Act provided that the local authority must be given at least 48 hours’ notice before the infant was taken into the home. The 1934 Act also raised the age to which these provisions applied from seven to nine years old.

1.104 In the case of ‘illegitimate’ children, the 1934 Act provided that they would be deemed to have been accepted for reward unless the contrary was proven.

1.105 When introducing the Bill, the Parliamentary Secretary to the Minister for Local Government and Public Health, Dr Ward, said that these changes were supported by a wide range of societies, operating particularly in the neighbourhood of Dublin. He named the National Society for the Prevention of Cruelty to Children, the Irish Women's Citizen's Association, the Catholic Protection and Rescue Society, the Nursing and Rescue and Protestant Children's Aid Society, St Patrick's Guild and the Sacred Heart Home as societies that had made representations on the matter. He said that poor law authorities had also sought changes, ‘notably the Rathdown Board, whose area seems to be particularly exposed to the evils which the Bill is intended to remedy’.

1.106 Section 57 of the Health Act 1953 provided that the health authorities would be the relevant authorities for the implementation of Part 1 of the Children Act 1908.

Abandonment of children

1.107 Section 12 of the Children Act 1908 dealt with the prevention of cruelty to children. Cruelty could take many forms including the abandonment of a child. It was an offence for any person who had the custody or care of a child to abandon the child.

---

46 2nd Stage speech of the Children Bill 1934, 15 February 1934.
47 This was an orphanage in Dublin which was not connected with the Sacred Heart mother and baby homes.
in a manner that was likely to cause unnecessary suffering or injury to the child’s health. Parents could be guilty of this offence if they failed to provide adequate food, clothing, medical aid or lodging or, if they were unable to provide these, if they failed to take steps to procure these under the poor law arrangements. Attempts were made to use this provision to prosecute women who left their children in mother and baby homes but they seem to have been unsuccessful (see Chapter 18).

Industrial schools

1.108 Under the Children Act 1908, children could be sent to industrial schools only if they were convicted of an offence. The Children Act 1929 provided that children could be sent to industrial schools if they were destitute and their parent(s) could not support them. This was subject to the consent of the parent(s).

Registration of Maternity Homes Act 1934

1.109 There was no regulation of maternity homes prior to 1934. Until then there was ‘no official control over maternity homes. It was quite open to any person to carry on a maternity home, and there was no machinery in existence to ensure that it was efficiently managed or that the premises in which it was carried on were suitable or in a good sanitary condition’. Local authorities did have the power to enter such homes for the purposes of the supervision of midwives under the Midwives (Ireland) Act 1918 but they had no supervisory powers over the home itself or any of the other employees.

1.110 The Commission on the Relief of the Sick and Destitute Poor including the Insane Poor had recommended in 1927 that a registration system for maternity homes be put in place.

1.111 This legislation defined a ‘maternity home’ as any premises which were, either wholly or partly, used or intended to be used for the reception of pregnant women or of women immediately after child-birth.

48 There was also no regulation of hospitals or other health care facilities and such regulation was not introduced until after the period covered by this report.
49 Dr Ward, Parliamentary Secretary to the Minister for Local Government and Public Health, 2nd stage speech on the Registration of Maternity Homes Bill, Seanad, 11 April 1934: http://oireachtasdebates.oireachtas.ie/debates%20authoring/debateswebpack.nsf/takes/seanad19340411000097?opendo cument
1.112 The Act required the local authorities to keep a register of maternity homes in their areas. Anyone who proposed to operate a maternity home could apply to the local authority for registration. The local authority could refuse to register a maternity home if it was satisfied that:

- the applicant for registration was not a fit and proper person to operate a maternity home;
- the premises were unsuitable;
- the superintendent nurse was not a qualified nurse or midwife: this applied only to maternity homes which did not exist before the Act came into effect.

1.113 If the local authority refused registration, the applicant could appeal to the Minister for Local Government and Public Health.

1.114 The Act made it a criminal offence to operate a maternity home without registration unless the home was specifically exempted. The minister had the power to grant an exemption to any hospital or institution which was a maternity home but was not carried on for private profit.

1.115 The operators of maternity homes were obliged to display their certificate of registration in a conspicuous place in the maternity home. Failure to do this was also a criminal offence.

1.116 The local authority could cancel the registration if any of the conditions for granting the registration were no longer being met.

1.117 The Act provided that records had to be kept, in a prescribed form, of all receptions into the home, all discharges, every confinement, every miscarriage, every birth and every death. A record also had to be kept of every removal of a child from the home, the name of the person who removed the child and the address to which the child was removed. It was an offence to fail to keep the specified records. It was also an offence to fail to produce such records for inspection as required by the local authority or the departmental inspector.

1.118 These records could be inspected at all reasonable times by authorised officers of the local authority or by any inspector; an inspector was a person authorised by the Minister for Local Government and Public Health to carry out inspections under the
Act. In effect, both the local authorities and the department had powers of inspection. The department did carry out regular inspections; the Commission does not know if all the local authorities did. While the department carried out inspections, only the local authority had the power to insist on changes or to de-register the maternity home.

1.119 There were specific provisions about notification of deaths. The maternity home operator was obliged to notify the local authority in writing of the death and its cause. This had to be done by registered post within 24 hours of the death. It was a criminal offence to fail to do this.

1.120 There were no set standards for maternity homes until the 1940s. The Department of Health set out some standards in the 1940s but these were not legally binding.

1.121 On 15 June 1961, the Minister for Health, Mr McEntee, told the Dáil that:

Maternity homes are regularly inspected by authorised officers of the local authorities (usually the county medical officer of health or his deputy). These homes are also inspected by an officer of my Department and any matter adversely reported upon is drawn to the attention of the local authority. These inspections and the power conferred by the Act on local authorities to cancel registration under certain circumstances ensure that a satisfactory standard is maintained in maternity homes generally.

Other relevant legislation

Parental control/age of majority

1.122 For most of the period being examined by the Commission, the age of majority was 21 or on marriage, if that was earlier.\(^ {50} \) It was reduced to 18 by the *Age of Majority Act 1985*. The question has arisen as to whether parents had the right to decide where their minor children should live and, specifically, whether parents had the right to place a minor daughter in a mother and baby home. Neither the right of the parents of a minor mother to decide where their daughter would live before or after the birth of her child nor their right to place their daughter in a mother and baby home.

---

\(^ {50} \) For much of the period covered by the Commission, the legal age for marriage was 21. A person under the age of 21 needed parental consent to marry; that consent could be given if the female was at least 12 years old and the male was 14. In 1975, the minimum age for marriage was raised to 16 with provision for the courts to consent to people marrying at an earlier age. The minimum age was raised to 18 in 1995 (again with the possibility of a court order between the age of 16 and 18). This meant that very young married people were regarded as adults and had the right to make decisions about their children.
home are matters which appear to have been addressed by law or by the courts. In *Child Law*, Geoffrey Shannon points out that the principal source of fundamental rights in the family law arena in Ireland is the Constitution. Article 41, which recognises the family as the natural and primary unit group of society lacks a child focus and establishes the principle of parental autonomy. Article 42 provides State recognition of the inalienable right and duty of parents to provide, according to their means, for the religious and moral, intellectual, physical and social education of their children. It seems clear that, under the Constitution of Ireland, parents enjoyed the primary right and duty to make decisions about their children’s lives. The law (as outlined above) required that parents maintain their children until the age of 16 but not for the full duration of their minority.

**Age of consent**

1.123 For most of the period covered by this investigation it was an offence to have sexual intercourse with a girl under the age of 17. Sexual intercourse with a girl under the age of 15 was a particularly serious offence which carried a potential penalty of life imprisonment. These limits were set by Sections 1 and 2 of the *Criminal Law Amendment Act 1935*. Prior to its enactment, the age of consent was 16 with 13 being the age limit for the more serious offence. With some exceptions, it seems that most of the mother and baby homes and county homes under investigation did not have a policy of reporting underage pregnancies to the Gardaí.

**Legitimacy**

1.124 The status of ‘illegitimacy’ remained in existence until 1987. This was clearly a major issue for the children of unmarried mothers and is considered in detail in Chapter 36.

**Short form birth certificates**

1.125 The *Vital Statistics and Births, Deaths and Marriages Registration Act 1952* provided for, among other things, a short form birth certificate. In his 2nd stage speech, the Minister for Health did not specifically mention the main reason for the introduction of this form, that is, it did not give information about a person’s

---

52 Section 1 was declared unconstitutional in 2006 and the *Criminal Law (Sexual Offences) Act 2006* was enacted to rectify the unconstitutional aspects but with the same age limits.
54 Dáil Reports, 20 February 1952.
parentage and, therefore, did not show whether a person was ‘legitimate’ or not.

General Mac Eoin TD was not reticent about this:

This is a very important Bill. We are told that the chief reason for its introduction is to enable statistics to be more readily compiled and made available, but the astonishing part of it is that a very important change in one of the most essential parts of the life of the people of the country is being altered under that title. Now, I am not in any way to be taken as prudish or of having any superiority complex or inferiority complex either one way or the other. On this matter, what I am going to mention is the question of short certificates; short certificates for births, short certificates for deaths and short certificates for marriages. This is, believe it or not, the beginning of the liberalistic mind in this country. It is the opening up and the starting up of the liberalistic mind in Europe being put across in this House for the first time under vital statistics. This is not a Department in which I had any part. I am not a shadow Minister for Health or anything like that, but I am an ordinary Deputy having positive views upon certain matters which are of the utmost importance to every person in this country.

This Bill will be welcomed by a lot of cranks. There is not a crank in the country who will not say “Well done” to the Minister. Very well. If he wants the approbation of those people, he can have it, and if what I am going to say will bring the reverse to me, I am prepared to take it and to stand up to it. First, as regards the question of the short certificates. The Minister was Minister for Agriculture, and he now proposes to do with the Irish people what he would not do with Coates’s herd book. He is going to show nothing as to who we are or where we came from or anything about us, and to legitimise everybody. He is going to make every one of us illegitimate. Now, that may be hard talk. I hope it will not be misunderstood, but it is direct.

1.126 Some deputies were perplexed by General Mac Eoin’s view, for example, Deputy Dr ffrench O’Carroll:

I am amazed at the attitude which Deputy MacEoin has taken up here to-day, and I am not surprised, without wishing to be personal, that during his term of office we did not have a Legal Adoption Bill brought into this Dáil. I cannot understand how anybody would oppose a section in a Bill which would seek to try to release the illegitimate people in this country who are being ground under the present law as virtual lepers in society. They are people who are
admitted into the world but not into the Christian society in which we live. It is no fault of theirs.

1.127 Other deputies questioned the effectiveness of the new form, suggesting that it would not be accepted for significant legal transactions but it was pointed out that it could be used for many everyday activities, for example, proof of age for examinations or work.

**Action for seduction**

1.128 At common law, the parents of a minor who had a child outside marriage could bring an action for seduction against the father of the child. The essential ingredients of the action were the existence of a ‘master-servant’ relationship, the seduction of the servant and the deprivation of the master of the services of the servant as a result of the seduction. In *Shine v Archdeacon* 55 the plaintiff was the father of a girl who had been employed as a servant by Mr O’Leary from the age of 16 years. At various stages the girl expressed her intention of leaving her employment but was persuaded by the defendant (a man other than Mr O’Leary) to stay. The defendant then had what was referred to in the judgment as ‘immoral relations with the girl’ and she became pregnant, giving birth to a child in a workhouse hospital in 1928 when she was still a minor (aged 20). The plaintiff claimed the sum of £300 for the seduction and ‘carnal knowing’ of his daughter as a consequence of which it was claimed he had lost her services and incurred expense in taking care of and nursing her and her child. The Circuit Court judge dismissed the plaintiff’s claim. The plaintiff’s appeals to both the High and Supreme Courts were dismissed on the basis that at the time the seduction had taken place the girl was in the service of Mr O’Leary and not her father and the fact that she was underage was immaterial.

1.129 Before 1930, an action for seduction was the only legal procedure available to the mother for recovery of money from the putative father which could be used for the maintenance of the child. As Judge Henchy described the position in the case of *O v M*, 56 aside from what he described as ‘that doubtful remedy’, ‘the mother was left by the law to fend for herself in the task of rearing the child’. 57

---

55 [1931] I IR 566.
57 Ibid, p. 35.
Affiliation orders

1.130 The *Illegitimate Children (Affiliation) Orders Act 1930* provided that a mother could apply to the District Court for an order requiring the father of her child to pay maintenance in respect of the child. The mother was required to have corroborative evidence to prove paternity. In practice, unless the father admitted paternity, it was extremely difficult for the mother to provide such evidence. It was not an effective means of providing support for ‘illegitimate’ children.
Chapter 2: Institutions

Introduction

2.1 The Commission’s Terms of Reference require it to detail:

- The types of institutional settings (e.g. mother and baby homes, county homes, private nursing homes, homes for infants or children) where single women and their children, or other children, were accommodated;
- The role and significance of different types of institution and their inter-relationships;
- Organisational arrangements for the management and operation of these different types of institution;
- The involvement of state authorities in legislating for, supporting, financing or regulating different types of institution.

2.2 Chapter 1 sets out the main legislation governing the different institutions. This chapter describes the various institutions. With the exception of three county homes, the Commission has not investigated any of these institutions so its information is not complete.

County Homes

2.3 The list at paragraph 2.5 were the county homes where unmarried mothers and children were resident. The practice of unmarried mothers being housed in county homes declined significantly from the early 1950s and ceased by about 1960. Children, mainly children with disabilities and including both ‘legitimate’ and ‘illegitimate’ children, continued to reside in county homes until about the mid to late 1960s. The Care of the Aged report shows that there were 53 children in county homes on 31 March 1966.\(^1\)

2.4 The conditions for unmarried mothers in county homes are described in Chapter 10. The Care of the Aged report shows that by 1966, improvement schemes had not yet commenced on a number of county homes:

A number of Homes have been rebuilt or reconstructed, wholly or in part, but many buildings are still of an unsatisfactory standard. The Homes cater for a

---

\(^1\) Inter-departmental Committee on the Care of the Aged, Report (Dublin, 1968): https://www.lenus.ie/handle/10147/559466
variety of patients—the sick, the infirm, the mentally handicapped and persons in need of shelter and maintenance because of social reasons.

2.5 County homes were originally known by their location only. There was at least one in every county except Louth. In the 1950s, they began to use religious names. This seems to have been an attempt to lose the stigma that attached to them. In practice, they continued to be known by location. The *Report of the Department of Health 1949/50* lists the county homes by location only. The *Care of the Aged Report 1968* lists them with their religious names. By the late 1960s/early 1970s, they were being used exclusively for the care of older people and they began to be described as ‘welfare homes’. Later they began to be described as public or community nursing homes and many of them still operate as such. It appears that they are still described locally as county homes. Institutions which were not formerly workhouses also became welfare homes, for example, St Clare’s, Glasnevin which had been opened as a specialist gastroenteritis hospital in 1944, became a welfare home in the 1960s and is still a public nursing home. These newer institutions never housed unmarried mothers and so are not included in the list below.²

**Magdalen laundries**

2.6 The Report of the Inter-Departmental Committee to establish the facts of State involvement with the Magdalen Laundries, generally known as the McAleese Report, sets out, among other things, how women and girls entered the laundries and the degree of State involvement with the laundries. The report examined ten laundries which were operated by four religious orders. These were:

**Sisters of Our Lady of Charity of Refuge:**
- St Mary’s Refuge, High Park, Grace Park Road, Drumcondra, Dublin
- Monastery of Our Lady of Charity, Sean McDermott Street (formerly Gloucester Street), Dublin 1

**Congregation of the Sisters of Mercy:**
- Magdalen Asylum / Magdalen Home, No. 47 Forster Street, Galway
- St Patrick’s Refuge, Crofton Road, Dun Laoghaire, Co. Dublin

**Religious Sisters of Charity:**
- St Mary Magdalen’s, Floraville Road, Donnybrook, Dublin

St Vincent’s, St Mary’s Road, Peacock Lane, Cork

**Sisters of the Good Shepherd:**
St Mary’s, Cork Road, Waterford
St Mary’s, New Ross, Wexford
St Mary’s, Pennywell Road, Limerick
St Mary’s, Sunday’s Well, Cork.

(There were industrial schools on the same grounds as the four Sisters of the Good Shepherd laundries and in High Park).

**The Magdalen redress scheme**

2.7 Subsequent to the publication of the McAleese Report, the Quirke report on the *Establishment of an ex gratia Scheme and related matters for the benefit of those women who were admitted to and worked in the Magdalen Laundries* was published in May 2013.⁴ It recommended the establishment of a Magdalen Restorative Justice Ex-Gratia Scheme. Initially, the Redress for Women Resident in Certain Institutions Act 2015 applied to the ten institutions investigated by McAleese and to two other institutions:

- The laundry operated by the Sisters of Charity in the Training School of St Mary’s Training Centre, Stanhope Street, Dublin 7 and
- The laundry operated by the Sisters of Mercy in the Training School of the House of Mercy Training School, Summerhill, Wexford.

2.8 The Religious Sisters of Charity had argued that Stanhope Street was a training centre which provided domestic training (including in laundry work) to young girls. They said that it never operated as a refuge or home along the lines of the Magdalen Laundries which the Congregation operated at Donnybrook and Peacock Lane, Cork and that it was operated on a fee-paying basis for the girls admitted to it. The Sisters of Mercy had argued that Summerhill was one of approximately 16 Mercy Homes consisting of a vocational training school for girls.

2.9 In May 2018, the scheme was extended to women who worked in the laundries of the 12 institutions but who lived in one of the adjoining 14 institutions.⁵ These 14 are:

St Michael’s Industrial School, Summerhill, Wexford

---

Maternity Homes

2.10 From 1934, maternity homes were required to be registered under the Registration of Maternity Homes Act 1934 (see Chapter 1). There were a large number of private maternity homes in existence for most of the period covered by the Commission. Some were very small and tended to be run by a nurse sometimes in her own home. (There was one registered maternity home that converted to bed and breakfast accommodation during the summer months). Some have been described as private mother and baby homes but the evidence available suggests that most were simply maternity homes and mothers and babies left soon after the birth.

2.11 The Department of Local Government and Public Health/Department of Health inspected the registered private nursing homes quite frequently. Many inspection reports are available in the files discovered to the Commission by the Department of Health. The Commission has not seen any evidence that the records of the vast majority of private nursing homes are extant.

2.12 It is difficult to know how many maternity homes existed because the local health authorities were responsible for the registration and their records are not all extant. The following list is compiled from lists of registered maternity homes drawn up by the Department of Health in 1956 and 1957 and from references in the institutional
records analysed by the Commission. It includes the major maternity hospitals, local health authority and voluntary hospitals and private nursing homes.

**Carlow:** Sacred Heart Home, Carlow
   St Brigid’s Nursing Home, Carlow

**Cavan:** St Phelim’s Hospital, Cavan (County Hospital)
   St Joseph’s Nursing Home, Portlurgan, Virginia

**Clare:** St Gerard’s Circular Road, Kilkee
   County Home, Ennis
   County Hospital, Ennistymon
   District Hospital, Kilrush
   District Hospital, Raheen, Tuamgraney

**Cork:** District Hospital, Millstreet
   County Hospital, Fermoy
   District Hospital, Mallow
   District Hospital, Kanturk
   St Anne’s Nursing Home, Fermoy
   St Patrick’s Franciscan Hospital, Mallow
   St Finbarr’s Hospital
   Cottage Hospital, Bandon
   Cottage Hospital, Kinsale
   Cottage Hospital, Macroom
   District Home, Middleton
   Cottage Hospital, Youghal
   Sacred Heart Home and Hospital, Bessborough
   Bandon Nursing Home, Millbrook, Bandon
   St Mary’s Nursing Home, Avondale Home, Upper Strand, Youghal
   General Hospital, Cobh
   St Philomena’s Nursing Home, 36 South Main Street Bandon
   Cottage Hospital, Middleton
   St Anne’s Nursing Home, North Main Street, Youghal
   Cottage Hospital, Dunmanway
   Cottage Hospital, Clonakilty
   Cottage Hospital, Bantry
   District Hospital, Clonakilty
   County Hospital, Skibbereen
Cottage Hospital, Castletownbere
Cottage Hospital, Schull
Erinville Lying-in-Hospital, Western Road
1, Lincoln Place, Grattan Hill
Glenvera Hospital, 10 Sidney Place
Miss Goulding’s Home, 18 St Patrick’s Place
Marie Celine Home, 4/5 Summerhill Terrace
Dunscombe Private nursing home
St Kevin’s Nursing Home, 29/30 South Terrace
Victoria Hospital Inc., Infirmary Road.
Yorkville Nursing Home, York Hill
Bon Secour Home, Cobh
Braemar House, Old Blackrock Road, Cork
Glenvera Nursing Home, Wellington Road, Cork
Lincoln Nursing Home, Grattan Hill, Cork
Mrs Dorgan’s Nursing Home, Anglesea Terrace, Cork
Mrs Grant’s Nursing Home, 81 South Mall, Cork
St Philomena’s Nursing Home, North Main Street, Bandon
St Philomena’s Nursing Home, Alexandra Place, Cork
Stella Maris Nursing Home, Wellington Road, Cork

**Donegal:**
County Home
District Hospital, Ballyshannon
District Hospital, Donegal
District Hospital, Lifford
District Hospital, Letterkenny
District Hospital, Glenties
District Hospital, Carndonagh

**Dublin:**
St Patrick’s Home, 381 Navan Road, Cabra (Pelletstown)
Tivoli Nursing Home, 3 Tivoli Terrace. S. Dun Laoire
Fatima Nursing Home, Tudor House, The Hill, Monkstown
St Clare’s Nursing Home, 8 Marine Terrace, Dun Laoire
Mellifont Nursing Home, 9 Mellifont Avenue, Dun Laoire
93 Lower Baggot Street
7 Cabra Park
103 North Circular Road
81 North Circular Road
450 North Circular Road
101 Connaught Street  
78 Drumcondra Road  
17 Earlsfort Terrace  
63 Eccles Street  
7 Greenmount Road  
7 Herbert Place  
15 Hatch Street  
23 Upper Leeson Street  
119 Upper Leeson Street  
107 Marlborough Road  
17 Lower Mount Street  
22 Ormond Road, Drumcondra  
Orwell Road, Rathgar (Bethany Home)  
13 Pembroke Street  
26/27 Pembroke Street.  
39 Percy Place (Nurse Dalton)  
28 Rathfarnham Road  
68 Sandford Road  
28 Vernon Avenue  
St Kevin’s Hospital  
Rotunda Hospital  
National Maternity Hospital, Holles Street  
Coombe Hospital  
Portobello Nursing Home, Portobello Bridge  
Leinster Nursing Home  
78, St Laurence’s Park, Stillorgan (Miss Craven)  
Prague Nursing Home  
8 Lansdowne Terrace, Ballsbridge (St Martin’s)  
Stella Maris Nursing Home  
St Michael’s Nursing Home, Dun Laoghaire  
Miss Hennessy’s Home, 43 Leeson Street Upper, moved to 119 Leeson Street Upper in the late 1940s (This seems to have been known as St. Philomena’s at some stage).  
Mrs Hudson, 14 Holles Street  
12 Seville Place (Miss McAlpine)  
61 Lower Beechwood Avenue, Ranelagh (Nurse Cadden)  
St Maelruin’s, 183 Lower Rathmines Road (Nurse Cadden)
Galway: St Bride’s Nursing Home, Sea Road, Galway
Maternity Hospital, Galway
Maternity Ward, Children’s Home, Tuam
St Theresa’s Nursing Home, Upper Salthill, Galway
Portiuncula Hospital, Mount Pleasant Avenue, Ballinasloe
Bon Secour Nursing Home, The Grove, Tuam
Our Lady of Fatima Hospital, Clifden
Calvary Hospital, Renmore, Galway

Kerry: County Home, Killarney
County Hospital, Tralee
District Hospital, Listowel
District Hospital, Dingle
District Hospital, Kenmare
District Hospital, Caherciveen
St Gabriel’s Home, Church Street, Listowel
Mrs Kings Nursing Home, 21 Ashe Street, Tralee
St Don Bosco’s Home, William Street, Listowel
St Anne’s Home, Beaufort, Killarney
St Anne’s Nursing Home, Strand Street, Tralee
Greenlawn Nursing Home, Upper Church Street, Listowel
Our Lady’s Nursing Home, 72 New Street, Killarney
Miss Culley’s Nursing Home, 12 Tralee Road, Castleisland

Kildare: St Vincent’s Hospital, Athy
St Teresa’s Home, Rathangan
Leinster Street, Rathangan

Kilkenny: County Hospital, Freshford Road, Kilkenny
County Home, Thomastown
Abbey Nursing Home, 42 Parliament Street, Kilkenny
Mount Lacken Nursing Home, Dublin Road, Kilkenny

Laois: County Hospital, Portlaoise
District Hospital, Abbyleix
County Home, Mountmellick
District Mental Hospital, Portlaoise

Leitrim: Our Lady’s Hospital, Manorhamilton
District Hospital, Mohill

Limerick: St Nessan’s Hospital, Croom - Maternity Section
Bedford Row Hospital, Bedford Row

District Hospital, Athlone
Stella Maris Maternity Home, Baylough, Athlone

**Wexford:**
County Hospital, Wexford
St John’s Hospital, Enniscorthy
District Hospital, New Ross
District Hospital, Gorey
Dr S A Furlong’s Private Nursing Home, Hill Street, Wexford
Dr Cuddingan’s Private Nursing Home, Wafer Street, Enniscorthy
Industrial schools

2.13 Industrial schools were established in the 19th century to cater for neglected, orphaned and abandoned children. Most were run by religious orders. They were certified and financed by the Department of Education. They were regulated by the Department of Education under the Children Act 1908 (the relevant sections were amended in a minor way by the Children Act 1941 and the Children (Amendment) Act 1957). From 1970/71 (following the publication of the Kennedy Report, officially titled Reformatory and Industrial Schools Systems Report 1970) they were described as 'residential schools' but the legal term 'industrial school' remained in place until 2007 and the relevant sections of the Children Act 1908 remained in place until then. Around 1982/3, they started to be described as 'residential homes' but they were still legally industrial schools. The Department of Health took over responsibility for them on 1 January 1984.

2.14 The Kennedy Report stated that there were 61 such schools in 1898 (71 in total on the island of Ireland). The Statistical Report of the Department of Education stated that there were 52 industrial schools in the school year 1924/25 but it does not list them. Subsequent statistical reports show that there were 52 in 1940 and 50 in 1950. A reply to a parliamentary question listed 42 industrial schools which existed in 1966.6 The Kennedy Report listed 31 industrial schools and three reformatories as being in existence in 1969 but notes that the number had reduced to 29 by publication date. The number had reduced to 25 in 1977; 25 were still in operation in 1981. By 1988, there were 24 residential homes for children which were former industrial schools and there were 17 homes approved under the Health Act 1953. At that stage the residential homes were subject to certain limited controls under the Children Act 1908 and the 17 approved homes were not subject to specific statutory regulations.7

---

6 Dáil Questions Nos 75 and 76; 26 January 1966.
2.15 From the early 1980s, the industrial schools were gradually changed from large institutions into group home structures. In some cases, the names were changed. So, some industrial schools also appear on the list of children’s residential homes under their new names (see below). In 1992, there were 22 industrial schools listed in the Child Care Act 1991 (Children’s Residential Centres) (Children’s Residential Centres) (Superannuation) (No 2) Order 1992 (SI 125/1992). Some of these are what might be regarded as separate group homes.

Commission to Inquire into Child Abuse (CICA)

2.16 The Commission to Inquire into Child Abuse (CICA) was established by the Commission to Inquire into Child Abuse Act 2000. Its main functions were to report on the abuse of children in certain types of institutions and to give those who suffered this abuse an opportunity to describe what happened to them. The types of institution covered included ‘a school, an industrial school, a reformatory school, an orphanage, a hospital, a children’s home and any other place where children are cared for other than as members of their families’. CICA reported in 2009; its report is generally known as the Ryan Report.

2.17 The Ryan Report reported on 17 industrial schools, three schools for deaf children, an institution for intellectually disabled children and a remand centre. Many children, including some as young as two, were transferred to industrial schools from mother and baby homes. The industrial schools investigated by the Ryan Commission were mainly those about which serious abuse allegations had been made and the majority were the schools for older boys. Very young children from mother and baby homes tended to be sent to the industrial schools for girls and junior boys, sometimes called the ‘convent’ industrial schools. Little is known about the living conditions and treatment of children in these schools.

Reformatories

2.18 Reformatories were intended for young offenders and children were sent to them by the courts. Initially, there were ten reformatories but only three by 1944 (St Joseph’s Limerick for girls, Daingean for boys (which had replaced Glencree in 1940) and St Anne’s Kilmacud which was opened in 1944 for ‘girls with marked tendencies to sexual immorality’; it became an industrial school as well as a reformatory in 1949 so is sometimes double counted). Subsequently, Ferryhouse
Industrial School was designated a reformatory; St Laurence’s Industrial School, Finglas, Dublin 11 was established in 1972 and was also a reformatory - it subsequently was subsumed into the Finglas Child and Adolescent Centre and two new reformatories were established - Scoil Ard Mhuire, Lusk, Co. Dublin (which replaced Daingean in 1973 and itself closed in 1985) and Trinity House, Lusk, County Dublin (opened 1983). By the 1980s all of these were described as ‘special residential schools’.  

2.19 Children under the age of 12 could not be committed to reformatories and court proceedings were always necessary for such committals so children were not sent from mother and baby homes to reformatories. Young mothers could have been sent to them by the courts after they left mother and baby homes but the Commission has not seen any concrete evidence of this.

2.20 The Residential Institutions Redress Scheme (RIRS) applied to all the industrial schools and a number of children’s homes - there are 59 industrial schools (including the older reformatories) on the RIRS list.

List of industrial schools

2.21 The industrial schools and reformatories are listed alphabetically by location (alternative location names are also in bold where that arises; where they were changed to a group home structure and renamed, the new name is also given). At least up to the 1980s they were generally known by location rather than saint’s name. The vast majority were established before 1922; the establishment date is given where this occurred after 1922. The closing date or range of dates is given. If 1992 is stated, that means it was still in existence in 1992. The order which ran the school is mentioned where it is known (almost all cases). From the 1950s, industrial schools for girls almost all took small boys (‘boys of tender years’ was the expression used) as well - up to about age seven. From the 1960s some of them also took older boys.

**Athlone:** St Joseph’s Industrial School for Girls, **Summerhill,** Athlone, Co. Westmeath (Sisters of Mercy) closed in 1960s

**Artane** Industrial School for Senior Boys, Dublin 5 (Christian Brothers, closed 1969; Ryan Report Volume 1)

---

9 For example, in SI 182/1984.
**Ballaghadereen**: St Francis Xavier’s Industrial School for Girls and Junior Boys, Ballaghadereen, Co. Roscommon (closed 1966; Sisters of Charity)

**Ballinasloe**: St Joseph’s Industrial School for Girls and Junior Boys, Ballinasloe, Co. Galway (closed 1968; Sisters of Mercy)

**Baltimore**: Fishery School for Senior Boys, Baltimore, Co. Cork (closed in 1950; a number of witnesses to the Laffoy Commission (later the Ryan Commission) were transferred to here from children’s homes in Dublin where they were being maintained by the Dublin Union under the Public Assistance Acts; most were non-marital children; there was no religious order involved; the management board included the local bishop, priests and others). Laffoy Third Interim Report December 2003.\(^{10}\)

**Benada Abbey**: Industrial School for Girls, Ballymote, Co. Sligo (closed late 1980s; Sisters of Charity)

**Birr**: St John’s Industrial School for Girls, Birr, Co. Offaly (closed 1963; Sisters of Mercy)

**Boofterstown**: St Anne’s Industrial School for Girls, Booterstown, Co. Dublin (closed 1981/82)

**Bundoran**: St Martha’s Industrial School for Girls, Bundoran, Co. Donegal (Sisters of St Louis) (opened in 1958, closed 1965/6)

**Cappoquin**: St Michael’s Industrial School for Junior boys, Cappoquin, Co. Waterford (closed 1999, Sisters of Mercy, Ryan Report Volume 11)

**Cariglea**: Park Industrial School for Senior Boys, Dun Laoghaire, Co. Dublin (closed 1954, Christian Brothers; Ryan Report Volume 1)

**Cashel**: St Francis’ Industrial School for Girls, Cashel, Co. Tipperary (closed 1969; Presentation Sisters)

**Cavan**: St Joseph’s Industrial School for Girls, Cavan (closed 1967; Sisters of St Clare (the Poor Clares))

**Clifden**: St Joseph’s Industrial School for Girls and Junior Boys, Clifden, Co. Galway (Sisters of Mercy; closed 1983; Ryan Report Volume 11)

**Clonakilty**: St Aloysius’ Industrial School for Girls, Clonakilty, Co. Cork (closed 1967; Sisters of Mercy)

**Dainegean**: St Conleth’s Reformatory School for Boys, Daingean, Co. Offaly (Oblates, closed 1973; Ryan Report Volume 1)

\(^{10}\) [http://www.childabusecommission.ie/publications/documents/abuse.htm#LinkTarget_53218](http://www.childabusecommission.ie/publications/documents/abuse.htm#LinkTarget_53218)
**Drogheda**: St Vincent’s (House of Charity) Industrial School for Junior Boys, Drogheda, Co. Louth (Sisters of Charity of St Vincent de Paul, now generally known as the Daughters of Charity; they ran Pelletstown; 1992)

**Dundalk**: St Joseph’s Industrial School for Girls, Dundalk, Co. Louth (Sisters of Mercy; closed 1983; Ryan Report Volume 11)

**Dundrum**: St Bernard’s Industrial School for Girls, Fethard, Dundrum, Co. Tipperary (1992; Presentation Sisters)

**Ennis** Industrial School: Our Lady’s Industrial School for Girls, Ennis, Co. Clare (closed 1964; Sisters of Mercy)

**Ferryhouse**: St Joseph’s Industrial School for Senior Boys, Ferryhouse, Clonmel, Co. Tipperary (Order of Charity (Rosminians), Ryan Report Volume 11)

**Finglas**: St Laurence’s Industrial School, Finglas, Dublin 11 (opened in 1972 and was also a reformatory; was later subsumed into Finglas Child and Adolescent centre)

**Glencree**: St Kevin’s Reformatory, Glencree, Co. Wicklow (closed 1940; transferred to Daingean, Oblates)

**Glin**: St Joseph’s Industrial School for Senior Boys, Glin, Co. Limerick (closed 1966; Christian Brothers; Ryan Report Volume 1)

**Goldenbridge**: St Vincent’s Industrial School, Goldenbridge, Inchicore, Dublin 8 (closed 1983, Sisters of Mercy, Ryan Report Volume 11)

**Greenmount**: St Joseph’s Industrial School for Senior Boys, Greenmount, Cork (closed 1959, Presentation Brothers; Ryan Report Volume 11)

**Kilkenny**: St Joseph’s Industrial School for Girls, Kilkenny (closed 1999, Sisters of Charity, Ryan Report Volume 11)

**Kilkenny**: St Patrick’s Industrial School for Junior Boys, Kilkenny (closed 1966; Sisters of Charity, Ryan Report Volume 11)

**Killarney**: St. Joseph’s Industrial School for Girls and Junior Boys, Liosomoine, Killarney, Co. Kerry (Sisters of Mercy; 1991; later called Liosomoine Group Home)

**Killybegs**: St Columba's Industrial School, Killybegs, Co. Donegal (closed 1950; Order of Charity)
Kilmacud: St Anne’s Reformatory School for Girls, Kilmacud, Co. Dublin (opened 1944; also an industrial school from 1949; 1991 (ceased to be a reformatory 1984), Sisters of Our Lady of Charity of Refuge)

Kinsale Industrial School: Our Lady of Mercy Industrial School for Girls, Kinsale, Co. Cork (Sisters of Mercy; closed between 1960 and 1965)

Lakelands: St Mary’s Industrial School, Lakelands, Sandymount, Dublin 4 (Sisters of Charity; 1991; later called St Mary’s Residential Homes, 26 and 28 Park Ave., Sandymount)

Lenaboy: St Ann’s Industrial School for Girls and Junior Boys, Renmore, Lenaboy, Co. Galway (Sisters of Mercy; 1991, later called Aisling and Loyola, Renmore)

Letterfrack: St Joseph’s Industrial School for Senior Boys, Letterfrack, Co. Galway (closed 1974; Christian Brothers; Ryan Report Volume 1)

Limerick: St George’s Industrial School for Girls, Limerick and St Joseph’s Reformatory School for Girls, Limerick were on the same site (Good Shepherds; they also had a Magdalene laundry on the same site called St Mary’s; 1992; later called Shalom)

Limerick: St Joseph’s Reformatory School for Girls, Limerick (see note re St George’s above; closed 1976)

Limerick: St Vincent’s Industrial School for Girls, Limerick (Sisters of Mercy; 1992; later called Mount St Vincent)

Loughrea: St Bridgid’s Industrial School for Girls, Loughrea, Co. Galway (closed 1967; Sisters of Mercy)

Mallow: St Joseph’s Industrial School for Girls, Mallow, Co. Cork (Sisters of Mercy; 1992)

Merrion: St Martha’s Industrial School, Merrion, Dublin 4 (closed before 1940)

Moate Industrial School: Mount Carmel Industrial School for Girls, Moate, Co. Westmeath (Sisters of Mercy; 1992; later called Mount Carmel Residential Home)

Monaghan: St Martha’s Industrial School, Monaghan (Sisters of St Louis; moved to Bundoran in 1958)

New Ross: St Aidan’s Industrial School for Girls, Newross, Co. Wexford (1966, closed 1968; Good Shepherd Sisters; they also had a Magdalen laundry on the same site, called St Mary’s)
Newtownforbes: Industrial School: Our Lady of Succour Industrial School, Newtownforbes, Co. Longford (closed 1970; Sisters of Mercy; Ryan Report Volume 11)

Passage West: St Joseph’s Industrial School for Boys, Passage West, Co. Cork (Sisters of Mercy; 1992)

Rathdrum: St Kyran’s Industrial School for Junior Boys, Rathdrum, Co. Wicklow (Sisters of Mercy; 1992)

Roscommon: St Monica’s (closed 1929; this is not on the redress list)

Rushbrook: St Colman’s Industrial School for Girls, Cobh/Rushbrook, Co. Cork (Sisters of Mercy; 1992)

Salthill: St Joseph’s Industrial School for Senior Boys, Salthill, Co. Galway (Christian Brothers, closed 1995; Ryan Report Volume 1)

Sligo: St Laurence’s Industrial School for Girls, Sligo (closed 1958; Sisters of Mercy)

Sunday’s Well: St Finbarr’s Industrial School for Girls, Sunday’s Well, Marymount, Cork (Good Shepherd Sisters; they had a Magdalen laundry on the same site called St Mary’s; 1992)

Templemore: St Augustine’s Industrial School for Girls, Templemore, Co. Tipperary (Sisters of Mercy; closed between 1960 and 1965)

Tralee Industrial School: Pembroke Alms Industrial School for Girls, Tralee, Co. Kerry (Sisters of Mercy, 1992; later Nazareth House)

Tralee: St Joseph’s Industrial School for Boys, Tralee, Co. Kerry (closed 1970; Christian Brothers; Ryan Report Volume 1)

Upton: St Patrick’s Industrial School for Boys, Upton, Cork (closed 1966; Rosminians; Ryan Report Volume 11)

Waterford: St Dominick’s Industrial School for Girls, Waterford (Good Shepherd Sisters; the Good Shepherds also had a Magdalen laundry on the same site called St Mary’s; 1992; later called Prospect House and Gracepark Training Centre)

Westport: St Columba’s Industrial School for Girls, Westport, Co. Mayo (Sisters of Mercy; closed 1973/4)
**Wexford:** St Michael's Industrial School for Girls, Wexford (Sisters of Mercy; closed 1982/3)

**Whitehall/Drumcondra:** St Joseph's Industrial School for Girls, Whitehall, Drumcondra, Dublin 9 (Sisters of Our Lady of Charity of Refuge; sometimes called High Park as it was on the same site as the High Park Magdalen laundry; 1992; in 1978, developed into two group homes Blaithin and Cuan Mhuire); An Grianán was also established on this site in 1971; Martanna House was a hostel for teenage girls on the same site - opened 1966.

### Residential Children’s Homes

2.22 The exact status of some of the residential children’s homes is difficult to establish. Most (possibly all at some stage) received some form of state funding. This sometimes came directly from the Department of Local Government and Public Health/Department of Health and sometimes from the local health authorities. Some homes were certified under the *Pauper Children (Ireland) Act 1898* or the *Public Assistance Act 1939* for the reception of poor children (see Chapter 1). Some were approved under Section 55 of the *Health Act 1953* for the boarding out of children. When an institution was certified or approved, it was usual to specify the total number of children who could be maintained there. There were no regulations about the ratio of staff to children.

2.23 Some homes were included in the RIRS scheme even though it is not clear that they were approved under the relevant legislation. In general, those in the RIRS scheme are likely to have received some form of state funding for at least part of their existence but it is not clear if this was accompanied by any inspection or regulation.

2.24 The Commission has not seen full lists of approvals under the relevant legislation. The only official lists seen by the Commission are a list compiled in 1982 for the Inter-Departmental Committee on the operation and financing of children’s residential homes and a list from 1992. The 1982 list shows a capacity of 376 in the approved homes. (The 23 certified industrial schools on the list had a capacity of about 800 at that time). The 1992 list has 21 homes which are described as ‘approved (or deemed to be approved)’ for the purposes of Section 55 of the *Health Act 1953* and 22 industrial schools. It is contained in SI 125/1992: *Child
Care Act 1991 (Children's Residential Centres) (Superannuation) (No 2) Order 1992. The following appear on one or both lists:

Ballymun Residential Project, 163/164 Balcurris Road, Ballymun, Dublin 11
Bartres, 1 Pottery Road, Kill-O-The Grange, Dún Laoghaire, Co. Dublin (the Grange)
Catholic Social Service Conference Hostel, 64 Eccles Street, Dublin 7
Corunum, Drumcondra
Derralossary House, Roundwood, County Wicklow
Don Bosco Houses, 57 Lower Drumcondra Road, Dublin 9 and 12 Clontarf Road, Dublin 3
Family Group Home, Letterkenny
Family Group Home, Geevagh, Sligo
Family Group Home, Wexford
Grianan Training Centre, 369 Collins Avenue, Dublin 9.
Homeless Girls Society Ltd., Sherrard House, 19 Upper Sherrard Street, Dublin 1
Kirwan House, Ranelagh
La Verna, Kenilworth Road, Dublin 6
Los Angeles Society Homes for Homeless Boys, 4 Conyngham Road, Dublin 8 and 22 Newtown Avenue, Blackrock, County Dublin.
Madonna House, Grove Avenue, Blackrock, County Dublin.
Miss Carr's Home, 5 Northbrook Road, Ranelagh, Dublin 6
Nazareth House, Church Hill, Sligo
Sacred Heart Home, 5 The Avenue, Royal Oak, Santry, Dublin 9 (formerly Drumcondra)
Smyly's Homes, Glensilva, 95 Monkstown Road, Blackrock, Co. Dublin, and Racefield House, 3 Lower Mounttown Road, Dún Laoghaire, Co. Dublin.
Society of St Vincent de Paul, Child Care Centre, 69 Amiens Street, Dublin 1
St Anne's Hostel, 72 Lower Seán McDermott Street, Dublin 1
St Helena’s, Finglas
St Mura’s Nursery, Fahan, Lifford, Co. Donegal
St Vincent's, North William Street, Dublin 1
Tabor House, Seville Place, Dublin 1
The Cottage Home, Tivoli Road, Dún Laoghaire, Co. Dublin

Trudder House, Newtownmountkennedy, Co. Wicklow.

2.25 The following is a list of the children’s residential homes that the Commission has discovered from its various sources. It does not include any institutions which the Commission knows ceased to exist before 1922. There may be some duplication because some were known by location and also by a religious name and some changed their names over time. It is quite likely that there were other such institutions.

**Cork**

Holy Family School for Moderate Learning Disability, Charleville, Co. Cork
Lota: Our Lady of Good Counsel, Lota, Glanmire, Co. Cork (For children with intellectual disabilities; Brothers of Charity; 1939-99; Ryan Report Volume 11)
School of the Divine Child, Lavanagh, Ballintemple, Cork
Scoil Eanna, School of the Angels, Montenotte, Cork
Scoil Triest, Lota, Glanmire, Co. Cork
St Bernadette’s, Bonnington, Montenotte, Cork
St David’s, Lota, Glanmire, Co. Cork
St Gabriel’s School, Curraheen Road, Cork
St Marie of the Isle, Sharman Crawford Street, Cork
St Mary’s, Rochestown, Cork
St Paul’s, Montenotte, Cork

**Donegal**

Family Group Home, Letterkenny, Co. Donegal
St Joseph’s Orphanage, Bundoran, Co. Donegal
St Mura’s Orphanage, Fahan, Co. Donegal

**Dublin**

An Grianán Training Centre, Grace Park Road, Dublin 9 (this is on the same grounds as the Whitehall/High Park Industrial School)
Ballymun Residential Project, 163/164 Balcurris Road, Dublin 11
Bartres Children Home, Kill O’ the Grange, Dun Laoghaire, Co. Dublin (originally known as The Grange)
Blaithin and Cuan Mhuire, Drumcondra: these were the group homes which were established in place of Whitehall/St Joseph’s/High Park Industrial School Cheeverstown House, Templeogue, Dublin 6
Coombe Ragged Schools and Boys Home (a Smyly home)
Cottage Home, Tivoli Road, Dun Laoghaire, Co. Dublin
Catholic Social Service Conference Hostel, 64 Eccles Street, Dublin 7
Chester Lodge, Moate, Co. Westmeath (Mount Carmel - this is probably the former industrial school)
Cloonamahon, Collooney, Co. Sligo
Cor Unum, Drumcondra, Dublin 9
CPI Marino Special School, Bray, Co. Wicklow
Cregg House: St Cecilia’s, Cregg House, Sligo
Don Bosco Houses, Gardiner Street, Dublin 1
Elliot Home (for Waifs and Strays/for Little Children), 7/8 Charlemont Street, also in Townsend Street and Bray
Emmanuel Home - opened adjacent to Bethany in the 1930s, later transferred to Tipperary but house was burnt down - arson - not clear whether children had yet moved there; relocated to Avoca in Wicklow
Finglas Child and Adolescent Centre, Dublin 11
Glensilva, 95 Monkstown Road, Dun Laoghaire, Co. Dublin (This has also been described as Our Boy’s Home; a Smyly home)
Homeless Girls Society, Sherrard House, 19 Upper Sherrard Street, Dublin 1
Kirwan House, Ranelagh, Dublin 6; also North Circular Road, Dublin 7
La Verna, Kenilworth Road, Dublin 6
Linden Convalescent Home, Blackrock, Co. Dublin (This, in spite of its name, is listed as a school for physically handicapped children in Department of Education Statistical Tables 1966/67)
Los Angelos Society Home for Homeless Boys, 4 Conyngham Road, Dublin 8 and 22 Newtown Avenue, Blackrock, Co. Dublin
Madonna House, Blackrock, Co. Dublin (This was initially on Merrion Road and then moved to Blackrock)
Martanna House Hostel, Grace Park Road, Dublin 9
Mary Immaculate School for the Deaf, Beechpark, Co. Dublin (Ryan Report Volume 11)
Miss Carr’s Children’s Home, 5 Northbrook Road, Dublin 6 (this is separate from the Miss Carr’s Mother and Baby Home - see Chapter 25).
Northcote Home, Dun Laoghaire
Philomena House, Dundrum (this is an exit pathway for many children from the Dublin Union in the 1920s; the Commission has not been able to find any reference to it in any other official document.

The Protestant Home for Orphan and Destitute Girls/Harold’s Cross Orphanage, transferred to Mayil Children’s Home Bray in the late 1940s and then moved to Westbank - Greystones (Miss Mather’s)
Racefield, Upper Mounttown Road, Dún Laoghaire (a Smyly home)
Sacred Heart Home, Drumcondra, Dublin 9: later in Santry
Scoil Ard Mhuire, Lusk, Co. Dublin (reformatory)
Society of St Vincent de Paul, Child Care Centre, 69 Amiens Street, Dublin 1
Smyly Homes: Mrs Smyly’s Homes for Necessitous Children (and Ragged Schools) - there seem to have been a total of 13 Smyly Homes at some stage; some specific ones are mentioned on this list; one was called the “Home for Big Lads” - it is unlikely anyone was sent from a mother and baby home to it
St Anne’s Hostel, 72 Lower Sean McDermott St, Dublin 1
St Augustine’s, Obelisk Park, Carysfort Avenue, Blackrock, Co. Dublin
St Clare’s Orphanage, Harold’s Cross, Dublin 6
St Joseph’s School for Hearing Impaired Boys, Cabra, Dublin 7 (Ryan Report Volume 1)
St Joseph’s School for the Visually Handicapped, Drumcondra, Dublin 9
St Joseph’s Orphanage, Tivoli Road, Dun Laoghaire, Co. Dublin
St Mary’s School for Visually Impaired Girls, Merrion, Dublin
St Vincent’s Orphanage, North William St, Dublin 9
St Mary’s School for Hearing Impaired Girls, Cabra, Dublin 7 (Dominican Sisters; Ryan Report, Volume 11)
St Michael’s, Glenmaroon, Chapelizod, Dublin 20
St Paul’s Hospital, Beaumont, Dublin 9
St Philomena’s, Stillorgan, Co. Dublin (this was established in 1932 specifically to cater for children who were in Pelletstown and could not be adopted or fostered)
St Saviour’s Orphanage, Lower Dominick Street, Dublin 1 (also known as Dominican Boys’ Home)
St Teresa’s, Blackrock, Co. Dublin
St Vincent’s Orphanage, Glasnevin, Dublin 9
St Vincent’s, Navan Road, Dublin 7
Stewart’s Hospital, Palmerstown, Dublin 20
Sunshine Home (Children’s Sunshine Home), Stillorgan/Leopardstown, Co. Dublin (this was a residential children’s home with no religious involvement; the St Vincent de Paul also had Sunshine Homes which were places where they brought poor children on holidays - they are not residential children’s homes in the sense being used here)

Tabor House, Dublin

The Bird’s Nest Home, 19 York Road, Dun Laoghaire, Co. Dublin (a Smyly home)

The Boley, Monkstown

The Boys Home, Grand Canal Street, Dublin 2

The Children’s Fold. The Coombe

The Los Angeles Homes, Dublin

The O’Brien Institute, Malahide Road, Dublin

Warrenstown House, Corduff Road, Blanchardstown, Dublin 15

Galway

Aasleagh, Leenane (Irish Church Missions); later Lurgan Street Dublin

Holy Family School, Renmore, Co. Galway

Kilcornan Centre, Clarinbridge, Co. Galway

Kerry

St Francis’ & St Mary of the Angels, Beaufort, Killarney, Co. Kerry

Kilkenny

School of the Holy Spirit, Seville Lodge, Kilkenny, Co. Kilkenny

Limerick

St Vincent’s Centre for Persons with Intellectual Disability, Lisnagry, Limerick

Louth

St Mary’s, Drumcar, Dunleer, Co. Louth

Meath

Orphanage Schools, Convent of Mercy, Kells, Co. Meath (also known as Sacred Heart Orphanage)

St Joseph’s Babies Home, Stamullen (associated with St Clare’s Adoption Society)
Sligo
Family Group Home, Geevagh, Co. Sligo
Nazareth House, Sligo

Tipperary
St Anne's, Sean Ross Abbey, Roscrea, Co. Tipperary (this is not the Sean Ross mother and baby home; it is a home for children with intellectual disabilities on the same grounds as the former mother and baby home)

Waterford
St Martin’s Orphanage, Waterford

Westmeath
St Mary’s, Delvin, Co. Westmeath

Wexford
Family Group Home, Wexford
Marlfield House Gorey (The Children’s Fold)

Wicklow
Deralossery House, Roundwood, Co. Wicklow (mainly for Traveller children)
Elliot Home, Bray
Sheeana, Wicklow (Irish Church Missions)
Sunbeam House, Bray
Trudder House, Newtownmountkennedy, Co. Wicklow (Traveller children)

Specific institutions

2.26 As already stated, the Commission has not investigated any of the institutions mentioned in this chapter. It has received information about some of them. In particular, the Daughters of Charity (see Chapter 13) provided information about a number of its institutions and the interaction between them.

Daughters of Charity institutions

2.27 The Daughters of Charity ran Pelletstown and they also had a significant involvement in children’s homes including homes for children with disabilities. The
interaction between Pelletstown and St Vincent's Cabra is described in Chapter 13. Both were originally part of the Dublin Union but Cabra was designated as a home for children with disabilities in the mid-1920s, ceased to be an integral part of the Dublin Union and was financed on a capitation basis from then on.

2.28 St Philomena’s, Stillorgan was established by the Daughters of Charity in 1932 to take some of the older children from Pelletstown who were not being boarded out. Many of the children were ‘mentally defective’ but others were there because their mothers would not agree to have then boarded out. In some of these cases, the mothers visited the children.

2.29 St Philomena’s was certified by the Minister for Local Government and Public Health for the reception of 208 children under Section 3 of the Pauper Children (Ireland) Act 1898. Problems arose when it sought certification under Section 47 of the Public Assistance Act 1939 because it had become a recognised national school and, as such, could not be a ‘certified’ school (see Chapter 1).

2.30 While St Philomena’s was not an integral part of the Dublin Union, it was almost treated as such by the Dublin board of assistance and its successors. It was inspected by the board and arrangements were made to have children resident there boarded out. The children were all the responsibility of the board.

2.31 It was financed by capitation rates and was also inspected by departmental officials (such inspections seem to have stopped in 1957 - see Chapter 1). A 1943 inspection by Miss Litster found the physical conditions to be good and the children were ‘excellently provided with clothing and boots’. There were good bathroom and lavatory provisions. The food was plain but adequate. The milk was supplied from their own herd of 14 cows which were tuberculin tested. (A further report of an inspection by Miss Litster in 1949 was similarly positive). The facilities had recently been enlarged and were generally bright and airy.

2.32 The children were almost all sent by Pelletstown; they were a charge on the Dublin Union and the capitation rate was 12s 6d a week. Miss Litster noted that there seemed to be no rules about moving children from one institution to another. She had been informed by the superior in Pelletstown that the former Dublin board of assistance had a rule that children who had reached the age of three and whose mothers were either visiting them or making contributions to their maintenance
should be transferred to St Philomena’s. In practice, only a small number of visits were paid by mothers and these visits were possible only for mothers who had got employment around Dublin. Contributions by mothers were irregular and seldom amounted to more than a couple of pounds a year. The current board of assistance was now ignoring this rule and trying to board out as many children as possible.

2.33 In February 1947, the minister consented provisionally to the reception of public assistance children from Balrothery and Rathdown boards of assistance under Section 35 of the *Public Assistance Act 1939* (see Chapter 1). This consent was subject to the condition that the provisions of the *Public Assistance Act* and associated regulations would apply as if it were approved under Section 47. This arrangement was legally dubious but it seems to have been applied to other schools as well.

2.34 Rathdown asked for approval for an increase in maintenance to 15s a week. This was approved. Other boards of assistance had to apply for specific approval if they wanted to send children to St Philomena’s. The capitation rate was increased to 17s 6d from 1 January 1948 and to 19s from 1 April 1948.

2.35 A medical inspector visited in 1949 and recommended that approval be for a maximum of 190 children. The Daughters of Charity had asked for an increase in the approval number to 220. The figure of 208 was retained as the officials were concerned that there were no other places for the children concerned even though they were aware that they were going against medical opinion. The children were all sent by the three Dublin boards of assistance other than one child from Laois.

2.36 In 1958, the Daughters of Charity asked to have some of the children who were applying for entry to an overcrowded Cabra (the residential school for ‘mentally deficient’ children - see above) sent to St Philomena’s. The Inspector of Mental Hospitals was asked for his views. It was approved for the admission of 38 such children.

2.37 There were discussions about not sending any Dublin board of assistance children to St Philomena’s (the number going there was declining because of greater use of boarding out) and using St Philomena’s as a home for ‘mentally defective’ children only. This was proposed in April 1959 by the Dublin assistant city manager. The
Department of Health official who discussed this with him suggested that ‘the problem of the unmarried mother and her child was decreasing steadily in size’ and it looked like a smaller institution than Pelletstown would be adequate. The question of exchanging St Philomena’s for Pelletstown was mentioned. In June 1959, the director of the Daughters of Charity, Fr Sheehy, told the department that Archbishop McQuaid had asked that the Daughters of Charity establish a home for ‘mentally deficient’ girls on the south side of the city. The proposal was that the children in St Teresa’s Home, Blackrock would move to St Philomena’s and a new home for girls would be established in St Teresa’s. Fr Sheehy was not in favour of the Pelletstown/St Philomena’s swap for a number of reasons including that the postulatum was in St Philomena’s and it would be undesirable to move the Pelletstown residents there. There were further discussions about the various proposals including consideration of sending some ‘mentally deficient’ children to Pelletstown. After discussions between all the relevant parties - the Daughters of Charity, the Department of Health and the Dublin board of assistance, it was decided to use St Teresa’s exclusively for children with intellectual disabilities and move existing residents to St Philomena’s with no change at Pelletstown.

St Mura’s, Fahan

2.38 St Mura’s Orphanage, Fahan, Co. Donegal was approved for the boarding out of children. In 1986, when the Department of Health was trying to rationalise the mother and baby homes and infant nursing homes, it was suggested that St Mura’s would be phased out. In the Department of Health memorandum on the subject, St Mura’s was described as catering mainly for pre-adoption placements arranged by St Mura’s Adoption Society and by CURA (see Chapter 26 for its role in relation to the Castle). The memorandum said that it had a capacity for 20 and that the babies came from various parts of Ireland. However, the suggestion that it be phased out was rejected by the Secretary of the Department of Health who pointed out that:

I do not think that we should at this time take any action in the case of the infant nursing home facility at Fahan, Co Donegal. It provides a facility which spares out national blushes in the area of adoption of ‘legitimate but unwanted children’. The resource involved at £13,600 is trivial. I will elaborate when you have had an opportunity to read the submissions.

12 This decision seems to have been largely driven by Archbishop McQuaid.
13 Department of Health, RM/INA/0/505362.
2.39 It would appear that this is a reference to the placement for adoption in Northern Ireland of extra-marital children who were not eligible for adoption in Ireland because they were regarded as ‘legitimate’.

St Clare’s Hospital

2.40 In 1943, the DLGPH decided to open a hospital to deal with gastro-enteritis after one of the worst epidemics that had struck the city for years. Bacteriological and clinical investigators found that the disease affected children independently of the economic circumstances of their families and of the type of milk supplied to them, whether highest grade, pasteurised or ordinary milk. This epidemic had been responsible for a significant rise in the infant mortality rate in the years 1942-44. The number of diarrhoea and enteritis cases reported in Dublin during 1943 was 2,013. The Medical Officer for the City of Dublin reported that 609 deaths due to diarrhoea and enteritis were notified in the city during 1943. All such deaths occurred in infants and children under two years old.

2.41 The Claremont Institution for Protestant Orphans at Glasnevin and its 28 acres were taken over by the Dublin board of assistance. It cost £3,700 and, after renovation costing £70,000, was officially opened in October 1944. It had accommodation for 106 cots. There were 50 medical staff. The Parliamentary Secretary to the Minister for Local Government and Public Health was quoted as saying that he thought he would be correct in saying that, notwithstanding the prevalence of a deadly form of this disease throughout Europe, Ireland was the only country that had provided a specially designed, specially equipped and specially staffed hospital for its treatment.

2.42 The Parliamentary Secretary also said the most serious public health problem in the country was infant mortality, particularly in Dublin. He said that the evidence pointed to unhygienic handling of milk and of feeding utensils as a causative factor.

Temple Hill

2.43 St Patrick’s Infant Hospital, Temple Hill (sometimes called Temple Hill Dietetic Hospital), Blackrock, is frequently wrongly described as a mother and baby home.

14 Irish Press, 22 August 1944.
16 It was also known as the Claremount Institution for the Deaf and Dumb.
17 Evening Herald, 19 October 1944.
18 Irish Press, 20 October 1944.
It was an infants’ nursery and mothers were not resident there. As a hospital, it received funding from the Hospitals Commission (see Chapter 27).

**Hospitals**

2.44 Children sometimes spent significant periods of time in hospitals, particularly children who had physical disabilities. Children’s hospitals had national schools within them. The following hospitals were included in the RIRS:

- Cork University Hospital School
- Harcourt Street Hospital, Dublin 2
- St Joseph’s Orthopaedic Hospital for Children, Coole, Co. Westmeath
- Our Lady’s Hospital for Sick Children, Crumlin, Dublin 12
- St Mary’s Orthopaedic Hospital, Cappagh, Dublin 11
- St Mary’s Orthopaedic Hospital, Baldoyle, Dublin 13
- St Paul's Hospital, Beaumont, Dublin 9
- Temple Street Hospital, Dublin 1

**Institutions for people with disabilities**

2.45 For much of the period covered by the Commission there was a severe shortage of residential services for adults and children with disabilities. Initially they were mainly housed in workhouses which were renamed county homes after 1922. Adults with disabilities who were unable to work were not eligible for specific income supports until the Disabled Person’s Maintenance Allowance was introduced in 1954.\(^{19}\) This was not payable to people living in residential institutions until 1996 when it was renamed Disability Allowance.

2.46 In the workhouse/county home system, people with disabilities were classified as ‘lunatics’ but this seems to have covered people with mental illness and people with intellectual and possibly even physical disabilities. One of the reasons why children remained in Pelletstown for lengthy periods was because they had disabilities and there were not enough suitable places for them to go. Children remained in county homes for similar reasons.

\(^{19}\) SI 207/1954 - Disabled Persons (Maintenance Allowances) Regulations 1954.
Physical disability

2.47 There were a number of residential schools for children with physical disabilities. The following were included in the RIRS:

- CPI Marino Special School, Bray, Co. Wicklow
- Mary Immaculate School for the Deaf, Beechpark, Co. Dublin.
- St Joseph’s School for Hearing Impaired Boys, Cabra, Dublin 7
- St Joseph’s School for the Visually Handicapped, Drumcondra, Dublin 9
- St Mary’s School for Visually Impaired Girls, Merrion, Dublin
- St Mary’s School for Hearing Impaired Girls, Cabra, Dublin 7

The three schools for deaf children were investigated by the Ryan Commission.

Intellectual disability

2.48 The Stewart Institution for Imbeciles\(^{20}\) which opened in 1869 and was initially supported entirely by charitable donations was the only residential institution for the mentally handicapped in Ireland in 1922. There were 125 places available. In 1926, St Vincent’s, Cabra became a home for mentally handicapped children (see Chapter 13). Subsequently a number of other institutions were established. They were all voluntary institutions; there were no State residential facilities for children with disabilities. They were mainly run by religious orders but, in the 1950s, associations of ‘parents and friends of the mentally handicapped’ began to get involved. The Hospitals Trust Fund did provide capital funding for some of the new institutions. There was very little regulation; in fact regulation did not become the norm until the 2000s. The State and the local health authorities paid a capitation rate for residents in broadly the same way as was done in mother and baby homes.

2.49 A White Paper on *The Problem of the Mentally Handicapped* was published by the Department of Health in 1960.\(^{21}\) It stated that the number of residential places for people with intellectual disabilities needed to be doubled from the 3,200 then available to about 7,000. The report of the Commission of Inquiry into Mental Handicap was published in 1965. It also recognised the need for more residential places for ‘mentally handicapped’ children. It is clear from this report that district mental hospitals and county homes were still being used to house children with intellectual disabilities. The White Paper recorded that there were 2,000 people in mental hospitals and 450 people in county homes who were described as mentally

\(^{20}\) Now known as Stewart’s Care: [https://www.stewartscare.ie/about/history/](https://www.stewartscare.ie/about/history/)

\(^{21}\) [https://www.lenus.ie/handle/10147/593379](https://www.lenus.ie/handle/10147/593379)
handicapped. The White Paper and the report outlined the development of services for children with intellectual disabilities including residential services.

They show that, in 1932, there were three special institutions with a total of 500 places; by 1939, there were 800 places and 1,030 by 1947 in six institutions; five additional institutions were established by 1953; this amounted to a total of 1,460 places. By 1960 there were 14 institutions with 2,620 places. At the time, there were plans for 600 new beds. The institutions had received £1.6 million in capital funding from the Hospitals Trust Fund. By December 1964, there were 3,130 places available. As well as the inadequacy of existing places, the White Paper recognised that there were other problems including finding suitable staff; the religious orders were having difficulties in this area. The existing institutions (except one) were designed mainly for children but nearly half of the residents were over the school leaving age (14 at the time) - clearly because there was nowhere for the residents to go.

**Institutions listed in White Paper (1960)**

- St Augustine's (Colony for Mental Defectives), Blackrock had 30 places in 1932 and 220 by 1960; all male
- St Raphael’s, Celbridge had 32 places in 1953 and 200 in 1960; all male
- St Mary’s, Drumcar had 115 places in 1953 and 340 in 1960; all male
- St Teresa’s, Stamullen had 60 places in 1947; ceased to exist in 1955; all male
- House of Our Lady of Good Counsel, Lota, Glanmire, Cork had 90 places in 1947 and 260 in 1960; all male
- St Joseph’s, Kilcornan House, Clarenbridge had 27 places in 1953 and 100 in 1960; all male
- St Vincent’s, Cabra had 360 places in 1932 and 480 in 1960; males aged 3-9 and females
- House of the Holy Angels, Glenmaroon, had 110 in 1953 and 235 in 1960; all female
- St Joseph’s, Clonsilla, had 42 places in 1947 and 270 in 1960; all female
- St Vincent’s Lisnagry had 35 places in 1960; all female
- St Philomena’s, Stillorgan had 100 places in 1960; all male
- St Teresa’s, Blackrock had 100 places in 1960; all female
- St Mary’s Delvin had 40 places in 1960; all female
- Cregg House, Sligo had 25 places in 1960; all female
Stewart’s Hospital had 120 places in 1932 and 280 in 1960; male and female.

**Inspection and conditions**

2.51 The Commission has not seen evidence that the institutions for children with intellectual disabilities were inspected. Little is known about the conditions within them.

**Transfers from Pelletstown**

2.52 The main institutions to which children with a disability were transferred from Pelletstown were:

- The Stewart Institution
- St Vincent’s, Navan Road, Cabra
- St Augustine’s Colony for Mental Defectives, Carysfort Avenue, Blackrock, Co. Dublin
- Our Lady of Good Counsel Residential Special School and Training Centre, Lota, Glanmire, Co. Cork
- St Raphael’s Residential Special School, Celbridge, Co. Kildare
- St Mary’s Convent, South Hill, Delvin, Co. Westmeath
- St Michael’s Mentally Deficient Home and School, Holy Angels, Glenmaroon, Chapelizod
- St Mary’s of the Angels, Whitefield, Beaufort, Co. Kerry, founded in 1968
- St Mary’s School for Hearing Impaired Children, Dominican Convent, Cabra
- St Mary’s Auxiliary Hospital, Baldoyle (orthopaedic hospital).

**People with mental illness**

2.53 People suffering from mental illness were also housed in workhouses/county homes as well as in mental hospitals (which, in the case of some district mental hospitals, were former workhouses). As already stated, children with intellectual disabilities were often housed in mental hospitals. The Commission of Inquiry on Mental Illness was established 1961 and it reported in 1966. This reported that there were approximately 1,000 beds in 13 private hospitals and about 18,000 beds in district mental hospitals:

One of the first tasks to which the Commission addressed itself was to consider the exceptional rates of residence in the psychiatric hospitals in Ireland. No clear explanation has emerged. There are indications that mental

---

22 [https://www.lenus.ie/bitstream/handle/10147/45690/8634.pdf?sequence=1&isAllowed=y](https://www.lenus.ie/bitstream/handle/10147/45690/8634.pdf?sequence=1&isAllowed=y)
illness may be more prevalent in Ireland than any other countries; however, there are many factors involved, and in the absence of more detailed research, the evidence to this effect cannot be said to be conclusive. Special demographic features, such as the high emigration rate, the low marriage rate and problems of employment, may be relevant to the unusually high rate of hospitalisation. In a largely rural country with few large centres of population, social and geographic isolations may affect both the mental health of individuals and the effectiveness of the mental health services. The public attitude towards mental illness may not be helpful to the discharge of patients and their reintegration in the community. On all these points, the Commission could do little more than ask questions.

2.54 The commission reported that, in the year ended 31 March 1965, the average number of patients resident in district, branch and auxiliary mental hospitals was 17,949:

In Ireland, approximately 7.3 psychiatric beds were provided in 1961 per 1,000 of the population; this rate appears to be the highest in the world and compared with 4.5 in Northern Ireland, 4.6 in England and Wales, 4.3 in Scotland, 2.1 in France and 4.3 in U.S.A. At any given time, about one in every seventy of our people above the age of 24 years is in a mental hospital.

2.55 There were 18 mental hospital districts each of which had a district mental hospital. The private mental hospitals had been established mainly before 1922; the first was St Patrick’s hospital which was founded in 1745. The majority of the public mental hospitals also predated the State. St Brendan’s, Grangegorman opened in 1814 as the Richmond Lunatic Asylum. St Ita’s, Portrane was built to cater for the overflow from St Brendan’s. The report lists all of the mental hospitals which existed at the time.

2.56 The report found that some buildings were new, or comparatively new, but most were erected between 1820 and 1900 and were:

clearly a legacy of the days when the emphasis was on security measures and on custodial care. In many cases praiseworthy efforts have been made to improve old buildings and some have been brought up to a good, or reasonably good, standard; others have been sadly neglected. In the Commission’s view a large number are unsuitable in design and lack the facilities necessary for the proper treatment of patients.
2.57 It went on to state:

Unfortunately, the carrying out of improvements has not been uniform and some hospitals, or parts of hospitals, have a standard of accommodation which varies from poor to bad. Some have adequate catering, heating and sanitary arrangements, but most need considerable improvements in regard to these facilities. Furniture and furnishings are inadequate in most cases. Facilities for occupational, recreational and industrial therapy and for proper medical treatment, are poor in most hospitals. In addition, a custodial approach still persists in some hospitals.

… there are still too many barrack-like structures characterised by large wards, gloomy corridors and stone stairways. Too many also have inadequate facilities and services and lack the purposeful activity and therapeutic atmosphere that are necessary in a modern mental hospital.

2.58 The report pointed out that health authorities had the power to send patients to private hospitals and homes and to pay for them at approved rates (varying from £5 10s a week to £11 11s) but this power was not much used. However, considerable use was made of a provision in the Health Act 1953, under which a person who was entitled to receive treatment free, or at a reduced rate, in a district mental hospital, could get a contribution towards the cost of treatment in a private hospital or home. The contribution rates at the time varied from £6 6s to £8 1s a week. The period of payment was limited to 13 weeks.

2.59 The Commission of Inquiry on Mental Illness did consider the mental health difficulties faced by children in industrial schools. It adverted to children who were deprived of a normal family life and recognised them as being vulnerable and possibly emotionally disturbed. They were children ‘for whom psychiatric and psychological services are particularly necessary. The provisions made for these services are very often most inadequate’. It does not seem to have specifically addressed the question of residents of mother and baby homes.

2.60 Mental hospitals were subject to inspection since the passing of the Mental Treatment Act 1945. This provided for, among other things, an Inspector of Mental Hospitals. It also set out the rules for admission to mental hospitals.
Chapter 3: Pre 1922

Introduction
3.1 Mother and baby homes were not unique to Ireland, and they were founded and run by a range of religious charities, not all Catholic. The template for mother and baby homes that emerged in Ireland in the 1920s was very similar to that followed in other countries.

3.2 This chapter examines the position of unmarried mothers and their children in Ireland before 1922. The Irish Free State did not begin with a blank canvas. The social attitudes and institutions that existed under the Union continued, and legislation, regulations and financial provisions introduced before 1922 remained in force until they were abolished or amended. The Irish Free State inherited a network of agencies and institutions catering for the poor and the needy. Some were directly run and funded by the state, such as the workhouses. Some were charitable agencies that received no state support; their funding came from voluntary donations, and perhaps from some form of commercial activity, such as a Magdalen laundry. The industrial schools can be regarded as a hybrid: they were run by religious orders, but funding and decisions on admission were determined by the state.

Illegitimacy
3.3 ‘Illegitimacy has been called a social problem for the last two centuries and a moral problem from time immemorial. A problem can in principle be solved, and in trying for a solution here moralists, administrators and social scientists have written a very great deal.’¹ These are the opening remarks of Cambridge social historian Richard Laslett in his history of illegitimacy in Britain, France, Germany, Sweden, North America, Jamaica and Japan from early modern times. Ireland was not alone in regarding pregnancy outside marriage as ‘a social problem’, and these attitudes were shared by both Catholic and Protestant churches.

3.4 The rate of illegitimacy varied significantly between countries, regions, and over time, though all statistics relating to ‘illegitimate’ births should be treated with caution. Contrary to what might be expected, the incidence of pre-marital

conception and ‘illegitimate’ births has generally been lower when couples married at a late age, as happened in Ireland from the mid-nineteenth century. Laslett suggests that the social controls exercised in countries or regions where couples married at later ages reduced the incidence of pre-marital/extra-marital births, whereas if early marriages were the norm, these social controls were less stringently enforced. Some societies were quite tolerant of illegitimacy. In the rural northeast of Scotland ‘illegitimate children were absorbed into their immediate and extended family and the community without prejudice’. Children were raised by the wider family, or by their cohabiting parents. However, in other parts of Scotland unmarried mothers were often abandoned by their families and left to fend for themselves. Such toleration of illegitimacy by families and communities was not the norm. Most unmarried mothers were rejected by their family and the wider society, condemned to a life of poverty. It was impossible for a single woman, without property, capital, or some exceptional skill, to earn an income that would support herself and a child, without substantial assistance from her family or the father of her child. This was true both in Ireland and elsewhere. Even today, when women have significantly greater career choices and governments give financial support to single parents, many single mothers face long-term poverty and a struggle to survive.

3.5 The rate of ‘illegitimate’ births in Ireland was extremely low compared to other countries. In 1911 the Irish figure was just over half of the English rate and one-third of the rate in Scotland. In the late nineteenth century the illegitimacy rate in Sweden was six times that in Ireland. Guinnane suggests that Irish women would have had stronger reasons for concealing a birth outside marriage than women who lived in a country where attitudes towards illegitimacy were less hostile. Guinnane and others suggest that the Irish illegitimate birth-rate was higher than the published statistics suggest, but nevertheless, having allowed for this, he concluded that ‘extramarital relations were, it seems rarer in Ireland than in other places’.  

3 Janet. Greenlees, Unmarried motherhood in Scotland during the twentieth century. Mother and Baby Homes, see Chapter 37.

3.6 In the past, domestic service was the most common occupation for young single women and it is not surprising that domestic servants accounted for the largest number of unmarried mothers. Many domestic servants were young; they worked and lived away from the protection of their family. The historian Kenneth Connell suggests that one explanation for the low rate of illegitimacy in pre-famine Ireland was the fact that there were fewer live-in domestic servants than in more prosperous economies. Material in the National Folklore Collection at UCD from County Antrim described farmers who would ‘put the servant boy and the servant girl to sleep or doss in the one (same) shake-down of a bed. Not out of any badness… I had heard, but because they were wild gatherers (miserly) and didn’t want to buy more bed-clothes for a second bed, because they didn’t want the clothes torn’. In the Irish countryside before - and probably long after - the Famine it was the lucky mother, or likely mother, of an illegitimate child who was not shunned by her neighbours and despised, if not cast off, by her own family.... Pregnancy outside marriage was a shameful matter to the girl and her family; it promised a wretched future for the child and herself, and prompted guilty concern in many a prospective father.

3.7 Connell, drawing mainly on evidence given to an inquiry during the 1830s, records many such comments by contemporary witnesses about illegitimacy. A woman who gave birth outside marriage was ‘despised by her equals’, she was ‘slighted and shunned by all her former acquaintances’, her ‘stain’ was ‘never forgotten’; it weighed on her family for 20 years, even her children bore some of the brunt. Some parents might permit their daughter to continue to live with the family, ‘more probably, ashamed of her and embittered by the disgrace she brought on the family, they turned her adrift’. Pregnant single women were often dismissed by their employer.

3.8 Pressure was exerted on the woman and the putative father to marry; in other instances the families collected a dowry and persuaded another man - who was probably her social inferior - to marry her. A putative father might be pressured to provide a dowry, but many women had to survive, unmarried, on whatever casual

---

5 Guinnane, *Vanishing Irish*, p. 84
6 University College Dublin, National Folklore Collection, Michael J. Murphy, collector Antrim.
work was available, this was often supplemented by begging or even prostitution. *The Farm by Lough Gur*, an account of life in rural Limerick in the late nineteenth century, tells the story of one young unmarried woman who was thrown out of the house by her father and had to live rough. He finally relented following the death of her baby; by then the unfortunate young woman was suffering from rheumatic fever.\(^9\)

### 3.9

The stigma of illegitimacy was life-long and could extend to later generations. Folklore evidence records that:

> When there’d be an out - fall (row between neighbours) or when they would start barging over the youngsters then you’d hear the pedigrees. “I wasn’t born between a back of ditch and a Holly bush…I wasn’t born between a back door and a window shut”.

### 3.10

Farmers ‘would move heaven and earth to prevent their daughters marrying a bastard’, unless he was well-off; a woman who was ‘illegitimate’ would find it even more difficult to marry into a respectable family. It was commonly believed that a girl who was a ‘bye-child’ - illegitimate - would ‘inherit the softness’ - moral laxity that had led to her illegitimacy. There was no legal provision requiring the father to support his child, unlike Britain but some magistrates might award damages for seduction or loss of wages.\(^10\)

### 3.11

Some mothers resorted to infanticide. Between 1850 and 1893 there were 2,501 cases of infanticide reported in the Return of Outrages, and these figures do not include the Dublin Metropolitan Police area, which recorded an average of two infant murders a year. Of the infanticide cases that were studied by Elaine Farrell, 84% of the infants were classed as ‘illegitimate’. Farrell claims that:

> the illegitimate status of an infant was considered the principal motivating factor for infanticide and concealment of birth in nineteenth-century Ireland due to the perceived stigma attached to giving birth outside wedlock. …. Suspects also confirmed that the stigma attached to illegitimacy played a role in their decision to murder or conceal the births of their offspring.\(^11\)

---

3.12 Some infanticides were carried out by recently-married couples, indicating that a stigma extended to premarital conceptions. A number of infants were killed by family members. In other instances mothers claimed that they killed their infant because of fears that a parent or another family member would learn of the pregnancy. When the body of a new-born baby was discovered, the unfortunate mother was often identified by gossiping neighbours, who had noticed her pregnancy - yet another indication of the pressures faced by single mothers. Infanticide did not cease in 1920.

3.13 ‘Illegitimate children’ were also abandoned; in 1858 Margaret Aylward, who founded the Sisters of the Holy Faith, estimated that roughly 100 children were abandoned in Dublin every year. On the eve of the famine, according to Sean Connolly, roughly one baby in every hundred born in Ireland was a foundling and most foundlings were ‘illegitimate’. Before 1820, Dublin and Cork foundling hospitals were taking in roughly 2,200 babies every year; few of those children survived to become adults. After 1820 both homes began to restrict admissions. Foundlings abandoned in areas remote from hospitals had probably an even lower chance of survival. Before the Irish Poor Law was established, responsibility for foundlings rested with the warden of the Church of Ireland parish where the child was found; he might send the child to the Foundling Hospital or arrange for it to be fostered in the parish. There are regular reports of foundlings in the Minutes of the Dublin Union in the 1920s (see Chapter 13).

The Poor Law

3.14 Most women who became pregnant outside marriage were rejected by their family and in Ireland, as elsewhere, they commonly moved away from home, drifting into cities and larger towns. Single mothers were found among the tramps and beggars that were a common feature of early nineteenth century Ireland. There was no national system of poor relief until the 1840s, when the poor law with its workhouses was established. Workhouses were not popular in Ireland, and with the exception of the famine years when many desperate and starving people had no option but to enter a workhouse, the number of residents (known as ‘inmates’) was well below capacity. Yet from an early stage, unmarried mothers and their children accounted for a significant number of inmates. From the 1840s, the Poor

---

13 Connell, ‘Illegitimacy’ p. 10
Chapter 3 Pre 1922

Law, which was funded by local taxes, admitted substantial numbers of single mothers and/or their children. The Poor Law was subject to the overall control of the Commissioners who were based in Dublin’s Custom House, but responsibility for key decisions and provisions of care and its quality rested with local poor law boards of guardians (see Chapter 1).

3.15 In 1905 there were 2,129 unmarried mothers and 2,764 children who were either ‘illegitimate’ or deserted in Irish workhouses. There were 2,783 unmarried mothers in English workhouses in 1920. Given that the population of England was nine times the population of Ireland, the figures indicate that a much higher proportion of Irish single mothers ended up in a workhouse, or, alternatively they remained there for a much longer period. Many of the Irish unmarried mothers were long-term residents, who remained in the workhouse as unpaid scrubbers, laundresses and attendants for years, so it is impossible to estimate the numbers of single mothers who gave birth in Irish workhouses in a single year. Some undoubtedly gave birth and left with their infant after a short time. In 1905 a total of 2,207 children were boarded out by the poor law authorities, but it is impossible to know how many of these children were ‘illegitimate’.

3.16 In 1862 the Irish Poor Law permitted (and encouraged) poor law unions to board out young children who were in the workhouse without their mother - in an effort to reduce the high mortality rate. Initially children were only boarded out until the age of five and they returned to the workhouse at that age. In 1869 the age limit was raised to ten; it was further increased to fifteen in 1898. Alice Litster’s summary of the history of boarded out children commented that ‘there was considerable diversity of practice’ between Unions. The law provided that only orphaned or deserted children could be boarded out by the poor law authorities. Single mothers were not eligible for outdoor relief (relief outside the workhouse) and a mother could only leave the workhouse if she was accompanied by her child, though many escaped, leaving a child/children behind. This regulation, taken from the poor law, remained in force in county homes after 1922 and it became the practice in Ireland’s mother and baby homes. Consequently unless a mother absconded, or her family agreed to provide for her and her child - taking both mother and child home, or paying for the baby to be nursed out (paying a foster...

14 Department of Health RM-INA-0-505478
mother to raise this child in her home) - a single mother and her child were condemned to a long-term stay in the workhouse.

**Other Options**

3.17 Given the social stigma associated with the workhouse, and the requirement to remain there with her child, the workhouse was probably a last resort for unmarried mothers. Most single women and children in the workhouse would have been from very poor families, or they had fled from their families or been abandoned by them. Little is known about single women from middling/large farms or daughters of shopkeepers and other middle-class families. Their invisibility is not unique to Ireland. Thane and Evans, writing about single mothers in England and Wales, refer to 'middle-class secrets', noting that some families arranged discreet adoptions or abortions. Kunzel, writing about the United States, also comments that less is known about single mothers 'who had the resources - financial and familial - with which to keep their pregnancies private'. There is evidence that pregnant single women moved from their home place and came to Dublin in search of privacy. Pregnant Irish single women were travelling to British cities by the 1920s and probably in earlier years. In 1924/5 only one-third of single women admitted to the maternity department of the Dublin Union were natives of Dublin; more than one-third had arrived pregnant in Dublin, the remainder gave a Dublin address and had allegedly been working in the city, though many were recent arrivals. Rev MacInerney claimed that:

most of the "girls in trouble" are fairly respectable girls from the country, or perhaps from the city or suburbs, who are filled with a wild terror lest their sin should be detected and talked about. They will go anywhere to hide their shame and to prevent their misfortune from becoming known to their friends and relatives.

3.18 Many of these women stayed in lodging houses until their baby was due. They gave birth in a Dublin maternity hospital and placed their baby at nurse. Some presented themselves as married women. Others gave birth in private nursing homes where standards of care and overall comfort varied greatly. The woman would pay for her care, and also pay the proprietor to place her child at nurse.

---

These private maternity homes were generally small, located in private houses. The owner/proprietor may have been a nurse or midwife, perhaps a widow for whom this activity provided a livelihood. The nurse might attend the birth, or she might send the mother to one of the city maternity hospital for her confinement and then take her back later. These homes were widely condemned for exploiting desperate pregnant women. Rev MacInerney claimed that many single pregnant women came to Dublin where they fell prey to ‘the harpies who batten on rescue work’; they were offered accommodation before the baby was born and given a promise to place the baby with a foster mother in return for substantial sums of money. He suggested that £50 was a common sum to pay for having a child placed at nurse long-term. Anecdotal accounts suggest some unscrupulous nursing home operators, having taken the pregnant woman’s money, forced her to remain in the house as a servant, allegedly being trained in domestic service. Jenny Wyse Power, a commissioner for the Dublin Union, claimed to have met several women with babies in the Dublin Union who had spent their entire savings, £30 or £40 in one of these homes, and were forced to go to the Union because they were destitute. There is undoubtedly some truth behind these stories, and probably some embellishment; however, evidence presented in other chapters confirms that some of the private nursing homes neglected children in their care, and otherwise flouted the law with respect to the registration of births and ‘informal adoption’.

The origins of mother and baby homes

Mother and baby homes did not originate in Ireland and the earliest mother and baby homes were not established by Catholic religious orders. There is a long history of charitable institutions catering for abandoned, or neglected children, and charities that supported widows, but unmarried mothers were not a popular cause for benefactors. The origins of mother and baby homes in Britain, the USA and Australia can be traced to Magdalen Asylums and other institutions that were established to rescue and reform prostitutes. By the end of the nineteenth century every major city in Britain and the United States had several such institutions. The Dublin Magdalen Asylum in Lower Leeson Street opened in 1767 with a mission to rescue ‘first fall’ Protestant women. However, Prunty claims that the first such asylum in Dublin was the Catholic Olivemount Institute in Dundrum, founded in

---

1742. These institutions were supported by a combination of charity and work carried out by the inmates, generally needlework or laundry. These were not popular charities so it was essential that inmates worked to contribute to the cost of the institutions; work was also seen as central the reformation of the women; ‘at least forty refuges or asylums’ were established in Ireland between 1765 and 1914.²⁰

3.20 By the late nineteenth century there were homes in Paris catering for single mothers, but most were established by civic groups, not by religious.²¹ In Italy many single mothers (and poor parents) left their children in foundling hospitals, such as the Innocenti in Florence or the Annunziata in Naples, without any indication as to their parentage. In France many children born to single mothers were placed in state care and boarded out.²²

3.21 In the late nineteenth century these institutions shifted their emphasis from rescuing prostitutes to preventing women from becoming prostitutes, a change that was associated with the growing number of women philanthropists. It was widely believed that many single mothers were forced into prostitution because they had no alternative means of support. In England the first homes for unmarried mothers opened in the 1860s and 1870s; they were run by charities that were associated with the Church of England. By the turn of the century the women’s social services division of the Salvation Army was the leading agency providing help to unmarried mothers and their children. These newer institutions used the term ‘Home’. As the historian of the mother and baby homes established in Cleveland (Ohio) noted, ‘Unlike the poorhouses, these would be “homes”, where religious influences were pervasive and where middle-class women could best serve their own ministries’.²³

In 1903 Dr Kate Barrett, a prominent figure in the Crittenton Homes, a network of US mother and baby homes associated with the Episcopalian church, published Some Practical Suggestions on the Conduct of a Rescue Home, emphasising the core principles of ‘religious conversion, domesticity, and disciplines within a familial

²³ Marian J. Morton, And sin no more. Social policy and unwed mothers in Cleveland 1855-1990 (Ohio state University Press, 1993) p 41
3.22 The Salvation Army opened homes for single mothers and their babies in Britain, Canada, the United States, Australia, and in Belfast. In 1909 they opened a special maternity hospital in London that accommodated several hundred unmarried mothers every year. But with a charge of 10s to 15s a week (which was more than a servant’s weekly wage), many single mothers could not afford to use it. Their policy was to admit only first-time mothers, though this was not always enforced. By the early twentieth century there were at least two dozen Salvation Army homes in London providing for unmarried mothers, who came from all parts of Britain. The homes were widely advertised in Salvation Army publications, and mothers-to-be or their relatives accounted for almost half the applications for admission. Women stayed for relatively short periods, on average three and a half months; they were expected to do housework or sewing which was sold to support the home. Salvation Army homes did not engage in commercial laundry. Prayer formed a major part of the routine. Almost one-third of mothers went to stay with family or friends when they left (it is not known how often this proved to be a long-term arrangement), the Salvation Army organised jobs as domestic servants for approximately half of the women - believing that service in a respectable home would protect their morality. The Army placed children at nurse in selected families, and later opened a home for ‘illegitimate’ children, but whether the children were nursed out or in a home, the mother had to pay for the cost - which could amount to up to 80% of her earnings, because there was a widespread belief at the time (not confined to Britain) that relieving single mothers of the financial responsibility for their children would only encourage further pregnancies. Some homes insisted that mother and baby should be together for six or twelve months, but the Glasgow Home for Deserted Mothers separated mother and child shortly after birth, placing the child in a foster home, for which the mother was expected to pay. The Salvation Army opened a home in Belfast in 1905. The majority of women admitted were either pregnant or the mother of a baby, and the number of maternity cases and unmarried mothers rose significantly from the late 1920s.

27 Leanne McCormick, Regulating sexuality. Women in twentieth-century Northern Ireland, (Manchester, 2007), pp 37. 50
3.23 The story in Scotland is broadly similar. In the closing decades of the nineteenth century charities that had previously operated reformatories for fallen women changed into homes that admitted single mothers who were pregnant for the first time. Women were sent to these homes by the parish and admitted ‘only if they agreed to part with their babies, and remained there for one to three years’. Scottish homes were generally described as maternity homes (a similar term was used occasionally in Northern Ireland), but during World War I they became known as Mother and Children’s Homes. Eleven of the 22 homes listed by Greenlees were established in the 1920s, five were founded between 1900 and 1920, the remainder after 1930.

3.24 In Australia a number of refuges for young unmarried mothers were founded from the 1860s. They admitted pregnant women and the mothers gave birth in the home; mother and baby remained there for approximately a year. Most of these homes operated laundries, as an essential source of income ‘for what continued to be unpopular charities’. These homes only admitted women ‘who have fallen only once’, and aimed to reform them. ‘Work was interspersed with prayer, male visitors were banned and letters were subject to perusal’. Some Australian refuges which were originally founded as homes for abandoned babies began to admit pregnant women in the hope that this would save infant lives. While the early homes were founded by Protestant charitable groups, by 1900 the Catholic church had also opened mother and baby homes; before that time Catholic single mothers had relied on Protestant refuges. Swain commented that ‘Pregnant women made passive penitents … willing to work and pray in exchange for shelter and a safe confinement. Rebellion against the harsh conditions was rare and criticism of the rhetoric of sin and reform virtually unknown’.

3.25 In the Netherlands the first homes for ‘penitent fallen’ women were established by the Reveil - an international Protestant revival community. Mothers and children in these homes underwent a regime of religious/moral re-education that was designed to rescue women from a life in prostitution. Until 1947 an unmarried mother in the Netherlands did not have rights as a parent/guardian of her child; all ‘illegitimate’ children were placed under the legal guardianship of a charitable society that was of the same religion as the mother. Mothers could apply to the

29 Greenlees, ‘Unmarried motherhood in Scotland during the twentieth century: mother and baby homes’ (Nov 2015)
30 Swain and Howe, Single mothers and their children, pp 75-6.
courts to secure the guardianship of their child, but guardianship was not automatically granted.31

3.26 In the United States the two largest chains of rescue homes targeting prostitutes - those run by the Salvation Army and the National Florence Crittenton Mission - evolved into homes for unmarried mothers. They did so, because they had lots of vacant places, and many single pregnant women had nowhere to go. Many hospitals refused to admit unmarried pregnant women; women were often dismissed from their job when a pregnancy became known, and they were commonly rejected by their families. By the 1920s there were more than 200 homes catering for unmarried mothers in the United States, run by evangelical women. These homes only admitted what they termed, ‘first offenders’; women having their first child. The description of the Crittenton homes, given by Regina Kunzel, is worth quoting, because many of the features that she describes were found in the Irish mother and baby homes established some decades later.

Evangelical women conceived of maternity homes as primarily redemptive … Religion was the foundation on which evangelical women built their redemptive program, and maternity home workers measured their own success by the rate of religious conversion confessed by the unmarried mothers under their care.

Religion informed every aspect of maternity homes, from their over-arching purpose to the details of everyday life within their walls…Days spent by unmarried mothers in early twentieth century maternity homes were punctuated by religious services.

3.27 In Salvation Army homes in 1912 ‘short prayer meetings are held night and morning and on Sunday afternoon a special meeting is convened, when the girls are particularly pleaded with to confess and forsake their sins’. Maternity home schedules suggest that when unmarried mothers were not praying they were working … Expected to do the basic work of the homes, including cooking, cleaning, and laundering, maternity home residents were subjected to a fairly heavy regime, usually spending seven to ten hours a day in domestic chores. Believing “the upbuilding of character” to be “slow work”, most maternity homes required the women to stay as long as necessary for redemption to take hold and stick. Many homes required unmarried mothers to sign an agreement to remain in the institution for a given period as a condition of admission.

31 Nelleke Bakker, Mother and baby homes in the Netherlands in the 20th century – see Chapter 37.
A maternity home resident could expect most aspects of her life - the way she wore her hair, the visitors she received, her mail - to come under the close scrutiny of her matron. Some homes permitted no visitors, others only female relatives; residents ordinary could not leave the grounds unchaperoned... The regulation and censorship of letters was a common practice'.

3.28 By the early twentieth century a template for mother and baby homes had emerged that can be found throughout the English-speaking world. Homes were run by voluntary agencies that were denominationally-based; they were distinct from the all-purpose workhouse/poorhouse. They were generally located behind high walls; isolated from the community; visitors were restricted, and women were required to stay for a specified period - at least six months after giving birth in order to ‘benefit’ from the discipline and rehabilitation that the home claimed to provide. The regime was also designed to act as a deterrent against becoming pregnant outside marriage. Morton commented that ‘At least until very recently workers at facilities for unwed mothers would have freely admitted that they were trying to control their clients’ behaviour and prevent additional illegitimate pregnancies’. A women’s privacy was generally protected by giving her an assumed name. When women left the homes they were commonly placed in jobs as domestic or institutional servants, because the evangelical women who ran these homes believed that a domestic setting would provide an element of supervision and reduce the risks of another pregnancy; there is also an implicit message that the promotion of domesticity would encourage the women to marry and thus achieve their true vocation in life.

3.29 Another key feature of these maternity homes was that their mission was ‘saving women, not children’. The primary goal was to rehabilitate the mothers and prevent them from becoming prostitutes or giving birth to additional children outside marriage. Higginbotham, writing about the Salvation Army homes in Britain, noted that ‘The rescue worker’s first concern was the restoration of the woman to a moral life, not the welfare of her child’. Infant welfare was at best a secondary concern, which may explain why the Salvation Army placed children at nurse in private homes, despite the fact that 60% or more of nursed out children died within the first year of life. If the mothers had been placed in non-domestic

33 Morton, *And sin no more* pp 48-50.
34 Morton, *And sin no more* p 13.
35 Morton, *And sin no more* p. 57
positions, she suggests that they could have cared for their children in the evenings, but the fears of moral relapse meant that the rescue workers preferred domestic situations, despite the fact that this involved separating mother and child. The focus was on ensuring that the women became useful members of society, ensuring that they were ‘trained’ and placed in some form of domestic employment. The fate of the children was something of an after-thought.

3.30 Given this emphasis on moral and religious salvation it is not surprising that Catholic homes were established to prevent unmarried mothers or their infants being ‘lost’ to Catholicism. Religion was central to the mission of mother and baby homes, and in cities such as Cleveland there was ‘lively competition among denominations’. It would appear that Catholic charities were slower to establish homes. Morton noted that in Cleveland the local bishop was initially reluctant to establish a mother and baby home ‘fearing that this would imply diocesan sanction for illegitimate pregnancy’. He was not the only senior clergyman who was opposed to, or at best unenthusiastic about, mother and baby homes. In 1920 Rev MacInerney quotes a letter from the Vicar-General of Southwark, who stated that ‘It is a reproach against the church that little is done for such unhappy women … some bishops are against the way of the sinner being made easy, and discourage our efforts’. The fact that religious sisters were not permitted to qualify as midwives (a requirement in Britain for all involved in assisting childbirth) would have made it more difficult for Catholic religious to establish mother and baby homes. It would appear that the primary motivation for establishing Catholic mother and baby homes was to counteract the possibility that Catholic women who were poor and pregnant would seek assistance from a Protestant charity. By the 1930s there were at least 44 Catholic homes for unmarried mothers in the USA, operating under guidelines established by the National Conference of Catholic Charities.

3.31 The Congregation of the Sacred Hearts of Jesus and Mary was a religious order that was founded in France and came to England during the turmoil of the Franco-Prussian war of 1870-71. One of the congregation’s first homes in England

catered for unemployed working girls, helping them to find work and providing religious instruction. In 1890 the archdiocese of Westminster established St Pelagia's mother and baby home, and invited the congregation to run the home. This was the first Catholic mother and baby home in the London area. Mothers remained in the home for a year; they were taught dressmaking and cookery; at the end of that year the children went to a nursery, run by the congregation, until they were either fostered or transferred to a Catholic orphanage. The congregation opened additional mother and baby homes in Liverpool and Scotland.42 These homes did not receive any support from central or local government, so they were dependent on earnings (the Liverpool home did laundry for ships), and on charity, but again the evidence suggests that unmarried mothers were not charitable causes that attracted public sympathy.43

3.32 Leanne McCormick has documented the existence of many rescue homes established before 1914 in Belfast and other parts of what became Northern Ireland. They included rescue homes founded by the Church of Ireland and Presbyterian churches, non-denominational Christian missions, and the Salvation Army. The Good Shepherd Sisters opened a home for ‘destitute penitents’ in 1867. McCormick claims that by the beginning of the twentieth century most women admitted to these homes were ‘generally not prostitutes … more likely to be unmarried mothers, girls whose parents were concerned about their moral well being’.44

3.33 In nineteenth century Ontario ‘an illegitimate birth was viewed largely as an individual problem’, and mothers known to have an ‘illegitimate’ child would find it difficult to secure work or shelter. The first home for unmarried mothers, run by a religious organisation, was founded by the Salvation Army in 1905. The Ontario Government made it known that they disapproved of the fact that there was no Catholic mother and baby home, and in 1914 the Archbishop of Toronto asked the Sisters of Misericordia to open a home.45

Ireland

3.34 There was a remarkable growth in the number of charities operating in Ireland during the nineteenth century; they were mainly concentrated in the cities and larger towns. Most charities were denominationally-based. Very few catered for single mothers. Lindsey Earner Byrne commented that ‘A conspicuous feature of the voluntary assistance landscape in the early twentieth century [in Dublin] was the lack of Roman Catholic initiatives in the area of maternal welfare’. If little assistance was available for poor married mothers, even less was available for unmarried mothers. They were not a cause that attracted widespread sympathy from donors, because unmarried mothers were not seen as ‘deserving’.

3.35 Children were seen as much more deserving cases. There were numerous orphanages, but it is unclear which orphanages admitted the children of single mothers. Orphanages tended to be subdivided on the basis of religion and social class. They contained orphans, both of whose parents had died, and many children who had lost one parent, where the surviving parent was unable to cope - widowed mothers were often encouraged to place their children in an orphanage and become self-supporting. Children’s charities were motivated both by a wish to care for needy children and a determination to save their souls: Religion was paramount, and the reality and perception of ‘souperism’ - charities that took babies and raised them in a religion other than their mother’s - was a common feature of life in both working-class Protestant and Catholic communities. St Brigid’s outdoor orphanage placed children in foster homes in rural areas of county Dublin. Initially run by laywomen, it was taken over by a religious order; boarding out ceased and the children were maintained in an institution in Eccles St. The Cottage Home in Kingstown (now Dun Laoghaire) catered for young children whose mother was dead or compelled to earn a living, but the parents or friends of the child had to contribute to their maintenance, though the charge may have been waived if a Catholic mother agreed that her child would be raised as a Protestant.

50 George D. Williams, *Dublin Charities, being a handbook of Dublin philanthropic organisations and charities; including benevolent and educational organisations; shelters, refuges, orphanages, hospitals, reformatories, industrial schools* (Dublin 1902), p. 141.  
51 Williams, *Dublin charities*, pp 146-7.
The *Irish Ecclesiastical Record*, described as ‘a monthly journal under episcopal sanction’ published four articles on the subject of unmarried mothers between 1921 and 1924. The primary motivation behind these articles was souperism - the loss of Catholics to Protestant charities - which was a major concern of the Catholic church in the late nineteenth century and the early twentieth century. Their concern was not without some justification. *The Handbook of Dublin Charities* (published in 1903) described The Bird’s Nest in Kingstown, (whose secretary was Miss E Smyly) as ‘a home for neglected children of the very poor’, which gave preference to Catholic children and the children of mixed marriages, though it only admitted children aged seven and over. Children placed in the Bird’s Nest or Smyly’s home were raised as Protestants. There were numerous allegations that desperate Catholic single mothers were being assisted by Protestant rescue societies, and their children placed in Protestant institutions. One woman, who appealed to Archbishop Byrne for financial assistance told him that ‘Miss Smiley (sic)’ had offered her £50 plus clothes for herself in return for her baby.

Ireland was seriously lacking in charities for unmarried mothers, especially when compared with the USA, Britain or Australia. The Dublin Hospital Girls’ Aid Association, founded in 1880 by a group of Protestant mothers, offered shelter and an occupation to pregnant single women, and tried to return them to their families. The Rotunda Girls Aid Society, founded in 1890 by Fr Ridgeway, who was based at the Pro-Cathedral in Marlborough Street, was for many decades the only Catholic charity in Dublin with a specific mission of caring for unmarried mothers and their children. Evidence suggests that many of the children were placed at nurse. 1911 saw the formation of the Catholic Protection and Rescue Society of Ireland (CPRSI) - which assisted single mothers, and arranged for their children to be placed at nurse. The CPRSI had a specific mission ‘to rescue the child whose faith is in imminent danger’. St Patrick’s Guild was founded in 1910 by Miss Cruice, at the request of a Dominican priest Fr Coleman - to care for ‘the unwanted child’. It too was motivated by a wish to counteract the numbers of

Catholic infants being placed with Protestant charities. It placed babies born to single mothers ‘at nurse’ for a fee. In a letter to Michael Browne, the bishop of Galway, Miss Cruice explained that ‘St Patrick’s Guild deals with what we might call the exclusive type’ of single mothers. In 1919 St Patrick’s Guild opened a home for the care of unmarried expectant and nursing mothers in Mountjoy Square, which also operated as a training school for nursery nurses. St Joseph’s Guild of Rescue and the Nursery Rescue and Protestant Children Aid Society also placed children ‘at nurse’. While the evidence is fragmentary it would appear that most, perhaps all of these charities, demanded a contribution from the mother or her family; they did not assist destitute mothers.

3.38 Dublin, like other cities at the time, had its quota of rescue homes in the early twentieth century, all with a strong religious emphasis. In 1928 a voluntary worker with the Dublin Magdalen Asylum (later known as Denny House) told the annual Gift Day meeting that when she had returned to Dublin in 1907 there were eight Protestant institutions ‘doing rescue work’, but only two - the Magdalen Asylum and Bethany Home - remained. She attributed the fall in the number of Protestant rescue homes in Dublin to ‘the more energetic action of the Roman Catholic authorities in looking after their own erring sisters’. Many rescue homes stated that they made no religious distinction but women who were admitted had to conform to the rules of the house, which included mandatory attendance at religious services. The only institution that provided lodging for a pregnant single woman - other than the workhouse - was the Magdalen Asylum founded by Arabella Denny in 1767. The 1903 Handbook of Dublin Charities stated that ‘The home is especially intended for Protestant young women after a first fall, and for those who are about to become mothers’. The charter provided that it should only admit Protestant women - either expectant single mothers or women with new-born infants. The mothers generally spent up to a year in the home, before being placed in a domestic situation. The regime combined work, penance and prayer - a combination that was deemed necessary to achieve rehabilitation. The regime followed in the Magdalen Asylum was similar to rescue homes for unmarried mothers in Britain - regardless of their denominational affiliation. Women were described as penitents. They were forbidden to use their own name

or speak about their past; they were given a number and known as Mrs One, Mrs Two etc. and they were classified on the basis of their life history. Women who had given birth to two or more children or prostitutes were segregated from first-time mothers, and their other children were not allowed in the asylum. Luddy comments that ‘it is unclear what became of them’. By the early 1920s the Magdalen Asylum was keeping mothers in the home for approximately nine months after the birth of their child. When she left the home, often for a domestic service position that had been found by the Asylum, her child was boarded out.

3.39 Catholic Magdalen homes, such as St Mary’s Asylum and Reformatory High Park did not admit pregnant women, and in contrast to what happened in the USA and Britain, none of these Catholic institutions evolved into mother and baby homes. The rules of the Good Shepherd Order which ran many of Ireland’s Magdalen Asylums (for Catholics) stated that no pregnant women should be admitted. Women who were found to be pregnant were thrown out of the homes. Admitting pregnant women was likewise forbidden in the homes run by the Sisters of Our Lady of Charity. Irish Magdalen Homes, with the exception of the Dublin Magdalen Asylum - an institution confined to Protestants - were not mother and baby homes.

3.40 By contrast the Prison Gate Mission in Blackhall Place which met women as they left prison ‘in order to try and reclaim them from their evil life and companions, by providing means of honest livelihood’, and also sheltered young women from the country who had failed to find work, in order to save them ‘from falling into evil ways’, evolved into Bethany Home in 1922 (see Chapter 22). The fact that no Catholic Magdalen asylum transformed into a mother and baby home probably reflects the fact that religious sisters were discouraged from involving themselves in maternity care - a limitation that did not apply to Protestant charities.

3.41 Bethany and Bessborough the two private (Pelletstown, Kilrush and Tuam were local authority homes) mother and baby homes that opened in the 1920s followed the template for a mother and baby home with minor variations. Religion occupied a central place in the homes; discipline, removal from the outside world and a

64 Minutes of Evidence Commission on the Sick and Destitute Poor, Day 4, 11 June 1925.
67 Williams, Handbook of Dublin Charities, p. 158.
regime of domestic tasks were major features. In the USA board meetings of the Crittenton homes opened with a prayer, as they did in Bethany - and Bethany meetings ended with a prayer. It was Crittenton policy not to reveal the name of any woman in their homes ‘in order to hide her shame’. This was also the practice in the Magdalen Asylum and the three homes run by the Sacred Hearts congregation, though not in Pelletstown and Tuam. McCormick, writing about rescue and refuge homes, in general, not just in Northern Ireland, commented that ‘The homes were therefore an important disciplinary tool for working class families, not simply a middle-class construction to impose middle-class values. Working-class parents could remove troublesome daughters who generated concern or had the potential to bring disgrace to their family’.  

**Welfare reform 1900-1920**

3.42 The dedicated mother and baby homes only accepted ‘first fall’ mothers - women who were pregnant for the first time. This distinction between a first-time mother and an unmarried mother of two or more children reflected the belief that first-time mothers could be rehabilitated, whereas the others were commonly seen as either depraved or mentally deficient. The practice of segregating first-time unmarried mothers was initiated by charitable institutions and it appears to have influenced proposals to reform the Poor Law in the years before 1914. The workhouses established in Britain and in Ireland in the nineteenth century admitted all categories of needy people and cared for them in one institution. They made no distinction between unmarried mothers and other women in need. By the early twentieth century, however, proposals for welfare reform favoured differential measures for those in need; for example the elderly poor would receive an old age pension and should no longer have to enter the workhouse. In 1906 the Vice-Regal Commission on Poor Law Reform in Ireland stated unequivocally that the workhouse was an unsuitable ‘refuge or asylum’ for mothers of illegitimate children. The commission recommended that first-time pregnant mothers should be sent to institutions owned or managed by religious communities or philanthropic persons - mother and baby homes. If no such institutions existed, they should be sent to a disused workhouse that was adapted for the purpose and would only accommodate single mothers and their children. This special home should be managed by a committee of contributory Boards of Guardians (in other words it

---

68 Morton, *And sin no more*, p. 10.
should serve several poor law unions), with a staff of special officers, ‘similar to those in charge of the religious or philanthropic institutions’. At this time many workhouse hospitals were staffed by religious sisters, and this comment would appear to suggest a similar arrangement. Women would give birth in a nearby hospital; (religious sisters did not deliver babies or supervise births) and the mothers would return to the institution and care for their children until they were at least one year old. At this point mothers should be placed in ‘suitable situations’ probably domestic or institutional service and the baby should be boarded out unless there were medical reasons for not doing so. Mothers on second or subsequent pregnancies should be sent to Magdalen homes and confined there. Their babies would remain with them until they were weaned. The Vice-Regal Commission drew a distinction between first-time mothers and ‘more depraved cases’ – mothers of two or more children. There is no indication that any steps were taken to implement these recommendations. The Irish volume of the 1909 Report of the Royal Commission on the Poor Laws reiterated the recommendations of the 1906 Vice-Regal Commission; the Scottish report also recommended that first-time unmarried mothers should be sent to special homes run by charitable organisations.  

3.43 The 1906 Vice-Regal Commission was the blueprint for the provisions that developed in the Irish Free State after 1922. The Children’s Home in Glenamaddy, later Tuam, was established in a disused workhouse, and it was supported by the local health authorities in counties Mayo and Galway. In County Clare, the former workhouse in Kilrush was dedicated to housing single mothers and their children. Pelletstown was established and controlled by the Dublin Union, as a home for pregnant and single mothers and their children, though many of the women admitted were from outside Dublin. By 1922 three mother and baby homes, run by charitable organisations existed - the Magdalen Asylum, the Bethany Home, and Bessborough mother and baby home.

**The Children Act 1908**

3.44 The early years of the twentieth century were marked by a growing concern with infant and child welfare in Britain, and this impacted on Ireland, which was part of the United Kingdom. The concern was partly prompted by eugenics and the need

---

for a large standing army; a high proportion of young working class males were too physically unwell or too small in stature to be accepted into the British army. By the end of the nineteenth century, the death-rate among adults was falling steadily, but mortality among children and infants was not showing a comparable improvement.

3.45 In 1908 the UK Parliament passed the *Children Act*, a wide-ranging piece of legislation which strengthened the provisions in the *Children Act 1897*. It contained clauses relating to reformatories and industrial schools; it even included a prohibition of juvenile smoking. The 1908 act reflected growing concern about the high rate of infant and child mortality, and the awareness that a disproportionate number of infant and child deaths occurred among children who were not being raised by their parent(s). Not all children who were placed at nurse were illegitimate, but the children of single mothers probably constituted the majority. Section I of the 1908 Act: Infant Life Protection was designed to combat ‘baby farming’ - a pejorative term that was used to describe circumstances where women, generally poor women, were paid to look after several children in their home. The mortality of boarded out infants and children was extremely high. There are many references to baby-farming in Britain in the late nineteenth century, both in the popular press and in medical journals, but significantly fewer references in Ireland.\(^71\) This does not mean that ‘baby farming’ was not practised in Ireland; the Irish authorities and journalists may have shown less interest in the matter. Ciara Breathnach has analysed one case in Dublin in 1905, where a married mother of five children was charged with causing the death of an infant under her care. The woman had taken charge of three children who were placed with her by the Cottage Home in Kingstown over the summer of 1905; all three died within a few months.\(^72\)

3.46 The *Children Act 1908* introduced a requirement that any person taking on the ‘nursing and maintenance, for reward’ of one or more infants under the age of seven, was required to give forty-eight hours’ notice in advance to the local authority, stating their name, address, and the sex and date of birth of the child. If a child in their care died or was removed to another address, the local authority must be informed within 48 hours. All deaths should be notified to the coroner who

was required to hold an inquest. Local authorities were required to appoint infant protection officers to visit homes where children were nursed out to check on conditions in the home and the standard of care. These regulations applied to children who were placed at nurse by a philanthropic society, such as St Patrick’s Guild or The Cottage Home and to infants who were privately placed by the mother or another family member. Infant Protection Officers could apply to have a child removed from a home if the foster mother or conditions were unsuitable - including cases of drunkenness, immorality, criminal conduct or negligence. Refusing Infant Protection Officers permission to examine a child or the foster home constituted an offence, and the visitor could apply to a judge for a warrant; the diligence of Infant Protection Officers varied. Persons convicted under Section 1 of the Children Act or the Infant Life Protection Act 1897, or from whose premises children were removed because they were insanitary or dangerous, were prohibited from taking children in future, except with the written approval of the local authority. The local authority could fix the maximum number of children to be kept in a particular dwelling or by a particular person. It could also exempt from visits ‘any particular premises within their district which appear to them to be so conducted that it is unnecessary that they should be visited’. The requirement to hold an inquest in all cases of death did not apply where the child was being cared for by a relative, or ‘to hospitals, convalescent homes, or institutions established for the protection and care of infants, and conducted in good faith for religious or charitable purposes, or boarding schools’.

War-Time Changes

3.47 Concern about infant and child welfare appears to have grown during World War One, perhaps because of the horrifying numbers of young men who were dying. The Notification of Births Act 1907 required that notice of births should be given to the local medical officer of health within 36 hours. However, this was not binding on all local authorities - each local authority could decide whether to introduce it or not. In 1915 the Notification of Births Act became obligatory if the birth took place in urban areas. This change was designed to enable the health authorities to care for the health of infants, and expectant and nursing mothers in cities and towns - the areas of highest infant mortality.

3.48 In 1916 the UK government introduced a programme of grants to local authorities and voluntary agencies in urban areas, including county boroughs, for (1) health-
visitors, (2) maternity centres, (3) midwifery facilities and (4) day nurseries. These grants were extended to rural districts in the following year. The grants could be used to provide milk or food to needy children, if that was done as part of a wider child welfare strategy. In 1918 the sum of money provided was increased and the programme was extended to include provision for the young children of widowed, deserted and unmarried mothers and Exchequer payments for health visitors. By 1920 this scheme was providing financial support to a number of Dublin voluntary organisations, including the Catholic Protection and Rescue Society of Ireland, St. Joseph’s Guild of Rescue, the Rotunda Girls Aid Society, and the Nursery Rescue and Protestant Children Aid Society - agencies that assisted single mothers and placed their babies in foster homes. The grant covered half of the cost of boarding out these children up to the age of five, which reduced the amount of money that a single mother needed to provide. The Exchequer grant also paid 50% of the estimated costs of keeping mothers and babies in the Dublin Magdalen Asylum (Denny House) for a maximum of six weeks before birth and up to one year after the birth.

Conclusions

3.49 The evolution of the poor law, child welfare and charities during the years when Ireland was part of the United Kingdom provided the framework within which provisions for unmarried mothers and their children evolved after 1922. Key elements of the pre-1922 provisions survived: child welfare and services for unmarried mothers were the responsibility of local authorities, who might devolve their care to a charity. Poor law regulations stipulated that a single mother was responsible for her child. She could not renege on this responsibility by abandoning her child in a mother and baby home or any other institution supported by public funds.

3.50 Ireland was unusual among English-speaking countries in the absence of mother and baby homes before 1918. The only institutions that provided accommodation for unmarried mothers and their children were the workhouses, and the small Protestant Magdalen Asylum (Denny House) in Dublin’s Leeson St. The 1906 Vice-Regal Commission had recommended that unmarried mothers should be in the care of religiously-controlled institutions, ideally institutions owned by these bodies. If there were insufficient places in voluntary institutions, local authorities
should establish mother and baby homes, but they should arrange for them to be run by religious orders or by members of a religious association.

3.51 By 1900 the template for a mother and baby home - secrecy, isolation, religion, domestic work and the requirement to spend a designated period in the home - had evolved in Britain, North America and Australia. The Irish homes established after 1922 followed these international models. The distinction between ‘first-fall’ unmarried mothers and mothers of two or more children was well-established in the English-speaking world, as a key element in provisions for unmarried mothers.

3.52 In the years after 1900 the British Government showed a growing interest in child and infant welfare. The Children Act 1908 introduced regulations and inspections of boarded-out children; many of these children were born to unmarried mothers. This was also the time when several charities were established in Ireland to assist single mothers by placing their children at nurse. These charities were primarily motivated by fears of proselytization and such fears were not without some justification. The UK Exchequer grants introduced in 1918 as part of a wider package of infant and child welfare measures, were the first that public funding was provided for unmarried mothers and their children outside the poor law.
Chapter 4: 1922-1939

Introduction

4.1 The early history of Ireland’s mother and baby homes coincides with the establishment of the Irish Free State. Until the opening of Pelletstown in 1919 (see Chapter 13), there were only two small homes that provided accommodation for unmarried mothers and their children: the Magdalen Asylum (Denny House, see Chapter 23) and St Gerard’s (see Chapter 27) which was run by St Patrick’s Guild.¹

4.2 The institutional and financial arrangements that were put in place for unmarried mothers and their children between 1922 and 1939 survived until the later decades of the twentieth century. The following mother and baby homes that are central to this Commission of Investigation: Bethany; Bessborough; Kilrush; Glenamaddy - later Tuam; Sean Ross and Castlepollard, opened during these years. Dunboyne was the only substantial home that opened after 1939. In 1920 an unmarried mother who did not enter a workhouse received no financial support from the public purse. During the 1920s and the 1930s a growing number of local authorities began to pay for the maintenance of unmarried mothers and their children in these special homes. The government introduced the Illegitimate Children (Affiliation Act) 1930 that was designed to make it easier to enforce affiliation orders against the fathers of illegitimate children; new regulations were introduced governing maternity homes; the provisions for children, who were not being raised by their families and the law relating to the provision of public assistance, were updated. England, Scotland and Northern Ireland introduced legal adoption during these years, but in Ireland adoption legislation was not introduced until the 1950s.

4.3 The significance of the coincidence between the establishment of mother and baby homes and Irish independence should not be overstated. Mother and baby homes were not an Irish solution to an Irish problem; Ireland was late in establishing mother and baby homes and the initial recommendation in favour of these special homes came from the 1906 Vice-Regal Commission on the Irish Poor Law. The

¹ There were many private maternity homes/nursing homes where unmarried mothers and their children were accommodated, but these were run at a profit. For details of these homes see Chapter 2.
establishment of the Bethany Home in 1922 also indicates that this ‘solution’ to the problem of unmarried mothers was not unique to the Catholic church.

4.4 The establishment of special homes for unmarried mothers and their children was prompted by a variety of factors.

- Reform of the poor law
- Greater awareness of the high infant mortality of ‘illegitimate’ children
- Concerns at the apparent rise in illegitimacy, and the moral backlash that followed the ending of World War One, which took on a heightened significance with the founding of the Irish Free State.

**Poor law reform**

4.5 Proposals for establishing special mother and baby homes emerged as part of a wider review of the Irish poor law that was initiated when Ireland was part of the United Kingdom. The reforms were implemented by an Irish government. In the 1920s primary responsibility for health and welfare services rested with the local authorities (see Chapter 1). They organised and delivered most services, either directly - as in a workhouse/county home, infirmary and mental hospital, or indirectly, by paying for a child in an industrial school. Legislation enacted by the UK Parliament, and by Dáil Éireann, determined eligibility, set regulations, including capitation rates and made loans to local authorities for capital purposes. The administrative model operated by the Department of Local Government and Public Health (DLGPH) after 1922 was almost identical to the pre-independence Irish Local Government Board. Department inspectors visited local authorities to check whether finances were in order and regulations were being implemented. They reported on conditions in local authority-run hospitals and homes, and the treatment of boarded out children, who were under the care of the local authorities. The department, like its predecessor, drew up detailed regulations, and issued numerous circulars to local authorities, but responsibility for delivering a particular service rested with the local authority, and despite the many circulars and inspections, there were often significant discrepancies between departmental regulations and local practice, and compliance with the regulations varied significantly between counties.

4.6 When Sinn Féin gained control of most local authorities following elections in 1920, it set about a programme of major reform of the poor law, which was regarded as
one of the most hated symbols of British rule, and a wasteful and unpopular means of caring for the poor and the sick. The Dáil Éireann proposals involved closing the workhouses - the multi-purpose institutions that catered for all categories of persons in need - and providing specific forms of assistance to each group. The poor law unions took no account of county boundaries and many unions straddled two or even three counties. The reforms substituted a county-based system. In place of the workhouse, each county would designate a county hospital and district hospitals to treat the sick and a county home, catering for the infirm elderly. Children in workhouses would be boarded out. Unmarried mothers might give birth in a county or district hospital, but they should not remain in these institutions beyond the post-partum period.

4.7 The first suggestion that special mother and baby homes should be established in Ireland came in the 1906 Vice-Regal Commission on Poor Law Reform in Ireland. Their report stated that the workhouse was an unsuitable ‘refuge or asylum’ for mothers of illegitimate children. First-time mothers should be sent to institutions owned or managed by religious communities or philanthropic persons. If no such institutions existed, they should be sent to a disused workhouse, adapted for the purpose that would only admit single mothers and their children. These special local authority homes should be managed by a committee of contributory boards of guardians, with a staff of special officers, ‘similar to those in charge of the religious or philanthropic institutions’.2 Mothers should remain in these special homes, caring for their children until they were at least one year old. At this point mothers should be placed in ‘suitable situations’ probably domestic or institutional service and their baby should be boarded out unless there were medical reasons for not doing so. Mothers of two or more children should be sent to Magdalen homes and should remain there. The 1906 Vice-Regal Commission provided the template for the mother and baby homes established after 1922, though this was not acknowledged.

4.8 Every county was asked to draw up a plan for the reformed delivery of health and welfare services. By 1927 schemes had been approved and were in place in every local authority except Dublin county and county borough, where the old poor law system continued. The overwhelming majority of these schemes made no provision for children ‘of any kind’ to be admitted to institutions; preferring that they

---

should be boarded out. Despite instructions from the DLGPH that all local authorities should make provision for unmarried mothers fifteen local authorities failed to do so. (Kildare, Kilkenny, Louth, Meath, Westmeath, Wexford, Wicklow, North Cork, West Cork, Limerick Borough, Waterford, Roscommon, Sligo, Cavan and Tirconail). Counties Galway and Clare and the Dublin Union established dedicated local authority homes for mothers and children. Cork South Board of Public Assistance (Cork - Ireland’s largest county was divided into sections for the purpose of administering health and welfare services), entered into an agreement with the Congregation of the Sacred Hearts of Jesus and Mary to send unmarried mothers in their area to the new mother and baby home at Bessborough (see Chapter 18). The local authority would pay a weekly capitation rate for all mothers and babies. All of these homes - whether they were private homes, such as Bessborough or owned and controlled by the local authority - such as Pelletstown, Glenamaddy/Tuam and Kilrush - were run by religious sisters. The Dublin Magdalen Asylum (later called Denny House), which only admitted protestant women, had no formal agreement with any local authority to admit mothers, but they received payments directly from the DLGPH covering approximately 50% of the cost of keeping a mother in the home for six weeks before the birth, and mother and baby for up to a year after the birth; a continuation of payments that they had received in the closing years of Ireland under the Union. There is no evidence that the Bethany Home, established in 1922, sought financial support from the DLGPH or a local authority until the late 1930s.

4.9 As already stated, 15 local authorities failed to make special arrangements for first-time unmarried mothers and there is no evidence that the DLGPH imposed any sanctions for their failure to do so. In the absence of alternatives, unmarried mothers in these counties, who sought assistance from the local authority, were admitted to a county home, or a district hospital (as happened in North Cork and Louth). The county homes (which were all formerly workhouses) that were originally intended to accommodate the elderly and incapacitated continued to house unmarried mothers and expectant mothers - like the workhouses before independence. Unmarried mothers remained in county homes in a number of counties despite the fact that the county schemes made no provision for this. Mothers and babies continued to be found in some county homes until the end of the 1950s, despite the DLGPH issuing recurring orders that they should be removed. But during the late 1920s and 1930s most local authorities began to
send some, though not all, first-time unmarried mothers who applied for assistance to one of the special mother and baby homes.

4.10 In 1930 only 8.26% of all illegitimate births were associated with the mother and baby homes that have been examined by the Commission. In 1931 with the opening of Sean Ross, this rose to 13%, and in 1932, it increased to 18.36%. By 1938, with Castlepollard also in operation, 28.3% of illegitimate births were associated with these homes. The 1930s is therefore the decade when mother and baby homes begin to accommodate a significant proportion of Irish unmarried mothers and their infants.

Infant Mortality and Illegitimacy

4.11 There was a growing interest in infant health and welfare in the years immediately before and during World War One. Infant mortality in Ireland was substantially higher than in England and Wales, and it showed less signs of improvement, though Ireland, as a predominantly rural country should have had lower infant mortality. The 1923 report of the Registrar General of Births, Marriages and Deaths - the first relating to the area of the Irish Free State, recorded an infant mortality rate of 66 per 1,000. Infant mortality in urban areas was 99 per 1,000; almost double the rate in rural areas. The death rate for ‘illegitimate’ children was 344 per 1,000 births, about six times the mortality of the children of married couples. At this time the death rate among ‘illegitimate’ children was significantly higher in every country, and that remained the case throughout most of the 20th century, but the adverse impact of ‘illegitimate’ birth was much greater in Ireland than elsewhere. In England and Wales, the mortality of ‘illegitimate’ infants was roughly double that of legitimate infants; roughly one child in eight born to a single mother in England and Wales died in the first year; in Ireland the figure was one in three. The highest mortality among ‘illegitimate’ children was between one and three months. The Registrar General noted that 1923 was the first year when the mortality of ‘illegitimate’ children was distinguished from overall infant mortality in Ireland. The second report of the DLGPH for the years 1925-27 quoted the annual reports of the Registrar General for the years 1925 and 1926, which showed that the mortality rate amongst infants born out of wedlock was about five times greater

---

These figures are derived from a table that totals the number of births in 8 large homes: Pelletstown, Tuam, Bessborough, Sean Ross, Castlepollard, Dunboyne, Bethany and Denny House. Regina Coeli is not included because of difficulties in isolating the new-born babies admitted. Statistics on births include babies who were born in these homes; babies born elsewhere to mothers who were in these homes until shortly before the birth, or mothers who gave birth elsewhere and were admitted shortly after the birth.
than that of legitimate infants, and that one out of every three of the first-mentioned class died before the completion of the first year of life’.

It is recognised that illegitimate infants are handicapped by constitutional and environmental disadvantages which tend to a heavy incidence of infant mortality, but even when allowance has been made for these factors, the death rate of such infants is disproportionately high in view of the experience of other countries. From analysing the statistics it is evident that this excessive mortality is accentuated at the age period from 14 days up to 3 months and in point of causation is associated with Enteritis and Diarrhoea. It may be inferred that the unfavourable results are traceable to the early separation of mother and infant and to the influence of unsuitable artificial feeding.

4.12 The message from this report was that unmarried mothers should remain with their children in the early months of the child’s life, so that the mother could breastfeed her child and reduce the risk of infant death. The high death rate among ‘illegitimate’ children also prompted greater scrutiny of boarded-out children and children placed at nurse, though any improvement in their care was dependent on the willingness of local authorities to enforce the regulations relating to these children, including removing children who were neglected or living in insanitary homes.

Illegitimacy and moral panic

4.13 The rate of illegitimacy in Ireland was low. Guinnane claimed that ‘By United Kingdom standards Ireland had very few births to unwed mothers, and by some standards it had practicably none’. He contrasted illegitimacy rates in Ireland with regions in Germany where the rate was five times higher. The official statistics undoubtedly underestimated the illegitimacy rate, but that would also be true for other countries, though the under-estimation/concealment might have been greater in Ireland, where considerable hostility was shown towards illegitimacy. The recorded rate of illegitimacy increased in the first three decades of the twentieth century, but the Irish figure remained low by international standards. The concerns expressed in Ireland about rising illegitimacy during the 1920s and 1930s were

---

4 Boarded out children were placed in foster homes by a local authority who paid the foster parent; children at nurse were either placed by a charity, or by the child’s mother or her family.

excessive - verging on the hysterical - but they had an impact on policy and attitudes.

Illegitimate Birth-Rate per 1,000 live births
1906 - 1913 from 1.98 (in 1908) to 2.21 (in 1910), average 2.10
1914 - 1918 from 2.31 (in 1914) to 2.50 (in 1917), average 2.43
1919 - 1925 from 2.58 (in 1922) to 2.71 (in 1920), average 2.65
1926 - 1929 from 2.81 (in 1926) to 3.20 (in 1929), average 2.99

4.14 The Catholic church had long inveighed against ‘occasions of sin’ - opportunities for young men and women to indulge in courtship. In earlier years priests had often targeted courting couples on country roads, “‘the horrors of night-walking and company keeping and the loathsome goings on in the lanes of Meelick after dark’”. Purpose-built dance halls became common only after the First World War; an earlier generation of priests targeted informal dance platforms at crossroads. Apart from new ‘occasions of sin’ in the form of motor cars, dance halls and cinemas, the main difference after 1922 is the existence of an independent government with the capacity to legislate to regulate dance halls and other ‘occasions of sin’. There was also a belief - not limited to Ireland- that the years of the First World War, and in Ireland, the war of independence and civil war, had resulted in a loosening of moral standards that must be reversed. The rise in illegitimacy was seen as the consequence of increased moral laxity; many believed that the solution was to legislate to enforce more stringent moral standards by censoring films and publications, regulating dance-halls, and associated activities. A number of historians have examined the battery of legislation introduced by the Irish Free State: censorship of films and literature (including periodicals); restrictions on dance halls, and the Criminal Law Amendment Act 1935 - which was initially intended to address the serious issue of under-age sexual activity, but was later extended to include a ban on the sale, importation, distribution and manufacture of contraceptives. There is no need to repeat this material here.

The sense of moral panic was aggravated by a belief in some quarters, that an independent, Catholic Ireland should become a role-model, an exception to the moral decline seen in most other western countries. This implied a need to ensure

---

and enforce higher moral standards than might have been expected when Ireland was part of the United Kingdom.

The coming of mother and baby homes to Ireland

4.15 In the early 1920s the *Irish ecclesiastical record*, a periodical supported and approved by the Catholic Church published four articles on the topic of unmarried mothers.\(^8\) The number and timing is significant; the *Irish ecclesiastical record* published no articles on this topic from its foundation in 1867 until 1920. The primary motivation of these articles was to highlight the risks of ‘souperism’ - the loss of Catholic mothers and children to Protestant charities - which had been a major concern of Irish Catholicism during the 19\(^{th}\) century. The articles highlighted the lack of places in institutions for Catholic unmarried mothers and their children, but opinions differed as to what type of homes should be established. The articles suggest that a wider debate was underway about the merits of establishing a National Rescue Home or several homes that would admit single mothers from all parts of Ireland. One author, Fr Maclnerney, was in favour of smaller homes. The prominent Catholic layman Sir Joseph Glynn suggested establishing hostels, where single mothers could live and work, and care for their child in the evenings and at feeding time. This debate, among Catholic clergy and active laity, can be seen as a response to Dáil Éireann’s recommendation that first-time unmarried mothers and their children should no longer be accommodated in a workhouse or county home, and the fact that the Dáil did not suggest alternative arrangements.

4.16 Fr Maclnerney’s first article, which was published in August 1921, i.e. before the Irish Free State was established, prompted a letter from the Mother Superior of the Congregation of the Sacred Hearts of Jesus and Mary, the religious order that ran St Pelagia’s Home in London. She indicated that her congregation was interested in establishing rescue homes in Ireland, and explained how they went about this in Britain. The congregation began by raising funds from charitable donations. Mother and child stayed in the home for at least a year. She claimed that ‘The greater number, at their own request, remain two, three or four years as the case may require. They are employed in laundry, needlework and household duties’. The congregation tried, but rarely succeeded, in getting the father of the child to

---

make a contribution towards the child's upkeep. ‘When the mother is placed in a situation the child is sent to one of our Orphanages or boarded-out, the mother paying a weekly or monthly sum out of her salary towards the support of her child. Sometimes the child is adopted by good Catholics’.

4.17 In late August 1921 (it is unstated whether this was before or after the letter quoted above), Fr MacInerney met the chaplain and secretary of St. Pelagia’s home, who were visiting Dublin. They informed him that the Mother Superior was interested in opening a similar home in Ireland. There were Irish women in St. Pelagia’s and her main objective was ‘to arrest the evil at its source: to get hold of erring girls and reclaim them in Ireland, instead of allowing them to drift into the underworld of English cities and towns’. They informed Fr MacInerney that the Mother Superior was prepared to buy a house with some acres attached near Dublin, Cork or Waterford. When he contacted the relevant Catholic prelates about this offer, the Bishop of Cork ‘promptly closed with the proposal and gave his hearty consent’  

On 10 February 1922 a meeting of the council of the Sacred Hearts congregation gave its sanction to the purchase of a 210 acre estate and large house in Cork - Bessborough, and Sister Martina was appointed as superior of this new foundation.

4.18 The St Pelagia’s model, which was similar to the regime followed by Protestant rescue homes in Britain, was transferred to Ireland by the Congregation of the Sacred Hearts, largely unchanged. The aim was to rehabilitate first-time unmarried mothers, by ensuring that they cared for their child for a definite period and the mothers remained in an institution where the practice of religion played a central role in their rehabilitation. The emphasis on keeping mother and baby together made medical sense, because that would enable breastfeeding, which was much safer for the infant, and should ensure better care for the child. It would also prevent ‘baby-farming’ - very young infants being handed over to uncaring minders for a fee. The process of caring for her child was seen as contributing to the mother’s rehabilitation. The women also carried out domestic duties and other forms of work. Although Pelletstown and Tuam were established by the local authorities, they were run by religious sisters, and the general ethos was not dramatically different to that found in Bessborough or Sean Ross and

---

9 MacInerney, ‘A postscript on the souper problem’.  
10 Sacred Heart Congregation Chigwell, Council Minutes 10 Feb 1922
Castlepollard, the other mother and baby homes established by the Congregation of the Sacred Hearts.

4.19 When Fr MacInerney wrote his articles in the *IER*, and when the Mother Superior of the Congregation of the Sacred Hearts responded, it would appear that both parties expected that any home (or homes) would be funded as a charity, perhaps by the Catholic Hierarchy. Fr MacInerney obviously regarded the support of the bishops as central, and the Mother Superior mentioned the need for fund-raising. Yet from its inception Bessborough received significant financial support from the local health authority – the South Cork Board of Public Assistance. The board made a per capita payment of 10s 6d for each mother and a similar sum for the baby (at this stage Bessborough did not admit ante-natal cases). The decision to allocate a per capita payment for the mothers and infants from South Cork admitted to Bessborough was crucial. Over the coming years other local authorities followed the example of South Cork, which meant that Bessborough and all homes established by the Congregation of the Sacred Hearts received most of their funding from local taxation. It is not clear how this transpired. Lucey, citing a 1923 report, states that the vice-guardians had introduced a new system, which involved placing unmarried mothers in the county home ‘under the care of a nun’ and in the belief that her supervision and care would prevent ‘subsequent relapses’. The minutes of Cork County Council in February 1922 discussed a scheme that involved establishing a county nursery, for deserted and orphaned children under the age of three. The nursery would also admit first-time unmarried mothers; single women who were pregnant for the first time would be admitted to a maternity unit attached to the nursery. All would be ‘under the care of the Religious Order in charge’ and overseen by a local authority committee.

4.20 The letter and the meeting cited by Fr MacInerney fill in part of that story. An alternative, perhaps complementary, version relates that the Congregation of the Sacred Hearts were contacted by Seamus Lankford, a Sinn Féin member, who had been appointed as one of three vice-guardians with responsibility for the Cork Union under the local government department that was established in 1920.

---

11 Vice-guardians were appointed by the DLGPH in place of elected guardians, who were suspended, generally because they had failed to exercise appropriate financial controls.
13 *Cork Examiner*, 16 February 1922
14 Lucey, *The end of the Irish poor law?*, p. 22
Lankford was introduced to the Congregation of the Sacred Hearts by Michael Sugrue, a Kerryman, who worked in London. Lankford paid a deposit on the large house at Bessborough, but according to his wife’s memoir the purchase money was provided by the Archbishop of Westminster.\textsuperscript{15}

4.21 Bessborough opened in 1922; the first residents were mothers and babies who had been transferred from workhouses in Cork city and county. In 1924 the Cork Joint County Scheme Order listed Bessborough as an auxiliary home of the South Cork Board of Public Assistance,\textsuperscript{16} in other words it was regarded as an integral part of the provision that the South Cork Board made for welfare and health in that area. We must presume that an agreement was drawn up between the Sacred Hearts congregation and the local health authority, but we have no copy of such an agreement, and no indication that such an agreement was approved by the Department of Local Government and Public Health.\textsuperscript{17}

4.22 The first women admitted to Bessborough were transferred from the Cork city workhouse, now designated as the county home, by the South Cork Board of Public Assistance. If unmarried mothers and their infants were being transferred from a workhouse/county home to a mother and baby home, it was obvious that the local health authority should pay for their upkeep. Yet within a relatively short period, the local authority was paying for the upkeep of unmarried mothers and infants from families who would never have contemplated entering a workhouse or county home. Dedicated mother and baby homes were seen by families, and by some pregnant single women, as more acceptable than the workhouse, and an alternative to private nursing homes.

4.23 The fact that the local authority funded the maintenance costs for a substantial number of unmarried mothers and their infants was critical in expanding the numbers of women entering mother and baby homes. If middling farmers or small businessmen had been required to pay for the upkeep of their daughter and her child, admissions would have been lower, and few mothers would have remained in a home for two years. Local authorities determined whether a woman should be admitted to a mother and baby home, and whether they would pay for her upkeep.

\textsuperscript{15} The annals of the Sacred Heart Congregation, which might have enlightened us about this, do not survive (and may not have been compiled) for the years 1919-27. Siobhan Lankford, \textit{The hope and the sadness. Personal recollections of troubled times in Ireland}, (1980), pp 269-70.
\textsuperscript{16} Lucey \textit{The end of the Irish poor law}, p 84
\textsuperscript{17} Dáil Éireann Local Government files have revealed nothing.
This marked a significant extension of public funding at a time when the new government was committed to reducing public expenditure - this is best exemplified by the notorious reduction in the old age pension in 1924. Local authorities were maintaining unmarried mothers and their babies for up to two years, perhaps longer, at a time when a majority of widows had no entitlement to a pension and the only option for those suffering long-term unemployment was to apply for home assistance, formerly known as outdoor relief.

4.24 In the early years a single mother who was admitted to Bessborough first had to attend at the county home, and initially it appears that Bessborough only admitted women (with children) after they had given birth. In 1924 a council meeting of the Congregation of the Sacred Hearts noted that the Bishop of Cork and parish council had asked the order ‘to undertake the supervision of unmarried mothers before the birth of children’ and the congregation had accepted this work ‘under certain conditions’ - which are not recorded.18 A later report by the Mother Superior noted that ‘there was a certain reluctance’ to admit women before the birth, and nothing happened until 1928 when ‘the Bishop brought up the question again’. By 1928 the number of women being admitted to Bessborough was falling and the bishop ‘almost insisted on the adoption of this work’. Other nuns were doing it and the Council agreed to fall in with the bishop’s wish, as the workhouses were closed to these cases’.19 By the end of the decade arrangements were in place enabling dispensary doctors or priests to arrange for an unmarried mother or pregnant unmarried woman’s direct admission to Bessborough. The removal of the taint of the poor law, plus the perception that Bessborough could shield an unmarried mother from public scrutiny, and the fact that the cost was borne by the local authority would have encouraged more families to send a daughter to a mother and baby home.

4.25 Bessborough, Sean Ross and Castlepollard were private institutions; the properties were owned by the Congregation of the Sacred Hearts. The congregation was responsible for the maintenance and upkeep of the homes and paying all bills. Lay staff, including nurses, were employed by the congregation. In the three homes established by local authorities - Kilrush, Tuam and Pelletstown, the buildings and grounds were the property of the local authority, and the Sisters were agents contracted by the local authority to run the homes. Kilrush and

18 Congregation of the Sacred Hearts, council minutes 23 March 1924
19 Congregation of the Sacred Hearts, general chapter 1933 Report of Superior General
Pelletstown were directly funded by the local authorities - i.e. they met the cost of food, heating, medical supplies etc., and the staff - lay or religious were local authority employees. Tuam had a different arrangement. The local authority was responsible for repairs and any expenditure on the building; they paid the cost of a chaplain, medical officer, and a local midwife - who was paid per delivery - but the running-costs were met by the Sisters, who were paid a capitation payment for each mother and child.

4.26 The fact that local authorities were supporting mothers and babies in these homes marked a significant change from earlier practice. In 1916 government funding had been given to charitable agencies that assisted unmarried mothers and their children, (see Chapter 3) but this was mainly dedicated to the costs of placing children in foster homes. Kilrush, Tuam and Pelletstown were owned and controlled by the local authorities, whereas Bessborough and the two later homes, were owned and controlled by a religious congregation, but all these institutions depended on public funding. All these homes, whether owned and controlled by a local authority or a religious congregation had a strong religious ethos that was central to their mission.

The Commission on the relief of the Sick and Destitute Poor

4.27 The Commission on the Relief of the Sick and Destitute Poor was established in 1925 to review the changes introduced by local authorities under the *Local Government (Temporary Provisions) Act 1923*. It was also charged with recommending legislation ‘for the effective and economical relief’ of various destitute classes including ‘unmarried mothers and their children’. In 1925 mother and baby homes were new, and they admitted less than 10% of unmarried mothers giving birth in Ireland, so it can be argued that future policy for unmarried mothers and their children had not yet been fully determined.

4.28 Statements by witnesses and members of the commission give some insights into attitudes at the time among health professionals, local government members, local and national officials and clergy. Many of the views expressed were similar to the attitudes that resulted in the establishment of mother and baby homes in Britain, the USA and Australia. Witnesses and commission members expressed concern over the high infant mortality rate, the exploitation and mistreatment of single mothers in private nursing homes, and the fact that children at nurse were often
placed in unsuitable homes. The paramount concern was the ‘problem’ of illegitimacy. How could the rise in illegitimacy be contained? What measures should be taken to prevent women who had one child from giving birth to additional children outside of marriage? There was widespread support for keeping mother and child together for at least one year, and while this was seen as having a positive impact on infant mortality - because the mother could breastfeed and give her child better care than in a foster home - that appears to have been a secondary consideration. Most of those who advocated keeping mother and child together believed that requiring a mother to remain in an institution would provide an opportunity for repentance and rehabilitation, and make her responsible for her child. The assistant secretary of the Department of Local Government and Public Health (DLGPH) told the commission that the department opposed permitting a mother to leave her child in an institution and go out to work, ‘we hold that this relieves the mother of responsibility’. Edward MacLysaght, a commissioner in the Dublin Union, who as a member of the Dáil Éireann Local Government Department appears to have been responsible for the establishment of the Kilrush home, also believed that a mother should remain with her child for approximately a year after the birth.

4.29 Sir Joseph Glynn, who was a member of the commission, was in favour of mothers and children living in hostels, which would care for the children during the day while the mothers worked nearby and contributed towards the upkeep of their children. He wanted hostels to accommodate a maximum of 20 mothers and children. He cited an official in the Child Welfare Department of the British Ministry of Health, who told him that ‘medical men condemned the living together in one building of a large number of babies of about the same age, owing to the rapid spread of infantile complaints among them’. Sean O’Farrell, Commissioner for the North and West Cork Boards of Health, was critical of Bessborough:

a large Home where you put a hundred or more than a hundred of these girls together is a disadvantage because they lose the sense of shame they would have had when they meet so many others who are in a like predicament to themselves. I would be rather inclined to favour smaller Homes for them. In the large Homes it becomes too much of an Institution and I think the people in charge would not have the intimate touch and association required.

---

20 Oireachtas Library. Minutes of Evidence, Commission on the sick and destitute poor, First Day, 27 May 1925
22 Evidence, Twenty-second day, 10 February 1926
4.30 The arguments against establishing large mother and baby homes did not receive serious consideration, and the only institution that came close to providing a hostel where mothers could work and keep their child was Regina Coeli, which was run by the Legion of Mary - but that role evolved gradually and almost by accident. (See chapter 21)

‘First Offenders’

4.31 There was widespread agreement among members of the Commission and witnesses that first-time mothers should be classified and segregated from mothers who had more than one child. Jennie Wyse Power, a member of the board of the Dublin Union, suggested that ‘you will get some very good mothers’ among second-time mothers, but she believed that ‘persistent offenders’ should remain in an institution for a longer period of time. The secretary of the Galway board of health was of the opinion that single mothers who had a second child had ‘very little’ chance of reformation. In such instances mother and child should be separated shortly after birth and the mother sent to a Magdalen home.\(^{23}\) One member of the Commission, in the course of questioning a witness drew a distinction between ‘the unfortunate girl who falls, not through her own fault, perhaps, and the others [are] the hardened people who come mostly from towns, and the lanes in towns’. He asked whether ‘the association of the first class with the second class tends to make the first class become more dissolute?’ MacLysaght was asked whether cases ‘where a woman has fallen more than a couple of times – put whatever limit you like on the number of her falls – cases of that kind may be treated as quasi-criminal?’ He agreed; he also agreed with the observation by the commission’s chairman that ‘that class of woman is a possible danger to the community’ and legislation should be introduced enabling her to be kept in an institution for some unspecified period.\(^{24}\)

4.32 There was widespread support for involving religious sisters in caring for unmarried mothers. Religious sisters had been working in Irish workhouses for almost fifty years, and many of the matrons appointed to the new county homes were religious sisters, so it is not surprising that they should be invited to supervise single mothers in whatever institutions might be established. Mrs Wyse Power wanted the nuns to keep in touch with first time mothers when they left the workhouse so that, ‘often she would keep straight for a while, or perhaps settle

\(^{23}\) Evidence, Sixteenth day, 22 October 1925

\(^{24}\) Evidence, Fifth day, 23 June 1925.
down altogether’. The only dissenter was Sir Joseph Glynn, who proposed that hostels should be supervised by trained social workers, (who were almost non-existent in Ireland in the 1920s), with a committee of women, ideally married women, because he believed that they would have a better prospect of gaining the mothers’ confidence.  

Fostering versus institutional care

4.33 The mother and baby homes that opened during the 1920s were designed with the mothers primarily in mind: rehabilitating, perhaps punishing them and allegedly training them for future employment. Little thought appears to have been given to what would happen to the children once they reached their first birthday. Witnesses disagreed about their long-term care. At this time few single women were in a position to provide for a child. It was generally expected that mother and child would separate - either permanently or perhaps maintaining some contact. The DLGPH was strongly in favour of boarding-out. In September 1924 the minister wrote to each county board of health noting that:

many healthy children are being maintained in County Homes. …adequate consideration has not always been given to the general advantages of the boarding out of children in suitable homes. It is believed that the successful upbringing of the children would best be achieved by having the children individually cared for in the families of the respectable poor.

4.34 The department wanted children to be boarded out in ‘rural locations…healthy surroundings’, which might enable them to work in agriculture. Pre-1922 poor law regulations which remained in force precluded children being boarded out in a town or village unless the minister gave express permission. The belief that rural homes were healthier than towns was correct, given that the death rate among children in urban areas was almost double the rural rate.

4.35 The DLGPH, in its enthusiasm, failed to consider the fact that Ireland had limited experience of boarding out under the poor law. A Cork witness noted that it was only possible to find foster families in poorer districts; there was little interest in becoming foster parents in prosperous areas such as Fermoy. MacLysaght noted that some local authorities were not in favour of boarding out. Miss Litster, an inspector of boarded-out children attached to DLGPH, noted that while she has

---

25 Evidence, Eighth day, 14 July 1925; Glynn, ‘The unmarried mother’
26 Commission on the Sick and Destitute Poor, Appendix VII. Letter 2 September 1924
had little difficulty in getting boards of health to adopt boarding out, ‘speaking
generally there is a tendency to put the child into the industrial school…Boards of
Health seem to think children are better off under the care of a religious institution’. She disagreed. She also cited ‘evidence of mothers leaving the county home with their child, and then applying to the court to have the child admitted to an industrial school’ - the mother would then take up a job, probably as a domestic servant.  

4.36 Many witnesses, including the assistant-secretary of DLGPH, expected mothers who were in paid employment to make a financial contribution to the cost of their child’s maintenance - whether the child was in an institution or boarded out. This determination to make mothers financially responsible for their child resulted in wholly unrealistic expectations; it ignored the reality that very few women at this time earned an income that would support a mother and a child. Many mothers who committed to paying for their child ceased doing so after one or two years.

Working in the homes

4.37 As the name indicates, the Poor Law required all able-bodied adults to work while in the workhouse. Most witnesses to the Commission on the Sick and Indigent Poor believed that the women in mother and baby homes should carry out some work. One witness claimed that women in Pelletstown did ‘any work the nuns ask them to do, but there is not sufficient employment for them’. They noted that women in the Dublin Union ‘do quite a lot of this laundry work’. Dr Thomas Hennessy TD, a member of the Commission claimed that single mothers in the workhouse worked hard: one described it as ‘slavish work. They were delicate refined girls who had the misfortune to fall and the idea seemed to be that because they were unmarried mothers it was good enough for them’. The annual report of the DLGPH for 1928-29 stated that mothers in Bessborough were trained in domestic duties, cookery, needlework, laundry and dairy work, poultry keeping and gardening. In 1930 the Congregation of the Sacred Hearts signed a lease on a shop in Cork that sold produce from Bessborough. No Irish mother and baby home ran a commercial laundry - probably because the maintenance payments by local authorities made this unnecessary. The report of a 1943 inspection of Bessborough by Miss Litster noted that there were nine former patients, who were

30 Congregation of the Sacred Hearts annals 19 August 1930. The shop was run for many years by two sisters; it closed in 1977; council minutes 10 February 1977
described as ‘old girls’ resident in the home. These long-term residents carried out ‘a good deal of work’ unpaid. They were not maintained by local authorities; she described them as ‘voluntary workers’.  

4.38 House work was viewed as training women for future employment and married life. It was widely assumed that most single mothers would either return home to their families (probably without the child), or find ‘a situation’, as servants with a family or in institutional employment. These assumptions were common-sense; in the 1920s the overwhelming majority of single Irish women of working age were either living with their family, and helping with domestic or farm chores - unpaid - or employed as live-in servants in Ireland or overseas.

4.39 The commission’s terms of reference included a reference to ‘economical relief’. There were strong pressures in the 1920s to reduce the cost of local taxation - rates, which was a heavy burden on farmers. The cost of maintaining women and children in county homes or mother and baby homes was met from local taxes. The secretary of the Co Limerick board of health wanted to make mother and baby care self-supporting by running a laundry or a similar activity; others suggested that some type of dressmaking/textile business should be attached to Pelletstown. Local authorities in the south-east investigated the possibility of establishing a mother and baby home, which would be supported by the mothers working in industries such as mattress covering, or shirt-making.

4.40 The Farmers’ Union, which represented larger farmers and lobbied for a reduction in rates, wanted the family of a single mother to be financially responsible for her upkeep, if she had been living at home prior to her pregnancy: ‘one feels that there must have been something wanting in parental control and that they should not be permitted to evade a natural and positive obligation to maintain her’. Admission to an institution should be an exceptional arrangement. Women from rural Ireland who became pregnant in Dublin should be returned to their families, who would be asked to maintain them. If a domestic servant became pregnant her employer should be responsible for the upkeep because she/he had failed to exercise proper supervision.

31 Department of Health, CCP/IMP/O/45492
32 Britain derated agricultural land in the 1920s, but that was financially impossible in Ireland because agricultural land accounted for a majority of rateable valuation in many counties.
33 County Kilkenny Board of Health and Public Assistance minutes, 25 March 1925
4.41 One of the most revealing statements came from a member of the Mayo Board of Health, who explained that although he was in favour of the principle that unmarried mothers should be removed from county homes:

I think the financial conditions of the County do not permit...I cannot see any advantage having this class under a religious order in a Central Home when they can be left in charge of a religious order in the ordinary County Home doing useful work. Their removal would mean the employment of several extra wardmaids which would be very difficult to procure. If it were possible to employ them it would be at great extra expense to the Ratepayers. ... If they were taken away to a Central Home it would mean employing 20 wardmaids at the rate of about £1 a week, and you would have to keep other attendants as well.\textsuperscript{34}

4.42 Although women were expected to carry out domestic duties in county homes and in mother and baby homes, a distinction should be drawn between the two. The residents in a mother and baby home consisted of young women with their babies and the workload was divided between all the mothers. Some witnesses alleged that there was insufficient work in Pelletstown to occupy the mothers. Single mothers in county homes were among the minority of residents who were young and healthy. Most residents were elderly, infirm, children or people with physical or mental disabilities, so the workload in terms of laundry, personal care, feeding and cleaning was considerable. Many county homes did not employ any indoor staff other than the matron; the work was carried out by single mothers, who were unpaid (See Chapter 10). The reluctance of local authorities to lose this significant source of unpaid labour is one reason why single mothers were found in county homes until the 1960s.

**Key Recommendations from the 1927 Commission**

4.43 The recommendations of the Commission on the relief of the Sick and Destitute Poor reflected the tone of the evidence summarised above. The commission favoured placing unmarried mothers in special institutions; they did not consider whether these institutions should be big or small, and they gave no consideration to the suggestion that hostels should be provided that would enable mothers to work and keep their child.\textsuperscript{35}

\textsuperscript{34} Evidence, Twenty-fourth day, 20 January 1926

\textsuperscript{35} The recommendations relating to unmarried mothers and their children are in Chapter VI, paragraphs 227-73.
First-time mothers

4.44 The commission endorsed the view that there were two categories of unmarried mothers - ‘those who may be considered amenable to reform’ and ‘less hopeful cases’. The first class was mainly comprised of first-time mothers; they concluded that first-time mothers required ‘a moral upbuilding…requiring firmness and discipline…characterised by and blended with a certain amount of individual charity and sympathy’. Those in charge should make ‘a true estimate of the character of each girl’. The ‘treatment’ of unmarried mothers should not be overly regulated or too hide-bound.

4.45 The commission considered that responsibility for first-time mothers should rest with the boards of health and voluntary organisations: ‘Boards of Health should be allowed an almost complete discretion in the matter of dealing with and paying for this class through the agency of Rescue Societies and other voluntary organisations’. They should pay for the mothers, and make arrangements with charitable organisations for their care. There is no suggestion that these homes should be inspected or should confirm to any standards with respect to accommodation, sanitation, food, staffing or living arrangements.

Others

4.46 As for the ‘residue…those who are the least open to good influences’, the commission would have wished to recommend the creation of ‘special homes…for this residue’, were it not for the expense. They estimated that there was a need for 500-600 places in ‘institutions under the control of the Boards of Health’ for women who were not deemed ‘amenable to reform’. Boards of Health also needed to accommodate approximately 500 children under one year of age and 1,000 older children. Pelletstown and Kilrush were viewed as suitable for this ‘residue’; it was recommended that these homes should include ‘a probationary department and a maternity department’ - where mothers could give birth and be ‘kept out of contact with the County Home’.

Duration of Stay and Detention

4.47 The commission recommended that women on a second pregnancy should be detained for two years; for subsequent pregnancies ‘the Board should have power to retain for such a period as they think fit, having considered the recommendation of the Superior or Matron of the Home’. The commission emphasised that the recommended periods of detention were ‘not intended to be in any sense penal. It
is primarily for the benefit of the woman and her child...We are not in favour of the rigid application of fixed periods of detention; those that we have mentioned are maximum periods within which the widest discretionary power should be used.’

The Board of Health should ‘normally’ act on the advice of the Matron.

No mother should be discharged until she has satisfied the Board of Health that she will be able to provide for her child or children, either by way of paying wholly or partially for maintenance in the Home or boarding it out with respectable people approved by the Board of Health.

4.48 Boards of Health should have discretion to permit a woman to leave without taking her child. Superiors (of religious institutions) and matrons had a duty ‘to endeavour to place those fit for discharge in suitable positions outside and to see that they will not be altogether without supervision’.

4.49 The goal of removing unmarried mothers from county homes came into conflict with pressure to control costs. The commission noted that unmarried mothers carried out a lot of work in county homes, and they saw ‘no objection in such women as the Matron considers suitable being transferred to the County Home for the purpose of assisting in the work of cleaning etc.’, presumably unpaid.

4.50 Despite government statements favouring boarding out, the commission wanted to leave boards of health with considerable discretion as to whether children should be boarded out or sent to industrial schools. Although they described boarding-out as ‘particularly suited to the present circumstances of the country, inasmuch as it involves no capital expenditure’, they concluded that there ‘is good in both systems - boarding-out and Industrial Schools’. Children who could not be boarded out should be sent to an industrial school; the cost should be shared between the board of health and the department. Measures should be introduced to enable this to be done without requiring a court order. The commission saw no reason why a board of health should keep any record of these children, once they had been transferred to an industrial school; this recommendation, plus the shared costs, would have acted as an incentive for boards of health to place children in institutions instead of boarding-out.

4.51 The commission noted that there had been a slight increase in the number of births outside marriage over the previous ten years. They expressed the hope that ‘with returning stability of Government and the gradual tightening of the reins of
discipline, both governmental and parental, that we may look forward to a decrease in the number of these births’. This paragraph can be read as an implicit endorsement of measures to control dance halls, and other activities that were believed to have contributed to the rise in the illegitimacy rate.

4.52 The commission also recommended strengthening the law with respect to affiliation orders, and sexual offences. They recommended that all private maternity homes should be licensed by local authorities, and subject to annual renewal of the license; licences should only be granted to homes that are ‘properly and suitably equipped for the purpose ….in charge of a respectable person trained in maternity care and nursing’. The *Children Act 1908* should be amended so that anybody proposing to take a nurse child should be required to give advance notice to a local authority, including notification of the number of children in the home. Foster parents should be required to notify the board of health if a child died or was removed from their care, and they should report on the condition of all the children under their care every three months. There was a brief reference to pregnant Irish women going to England, but the commission failed to propose any scheme for their repatriation, hoping that the numbers would decline ‘with better organisation’ of ‘the machinery for dealing with expectant unmarried mothers’, in Ireland.

4.53 The most significant outcome of the report of the Commission on the Sick and Destitute Poor, as it related to unmarried mothers and their children, was that there was no recommendation to change the arrangements whereby responsibility rested with the local authorities, working closely with religious institutions. There were no proposals to change the discretion of the boards of health on key decisions, such as retaining some mothers in county homes to carry out unpaid labour and whether children should be boarded out or sent to industrial schools. While the commission recommended the introduction of legislation relating to private maternity homes, and tougher regulations with respect to children placed at nurse, there was no suggestion that mother and baby homes, owned and run by religious congregations should be inspected or regulated by the state or by local authorities, despite the fact that the mothers and children were funded by taxpayers.

4.54 The key principles underlying the recommendations were local autonomy, concern for costs, and an innate belief that religious sisters were the best judge of how to rehabilitate an unmarried mother. A health authority, which wished to send
mothers to a mother and baby home run by a religious order or a charity, signed a generic agreement with that home. The memorandum of agreement signed in 1931 between Tipperary North Riding Board of Health, and Shan (sic) Ross Abbey acknowledged that the Mother Superior had almost total discretion over decisions relating to the home. It stipulated that she ‘shall be the sole judge of the suitability for admission of any person…and also after consultation with the Medical Officer in charge of the person of his (sic!) fitness for discharge’ from the home. There is evidence that the agreement with Castlepollard - which the Commission has not seen - was altered by the congregation to enable them to refuse admission to women ‘suffering from disease, with a vicious history, or who had been in prison’.

Underlying the recommendations there is also an implicit distinction being made on the basis of family circumstances and social class; some mothers, (presumably poor women) required a lengthy stay in an institution, others could be released at an earlier stage.

The Dáil showed very little interest in unmarried mothers or their children. The only references occur in debates on the Estimates for the DLGPH when some speakers referred to the number of single mothers and children in county homes. Deputies obviously believed that unmarried mothers should be removed from the county home, not because of any concern for their well-being, but because of a belief that respectable older people should not be in contact with this undesirable group. Money was extremely scarce in 1920s Ireland - and the needs of unmarried mothers were outranked by a considerable margin by demands to build or improve county hospitals, and introduce pensions for widows and their children. Widows with one child could apply for home assistance (under the British system relief outside the workhouse was available only to widows with two or more children), but no consideration appears to have been given to extending home assistance to the unmarried mother and her child, to enable them to live in the community, though it is possible that some local authorities paid home assistance in such cases. None of the legislation passed by the Oireachtas which impacted on unmarried mothers

36 As is explained in the Commission’s 5th Interim Report, the correct spelling is Sean Ross; the correct pronunciation is Shan Ross
37 Memorandum of Agreement made the 21st day of September 1931 between Tipperary (North Riding) county Board of Health and Shan Ross Abbey
38 Congregation of the Sacred Hearts Archives. J. A Shaw and co Solicitors Mullingar to Mother General Chigwell re Castlepollard 14 Feb 1952
or their children involved a significant increase in public spending by central government, though several measures impacted on local authority finances.

**Changes in provision 1928-39**

4.57 The annual report of the DLGPH for 1927-28 stated that following the publication of the commission’s report:

> A lot of valuable interchange of views has taken place between representatives of this Department and experienced social workers, and as regards unmarried mothers of first born children, an awakened interest is shown for their welfare and measures are being developed to provide institutions hitherto lacking.\(^{39}\)

4.58 Regrettably this Commission has not seen any contemporaneous files that might inform us of these discussions.

4.59 The 1927 commission’s recommendations affirmed the central role of local boards of health in determining the care and support to be given to unmarried mothers and their children. Given their central role it is not surprising that councillors and officials were often concerned at the cost. The Galway county secretary reported that each illegitimate child cost ratepayers approximately £300; in 1928 one member of Galway County Council called on Dáil Éireann ‘to introduce legislation giving power to commit second offenders to a Magdalen Asylum’; he suggested that a copy of this resolution should be sent to every TD in the county.\(^{40}\) The board of health in Tipperary North protested at paying 21s a week for a mother and child in Sean Ross, compared with 12s in the county home.\(^{41}\)

4.60 However this concern about the cost to ratepayers had to be weighed against the general opinion that unmarried mothers should be segregated from more ‘respectable’ sections of the community, such as older residents in county homes, and married women giving birth in public hospitals. While Dublin maternity hospitals had long provided maternity care for all women - single and married - this does not appear to have been the case elsewhere. Despite the potential cost, the Galway board of health agreed to open a maternity unit in Tuam, which would

---

\(^{39}\) DLGPHG Report 1927-28

\(^{40}\) Connacht Tribune, 8 September 1928

\(^{41}\) Nenagh Guardian, 29 July 1931
make it possible to exclude unmarried mothers from the Central Hospital in Galway.

4.61 In the mid-1920s there were four homes for unmarried mothers in receipt of local authority funding; three of which - Pelletstown, Tuam and Kilrush - were owned by local authorities, one - Bessborough - was a private institution. Local health authorities in Wexford, Waterford and Kilkenny were exploring the possibility of establishing another local authority home, catering for the three counties in the former New Ross workhouse. This plan did not materialise for reasons that remain unclear. From 1930 the expansion in institutional places for unmarried mothers was in private institutions established by the Congregation of the Sacred Hearts with the opening of Sean Ross and Castlepollard. The local authority home in Kilrush closed in 1932 (see Chapter 16).

4.62 The apparent withdrawal by local authorities from providing mother and baby homes in favour of homes owned by religious orders is consistent with the views expressed by Richard Mulcahy, the Minister for Local Government and Public Health, during the debate on a private member’s bill to provide money for nursing organisations from the Irish Hospitals Sweepstake.

We are trying in a gradual way to bring about a situation in which county homes, instead of being under the direct management of the local authorities, will be under the management of a religious order, responsible to the local authority for taking into the institution, on a capitation basis, persons whom the local authority directs should be taken in.

4.63 He claimed that such arrangements were already in place in the old county home in Mallow.

It is common knowledge to deputies that every institution in the country dealing with unmarried mothers is run in the same way (as this former county home in Mallow), entirely under the control of religious organisations fed by State money in one way on a definite basis but under the control of the religious orders and drawing funds and inspiration and help from charitable, as well as State sources.

42 Kilkenny Board of Health minutes, 25 March 1925
43 Dáil Debates, 18 Nov. 1931 cols 1633-34.
There is evidence that the DLGPH actively encouraged the Congregation of the Sacred Hearts to establish additional mother and baby homes. In the summer of 1929 Mrs Margaret Crofts, the senior inspector in the DLGPH visited Hayling, on the south coast of England, where the congregation ran an open air school, and it would appear that she met the Mother Superior. She subsequently wrote to the congregation, suggesting that they might establish a home ‘in connection with’ Bessborough that would accommodate young women over the age of 16 who were ‘feeble-minded’. This proposal reflects a belief that many unmarried mothers or women who were deemed to be at risk of becoming unmarried mothers were ‘feeble-minded’. Mrs Crofts wrote again some months later suggesting that they should establish homes - presumably mother and baby homes - in Waterford and Limerick. In July 1930 the Mother Superior of the congregation visited several dioceses in Ireland and met bishops to discuss the possibility of opening a home in their diocese. She visited one unnamed institution in Carlow with Mrs Crofts. In September she informed the triennial council meeting of the congregation that the Irish government was ‘anxious that a house should be opened’ and she read a letter from Bishop Fogarty of Killaloe welcoming them into the diocese ‘with certain conditions’, which are not stated. Mrs Crofts appears to have been involved in the search for a suitable house, though Corville House near Roscrea was identified by a member of the local Cistercian Order. When the Mother Superior travelled to Roscrea to inspect the house, having already purchased it unseen, she ‘had a long chat with Mrs Crofts and after consideration it was thought advisable to erect a new wing in Corville’. Mrs Crofts visited Chigwell in November 1931.

By March 1932 fourteen health authorities had agreed to maintain women in Bessborough or Sean Ross: South Cork, Kerry, Waterford, Wexford, Wicklow, Kildare, Kilkenny, Laois, Offaly, Tipperary North Riding, Tipperary South Riding, Clare, Galway and Mayo. Efforts were underway to establish a home for unmarried mothers for the counties of northern Leinster plus Monaghan and Cavan. By the following year Limerick City, Leitrim and Monaghan were sending mothers to special homes, and the Congregation of the Sacred Hearts had obtained permission from the Bishop of Meath to establish a third home. The congregation’s archives suggest that the department encouraged this expansion. The council minutes of 11 May 1932 record that ‘Owing to the near date of the

44 Congregation of the Sacred Hearts annals 10 Sept, and 3 Dec. 1929
CHAPTER 4 1922-1939

Chapter, Rev Mother General and Her Council reluctantly give their consent to accept an offer from the Local Government Board of Dublin [sic- the records of the Congregation contain numerous errors in titles of Irish government departments and Irish dioceses] to open another home for unmarried mothers in the diocese of Meath, but in the future interests of the congregation they consider it would not be advisable to refuse the work’. In 1934 two members of the congregation travelled to Ireland to inspect possible sites for a third home. They visited four properties accompanied by Mrs Crofts and an architect, and decided to purchase Castlepollard. They met officials of the DLGPH. Draft terms for the new homes were agreed some days later.  

Irish Hospitals Sweepstake and mother and baby homes

4.66 In the 1920s most mothers entered mother and baby homes following the birth of their child. Babies were born elsewhere; for Bessborough this was generally Cork county home; Pelletstown, in the Dublin Union (James’s Street); for Tuam the Central Hospital in Galway. The Clare County nursery in Kilrush was the exception - women gave birth in that institution, as they did in many county homes. In March 1930 the minutes of the South Cork board of public assistance recorded that their proposal to arrange for the admission to Bessborough of pre-natal unmarried mothers, chargeable to the South Cork board, had been submitted to the minister, and he saw no objection to the terms of the draft agreement with the Bessborough authorities. The minutes of the Congregation of the Sacred Hearts council record that the Bishop of Cork had asked them to do this in 1924. No copy of this agreement to admit pregnant women has been found in the records of the congregation or the records of the Cork board of public assistance or the DLGPH.

4.67 The extension of the remit of mother and baby homes to provide maternity services was made possible by the Irish Hospitals Sweepstake. The sweepstake, which was founded to meet the financial needs of Dublin voluntary hospitals, had turned into a remarkably lucrative source, with the result that there was pressure to make some of the revenue available for other causes. In February 1931, Dr PJ O’Dowd, Fianna Fáil TD for Roscommon, introduced a private members’ bill to extend the sweepstake to public hospitals outside Dublin. He suggested that mother and

48 Council minutes 23 Mar. 1924
baby homes should also qualify for funding, in order to speed up the removal of unmarried mothers from county homes. Dr O’Dowd abandoned his bill when the government announced that they would introduce similar legislation. Section 6 of the Public Charitable Hospitals (Amendment) Act 1931, which was introduced in place of Dr O’Dowd’s bill provided that one-third of the available surplus in any sweepstake would be paid to the Minister for Local Government and Public Health ‘and shall be applied by him in such manner as he shall think fit in or towards the provision, improvement or equipment of institutions for the prevention, treatment or cure of physical or mental diseases or injuries of human beings’.  

4.68 Although section 6 of this Act is headed ‘Application of portion of proceeds of sweepstakes to poor law hospitals’, Bessborough mother and baby home was one of the first beneficiaries. On 9 December 1931 the Mother-General of the Congregation of the Sacred Hearts wrote to the DLGPH applying for a grant under this section. She explained that the community had opened two hospitals during the past year, one at Bessborough, the other at Sean Ross Abbey. Her request received strong support from Mrs Crofts, who emphasised that the hospitals were ‘absolutely separate institutions from the Homes for Unmarried Mothers’, and it would be necessary ‘to enlarge the accommodation in the near future. We want to encourage expectant unmarried mothers to avail of hospitals consequently the charge cannot be prohibitive’. She described the charge for keeping mother and baby in these homes, one guinea per week, as ‘more or less prohibitive’, but she suggested that the Sisters had ‘to a certain extent to balance the loss on the hospital’.

4.69 On 25 January 1932 the Mother Superior phoned Mrs Crofts in relation to alterations in the building plans for Sean Ross. Some days later a letter in the name of the Minister for Local Government and Public Health was sent to Chigwell asking for an estimate of ‘works that would come within the terms of the 1931 Act’. The Mother Superior responded promptly explaining that the hospital at Bessborough was ‘merely a cottage’; to build and equip the necessary hospital would require £5,000. To build and equip the hospital at Sean Ross, where apparently work was underway would cost £2,500. She claimed that the hospitals were necessary because

50 Dail Debates 20 Feb. 1931
51 Congregation of the Sacred Hearts Annals 9 December 1931
52 Department of Health, INACT/INA/0/ 463708
53 Congregation of the Sacred Hearts Annals 25 January 1932
when unmarried mothers are received they are in all cases in need of nursing, due to physical suffering, and in many cases, although not perhaps actually feeble-minded, close study reveals a certain amount of mental deficiency.

4.70 The hospitals were developed ‘to meet the need of nursing and the continuing possibility of mental disease’. In the absence of nursing care she believed that ‘the girls would develop into chronic invalids and mental deficients’. She expressed the opinion that these hospitals came within the terms of the 1931 act. The highlighting of mental deficiency and mental illness may have been designed to bring this application within the terms of the 1931 act; it is unclear otherwise how hospitals attached to mother and baby homes would qualify. On 11 February 1932, five days before a general election, the department informed the Sacred Hearts congregation that the ‘Minister is prepared to give favourable consideration to your application’. An application for a grant towards the cost of a hospital at Bessborough would be approved on condition that plans and estimates were submitted to the department. With respect to Sean Ross ‘a report from a medical inspector would probably satisfy the secretary that suitable provision is being made for unmarried mothers both before and during their confinement’. A medical inspector visited Bessborough and Sean Ross some weeks later. He described the work carried out in Bessborough as ‘most valuable”; the institution was ‘very well administered; they should be given ‘every possible assistance’. When he visited Sean Ross he suggested to the Sister in charge that if ‘she put her requirements on paper that I would look at them and report to the Dept.’

4.71 The initial letter had requested £5,000 to set up and equip a hospital at Bessborough, but once the congregation had received ministerial approval in principle, their ambition soared. They received initial approval for a grant of £13,000, which was later increased to £17,000 - the cost of constructing a new maternity hospital at Bessborough, minus the cost of the architect’s and quantity surveyor’s fee. If the department or the Hospitals Commission attached conditions to this grant, no copy survives. We must presume that Bessborough was awarded funding on the basis that the institution was ‘partly maintained by a local authority’ - though the maintenance amounted to paying for mothers and children.

54 Congregation of the Sacred Hearts Annals 8 February 1932, 11 February 1932
55 INACT/INA/0/463708 Grants from Hospitals Trust Fund
56 First report Hospitals Commission, 54,
4.72 It is unclear whether this generous award was approved by Richard Mulcahy, or by Seán T. O’Kelly, who succeeded him as Minister when a Fianna Fáil government took office following the 1932 general election. Tenders for the new hospital were advertised in January 1933.\(^{57}\) In 1934, as the hospital was nearing completion, the congregation applied to the Hospitals Commission for a grant of £2,802 15s towards the cost of equipment. They received a grant of £1,500, under the provisions of the *Public Hospitals Act 1933*.\(^{58}\) While these grants were recommended by the Hospitals Commission (whose records do not appear to survive), all decisions on grants were made by the Minister for Local Government and Public Health under the 1933 Act (see Chapter 1).\(^{59}\)

4.73 The *Public Hospitals Act 1933* extended the definition of a hospital to include ‘any institution or organisation for affording asylum to blind, deaf, dumb, or mentally defective persons or to expectant mothers, or others with their children of less than five years’. Organisations and institutions catering for unmarried mothers and children were eligible to apply for funding; likewise ‘the portions of County Homes utilised as infirmaries’.\(^{60}\) The construction of a dedicated hospital in Bessborough, and the opening of maternity units in Tuam, Pelletstown, Sean Ross and Castlepollard extended the capacity of these homes significantly, and their remit now included childbirth. This happened at a time when religious sisters were not yet permitted to attend at births. The papal restriction was removed in 1936.

4.74 The introduction of maternity units into these homes reflects pressure to segregate unmarried mothers from other maternity cases in public hospitals. Figures presented to the Commission on the Sick and Destitute Poor suggest that most unmarried mothers outside Dublin gave birth in former poor law institutions, and the quality of the infirmaries in the county homes was very unsatisfactory - they were often without indoor toilets or running water - making them utterly unsuitable as maternity units.\(^{61}\)(see Chapter 10)

4.75 The Hospitals Commission, which was responsible for advising the minister on the use of the Hospitals Trust Funds, appears to have approved of the segregation of unmarried mothers. Their first report contains a short description of St Patrick’s

\(^{60}\) *First report Hospitals commission*, p 2.
Guild, and St Gerard’s, the guild’s 24-bed home for unmarried mothers in Dublin’s Mountjoy Square (see Chapter 27). It stated that:

confinements do not take place in the Home except in emergencies, the patients being usually sent to the City Maternity Hospitals. It is doubtful if this is good practice under the circumstances and the Commission would recommend that suitable accommodation for delivery in the Home be provided. This Home offers a desirable privacy not easily attainable in Public Maternity hospitals.61

4.76 St Patrick’s Guild received a total of £31,274 from the Hospitals Commission in the years up to 1941. The Hospitals Commission met the deficits of voluntary hospitals and in the 1930s it paid a total of £8,338 to meet deficits incurred by St Patrick’s Guild. However in 1936 the Hospitals Commission determined that it could only meet deficits on St Patrick’s Infant Hospital at Temple Hill, which housed children before they were placed at nurse, and nurse children who were returned to the guild because they were ill. It refused to meet the deficit on the guild’s placement services, though it continued to meet deficits on other activities. In 1933 St Patrick’s Guild made a successful application for payments under the Maternity and Child Welfare Scheme, which met 50% of the cost of placing children at nurse.62

4.77 The Hospitals Trust Fund provided substantial capital funding for dedicated mother and baby homes. Bessborough received £23,605 for the construction and equipment of its new maternity unit; Sean Ross secured £44,063, for improvements and extensions including a new nursery, improvements to drainage and sanitation and a new cow shed and dairy, to ensure that the home would be supplied with clean milk. The largest sum, £68,000, went to Castlepollard. This covered the entire cost of fitting and equipping a 120-bed unit, which included the maternity and infant units, and accommodation for mothers. The building was completed in the 1940s, and although we have no descriptions of the accommodation available in the 1930s, evidence indicates that until it opened some women were sleeping in unheated lofts above the stables (see Chapter 20). Pelletstown received £43,385 for additions to the maternity wing, including a new storey, a 20-bed isolation unit and sanitary annexes.63 The Hospitals Commission

62 Department of Health, RM/ARC/0/521022
63 Hospitals Trust, Ireland’s Hospitals, 1930-55, Appendix II, pp 63-72.
ensured that mother and baby homes had modern facilities - maternity units, sanitation, heating - facilities that were probably comparable to maternity units in the county hospitals that were being constructed or renovated at this time. Galway County Council provided funding for a small maternity unit in the Children’s Home in Tuam. This was the only part of the building to undergo any significant improvement (see Chapter 15). In 1938 a grant of £400 from the Hospitals Trust Fund was made to Tuam, which was two-thirds of the cost of erecting a new laundry and disinfecting equipment. A later application for a new entrance gate and wall was rejected.  

4.78 The generous capital resources allocated to mother and baby homes reflected the policy of the DLGPH - initiated under a Cumann na nGaedheal government - and continued, apparently seamlessly, by Fianna Fáil. The second report of the Hospitals Commission for the years 1935 and 1936 noted that ‘The completion of the institution [Castlepollard] will go far towards meeting the requirements of the scheme initiated by the Department for dealing in an enlightened manner with a particular important aspect of the unmarried mother problem’. There is evidence that the department was keen to see the establishment of an additional mother and baby home. In 1936 the council of the Congregation of the Sacred Hearts noted that the ‘Local Government Board of Health Dublin [sic] are anxious another house will be established in or around Sligo’. The congregation secured the approval of the Bishop of Sligo (sic - the correct name is Bishop of Elphin) and a superior was appointed for the proposed Sligo home. The Mother Superior and another Sister visited Sligo ‘touring with Mrs Crofts’ but they failed to identify a suitable house in that area. Mrs Crofts contacted Chigwell the following year suggesting that they should open a home in Wexford. The minutes note that ‘she had an interview with Bishop Codd [Ferns] and he is evidently anxious that we should take up the work of unmarried mothers in the diocese. She thought that Sligo should not be considered until something better offers itself in or around Sligo’. The congregation duly contacted Bishop Codd seeking his permission, and the Mother Superior visited the DLGPH to meet the new secretary of the department. She had ‘a very favourable meeting’ before Mrs Crofts drove her and her companion to Wexford where they inspected houses, but found ‘nothing satisfactory’. By this

64 The reports of the Hospitals Trust list all applications for funding, both successful and unsuccessful.
time the existing mother and baby homes were overcrowded - hence the department's wish that an additional home should open.

4.79 The inclusion of mother and baby homes among the institutions eligible for funding from the Hospitals Commission made it possible to expand the number of places, and to add maternity units, marking a further extension in the segregation of unmarried mothers. Unmarried mothers and their infants do not feature in Dáil or Seanad debates and parliamentary questions during these years. Many questions were tabled about availability of hospitals sweepstake money for various institutions, but none relate to mother and baby homes.

The Legitimacy Act 1931

4.80 The funding of mother and baby homes and associated maternity units was only one aspect of government ‘policy’ towards unmarried motherhood during these early decades after independence. The *Legitimacy Act 1931* provided that the child of a single mother was ‘legitimate’ if the parents married within ten months of the birth. The UK had introduced a similar act in 1926; the terms were broadly similar in both instances, but in the UK the man could make a statement that he was the child’s father either at the time of the marriage, or within a year, which was less stringent than the Irish requirement.\(^{67}\)

The Illegitimate Children (Affiliation Orders) Act 1930

4.81 This was designed to make it easier to claim maintenance payments from fathers of illegitimate children. Local authorities were financially responsible for maintaining mothers and children in institutions and for the cost of boarded-out children. Many councillors and officials believed that they could reduce the costs to ratepayers by pursuing putative fathers. The Affiliation Orders Act can also be presented as a means of levelling the burden between single mothers and the fathers. Giving evidence to the Commission on the Sick and Destitute Poor, Rev Patrick Devane expressed the view that ‘it seems rather unjust to the woman that she should bear the whole brunt of the trouble’; the father of the child should be made ‘answerable for his conduct’.\(^{68}\)

4.82 In the 19th century the law on affiliation orders in Ireland was much more restrictive than in Britain. The only legal remedy was to take a case for seduction against a

\(^{68}\) Evidence Commission on the Sick and Destitute Poor, Twentieth day 5 Nov. 1925
putative father; the case could not be taken by the woman; it could be taken only by her father or her employer. This reflected the subordinate status given to women. Few cases were taken and the success rate was extremely low. A memorandum prepared as background to the 1930 Act noted that the existing remedy ‘is a costly one and is of no avail unless the putative father is a “good mark” and has means or property which can be made available to meet an execution order of a Court or an instalment order’. Poor law guardians had powers under nineteenth century legislation to recover the cost of maintaining an illegitimate child under 14 years who was a charge on the rates, but these proceedings required the mother to be examined in court and have her evidence corroborated; it gave the mother no personal redress.

4.83 The Department of Justice memorandum reflected a degree of sympathy for unmarried mothers, while also expressing the unsubstantiated opinion that there was a link between single mothers and prostitution:

> It is doubtful if anybody would be found to question the wisdom or justice of enabling the mothers of illegitimate children to compel the fathers of such children to contribute to their support. Many unfortunate unmarried mothers are denied the shelter of their own families and it is possible that some of them, who might otherwise reform, drift into the prostitute class in a spirit of despair induced by the hardships they suffer. It can be readily appreciated that girls of the domestic servant class who get into difficulty find themselves in a position of great hardship trying to earn their living and to maintain an illegitimate child away from their ordinary place of work. A weekly contribution from the father of the child would ease this situation considerably. It is not impossible too, that the ability to obtain an affiliation order may lessen the number of cases of infanticide.

4.84 In 1928 Roscommon county board of health adopted a resolution, which had previously been passed by Cavan county board of health, asking the minister to introduce amending legislation to enable district justices to make affiliation orders against alleged fathers of illegitimate children ‘thereby relieving the Board of a stupendous burden’. Several local authorities interrogated pregnant women who applied to them for admission to a mother and baby home about the identity of the

putative father; the local authority solicitor would review the cases and determine whether or not to prosecute. In his evidence to the Carrigan Committee, Rev Richard Devane included a report by the secretary of the Galway board of health, titled, ‘The Fruits of the Dance-Hall’, which stated that the Galway county homes committee had passed a resolution urging the government to introduce laws to make the putative father responsible for the cost of maintaining his child. It claimed that each illegitimate child who became a charge on the poor rates from infancy until the age of 15 cost the county £300; the total bill for the 54 illegitimate children born during the previous year, maintained in the county institutions would reach £16,000.  

4.85 There were few successful prosecutions under the 1930 Act. A mother had to provide corroborating evidence as to the identity of the putative father; she needed a witness who was willing to testify. The Minister for Justice claimed that corroborating evidence was necessary to prevent men being blackmailed, and several TDs appear to have been sympathetic towards putative fathers. Cases had to be brought to court, either before the child was born or within six months of the birth. In 1936 the solicitor to Mayo County Council told the board of health that they had failed in a few recent prosecutions against putative fathers. He recommended that the board should cease prosecuting on the evidence of unmarried mothers ‘owing to the expensive nature of proceedings’. In 1949 a Department of Health file noted that no proceedings had been taken in Co Monaghan ‘In this county, as in many others it is considered a waste of time and money to pursue putative fathers either possessing no means or liable to leave the country as soon as an action is mooted’.

4.86 Some local authorities persisted in attempting to enforce affiliation orders despite the low success rate. In 1943 Galway county council determined to pursue the putative father of one infant admitted to the home, who was serving in the army. Another putative father would be interviewed about his means when he was discharged from Limerick prison. Westmeath County Council was among the most assiduous in this respect. When a woman from that county was admitted to

Castlepollard, a Senior Assistance Officer (SAO) visited to interview her about the putative father, and he might follow up on her report by carrying out further investigations in her native area. In 1938, for example, the SAO ‘interviewed […] in connection with the case’. This man was described as single, 36 years old, living with his mother on a 30 acre farm. He denied ‘ever keeping company with […] and stated that he is not the father of the baby’. He claimed to have an alibi for a particular date (presumably the date when […] alleged they had sexual relations). The SAO also interviewed a woman, who could not confirm the statement that […] had made ‘regarding the events of 7 November’. A putative Westmeath father investigated the following year was described ‘a young labourer and son of a labourer, residing with his father and is presently employed on a relief scheme’,76 so presumably not worth pursuing for child support. Another was traced to the Curragh, where he was serving in the army. One man, who admitted keeping company with a single mother but denied that he was father to her child, was pursued in the courts. One father who had already had a decree issued against him requiring him to pay £1 a week for the maintenance of his child was pursued for the full maintenance cost. It was reported that he had an equal right to a 28 acre farm; he worked with several farmers and did not hand up any money to his mother. In 1941 Westmeath secured £15 15s 6d from a putative father, and then pursued him for the legal costs. His solicitor contacted the board of health, indicating that he would pay the board, but not the mother of the child. A number of mothers interviewed in Castlepollard gave vague descriptions of the putative father - alleging that he was a stranger to the area; sometimes giving what was evidently a false name, but the local authority often pressed for more information. One report from the Westmeath board of health’s solicitor in 1941 described the statement of one Castlepollard mother as ‘vague and unsatisfactory. No date of any kind is given, neither the date of birth of the child. Nor even the year or month when she first met […] or even started to keep company with him’. The solicitor asked about the occupations of the mother and the alleged father; whether any letters between them existed; had he ever visited her family home? He also threatened to summon other (named) witnesses to give evidence, if they refused to make voluntary statements.77

4.87 Westmeath local authority persisted with these investigations. Managers’ orders were issued throughout the 1950s, noting the admission of women (initials only

76 Mullingar, Westmeath Board of Health and Public Assistance minutes 26 Sept. 1938 and 30 Mar. 1939,

recorded) to Castlepollard with the accompanying instruction: ‘X to be instructed to take the usual statement’ (as to paternity). Only a tiny proportion of inquiries resulted in prosecutions, either because of lack of corroborating evidence, or the putative father was not worth pursuing. County Kildare took seven affiliation actions between 1939 and 1950, and five were approved. Of the 280 affiliation cases taken in Dublin between 1940 and 1948, the judge’s ruling is recorded for 236; an affiliation order was approved in 122 cases - just over half. In only four cases did the man admit paternity. Although the Department of Justice recommended that all affiliation cases should be tried ‘without the presence of the public or the press’, and the District Justice should arrange where a mother was ‘young and friendless’ that a ‘suitable woman’ should accompany her to the court, many local newspapers published details of these cases and gave the names of both the mother and the putative father. Some cases were adjourned repeatedly; some mothers withdrew their claim following a number of adjournments. A 1950 memorandum by the Adoption Society of Ireland claimed that ‘in only two out of two hundred cases before the court was paternity successfully established, and the man solvent’. Nevertheless local authority records suggest that the threat of an affiliation order was used to put pressure on putative fathers, and an unknown number probably made payments without being brought to court in order to avoid publicity. The visits of assistance officers, who were generally men, to the mother and baby home to interrogate mothers about intimate personal details would have been traumatic; subsequent inquiries conducted among family, friends and neighbours threatened to destroy her privacy, while exercising social pressure on the putative father, even if he avoided prosecution.

Registration of Maternity Homes Act 1934

4.88 It is because of the high death rate amongst illegitimate children that we want to establish some more effective control over the numerous maternity homes now operating. As Deputies are probably aware, these institutions take it upon themselves to dispose of and to board out these children. From the abnormally high death rate amongst this class of children one must come to the conclusion that they are not looked after with the same care and attention as that given to ordinary children.

78 National Archives of Ireland, Department of an Taoiseach, SS931
80 Adoption Society of Ireland Memorandum 9 Feb 1950s
81 Dáil Éireann 7 Feb. 1934
4.89 The *Registration of Maternity Homes Act 1934* was a significant piece of legislation, which had the potential to improve conditions for all women who gave birth outside the family home, irrespective of marital status. It was explicitly seen as a measure to improve the health and survival prospects of unmarried mothers and their children, as it would entail the registration and inspection of the many private nursing homes where unmarried women gave birth and others placed their child. The paragraph in the annual report of the DLGPH for 1934-5 relating to the Act noted that:

The Commission [on the relief of the Sick and Destitute Poor] adverted to the high death rate of illegitimate children and went on to point out that it frequently happens that the mother of an illegitimate child, or the mother’s family at the time the mother leaves the hospital or home, makes arrangements with someone to take the child, either by paying a lump sum down or undertaking to pay something from time to time. These arrangements are often made or connived at by those who carry on the poor class of maternity homes, and the results to the child can be read in the mortality rates. If a lump sum is paid or if the periodical payments lapse, the child becomes an encumbrance on the foster-mother who has no interest in keeping it alive. The aim of the Registration of Maternity Homes Act is to bring maternity homes under proper control, to ensure that the patients who enter them will get skilled treatment, and that the infants will be protected.

4.90 Local authorities were required to keep a register of maternity homes; they had power to refuse registration if the applicant was not a ‘fit and proper person’; if the premises were unsuitable or if the superintendent nurse was not a qualified nurse or a certified midwife. Premises would be subject to inspection. Introducing the bill, the Parliamentary Secretary to the Minister for Local Government and Public Health, Dr Conn Ward, who was effectively Minister for Health, but without a Cabinet seat, quoted several paragraphs from the report of the Commission on Sick and Destitute, including statistics showing that in 1924 the infant mortality rate of illegitimate children was five times the national average. He referred to the fact that ‘the poorer class of maternity homes’ often made arrangements to place the children of single mothers, sometimes for a lump sum.

4.91 A maternity home was defined as ‘any premises which are, either wholly or partly, used or intended to be used for the reception of pregnant women or of women immediately after childbirth.’ It was not necessary that women gave birth in the
home. In the initial draft any hospital or premises maintained or controlled by a department of the state or by a local authority, or by a body constituted by special act or by charter was exempt from the act, and the minister was given power to exempt from registration any hospital or maternity home, which was ‘not carried on for private profit’. This clause would have exempted the mother and baby homes, but speakers in the Seanad demanded that all maternity homes should be registered. An amendment to that effect was introduced at committee stage, though the minister retained the discretionary power to exempt an institution from registering. Each maternity home was required to keep a register recording admissions, discharges, confinements, miscarriages, births, deaths; details about the removal of children and the address to which they were removed.

Most private maternity homes, catering primarily if not exclusively for single mothers were in Cork and Dublin, though others may have existed elsewhere. Before the 1934 Act, the only powers to inspect these maternity homes were under the Midwives Act 1918, which was designed to ensure that only registered midwives and other qualified persons (such as medical practitioners) attended women in childbirth. In 1931 the superintendent medical officer of Cork county borough inspected twenty-two private maternity homes in Cork city and determined that thirteen were unsatisfactory; they had no bathrooms, ten had outside water closets. One home had a water closet in the yard, which was also used to keep pigs.

When the 1934 Act came into operation, the department was determined that the register should be comprehensive, and they rejected requests by the Dublin maternity hospitals for exemption, arguing that their inclusion was important to send a message. All county homes were included on the register, as were Pelletstown, Bessborough, Sean Ross and Castlepollard, Tuam and the Bethany Home, though Denny House and Regina Coeli were not. Perhaps they did not apply because they thought they were not covered as mothers did not give birth in these establishments. The act subjected mother and baby homes to inspections by the DLGPH for the first time, though only to ensure their compliance with the terms of the 1934 Act, so there appeared to be some doubt as to whether the inspection extended beyond the maternity units.

82 Dáil Debates, 7 Feb 1934; 20 Mar. 1934
83 J.C. Saunders, Cork County Borough: annual report of the medical officer of health for the year 1931 (1932), pp 54-5.
84 National Archives of Ireland, M.34.58 Dublin County Borough M.C.W. - Registration of Maternity Homes Act 1934 Reports, Registrations and Cancellations.
4.94 The inspections under the 1934 act were carried out by the medical inspectors of the DLGPH, and by Mrs Margaret Croft, Chief Inspector in the Department, and her successor Alice Litster. The non-medical inspectors who were assigned to this role, required a letter signed by the secretary of the department authorising them to inspect maternity homes. Inspectors completed a detailed printed form that did not distinguish between a mother and baby home and other maternity units. The Commission has seen a number of these inspection reports; they indicate that the DLGPH used these inspections to press for higher standards in all aspects of maternity and infant care, in mother and baby homes and private nursing homes. Maternity homes were also subject to inspection by the local authority; the Commission does not know if their inspections were equally stringent. The department could press for higher standards but it could not de-register a nursing home; this power was available only to the relevant local authority.

4.95 In 1936 the DLGPH inspected the Bethany mother and baby home for the first time. The inspection determined that the bedrooms were overcrowded and the medical staff (which included nursing staff) was inadequate. Several nurses who had previously worked in Bethany had not secured Irish registration, or lacked a CMB (the Central Midwives Board) qualification. Following this inspection Bethany decided to employ a CMB-registered nurse for a week, and give notice to another nurse, who appears to have lacked the appropriate qualifications. This is one indication of the impact of the Act on the standards in maternity homes. However the department only inspected maternity homes at annual or longer intervals, so enforcing higher standards was dependent on the local authorities, and there is considerable evidence of poor and sub-standard private maternity homes well into the 1950s.

Children Act 1934

4.96 The DLGPH regarded the Children Act 1934, which amended Part I of the Children Act 1908 as complementing the Registration of Maternity Homes Act - both measures were designed to improve the survival prospects of illegitimate children. Introduced within days of the second reading of the Maternity Homes Bill, it also followed the recommendations made by the Commission on the Sick and Destitute Poor. It was designed to close some gaps in the Children Act 1908.

85 Department of Health, INACT/INA/O/ 451286
86 Representative Church Body, Church of Ireland, Library, Bethany board minutes, 11 Sept. 1936 and 9 Oct. 1936.
87 National Archives of Ireland, S6430 Registration of Maternity Homes 1934
The 1908 Act gave no function to the Minister for Local Government and Public Health, which is not surprising as the act predated independence. This meant that the department had no power to ensure that local authorities were enforcing the 1908 Act. This was rectified. The 1934 Act also implemented the commission’s recommendation that anybody proposing to take a child at nurse would have to register their intention 48 hours before doing so, which would (in theory) give the local authority time to prevent a child being placed in an unsuitable home. In future the presumption would be that any child placed in a private home was being kept for reward, unless proven otherwise, and the oversight of the local authority, hitherto limited to children under the age of seven was extended until the age of nine.\textsuperscript{88} The act made it an offence to publish advertisements seeking foster homes (small ads of this nature featured in national and local newspapers), unless the name and address of the person who was arranging the placement was given.

\textsuperscript{4.97} Dr Conn Ward emphasised that the proposed reforms had the support of a wide circle of social welfare workers and societies, including the NSPCC, Irish Women’s Citizen’s Association, CPRSI, the Nursery Rescue and Protestant Children’s Aid Society, Saint Patrick’s Guild and the Sacred Heart Home.\textsuperscript{89} During the second reading in the Seanad, Sir E. Coey Bigger - former chief medical officer of the Irish Local Government Board expressed the opinion that the Bill ‘may reduce very materially the death rate of illegitimate children. These children are not wanted, they are boarded out, and if they died so much the better’. He described the Bill as a ‘good one’. Senator Jennie Wyse Power suggested that a mother might come to Dublin with her child ‘on a train and she must get rid of the child immediately, as she wants to go back’. Following the passing of the Act she believed that mothers could go to a local assistance officer and find a suitable foster home on their panel of names.\textsuperscript{90}

\textsuperscript{4.98} The concern that children at nurse were being placed in ‘unsuitable’ homes was not entirely altruistic. The report of the DLGPH noted that:

If the home or the foster-parent was unsuitable, the only remedy was to proceed to have the infant removed to a place of safety until it could be restored to its relatives or otherwise lawfully disposed of. There was a great

\textsuperscript{88} Dáil Éireann 15 Feb. 1934
\textsuperscript{89} Seanad Éireann, 11 April 1934.
\textsuperscript{90} Seanad Éireann, 11 April 1934, 18 April 1934
likelihood that the infant would then become a charge on the rates, and the persons who should be responsible for it would escape their liabilities’.

4.99 Children placed at nurse by voluntary societies were supported by a combination of government payments and payments by the mother or her family. However, the government grant expired when the child was five and most mothers contracted to pay for the maintenance of their child for three to four years. When payments ceased, the charitable society would commonly ask the foster parent(s) to ‘adopt’ the child, but many children had been placed in impoverished homes, and when payments ceased, they were commonly sent to a county home, or an industrial school. Although the 1934 Act strengthened the regulations governing the placement and inspection of children at nurse, the benefits of these reforms were largely dependent on the commitment of local authorities to enforcing the regulations, and this varied considerably - see Chapter 11.

The Public Assistance Act 1939

4.100 The Public Assistance Act 1939 consolidated the laws relating to the relief of the poor by local authorities; it updated and amended the laws, and repealed obsolete provisions but did not significantly change the poor law provisions (see Chapter 1). Although the overwhelming majority of women and children in mother and baby homes were maintained by a public assistance authority, there is no reference in the act to the homes or the maintenance of unmarried women and their children. It does not specify an entitlement to public assistance, for any defined categories of destitute persons, so the decision to maintain a woman or her child in a mother and baby home, or a county home remained at the discretion of the local authority. Local authorities had discretion to charge women, (or their families) for maintenance; the extent to which these charges were levied or enforced is unknown. They would have been levied and collected by the local authority, not by the mother and baby home or county home.

4.101 The specific provisions in the 1939 Act relating to unmarried mothers and their children emphasised duties rather than rights and they were mainly concerned with children. Section 27 retained a core provision of the nineteenth century poor law: that ‘every woman was liable to maintain her children - legitimate or illegitimate - under the age of sixteen’; whereas a man was only liable to maintain his legitimate

91 Report DLGPH 1934-35 para. 166.
children. It specified that ‘every illegitimate person shall be liable to maintain his or her mother’; legitimate persons were liable to maintain both parents. A married man was liable to maintain his wife and ‘every child, whether legitimate or illegitimate, of his wife who was born before her marriage to him’, and was under 16 years of age. The act increased the age at which children could be regarded as dependents, from 15 to 16 years.

4.102 It set out the circumstances under which a public assistance authority would assume the rights of parents over children, and the powers of local authorities to place children at nurse; board out children or send them to special schools - a category that included industrial schools - and place children in service or in a trade. These provisions only applied to children (‘legitimate or illegitimate’), whose parent(s) were dead, or a child who was deserted by his parent(s). If an ‘illegitimate’ child was deserted by his/her mother, the mother could reclaim her child from the public assistance authority at any time. Vesting of parental rights in a public assistance authority did not relieve a parent of the responsibility to maintain their child.

4.103 The 1939 Act reiterated the responsibility placed on a single mother for the maintenance of her child - a responsibility that took no account of her financial and personal circumstances. This was a long and complex Act and there was no real debate about unmarried mothers during its passage through the Oireachtas, though it is perhaps worth quoting from a speech by Deputy Cogan about county homes.

People who have worked all their lives and who have been in the habit of earning their living cannot be expected to go into an institution, no matter by what name it is called, so long as that institution is also open to other sections of the community. For that reason, I think the county homes, if they are to be continued at all, must be confined exclusively to one section of the community that is the aged and infirm. Other institutions must be provided for the various other types of people who are treated in those county homes.  

Conclusions

4.104 The years from 1922-39 were marked by significant changes in provision for unmarried mothers and their children. In 1922 most unmarried mothers received

---

92 Dáil Éireann 6 June 1939
no state support. Some gave birth in poor law institutions and remained there for many years; these were probably the poorest and most isolated women, who had no assistance from family and no personal financial resources. Others gave birth in Dublin maternity hospitals, private nursing homes or poor law institutions and they departed with their children shortly after the birth. Most of these children were probably placed ‘at nurse’ either by the mother, or her family, or through one of the charitable organisations, and the cost was borne by the mother or her family.

4.105 In 1925 there were 772 unmarried mothers in county homes, and an additional 242 women in special institutions. In March 1940 there were 338 women maintained by poor law authorities in extern institutions - Sean Ross, Bessborough and Castlepollard - a significant rise from the 82 in 1931. A further 188 mothers were in Tuam and Pelletstown, but 584 unmarried mothers remained in county homes. The numbers entering mother and baby homes were rising. In 1935 Bessborough was ‘obliged to put up extra beds in each ward’ and was reported to be overcrowded.\(^93\) When the Mother Superior of the Congregation of the Sacred Hearts visited Sean Ross in February 1935 she ‘found a crowded house’.\(^94\)

4.106 In 1938 the home for unmarried mothers and children run by St Patrick’s Guild in Mountjoy Square transferred to the suburbs but in the following year there was a dispute between the Committee of St. Patrick’s Guild regarding the operation of the home, and Miss Cruice decided to close it ‘as she considered that the type of cases for which this home was intended were not coming there’.\(^95\) She made several attempts to persuade the Congregation of the Sacred Hearts to take over this home, but the secretary to Dr McQuaid, Archbishop of Dublin refused them permission to open a house in Dublin.\(^96\)

4.107 By 1938 over 28% of births to unmarried mothers took place in the main mother and baby homes. Pregnant women and unmarried mothers continued to be admitted to county homes, because the three homes run by the Congregation of the Sacred Hearts admitted only ‘first offenders’, and some local authorities refused to pay for women in mother and baby homes, because they valued their unpaid labour as a means of reducing the rates bill. The refusal to accept mothers who were giving birth to a second or subsequent infant was not confined to the

\(^93\) Department of Health, INACT/INA/O463708

Catholic homes; the Magdalen Asylum, Leeson St. (later known as Denny House) would not admit women on their second pregnancy, though Bethany admitted some second-time mothers. There are indications that women from families who would never have entered a workhouse, for example women who would have formerly given birth either at home, or in the hidden world of private maternity hospitals and private child placements were being admitted to mother and baby homes.

4.108 Bessborough was established at a time when Ireland was in transition between being part of the United Kingdom, and the founding of the Irish Free State, so political and administrative arrangements were in flux. The initiative in establishing Bessborough and arranging for local authority funding rested with the local authorities, the religious order and the local diocese. By the early 1930s the DLGPH was encouraging the Congregation of the Sacred Hearts to expand in Ireland. The minister disbursed Hospitals Commission funds that were under his discretionary control; Mrs Crofts, the Department’s chief inspector was in regular contact with the congregation, visiting them in England, chauffeuring them around Ireland and keeping them in touch with developments. In January 1933 she wrote telling them that she expected ‘some good news about Sean Ross’; a grant of £8,000 towards the new nursery was approved some days later. The department hoped that the congregation would open an additional mother and baby home. The congregation used their presence in Ireland to meet local clergy and recruit postulants. Minutes of the council of the congregation in 1937 record that the mother general spoke of ‘the difficulty in securing Postulants’; she suggested that a sister should be sent to Ireland to tour schools, and there are reports of sisters who visited Ireland returning with a postulant.

4.109 The state and the local authority did not coerce women to enter these homes, and neither did the Catholic church. However it is not surprising that many families or single women, faced with a crisis pregnancy and the cost of ensuring their daughter’s privacy and care, resorted to mother and baby homes. They provided accommodation, which was undoubtedly superior to what was available in a county home or some private nursing homes, and maternity care, free of charge, without

---

97 Rev PJ Roughneen of Ballaghdereen, giving evidence to the 1930 Department of Justice Committee to review the Criminal Law Act referred to the number of single mothers who gave birth in their family home or in a district hospital. He believed that the number of recorded illegitimate births did not reflect the true figure.

98 Congregation of the Sacred Hearts, annals 31 Jan. and 3 Feb. 1933

99 Congregation of the Sacred Hearts, council minutes 18 Oct. 1937
the stigma associated with the poor law. This was a considerable financial saving for the women and their families.

4.110 There are many statements indicating that women who gave birth in the three mother and baby homes run by the Congregation of the Sacred Hearts were expected to remain until their child was two years old and often older, whereas mothers were discharged from Pelletstown and Tuam when their child was one year old. In the 1930s the average stay for a Tuam mother was 256 days after the birth, compared with 379 in Bessborough. In theory the mothers were given training that would enable them to find work when they left the home. The time spent caring for her child was seen as increasing her sense of responsibility and reducing the prospect of a second pregnancy. One of the arguments advanced in favour of mother and baby homes was the belief that mothers would be assisted in finding employment, in contrast to the single mothers who might remain in the county home for many years at ratepayers’ expense. The Annual Report of the DLGPH noted that:

The policy of special institutions recommends itself on the ground of economy, for unless active measures designed to enable them to return eventually to the work-a-day world are taken at the critical time, they are in danger of becoming a permanent burden on the ratepayers or of drifting into a life of degradation.

4.111 It was widely believed that single mothers who left a county home often returned on a subsequent pregnancy; the regime of mother and baby homes was designed to prevent such recurrence.

4.112 Decisions as to the length of stay were left to the Sisters who ran the homes. They had no legal right to retain a mother, (neither did the local authorities) or indeed to insist, as they did that mothers should leave only having been entrusted to a family member, provided that a mother took her child when she left. The two-year stay would appear to have also been the practice in the Sacred Heart home in Highgate (London) - St Pelagia’s, however in 1940 the Catholic Moral Welfare Committee (presumably of the Westminster Archdiocese) wrote to Chigwell and suggested that mothers in this home should not be compelled to remain for two years. A meeting was arranged to discuss this change with the Archbishop of Westminster.

---

100 Mothers whose babies died left the institutions shortly after the death.
101 Annual report 1929-30
and Canon Craven - who were responsible for the Catholic Moral Welfare Committee - and it was agreed that mothers should in future stay for six months. The congregation’s annals record that it was ‘all very satisfactory’.  

4.113 It is puzzling that local authorities, who were always conscious of the need for economy, did not try to reduce the length of stay in order to save money. Public officials deferred to the views of the Sisters that ‘a number of the girls are very weak willed and have to be maintained in the home for a long period to safeguard them against a second lapse’. The belief that the religious orders knew best is also evident in Galway county council’s agreement that children should remain in the Tuam home until the age of 6 or 7; it is also found among local authorities who preferred to send children to industrial schools rather than board them out. In the early years after Bessborough was established the Mother Superior of Bessborough asked the approval of the Cork board of public assistance before agreeing to a mother being discharged; in all such cases the mother was said to be going to live with a family member; a number of mothers would join a sibling in America. The board was also asked to approve mothers being placed in ‘situations’ by the congregation. Women who were ‘too weak-willed to care for themselves’, in the opinion of the Bessborough Sisters, were transferred to the county home; there is no indication that this alleged incapacity was verified by a doctor. The board also approved Bessborough’s decision to ‘detain’ 16 women in the home, free of charge in order ‘to safeguard them from a second relapse and to avoid incurring more expense’.  

4.114 A mother’s length of stay was determined by her family’s circumstances. Mothers were expected to contribute to the support of their infant. Those who could pay to have a child placed at nurse could leave at an earlier date, generally with the support of their family. But for many women the length of stay was determined by the future arrangements that a local authority made for her child - and local authorities generally did not board out children until they were at least two years old, and often older. The number of children boarded out (not all would have been children of single mothers) increased from 1895 in March 1927 to 2,253 in March 1935 and 2349 in March 1939. The report of the DLGPH for 1934-35 stated that:  

it is expected of every mother that when she is placed in a situation she will contribute to the maintenance of her child. The amount of the contribution is

102 Congregation of the Sacred Hearts, annals 18 March 1940 and 1 May 1940  
103 Minutes Cork Board of Public Assistance, 4 May 1927; 23 Nov, 1927; 27 Aug. 1930; 26 Nov. 1930
based on the wages earned by the mother, the generally accepted principle being that a working girl should be allowed to retain ten pounds annually for her own requirements and should contribute the balance of her wages towards the maintenance of her child should the latter be boarded out by the Board of Health and Public Assistance. No accommodation is provided to children over two years of age, because it is assumed that by the time the child is a couple of years, provision will be made elsewhere for it, either by the mother herself, who should by that time be ready to take up a situation, or by the Board of Health and Public Assistance. For one reason or another, the Boards experience difficulty in finding suitable foster homes and extra accommodation may have to be provided in the special homes for children over two years of age.\footnote{Annual Report DLGPH 1934-35, para. 179}

4.115 The 1930s brought a significant expansion in welfare provision. The \textit{Unemployment Assistance Act 1934} provided a means-tested income to able-bodied individuals and their families whose income was below a certain level and who were available for work. Although women were not excluded from claiming Unemployment Assistance, in practice very few were successful, though it would appear that some unmarried mothers sought and may have received this payment. In particular, mothers of young children had difficulties meeting the criterion of being available for work. The \textit{Widows’ and Orphans’ Pensions Act 1935} introduced both insurance based and means-tested pensions for widows, plus additional payments for each dependent child. This had also been among the recommendations of the Commission on the relief of the Sick and Indigent Poor. No reference was made to unmarried mothers or their children during the debate on this Act or subsequent acts relating to widows and orphans’ pensions. Widows and orphans were universally regarded as deserving of government support, though the means-tested pensions provided only minimal support. Nobody suggested extending these pensions to unmarried mothers who were supporting a child and this was also true of debates over widows’ pensions in other countries. Unmarried mothers and their children ranked low in the hierarchy of deserving welfare claimants.

4.116 In 1939 Alice Litster a DLGPH inspector compiled a report about unmarried mothers and their children for the secretary of the department. In 1938, 1878
births of illegitimate children were registered in Ireland; 426 of these children, 227 per thousand, died before their first birthday, compared with 80 per thousand in England and Wales. She noted that 352 of the 446 deaths occurred in institutions. She continued:

The chance of survival of an illegitimate infant born in the slums and placed with a foster-mother in the slums a few days after birth is greater than that of an infant born in one of our special homes for unmarried mothers. I except the Manor House, Castlepollard, in which the infantile death rate is comparatively low. In theory, the advantage should lie on the side of the child institutionally born. Pre-natal care, proper diet, fresh air, sufficient exercise, no arduous work, proper & comfortable clothing, freedom from worry, the services of a skilled doctor, the supervision and attention of qualified nurses, all should be available and should make for the health of the expectant mother and the birth or survival of a healthy infant. The mothers are in general young and healthy; the men named as fathers frequently young countrymen, often farm labourers. Skilled attention is available at birth. It should be unnecessary that many of these babies should require to be artificially fed. Cleanliness, medical attention, dietetic knowledge, all that human skill may continue to preserve child life should be at hand. Yet any infant born in any other circumstances appears to have a better chance of life. I have grave doubts of the wisdom of continuing to urge Boards of Health and Public Assistance to send patients to the special homes so long as no attempt is made to explore the causes of this abnormally high death rate.105

4.117 One of the reasons why mother and baby homes were established was to reduce the appallingly-high mortality of illegitimate infants, and to reduce the illegitimacy rate. By 1939 some modest improvement had been achieved with respect to infant mortality - but the gulf between the mortality of illegitimate and legitimate infants remained enormous - and Ireland was seriously out of line with neighbouring countries. The rate of illegitimacy was rising. Miss Litster’s report appears to be the first criticism of the mother and baby homes by a public servant. The paragraphs quoted above were in a hand-written draft; they were omitted from her typed report, on the recommendation of either the secretary or the assistant secretary of the department.

105 Department of Health 489778
It is important not to overstate the amount of attention given to unmarried mothers by the government, the Oireachtas or public opinion, during the first twenty years after independence. There is little evidence that ministers or politicians had a serious interest in their welfare. The detailed arrangements for public support were left to local authorities, with the role of central government limited to legislation, inspections, and making hospitals sweepstake grants available for mother and baby homes. Local authorities appear to have often disregarded government directions but they often deferred to the views of the Sisters in charge of mother and baby homes.
Introduction

5.1 By 1939 a system of mother and baby homes was in place that survived into the later years of the twentieth century. But, as reported in the previous chapter, Alice Litster, the Department of Local Government and Public Health (DLGPH) inspector was questioning the value of sending women to these homes if the objective was to reduce the appalling high rate of mortality among infants born out of wedlock. The war years provide the first evidence of a strained relationship between the DLGPH and the Sisters that ran the mother and baby homes. Very few records concerning these homes survive for the 1920s and 1930s and most passing references in annual reports of the DLGPH were positive. The files for the 1940s reveal a more critical attitude. The war years confirmed Miss Litster’s concerns about the high rate of infant mortality in mother and baby homes. More than three quarters of all child deaths associated with Pelletstown, Tuam, Bessborough, Sean Ross and Castlepollard occurred prior to 1946. During these years Miss Litster and the Joint Committee of Women’s Societies and Social Workers (JCWSSW) produced papers that were critical of existing arrangements, and they proposed a number of changes. Yet, although the late 1940s brought major reforms in health care and social welfare with the formation of separate departments dealing with health and social welfare, and proposals for a dedicated Mother and Child Scheme that was designed to reduce maternal and infant mortality, there is no indication that consideration was given to changing the provisions for unmarried mothers and their children despite the appalling level of infant mortality among ‘illegitimate’ children. The only significant change in the aftermath of World War II was the introduction of legal adoption in 1953 and a renewed effort by the Department of Health to remove unmarried mothers and their children from county homes (see chapter 10).

5.2 This chapter begins with a discussion of the impact of World War II on life in Ireland, because this is relevant to the health of unmarried mothers, conditions in mother and baby homes and county homes and infant and child mortality. This is followed by an examination of conditions in mother and baby homes, with a particular focus on Bessborough and Pelletstown. The next section examines the

1 The JCWSSW was an umbrella group of women’s societies, established in March 1935, chaired by Mary Kettle; they were concerned with a wide range of aspects of women’s and children’s welfare. Susannah Riordan, ‘Storm and Stress’ in Catherine Cox and Susannah Riordan (eds), Adolescence in Modern Irish History (Houndsmill, 2015), p. 146.
proposals that were put forward for changes in the regime for unmarried mothers and their children, and why they were not implemented.

Impact of World War II

5.3 The traditional freedom to emigrate to Britain was restricted during the war years. Women and men who were planning to work in Britain had to secure travel documents and undergo medical examinations. By 1943 every would-be emigrant had to undergo a medical inspection before travelling and many emigrants were sent to delousing stations, an indication of the appalling sanitary conditions prevailing in many poorer households. In some cases these medical examinations revealed that a woman was pregnant. Wartime pressures in Britain meant that health authorities and charities were showing a greater determination to return pregnant unmarried women to Ireland. The number of ‘illegitimate’ births rose during the Emergency (the name that was commonly applied to the war years in neutral Ireland).

5.4 The increase can be partly attributed to the repatriation of pregnant women and the greater difficulties that women and men faced in emigrating during these years. The number of births registered in 1942 increased by 16%; the number of ‘illegitimate’ births registered increased by 22%. These are quite exceptional rates

---

of increase. The Commission on Emigration suggested that the rise in births in 1942 was partly due to an increase in the number of marriages and also to the introduction of war-time food rationing, which encouraged prompt and more complete registration of births. However, there was probably also a genuine increase in ‘illegitimate’ births. They increased in Britain during the war years as they had during World War I. A closer look at changes in the number of ‘illegitimate’ births registered by county suggests that the war probably resulted in a rise in ‘illegitimate’ births in areas with strong concentrations of military. They increased by over 55% in Kildare, location of the Curragh Camp, for example. The fall in ‘illegitimacy’ in the late 1940s, which continued throughout the 1950s, was probably due to the easing of restrictions on women emigrating to Britain in 1946.

5.5 The Emergency placed considerable strain on living standards, especially for poorer citizens. This had significant consequences for general health and well-being and for the health and well-being of unmarried mothers and their infants. The price of food, fuel, clothing and other basics increased substantially and there were major shortages of many items. The capitation rates paid to mother and baby homes and the rates paid to foster parents for boarded out children failed to keep pace with inflation which probably forced the mother and baby homes to reduce their material standards and may have deterred people from applying to become foster parents.

5.6 Infant mortality fell at a gradual pace during the 1930s and the gap between the mortality of ‘illegitimate’ infants and the national figure narrowed slightly, though it remained far in excess of Britain or Northern Ireland. In 1938 infant mortality among ‘illegitimate’ children was 193 per 1,000 births, compared to 62 for ‘legitimate’ children. In England and Wales the comparative figures were 90 and 49; Scotland 96 and 67, Northern Ireland 131 and 68. Infant mortality rose significantly during the war years; the increase was most pronounced in Dublin. The spike in infant mortality in Dublin and urban areas more generally attracted the attention of doctors and statisticians. It was also reported in the newspapers. The *Irish Independent* summarised the report of the Registrar-General for 1941:

> These figures [infant and neo-natal mortality], even if the calculation on which the number of stillborn children is based is not quite accurate, show that here

4 Daly, *Slow failure*, p. 151.
we have a problem of major importance from the point of view of public health. As regards the causes of this relatively great loss of life, many of them seem to be obscure and uncertain in the present state of medical knowledge, but the publication already mentions some points which seem to have a practical bearing. Thus it reviews experiments carried out at different times and in different parts of the world on diets for expectant mothers, all of which tend to show a satisfactory reduction in the number of stillbirths and of deaths in early life when the mother’s diet is brought up to a first-class standard. These conclusions seem to be borne out by the difference in the death-rates during the first month of life in towns and in the country in Ireland. There is a substantially lower rate in the country, where, in general, the diet would be better balanced. It is also suggested that still more could be done in the training of doctors and nurses in infant and child health, especially in the care of premature babies, who constitute nearly half the deaths in early life. And while it is emphasised that the conclusions reached are tentative, at least they serve to indicate lines along which further research may profitably be undertaken with a view to lessening a problem of great moment in these days of falling birth rates.6

5.7 In the 1940s it was not possible to determine whether a child was premature so references to prematurity generally imply low birth-weights. The highest rates of infant mortality in the years after 1920 were in 1943 and 1944. Infant mortality in Dublin rose by 40% from 90 per 1,000 in 1939 to 126 in 1943; the national rate increased by 24%. Dublin experienced a long and severe epidemic of gastro-enteritis. In 1941 a total of 1,293 infants died from the disease in the Dublin County Borough. The epidemic continued until 1944, ‘before anyone kicked up a row about it’.7 Mortality was concentrated in infants under one year. In 1943 there were 2,321 cases of gastro-enteritis reported nationally, with 2,182 in the major cities; 1,176 children died under one year, as did 57 aged between one and two years.8 As gastro-enteritis was not a notifiable disease these figures may be an understatement.9 In 1942, Dublin’s Cork Street Fever Hospital warned of a diphtheria epidemic, and reminded parents that children should be immunised.10

Prices and cost of living

5.8 Supplies of food, raw materials and imported goods worsened during 1940. The shortages became acute from January 1941, when Britain imposed draconian cuts on supplies and shipping space allocated to Ireland. The greatest impact was on grain and fuel. The cost of living index rose by 70% between February 1939 and February 1945. Food prices rose by 65% despite the introduction of limited price controls, and the cost of clothing doubled. Clothing was rationed; this had a major impact on poorer people because more prosperous families held on to old clothing, repaired it, adapted it to fit another family member or passed it on to relatives, as opposed to donating it to charity. Shoes were also rationed. There were shortages of hardware, building materials and basic household goods; improvements and repairs to buildings were postponed until after the war.

5.9 In September 1941 the government introduced a food allowance scheme for welfare recipients living in urban areas. Vouchers could be exchanged for specific quantities of food; this was done to avoid having to increase welfare payments. But capitation rates for mother and baby homes remained unchanged until a relatively late period in the war; likewise payments to foster parents of boarded out children. Figures compiled by the Congregation of the Sacred Hearts of Jesus and Mary for the weekly cost of maintaining a mother in Castlepollard show rising per capita costs during the war:

5.10 In August 1943 the Mother Superior wrote to the local authorities who sent women to Castlepollard, seeking an increase in capitation rates, ‘owing to the increased...”

---

cost of maintenance etc’. She explained that she had delayed seeking an increase but had found it impossible to keep out of debt over the previous 12 months. Capitation rates for a mother and infant were increased from 21s to 25s; a further increase to 28s 6d was approved in 1946.¹²

5.11 During the war years, Britain adopted an interventionist food policy with extensive rationing and price controls and nutrients were added to basic food products such as bread and flour. This ensured that all sections of the population were adequately fed and, indeed, the nutritional standards of poorer people improved with obvious benefits for health and well-being. Ireland adopted a more laissez-faire approach. Rationing was limited - mainly to tea, sugar and butter. Bread rationing was not introduced until 1947. There is evidence that nutritional standards deteriorated during the Emergency.

5.12 The staple diet for most Irish people, especially those from poorer families, consisted of bread, potatoes, butter, milk and tea. Much of the protein came from eggs and bacon. Ireland was a net exporter of meat, eggs and dairy produce but was heavily dependent on imported wheat to produce flour and ultimately bread. The wheat shortage became acute from January 1941. The amount of creamery butter produced fell by one-quarter between 1938 and 1944 as land formerly used to feed cattle was ploughed for wheat. By the summer of 1942, butter production barely met national needs. Margarine, which was made from imported vegetable oil, disappeared from the Irish diet. There were shortages of milk in the Dublin area in January/February 1942 - mainly because farmers were withholding supplies. In December 1942, the weekly butter ration was reduced from 8 to 6 ounces a week per person and later to 4 ounces. There were shortages of milk during the winter months. Output of bacon, ham and gammon fell by a remarkable 74% because of lack of food for pigs. Exports of eggs rose, because Britain offered high prices, resulting in a shortage of eggs and a sharp rise in prices. By 1943 egg prices were 140% above their pre-war price, making them unaffordable for many poorer families, and tempting small farmers/labourers to sell eggs rather than eat them. Eggs were often unavailable during the winter months, regardless of price.

¹² Department of Health: INACT/INA/0/464172.
Wartime shortages resulted in acute deficits in essential fats and proteins in the diets of poorer families, especially those living in cities and towns, who could not produce their own eggs, bacon or milk. Higher food prices and shortages of eggs, butter and bacon inevitably meant a greater dependence on bread. Britain introduced bread rationing, but the Irish government was loath to take that step, though it would arguably have been better if it had done so. In order to stretch the supplies of wheat, the extraction rate of wheat used to manufacture flour rose from a pre-war 70% to 75% in September 1940, 80% in January 1941, and 95% in March 1941. This resulted in extremely coarse flour, and unappetising dark bread. Nowadays wholemeal bread is considered a healthier food than white bread but bread made from this coarse flour resulted in an elevated level of phytic acid, which reduces the body’s ability to absorb calcium. Lack of calcium causes rickets, especially among children. Britain addressed this problem by adding calcium to flour and the incidence of children’s rickets did not rise during the war. In Ireland, by contrast, the incidence more than doubled from ten per 1,000 in 1939-40 to 23 per 1,000 in 1941-2. In 1943 the Irish Medical Research Council issued a report arguing against 100% extraction and recommending that Ireland follow the British practice, but this advice was not followed until June 1946. The first report of the National Nutrition Survey, which examined diets in Dublin families, acknowledged that the high rate of extraction of wheat, the high consumption of bread and the fact that it was not fortified with calcium ‘must have been an important contributory factor, if not the main factor, in the high incidence of rickets in Dublin at that time’.

Maternal and Infant health

The impact of wartime shortages on single mothers and their children should be analysed in two phases. The health and nutrition of pregnant and neo-natal women who entered mother and baby homes and county homes was determined by their diet and living conditions before they entered the home and by the stage in pregnancy at which they were admitted. The nutritional status of the mother after the birth was influenced by conditions in the homes.

Most unmarried mothers were poor. Food shortages and higher prices meant that their diet deteriorated before and during pregnancy. A 1939 study of pregnant women in Dublin whose husbands were unemployed showed that their

---

haemoglobin was 64% of the desired level; a 1942 study using the same methodology estimated that the average haemoglobin level had fallen to 45% of the desired level.\footnote{Fee, ‘The effects of World War II’, p. 166.}

5.16 Many unmarried mothers had an inadequate and restricted diet with obvious implications for their health. Some experts pressed for them to be admitted to mother and baby homes several months in advance of giving birth so that they could receive better nutrition. Miss Litster noted that expectant mothers were only admitted to Tuam after their seventh month, in order to save costs for the local authorities; she believed that ‘It is doubly important in County Galway to encourage early admission since many of the mothers come from poverty-stricken homes and should have proper food and care in pregnancy’.\footnote{Department of Health, INACT/INA/0/474129.}

5.17 References to ante-natal care begin to emerge in DLGPH files in the 1940s. Ante-natal care was initiated in Britain, the USA and Australia during World War I and it expanded during the 1930s; the primary motivation was to reduce maternal deaths, but the monitoring of maternal blood pressure was also important for foetal health.\footnote{Tania McIntosh, A social history of maternity and childbirth. Key themes in maternity care (London, 2012), pp 54-60.} The Rotunda Hospital was running ante-natal clinics by 1932-33 but most women only attended once. By 1936-37, however, 57% of women who gave birth in the Rotunda had received ante-natal care. In 1937, Holles Street announced that it hoped to increase its ante-natal clinics when an extension to the hospital had been completed.\footnote{Information from the annual clinical reports of the Rotunda Hospital and the National Maternity Hospital, Holles Street.}

5.18 Maternal health had a significant impact on a mother’s capacity to breastfeed. The 1942 study of nutritional anaemia among pregnant and nursing women in Dublin showed that, when women were given one balanced meal a day for three months before giving birth and two months afterwards, their haemoglobin level increased and they were able to breastfeed, but when the additional food was withdrawn, mothers lost their breast milk.\footnote{Fee ‘The effects of World War II’, p. 166.} Breastfeeding is important in preventing infectious diseases, especially gastro-enteritis, and ensuring good infant nutrition. By the onset of World War II it was widely recognised that many working class mothers were unable to breastfeed because of poor nutrition. A 1938 inquiry into the causes of infant mortality in Dublin - initiated by the DLGPH and Dublin
Corporation - noted that ‘many expectant mothers were suffering from malnutrition’. Only 6% had an adequate intake of protein and only 8% had an adequate intake of calories. By 1941, the Infant Aid Society (a voluntary organisation) was distributing free milk to expectant or nursing mothers in most urban areas and in 29 county health districts. By 1943 the Dublin Archdiocese’s Catholic Social Services Council was running 15 pre-natal and post-natal welfare centres, supplying 480 expectant and nursing mothers with ‘a substantial meal and pint of milk a day’.19 Pregnant single women were unlikely to benefit from these schemes. In 1946, calcium intake in the poorest Dublin slum families was just over half (51%) of the recommended intake. The deficit for pregnant or nursing women would have been greater - the National Nutrition Survey cited the recommendation of the Technical Commission of the League of Nations that they should consume ‘about two pints [of milk] daily’. The Commission has not seen any evidence that pregnant or nursing mothers in mother and baby homes received two pints of milk a day. Poorer Dublin families also had an inadequate intake of vitamin A (from certain vegetables and summer milk) and riboflavin; their intake of vitamin C was described as ‘somewhat insufficient’.20 The position was similar for those living in large and small towns.21 There is substantial evidence that doctors and some public officials were aware that poor pregnant women were undernourished with adverse consequences for their health and the health and well-being of their infants. But there is no evidence that this knowledge was applied to the health and nutritional status of unmarried mothers, who tended to be seen as a distinct group.

Mother and Baby Homes during the Emergency Years

5.19 The Commission does not have detailed information about many aspects of mother and baby homes before, during and after the Emergency, so what follows is incomplete. Most of the evidence comes from inspections carried out under the Registration of Maternity Homes Act 1934. Not all of the inspection reports survive, which is frustrating, but the evidence, however incomplete, provides valuable contemporary descriptions of conditions in the homes.

5.20 The conditions within the homes and how they fared during the Emergency were dependent on a variety of factors. Did the home produce its own food - especially

19 Lindsey Earner-Byrne, Mother and child: Maternity and Child Welfare in Dublin, 1922-60 (Manchester, 2007), pp 64, 66, 98.
20 Department of Health, National nutrition survey, Part I vol, pp 11, 14, 16.
milk, eggs, potatoes and vegetables? Was there turf or timber on the property? Sean Ross had a farm of over 500 acres, although much of the land was unsuitable for tillage or grazing. In 1946 Sean Ross had 63 acres of arable land, which produced potatoes, vegetables and grain, plus an additional 100 acres of grazing land. The estate supported 44 dairy cows, which produced an estimated 60 gallons of milk a day. This should have been sufficient for the 330 resident mothers and children and the members of the religious congregation. The estate included bog land, which supplied turf, and this meant that Sean Ross did not have to buy fuel. In an interview published in the *Nenagh Guardian* in 1988, Sister Hildegarde claimed that Sean Ross 'came through the difficult war years well'. They cut timber and turf on the estate, and the religious sisters and mothers worked on the bog. ‘We were fairly warm in that cold winter 1946/7’.  

5.21 Castlepollard, Bessborough and Pelletstown also had farms, which presumably made it easier to maintain food supplies, especially items such as milk, but the 40-acre farm would not have supported enough cows to make Pelletstown self-sufficient in milk. Bessborough consisted of approximately 200 acres, though not all was used for farming and it should have been self-sufficient in milk for much of the year. Tuam did not have a farm, though pigs and poultry may have been fed on scraps, but milk supplies may have been precarious, both in terms of quality and quantity. Milk production was highly seasonal so all the institutions may have experienced shortages in the winter months. A file on a typhoid epidemic in Sean Ross in 1944 refers *en passant* to a herdsman who fell ill on 25 March 1944. This man ‘had the job of milking troublesome cows’. The report by the local medical officer of health noted that ‘he had none to milk for over three months before the onset of his illness’.  

5.22 In August 1942, the Dublin Union, of which Pelletstown was a specialist unit, reported that it might be necessary to ration butter supplies because their regular contractor could only provide half the normal quantity and they had failed to obtain either lard or margarine. A medical official wondered whether some kind of spreadable cheese might be available as a substitute. It is improbable that the butter shortage was unique to Pelletstown and it is noteworthy that this shortage happened in August when butter production should have been at a peak. Diets in

---

22 *Nenagh Guardian*, 6 July 1946.  
24 Department of Health, INACT/INA/0/ 445784  
mother and baby homes and county homes almost certainly deteriorated during these years. The diets reported for county homes (see chapter 10) indicate a heavy reliance on bread as a staple for at least two daily meals. It is unlikely that mother and baby homes were markedly different. It would appear that the mother and baby homes baked their own bread - but that did not necessarily mean that bread was plentiful or nutritious - all the homes had to secure sufficient flour. Children in these homes, in common with children in poorer families, were at increased risk of rickets.

5.23 A report by Miss Litster of a visit to Bessborough on 16 June 1943, described the rate of breastfeeding when mothers had left the maternity hospital (where their babies were born), as ‘negligible’. She expressed concern, given the links between gastro-enteritis and non-breastfed babies. She highlighted two issues. One was the quality of milk. Because Bessborough milk was not sold in the market it was not TB tested (a later report confirmed that the herd was TB free). She wondered whether ‘the cause [of low breast-feeding] may lie in the adequacy of the diet of pregnant or nursing mothers’; she noted that ‘no dietary scale is laid down for such institutions’. (The department approved a dietary scale for county homes).

5.24 On the day of Miss Litster’s visit which was ‘a fast day’, dinner in the Bessborough home (the non-maternity wing) consisted of potatoes, cabbage, cheese, tea, bread and butter; breakfast of tea, bread and butter; evening meal of tea, bread, butter, lettuce, and scallions. She claimed that the older children seemed well nourished, ‘and their diet seems ample and good’. Dinner in the maternity hospital consisted of potatoes, cabbage, egg (baked), stewed rhubarb and coffee. No details were given of the other meals, but they were probably similar to those in the home. The diet quoted is seriously lacking in protein; it is difficult to comment on calories. The fact that Bessborough was imposing the dietary restrictions of a ‘fast day’ on unmarried and nursing mothers is questionable; 16 June 1943 was a Wednesday, and was not in Lent or Advent (when all adults were subject to these dietary restrictions on all days), or pre-Pentecost, so it is unclear why this was a ‘fast day’. This suggests that the Sisters may have treated Wednesdays and Fridays as ‘fast days’, or perhaps more

26 A fast day under Catholic regulations meant no consumption of meat, and only one main meal and two collations – light meals consisting of little more than bread and tea, coffee or milk.
27 Department of Health, CCP/IMP/0/45492.
accurately days of abstinence from meat; if that is correct the women were being subjected to a penitential diet, twice a week, that was inadequate for pregnant or nursing mothers. When Castlepollard was inspected on a Friday in 1941, dinner consisted of kippered herrings, potatoes and rice pudding which was more substantial than the Bessborough fare.\(^{28}\)

5.25 A 1947 report on Castlepollard by Miss Litster recorded a sharp increase in spending on bedding, hardware, crockery, clothing and fuel. This may reflect efforts to address wartime shortages because goods were becoming available. She noted that ‘The scale of diet is now ample and I have heard no complaints either as to quantity or quality of food’. Her use of the word *now* and the reference to complaints suggests that the diet was not as ample on a previous inspection (which does not form part of the records made available to this Commission).\(^{29}\)

5.26 Fuel was equally problematic, because there was an acute shortage nationally of coal and oil and a fuel shortage had implications for health and infection control. There were problems adapting heating systems that were designed to use coal or oil to burn turf and the heating supplied by these systems was less efficient. Sean Ross would appear to have been especially fortunate, given that bog land formed part of the estate. Castlepollard generated its own electricity, but during the war years they were supplying the town of Castlepollard because the power station serving the town was destroyed in 1941 (see chapter 20). That would have reduced the capacity to supply the mother and baby home. The records of the Congregation of the Sacred Hearts state in June 1947 that ‘the question of fuel is very serious’ in Castlepollard, and the congregation agreed that they should change to oil.\(^{30}\) The modern purpose-built hospital/home which opened in March 1942\(^{31}\) had full central heating, but when Castlepollard was inspected in March 1941, 44 mothers were sleeping in two lofts over the stables, a distance from the main house.\(^{32}\)

5.27 The architectural plans for the Bessborough maternity hospital provided for 75 radiators, which would have ensured adequate heating if the system was

operating.\textsuperscript{33} When Dr Florence Dillon carried out an inspection on 25 November 1943, she reported that there was no heating in the hospital except in the workroom where the girls were sewing around the anthracite stove, which I do not consider adequate. For the hospital wards etc. it was very cold, the central heating not being on. The allowance of oil does not permit the engine to function full time.\textsuperscript{34}

5.28 When Bessborough was inspected on 6 December 1944, the day nursery for toddlers was unheated and, while some of the children were wearing stockings, others were barefoot; the nursery for younger children was not heated. There was no heating in the maternity hospital but it was expected that an electric radiator would be used in the evening; an electric radiator was in use in the room where sick babies were kept. Fuel shortages were beyond the control of the congregation. In January 1945, the Mother Superior noted that wartime shortages meant that they were unable to heat the hospital and home nurseries sufficiently. When Dr James Deeny, the department’s chief medical advisor, visited Bessborough in October 1945 shortly after the war had ended, he was told that the oil fuel ration had been reduced from 840 gallons to 65, a reduction of 92%.\textsuperscript{35} In 1946, a meeting of the board of Bethany noted the ‘great inconvenience of inadequate water heating owing to the insufficiency of supply of suitable fuel’. A later meeting noted that water heaters had been installed.\textsuperscript{36}

5.29 The grounds of the three Sacred Heart homes contained mature trees that could be used for fuel. There is disconcerting evidence that mothers in Castlepollard were engaged in felling trees during these years (see Chapter 20) - a dangerous occupation and one that was not traditionally carried out by women in rural Ireland, though they would have worked on the bogs saving turf. Fuel shortages had serious consequences. There was the obvious discomfort and damage to health from being cold, especially in the case of underweight or premature infants. Lack of heat meant a shortage of hot water, the inability to wash hands, bathe and launder clothing regularly, not to mention the difficulties of drying laundry in Ireland’s damp climate. Studies of tenement Dublin during the Emergency noted a decline in personal hygiene because of lack of hot water for personal washing and laundry.

Failure to maintain adequate hygiene standards had serious consequences in mother and baby homes where large groups of vulnerable infants and children were crowded together. Many women came from houses that lacked running water or any form of modern sanitation and they would not have been aware of the need to wash hands and maintain personal hygiene. While lack of water and sanitation presented health risks in a domestic setting, that risk was magnified in these large and often-overcrowded institutions.

Health, Hygiene and Overcrowding

The powers of inspection under the Registration of Maternity Homes Act 1934 represented a significant intervention by a government department into all maternity hospitals/nursing homes (see Chapter 1). The inspections exposed serious shortcomings in the mother and baby homes and at times they threatened to precipitate a confrontation between church and state. However, the inspections also revealed limitations in the department’s authority. Maternity homes were licensed by the local health authorities, and they, not the department, had the power to close a maternity home. The key concerns raised by inspections were overcrowding, staffing, staff qualifications, hygiene and the most acute issue - infant mortality. However, there was no provision in the Act requiring the person in charge of a maternity home to have a professional qualification.

Section 12 of the 1934 Act provided that ‘An inspector shall be entitled at all reasonable times to enter any maternity home and inspect such maternity home’. It also provided that

If any person obstructs or impedes any authorised officer or any inspector in the exercise of the powers conferred on him by this section such person shall be guilty of an offence under this section and shall be liable to summary conviction thereof to a fine not exceeding five pounds.

All licensed maternity homes were required to maintain a record of every admission and discharge, every confinement, miscarriage, birth and death. They were required to record ‘every removal of a child therefrom and of the name of the person by whom and the address to which such child is removed’.

CHAPTER 5 THE WAR YEARS

Bessborough

5.34 On 27 June 1941, Dr Florence Dillon inspected the maternity hospital in Bessborough where women spent the final weeks of pregnancy, gave birth and recovered, before transferring with their infant to the Bessborough home. The hospital also accommodated new-born infants and infants who were not deemed sufficiently well to be moved. She described the hospital as overcrowded with 31 patients in a space designed for 26. One locked bathroom contained a bed; ‘the sluice room was full of mattresses etc’; one toilet was used to store dustpans and brooms, and one was out of order. These arrangements suggested scant attention to sanitary requirements in this hospital, which was adequately provided with sanitary facilities by the standards of that time - three baths and five WCs - if not used for other purposes.

5.35 Dr Dillon described the attitude of the religious sister who was in charge of the maternity hospital (the Mother Superior of Bessborough was technically the matron of the hospital) during her inspection as ‘quite discourteous and obstructive’. When she insisted on the locked bathroom being opened she claimed that the sister in charge ‘queried would she send for the guards’. The register had not been written up since 1939 and there was no record of confinements, contrary to the 1934 Act. She was unable to check the fire prevention arrangements. She claimed that breastfeeding was discouraged, though the congregation denied this.

5.36 This was not the first occasion that the department had expressed concerns about Bessborough. In 1936, Miss Litster and Miss Fitzgerald-Kenny raised questions about Bessborough children who were placed at nurse through the Catholic Women’s Aid Society. The inspectors were obviously citing the clause in the 1934 Act that required a maternity home to record details relating to the destination of infants who were being discharged. In 1941 the Bessborough chaplain, who was also chairman of the Catholic Women’s Aid Society, claimed that there was no legal obligation to answer these queries. In July 1941 - possibly in reaction to Dr Dillon’s inspection - the Bishop of Cork, Dr Cohalan, reassured the Bessborough Mother Superior that

You are not a Government Institution. But like the Religious who conduct schools, or who have charge of orphans, or of Industrial Institutions, you can do Catholic social work and receive remuneration and allow Government

38 There is further information about conditions in Bessborough and Pelletstown during these years in chapters 13 and 18.
Inspection. But this inspection must not encroach on your independence as a religious community.\(^{39}\)

5.37 Miss Litster inspected Bessborough towards the end of 1941, presumably to check whether the issues highlighted by Dr Dillon had been rectified. She gave a favourable account of the home and hospital - ‘the food appears to be plentiful and good’; there was an ‘atmosphere of kindness’ in the home, but ‘little personal contact between mother and child’. The ‘girls’ were employed ‘at farm and garden work, butter-making, knitting, kitchen and household work generally’. The hospital was ‘scrupulously clean’, ‘food good and well-cooked’, however ‘there was not the same atmosphere of kindness’ as in the home. She claimed that former ‘inmates’ described the sister in charge as ‘harsh, domineering, and “a slave-driver”’; ‘she certainly resents any adverse criticism’. This suggests that Miss Litster had spoken to some Bessborough mothers. She noted that this sister had no qualifications for the position except experience (Dr Dillon had already reported this), which ‘appear to decide the point’ as to her suitability. Poor record-keeping was not confined to the hospital: ‘It is impossible to get any records properly kept in the Home’.

5.38 Miss Litster explained to colleagues that her report had been delayed because she was trying to determine what obstacles might exist to replacing the matron. This proved to be a lengthy affair, and the time-table was determined by the congregation, not by the department.

5.39 In January 1942, six months after Dr Dillon’s inspection, and shortly after Miss Litster had written her report, the DLGPH wrote to the Mother Superior in Bessborough highlighting the shortcomings in the maternity hospital: overcrowding; inadequate sanitary arrangements because of the misuse of a bathroom, toilets and sluice room; registers not completed; discourtesy to the inspector who was unable to check on fire safety; a tendency to discourage breastfeeding and the fact that the matron of the maternity home was unqualified. It would appear that these concerns were conveyed to the headquarters of the congregation in Chigwell; on 10 March 1942 the annals record that the Mother Superior, Sister Martina, was ‘not very successful in Bessborough- a change may be demanded’.\(^{40}\)

\(^{39}\) Department of Health, CCP/IMP/0/45492.

\(^{40}\) Congregation of the Sacred Hearts, annals, 10 March 1942.
When the Mother Superior in Bessborough wrote to the department she dismissed all criticisms. She claimed that mothers were forced to breastfeed when they were disinclined to do so. The overcrowding was minor - there was plenty of room and a previous inspector (unnamed and no evidence in the department’s files) had given permission to exceed the numbers stipulated on the registration document. Temporary beds were left in place to save the backs of the staff. The ‘inmates’ had placed ‘a few brushes’ in the toilet at a time when the sister in charge was ‘unwell’...There was ‘a misunderstanding’ concerning the register. In a follow-up letter she suggested that the apparent discourtesy shown to Dr Dillon was probably due to the matron’s state of health. An official in the department described her replies as ‘evasive and unsatisfactory’; he suggested that the priority should be to appoint a qualified person as matron of the maternity hospital. A letter issued in the name of the minister, asked when ‘a more detailed reply will be furnished as to when the re-organisation suggested will be undertaken’; it demanded an assurance that the congregation would co-operate with inspections. The congregation promised to appoint as matron of the hospital a qualified nurse, a Sister, who was preparing to take her midwifery examinations in June 1942, and they asked the department to wait until she was qualified. However, this Sister died shortly after taking her CMB. By June 1943, two years after Dr Dillon’s inspection, the maternity hospital remained under the control of the same, unqualified matron.

The main focus of Miss Litster’s inspection in June 1943 was the appalling rate of infant mortality. There were 27 babies aged from three weeks to nine months in the day nursery in the home; eight were breastfed, only three were fully-breastfed. She described ‘the greater number’ as ‘miserable scraps of humanity wizened, some emaciated, and almost all had rash and sores all over their bodies, faces, hands and heads’ (A handwritten note on this file suggested that this phrase should be omitted from the final version of her report). Many children in a second day nursery had sores on their faces, hands or scalps. However, the cots were clean and bed clothes, clean and good. An official in the department commented:

That 60 per cent of these children die would seem to show that very little pains are taken to keep them alive, this is borne out by the fact that the babies still alive are covered with sores...Overcrowding must stop; the matron should be a trained nurse, and school-going children should not be in the Home.
5.42 He conceded that the capitation rate was probably too low given current prices. The assistant county medical officer of health for Cork South noted that most infant deaths occurred in the home - not in the hospital. The Mother Superior was unqualified; her only training consisted of two months in the Children’s Hospital, Temple Street. He recommended appointing a qualified children’s nurse, ideally someone with expertise in infant feeding; mortality statistics should be analysed to see if that had an impact. The Cork county medical officer of health claimed that many of the infants were born ‘in a state of debility’; he highlighted the low rate of breastfeeding and ‘a lack of interest in the child’s welfare on the part of the mothers…the most skilled medical and nursing attention is essential’ if these infants were to survive. He recommended the appointment of a nurse with special training in infant welfare and he suggested that the Bessborough Mother Superior supported this recommendation, though the Commission has no evidence to that effect.

5.43 The visiting medical officer at Bessborough, who had served since the home opened in 1922, wrote a very exculpatory report on infant deaths. He described the milk produced by the Bessborough herd as of the best quality and tubercule-free. Despite attempting every form of feeding - ‘chicken broth, meat juice, Benger’s food, extract of malt, cream, halibut oil, cod-liver oil, Sister Laura’s food, some of the children lost weight and died’. He claimed that some infants ‘show a remarkable difficulty in digesting food’; some even failed to assimilate the nourishment in breast milk. He attributed this to their ‘illegitimacy’, the fact that their ‘period of gestation is different to that of the married woman’, which reflected the worry and mental upset of being a single mother. He dismissed the high incidence of gastro-enteritis as ‘a disease common in infants in late summer and early autumn’, which was ‘sometimes very fatal’.

5.44 By November 1943 the matron of the maternity hospital had been succeeded by a religious sister who was a SRN, but who apparently lacked a midwifery qualification. The maternity unit was staffed by only one qualified lay midwife, two nurses and ‘2 girls’ - whether they were paid or not is unclear. Dr Dillon insisted that the minimum requirement was two nurses with CMB.

5.45 In December 1943, two and a half years after Dr Dillon’s initial inspection, the head of the firm who audited the Bessborough accounts informed John Garvin, the assistant secretary of the DLGPH, that a Sister who was about to complete her
CMB would join the staff, and that the congregation was willing to appoint another 
lay midwife if that was considered necessary. The auditor reported that the rashes 
that affected many infants had been identified as scabies - a highly contagious 
disease transmitted by mites. (The Commission has not seen independent 
evidence of this diagnosis.). Eradicating scabies required a stringent regime of 
hygiene, laundry and isolation. The auditor suggested, citing a press cutting, that 
the high rate of infant mortality was not peculiar to Bessborough, though the 
community regarded it as ‘their primary concern’. He did not indicate what 
measures they were taking to address it. Dr Dillon dismissed this intervention: ‘I 
do not see how the medical personnel or mortality data can be advantageously 
discussed with’ the auditor. There was still only one qualified midwife in the 
hospital.

5.46 The high rate of infant mortality persisted in Bessborough. When Miss Litster 
reported in December 1944 on a recent inspection, she described control over the 
home - where most infant deaths occurred - as 'loose'. She recommended closing 
Bessborough to all patients maintained by the local authorities for at least six 
months; this was the only power open to the department. Having apparently read 
this report Dr Conn Ward, the Parliamentary Secretary in the DLGPH, who was 
effectively the Minister for Health, called for 'drastic action'; an official reported that 
Dr Ward believed that ‘the medical supervision in the institution cannot but be 
criminally casual’. The Cork county medical officer of health was asked to supply 
details of the arrangements for medical attendance and the terms of the contract 
for the medical officer attached to Bessborough, plus weekly details of infant 
deaths with medical certification of the causes.

5.47 Dr Deeny, the DLGPH's chief medical advisor, suggested that ‘any interference 
from an outside agency would not have a lasting effect’. He recommended that the 
department write to the Superior General of the congregation, and to the bishop, 
requesting an immediate change of management, and that Bessborough should be 
closed to local authority patients for at least three months. Another official, who 
described Miss Litster's reports as 'most alarming', commented that 'the authorities 
of this Institution have never been amenable to our advice and instructions and the 
Matron has the confidence and support of the Bishop in this case'; the only option 
was to write to Chigwell.
5.48 On 5 January 1945 the Secretary of the DLGPH wrote to the Superior General in Chigwell, telling her that the management of Bessborough had caused Dr Ward ‘grave concern for a considerable time’. He referred to the high death rate and inadequate staffing, and he enclosed a copy of Miss Litster’s most recent inspection report. If the position did not improve radically Dr Ward would carry out ‘a complete review of the policy whereby responsibility for this type of institutional treatment has been committed to communities of your Order’. The first essential step was to appoint a new Mother Superior, who should have satisfactory qualifications and experience in midwifery and children. Pending a reorganisation, local authorities were being instructed not to send any unmarried mothers or expectant women to Bessborough. Local authorities who were maintaining children in Bessborough without their mothers were urged to find foster homes.

5.49 The Superior General replied to this letter on 12 January, expressing her ‘shock’. She claimed that she had ‘no idea that your Board were still un-satisfied with the management of Bessborough’. She promised to make the necessary change as soon as possible. This letter contains no expression of concern or regret over the high rate of infant mortality; her ‘distress’ related to the department’s letter.

5.50 On 6 January 1945, the day after the department wrote to Chigwell, Dr Deeny visited Bessborough, accompanied by his colleague Dr Lysaght and Dr Condy, medical officer of health for Co Cork. He ‘found the institution to be well maintained, perfectly equipped, and seemingly suitably staffed for the present Maternity work’. The institution was ‘spotlessly clean’ and the rooms reserved for storing milk and preparing infant formula also passed the inspection. He decided to examine the infants, ‘owing to the appalling infant mortality’, and when he had stripped the infants he discovered that the vast majority had excoriated buttocks due to a failure to change their nappies sufficiently; some infants had septic sores. Many had bowel infections. He concluded that there was ‘heavy infection of the home with some organism which is transmitted from child to child’. He claimed that the Mother Superior was completely unaware of the conditions in the nursery: ‘The clean counterpanes on the cots etc. satisfied her and she had little or no knowledge of what was hidden below’. The incident revealed ‘gross ignorance on the part of the sister responsible. No person with even a smattering of knowledge of child health would allow such a state of affairs to continue’. He commented that ‘No attempt has been made to train the mothers in the care of their children and if such an attempt has been made the results prove that it was a lamentable failure’.
Dr Deeny suggested that ‘medical attention must be of a most superficial nature’. He described the visiting medical officer as ‘distinctly culpable…There is no doubt that in this case and in view of the hundreds of children whose lives have been lost his complacency or ignorance should be regarded as criminal’. He recommended that the medical officer should be dismissed. The Mother Superior should be ‘replaced by someone with ability to administer an institution dealing with maternity and the care of infants and children’. The Sister in charge of the infant department was ‘both stupid and ignorant. She, above all others must be held primarily responsible for the hundreds and hundreds of babies under her charge who have died in the past four years’. He recommended she should be removed immediately, and two trained Sisters or nurses should be appointed.

In response to queries from the department, Dr Condy reported that the visiting medical officer had no fixed hours of attendance. In recent times he had generally visited the home twice a week and when called. He did not necessarily see all the infants; no proper records, such as weight cards were kept; however arrangements were now in place for weekly returns of deaths and their certification.

There is no typed copy of Dr Deeny’s report on the departmental files, which is surprising, because there are generally multiple, typed copies of important documents on file. This devastating report from the chief medical advisor finally prompted the Superior General in Chigwell to announce that the Mother Superior, Sister Martina, would be replaced by Sister Rosemonde McCarthy, the Mother Superior in Sean Ross. A hand-written note by Miss Litster described her as ‘a nun of outstanding character and organisational ability’, who ‘could probably re-organise the Sacred Heart Home effectively’, but she expressed regret that Sean Ross ‘should lose her resources even temporarily at a time when she is re-organising certain departments in that institution’.

It would appear that the Mother Superior in Bessborough had contacted the Bishop of Cork, Dr Cohalan. He wrote to the Secretary of DLGPH, stating that she had informed him that the Superior General in England was asked to remove her. That procedure was scarcely correct. Mother Martina is Reverend Mother of the community of Sisters; it is an Ecclesiastical appointment, it was not a correct thing to call for her removal.

41 Department of Health, CCP/IMP/0/45492.
Bishop Cohalan suggested that ‘The thing is, to find the cause of the evil, and the best remedy’. He noted that he had dealings with the DLGPH ‘in the early days of Bessborough and got the greatest help from the Secretary and Dr Stapleton’ (The Commission has seen no record of these contacts).

By February 1945 the sister in charge of the infant department had been replaced by a trained nurse, but the Superior General in Chigwell wrote to the department stating that ‘it would make things pleasant for all’ if the removal of the Sister, who had been in Bessborough for 23 years, was delayed until the congregation held elections, which they proposed to do when the war had ended.

The department drafted several responses to Bishop Cohalan and the Superior General and they eventually sent two distinct though similar letters. Both letters emphasised that the ecclesiastical status of the Bessborough Mother Superior was not being questioned; the parliamentary secretary was only concerned with her position as matron of a home which had exceptionally-high infant mortality. He claimed that 102 of the 124 infants born or admitted during the year ended March 1944 had died.

Apart from any public scandal which might result the Parliamentary Secretary felt that the case called for immediate action and that to allow Rev Mother Martina to continue as manager would mean acquiescence on his part in the dreadful state of affairs which has been disclosed.

Mr Garvin welcomed the bishop's letter, and his acknowledgement that the situation was serious. He expressed the hope that Bishop Cohalan would support the appointment of Sister Rosemonde. The letter to the Superior General at Chigwell emphasised that given the high mortality in the home ‘delays or objections, based on internal arrangements in the Order, to the re-organisation suggested in the Parliamentary Secretary's letter…cannot be entertained’; the ‘first essential step towards improvement of conditions' was to appoint a Mother Superior ‘possessing satisfactory qualifications and experience'.

It proved easier to appoint a new medical officer than to change the Mother Superior. Dr Sutton, a gynaecologist, was appointed in March 1945. In a letter to Dr Deeny he told him that having paid four or five visits to Bessborough, ‘I just don't know where to begin or end. Many changes and improvements are needed but I have no jurisdiction over some of these’. It is regrettable that he did not
expand on these comments. Dr Deeny forwarded the relevant sections of his report ‘so that he can see what we want, the matters to which we object etc’.

5.60 Bessborough was closed to patients funded by local authorities on 12 January 1945, although women and infants who were in the home appear to have remained and private patients continued to be admitted. Thirty-nine infants were born between 14 January and 20 July 1945, and 29 ‘(almost three-quarters)’ died. Miss Litster noted that ‘The majority of the deaths have again occurred in the Home as distinct from the Hospital’. Sister Martina was still in charge. A department medical inspector, Dr Sterling Berry, reported that ‘the authorities appear to be taking in other cases, the appalling death rate amongst the infants is continuing’. He recommended that Dr Condy should be asked to make a thorough inspection, particularly of the home; the licence to operate a maternity home should be withdrawn ‘unless he was satisfied’. Dr Deeny recommended its immediate withdrawal. However, this was a matter for the local authority acting on the advice of the county medical officer of health and, as the decision could be appealed to the minister, ‘any pressure from this Department...would have to be informally made’. The department contacted Dr Condy, but Dr Deeny noted that ‘for some reason or other, whether because he is in an embarrassing position in the matter, sounded to me very non-committal over the phone’. There is no evidence that the local health authority contemplated withdrawing Bessborough’s maternity home licence. In fact, Dr Condy and the local health authority do not appear to have taken any initiative in dealing with the high rate of infant mortality and seem to have only taken action when prompted by the department.

5.61 Dr Condy reported on Bessborough deaths some days later; 29 of the deaths were infants under one year, and ‘the cause of deaths...was with a few exceptions, of a preventable nature, and the high trend of infant mortality...has continued without improvement for several years’. He and Dr Sutton determined that the nursing staff was ‘inadequate in number and without proper training and qualifications for the care of these infants’. The Mother Superior, who was also matron of the maternity hospital, ‘was almost entirely occupied in the administrative control of the Institution and attached farm, and appears to have little to do with the medical aspect of the Home’. He claimed that ‘the Authorities of the Home appear to be
willing to comply with any necessary requirements’ except the requirement to appoint a qualified matron.

5.62 On 13 September 1945, more than four years after Dr Dillon’s report, the Superior General at Chigwell informed the department that the congregation had held their general election. Sister Martina would be succeeded by Sister Rosemonde, who was matron and Mother Superior at Sean Ross; Sister Brigid would become Mother Superior in Sean Ross, and Sister Helena - then the matron of a maternity home in Westmoreland - would move to Castlepollard. These changes followed the congregation’s time-table and took place at their convenience; the congregation failed to provide the department with copies of the Sisters’ qualifications (if any).

5.63 Dr Deeny visited Bessborough in October 1945. He was accompanied by a medical colleague and Drs Condy and Sutton. They highlighted several issues: the need to eradicate chronic skin infections among the children; dividing the large nurseries to ensure that infected children could be segregated; and separating each child’s clothing in order to control infection. They recommended improvements in the milk kitchen and the heating of the nurseries plus the provision of a day room for the mothers. The doctors determined that the Bessborough home needed three additional trained nurses, one on night duty, one concentrating on the nurseries and a third floating between the nurseries and the maternity unit.

5.64 Mother Rosemonde asked Dr Deeny to ‘use his influence with the Church, as she did not want to begin her work in Cork subject to any prejudices on the part of the Bishop on account of the manner of her appointment’. She did not propose to admit any private patients or request an end to the ban on local authority-funded patients until everything was in order. Dr Deeny met Fr Hegarty, Director of the Catholic Women’s Aid Society and assured him ‘that we were merely carrying out our duty, distasteful though it may have been’.

5.65 In November 1945 the Superior General from Chigwell met Dr Ward and expressed ‘sincere regret regarding the conditions that obtained at Bessboro’. She emphasised her ‘appreciation of the patience and understanding that had been
shown and the consideration that had been extended to her and to the Order’. Dr Ward indicated that local authorities would be permitted to send women to Bessborough when the reorganisation and some structural alterations (probably dividing the nurseries) had been completed. On 14 December 1945 local authorities were notified that they could send women to Bessborough.

5.66 When Miss Litster carried out an inspection in March 1946 she reported that changes had been made. However, it was ‘too soon to expect any noticeable effect upon mortality’. The long nursery ‘in which the majority of the deaths of infants occurred’ had been divided into three smaller rooms, each containing two radiators and a fixed bath (all apparently new). There were only ten infants in the three rooms, and all ‘appeared to be healthy, normal babies…no scalding or excoriation’, though very few infants in either the home or the hospital were breastfed. There was also an isolation room. The older children were ‘on the whole plump and healthy, a few showed the remains of rash on buttocks, but the condition appears to be rapidly clearing’. New wash-hand basins had been installed in two dormitories for mothers in the home, ten in one 24-bed room, and eight in a 16-bed room, but the water had not yet been connected. This suggests that facilities for washing and bathing in the home had been inadequate. A large 32-bed room on the top floor had no daytime heating, but heat was switched on at night; there was no information about washing facilities.

5.67 There were 23 children in the home without their mothers ‘mainly children of private patients who have been allowed to take their discharge soon after confinement’. Sister Rosemonde proposed to end this practice. During the 1940s the infant mortality in Bessborough was substantially higher among the children of private patients. These mothers left shortly after giving birth; their children remained until placed at nurse by the Catholic Women’s Aid Society. None of these infants was breastfed and it is unclear who was responsible for caring for them. In 1949 Miss Litster commented that ‘mothers left behind are found unwilling to care for the babies of discharged mothers’. It would appear that the children born to private patients experienced greater neglect than infants whose mothers remained in Bessborough.

5.68 During the half year April - September 1946 infant mortality fell to 87 per 1,000, compared with 406 for the previous year (March 1945-46). Dr Deeny noted that the report ‘makes very satisfactory reading & completely justifies the action taken
last year’. It proved the value of ‘suitable control measures, since most of the deaths were due to enteritis’. By January 1947 an increasing number of infants in the hospital and in the home were breastfed. Infant mortality had fallen significantly but Dr Deeny, noted that it remained too high.

**Overcrowding**

5.69 The rising number of ‘illegitimate’ births during the early 1940s put pressure on mother and baby homes. The number of babies born in the homes examined by the Commission rose.

5.70 The homes were accommodating a smaller proportion of unmarried mothers and babies than in the late 1930s which suggests that there was a shortage of places. There is extensive evidence that it was proving difficult to find foster homes both for privately-placed children at nurse and children placed by the local authorities. These delays aggravated overcrowding among children. Overcrowding did not commence during the war years. Bessborough was installing additional beds in wards in 1935. When Bethany Home was first inspected in 1936, Mrs Crofts determined that the bedrooms were overcrowded and the board of management determined to cap the number of women at 20 except in an emergency. But when Dr Dillon carried out an inspection in June 1939, there were 26 women and 42 children resident in Bethany.

47 Department of Health, NATARCH/ARC/0/521019.
5.71 When Miss Litster inspected Castlepollard in March 1941 she determined that it was overcrowded and she advised the Mother Superior not to admit any women until the numbers had fallen. The department sent a letter to this effect to the local authorities who sent women to that home and they pressed for the removal of children aged over two years. However, when Dr Dillon visited Castlepollard two months later, it was overcrowded. She described conditions as ‘very bad’, noting that ‘there is a serious menace to health in the present conditions’. There is no indication that Miss Litster’s recommendation to suspend admissions to Castlepollard had any impact, though numbers were much reduced when Castlepollard was inspected in 1942.\(^\text{48}\) The department’s capacity to enforce rules about maximum numbers was constrained by the fact that the legislation did not set down regulations with respect to space in maternity homes. Each home was licensed for a specified number of beds, but the licenses were issued by the local authorities.

5.72 Overcrowding was a feature of mother and baby homes from the mid-1930s. Lack of space, combined with large wards/dormitories increased the risks of infection and infant death, especially in the years before antibiotics. The original plans for Bessborough maternity hospital provided for 26 beds, and a babies’ room but no nursery, unless the small babies room was intended as such. In October 1934 the matron informed the department that, owing to increased patient numbers, they had turned the single rooms into wards and increased the number of beds in each ward. The statistics given in the various inspections of the Bessborough hospital indicate that the number of ‘inmates’ was consistently above 26.\(^\text{49}\) Although the hospital was designed for 26 women, Cork South public assistance authority appears to have specified 48 on the certificate of registration, and the department did not believe that this could be arbitrarily reduced. The infants’ room in the hospital was designed to accommodate 28 infants, on seven infant trollies with four cribs each, to minimise space. This congestion made it impossible to implement infection controls.

5.73 When a department official surveyed Sean Ross in 1945, there were 144 resident mothers, but he considered that the maximum occupancy should be 124. The number in Sean Ross rose to 163 when Bessborough was closed to local authority

\(^{48}\) Department of Health, NATARCH/ARC/0/403458.  
\(^{49}\) Department of Health, CCP/IMP/0/45492.
patients; in 1949 it was still above the recommended number. In 1948 Miss Litster noted that in 1943 the same official had determined that Castlepollard could accommodate 122 women, but ‘the Rev. Mother does not seem to have been informed of that decision, nor does any reference to the number to be accommodated appear in the terms of agreement’. In May 1948 there were 131 mothers and 135 children in Castlepollard; by the following January the number of mothers was unchanged but there were 160 children. Miss Litster suggested that ‘in view of the probable effect upon health of over-crowding, it would be well that some decision should be come to and the Community advised of a definite figure not to be over stepped’. It is unclear whether this happened.

5.74 A Department of Health circular issued on 1 July 1949 stated that ‘the number of patients who may be accommodated in each room should be based on a minimum space of 1,000 cubic feet for the mother and 200 for the infant’. In a common infants’ room, i.e. with several infants, the ideal was to leave 12 feet between cots; a minimum of 8 feet was essential. Those recommendations would permit only two infants in the Bessborough hospital nursery; there were ten at the most recent inspection. The department asked whether permitting 48 mothers to be accommodated in the Bessborough hospital endangered maternal health. If it proved desirable to reduce the numbers, could that be achieved ‘through administrative action’? These recommendations were laid down 14 years after the home was registered and they did not have any legal force; as noted earlier, the licence to operate under the 1934 Act was awarded by the local authority, not the department.

5.75 Bessborough’s appalling wartime infant mortality exposed several disturbing issues about mother and baby homes. The hospital was probably overcrowded for much of the time since it opened. The absence of a dedicated nursery in the hospital plans reflects a lack of concern for the health and well-being of infants. The reforms introduced by Sister Rosemonde appear to have been effective – the rate of breastfeeding increased; the installation of wash basins and baby baths improved the sanitary facilities and should have helped to reduce infection. This episode exposed tensions between the Congregation of the Sacred Hearts, the Catholic church, the DLGPH and the local authority. The Bishop of Cork objected to the department’s intervention. The congregation stubbornly resisted making

---

50 Department of Health, INACT/INA/0/464099.  
51 Department of Health, INACT/INA/0/450464.
changes to the management of Bessborough that the department demanded until this could be done by a meeting of the congregation, despite the fact that infants were continuing to die in appalling numbers. Registration of the maternity home was a matter for the local authority and there was a discrepancy in the numbers approved between the department and the local authority. The department withdrew approval for local authorities to pay for mothers (and infants), but Bessborough continued to admit private patients, and many of their infants died, despite the fact that the institution was not overcrowded and the staff presumably had a lighter work load. The determination shown by the congregation to keep Bessborough open for private patients suggests a callous disregard for infant lives.

The episode also reveals the dangers of disregarding professional qualifications. Bessborough was overseen by Sisters who had no formal qualifications in nursing and midwifery. When confronted with the department's demand to appoint qualified nursing staff, the congregation proposed to appoint members of their order, who were about to sit their professional examinations, to management positions. The failure to check the qualifications of those in charge raises further questions about the oversight exercised by the local authority or the department, but it was consistent with the failure to demand that religious personnel in charge of voluntary health/welfare institutions should have appropriate professional qualifications. The local authority could have withdrawn registration - which would have prevented Bessborough from admitting private patients - but there is no indication that this was considered, and there is some evidence that the Cork local authorities and professional staff was more sympathetically-disposed to the institution than the department.

**Pelletstown**

In 1941, the DLGPH inspector, Miss Clandillon, noted:

> At the beginning of March there were close on 400 children in St Patrick's Home Pelletstown and despite the extra accommodation recently provided, there is still considerable overcrowding. Between 20 and 30 children are of an age, and suitable for boarding out, and steps should be taken to place them in foster homes as soon as possible. The relieving officers in North County Dublin and in the other districts mentioned elsewhere in this report should be instructed to make every effort to find suitable foster homes for the children, and I recommend in addition, that a comprehensive scheme of advertising for foster parents in these areas be accepted. Unless additional
foster homes are procured, the question of accommodation in Pelletstown will soon present a serious problem.  

5.78 The Pelletstown story is both similar and different to Bessborough. While the infant mortality crisis in Bessborough was not known to the public, conditions in Pelletstown were subject to public scrutiny, because Pelletstown was run by a local authority. Pelletstown also admitted seriously ill ‘legitimate’ children for whom there was no other suitable facility.

5.79 Infant mortality in Pelletstown peaked in 1937, and although there were mortality spikes in the early 1940s, the outcome was much better than for Bessborough (see chapter 13 statistical report), despite the surge in infant mortality in Dublin in the early 1940s. In January 1940 the paediatrician Dr Robert Collis gave a lecture to the Dublin constituencies’ council of the Labour Party. He informed them that the death rate among infants under one year in Dublin was double that in rural Ireland and three times the rate in Swedish cities, and that over 300 per 1,000 Irish ‘illegitimate’ babies died before their first birthday. He described Pelletstown as a place where a few devoted Sisters gave their lives looking after hundreds of these children, who were often weakly and required special attention, but there was no resident medical officer and few trained nurses in the institution.

5.80 Pelletstown had an isolation unit, in contrast to Bessborough. It consisted of two rooms, where children with diverse infections were accommodated (often crowded) together, and the risks of cross-infections were high. The Daughters of Charity had highlighted the need for an adequate isolation unit some years earlier. In 1937 their solicitor wrote to the secretary of the DLGPH in relation to this. He noted ‘many of the infants come from very poor homes where they have been badly nourished’. Roughly 40% of babies were delicate; ‘additional nourishment is essential. Many of the mothers, too, require additional nourishment, including stimulants, for some time after admission’. He noted that over the past three years Pelletstown had suffered a number of epidemics, which had ‘taxed seriously the resources of the Institution’ because of inadequate isolation facilities. Responding to Dr Collis’s lecture, which was widely reported, a medical officer explained that the isolation unit

---

53 Irish Press, 11 Jan. 1940.
54 Document supplied by the Daughters of Charity 18 June 1937.
consisted of two large rooms, one of which contained 15 cots, and the children in it were mostly healthy, awaiting discharge. The other contained children suffering from pulmonary and intestinal trouble, who were kept there because they were infectious. As soon as they were well, they were transferred to other parts of the house, where there were spacious rooms, well ventilated. All these children were seen and examined and their ages, weights and condition noted by the medical officer as soon as they arrived. The sister in charge of these children was a trained nurse.

5.81 Pelletstown was in the process of constructing a new isolation hospital. The visiting medical officer acknowledged that Pelletstown was overcrowded ‘due to economic conditions’.\textsuperscript{55} Representatives of the Irish Labour Party accompanied by Dr Collis visited Pelletstown in February 1940 at the invitation of the Dublin board of assistance. Their report paid tribute to the Sisters and nursing staff:

Their work cannot be too highly praised - of this we and Dr Collis were always convinced. That they have to carry out their work under conditions which restrict and to some extent circumvent their efforts is not their fault - nor, indeed, is it entirely the fault of the Dublin Board of Assistance.

5.82 The delegation noted that there was no resident medical superintendent to care for the children and provide medical cover in the maternity department. They recommended the appointment of a visiting consultant child specialist to advise on ‘all difficult feeding problems and for diseases of children’ and the appointment of additional trained children’s nurses to bring staffing into line with a children’s hospital. Although there had been some improvements since the visit of Dr Collis 18 months previously, the new ward was still unfinished, due to an ‘extraordinary delay’ in providing it with heat, light and water. The delegation noted that the acute overcrowding could not be resolved until the new ward opened. The new isolation block was unfinished and heating arrangements appeared to be inadequate. The women members of the delegation were impressed with the general happiness and well-being of the children but they expressed concern about the mothers, ‘who are, for practical purposes, completely confined to it for two years’. They recommended that they should have a free recreation period each day, a general

\textsuperscript{55} Irish Press, 25 Jan. 1940.
library and an adequate recreation room with a radio. They also suggested that ‘some increase in personal privacy would be very desirable’.56

5.83 In April 1942, Minister for Local Government and Public Health, Seán T O’Kelly removed the members of the Dublin board of assistance from office for failing to control expenditure and replaced them with three appointed commissioners, Seamus Murphy, Mrs Mary J McKean and Edward Murray. The Irish Independent described Mrs McKean as ‘one of the soundest appointments made to a public position’. She was the only woman on the board of the Richmond Hospital, a member of the board of Cork Street Fever Hospital, a former member of the board of Grangegorman Mental Hospital and she had worked for many years with the Infant Aid Society, a voluntary organisation that distributed quality milk to poor Dublin children.57 The commissioners, especially Mrs McKean, took a keen interest in Pelletstown and they held weekly board meetings in Pelletstown. Their report for the year 1943 noted that ‘Many changes were introduced during the past year’. The report noted that

It will be necessary to make a detailed report on the girls and children in St Patrick’s Home - where the girls come from, their mental condition, how they should be treated, when they should be discharged and many other questions, about which divergent opinions are expressed and on which a definite policy has never been decided. The increased number of very young children in the Home constitutes a problem which will require to be dealt with in the near future’.58

5.84 They were examining the future relationship between Pelletstown and St Kevin’s Institution (the former Dublin Union).59 In October 1944 they opened St Clare’s Hospital in Glasnevin, a local authority institution to treat children from Dublin who were suffering from infectious disease (see Chapter 2). The hospital had a resident medical officer and trained nurses; it had accommodation for 106 cots. Many Pelletstown children were transferred to St Clare’s. Arrangements were introduced to screen women and children for venereal disease before they were admitted to Pelletstown. A report by Miss Litster dated December 1944 noted that infant mortality in Pelletstown had been falling in recent years. She credited this to

the introduction of screening for venereal disease prior to admission. Children arriving in Pelletstown were placed in an isolation unit until it was evident that they were not carrying an infection. Miss Litster noted that Mrs McKean had improved conditions in Pelletstown and the commissioners were scrutinising arrangements for children at nurse.\footnote{Department of Health, RM/ARC/0/489773.}

5.85 In the days before antibiotics became available, isolating women and children to ensure that they were not carrying an infectious disease was one of the most effective means of reducing illness in these homes. Women admitted to Sean Ross were advised to supply an up-to-date medical certificate stating that they were not suffering from an infectious disease; if they failed to do so they were initially confined in an isolation unit. There is no indication that this happened in Bessborough. Tuam also lacked an isolation ward, despite a much greater risk of infection as Tuam admitted older children whose parent(s) were unable to care for them because of some temporary crisis. In 1947 Miss Litster noted ‘the constant risk of infection brought in from outside by admission of whole families of itinerants, destitutes, etc’, the absence of an isolation unit, which meant that newly-admitted children mingled with ‘the others in the Home’. She noted that Dr Dillon had commented on this in an inspection report in July 1945 (which the Commission has not seen). Tuam did not carry out routine examination and testing for venereal disease.\footnote{Department of Health INACT-INA-O-442853.}

5.86 The large wards that were characteristic of Irish mother and baby homes were a recipe for spreading infection. Improvements carried out in Bessborough in the mid-1940s included splitting larger rooms into smaller units. Instituting a stringent hygiene regime was also crucial. This would have been difficult, if not impossible, in the many county homes that lacked adequate water and sanitation (see chapter 10), and in Tuam, where there is no evidence of significant investment in bathrooms and modern sanitary services, water pressure and water supplies were seriously inadequate.

5.87 When Sean Ross suffered a typhoid epidemic, the visiting medical officer appointed two additional qualified nurses as temporary fever nurses (the local health authority queried his right to do so), and he went to considerable efforts to trace the origins of the outbreak, and prevent its spread. His measures included a
draconian hygiene regime, which required women to wash their hands in disinfectant after using the lavatories. He noted that ‘the use and abuse of the lavatories by the type of girl that enters these institutions and who have not been used to such amenities was such as to convince me that the spread of the disease was due to infection from the lavatory seats’. While readers may be offended by these comments, in 1946 only 33,000 of the 423,000 rural homes had a piped water supply and less than 17,000 had a fixed bath. Only 15% of all Irish homes had a fixed bath. Few women in mother and baby homes would have been aware of the importance of personal hygiene when caring for infants and there is no indication that they were given instruction in the homes.

Proposals for change

5.88 The spike in mortality during World War II was an impetus for reform. Children’s allowances were introduced in 1944; the unwieldy DLGPH was divided into the Department of Local Government and the Department of Health in 1947. A major review was carried out of measures dealing with infectious diseases, especially tuberculosis and services for mothers.

5.89 The mortality crisis of the 1940s alerted the department to the overcrowded and unsatisfactory conditions in the mother and baby homes. Miss Litster and her colleagues were meeting unmarried pregnant women who arrived into the Custom House seeking admission to mother and baby homes (See Chapter 8). Many of these women had been returned from Britain, by British Catholic charities or local authorities, often against their will; others travelled to Dublin from provincial Ireland seeking assistance. (See chapters 7 and 8).

5.90 In 1943, the Joint Committee of Women’s Societies and Social Workers (JCWSSW), a women’s voluntary group with an address at 9 Ely Place, submitted a report to the DLGPH about unmarried mothers and their children. They interviewed people who were knowledgeable about infant and child welfare and they visited three homes included in this inquiry: Pelletstown, Bethany and the Magdalen Asylum (Denny House). They received information by letter from Sean Ross.

62 Department of Health, INACT/INA/0/445784.
63 Riordan, ‘Storm and Stress’, p. 146.
5.91 Their report can be read as a reflection of enlightened and interested female (perhaps even feminist) opinion. It also reflects some contemporary stereotypes about heredity and mental illness among unmarried mothers and their children. The JCWSSW criticised the large size of Irish mother and baby homes and their regimentation and they claimed that mothers were not involved in regular care of their children. The JCWSSW acknowledged the hostility shown towards single mothers, noting that it was usually impossible for a mother ‘to take the child to her own people; she has to earn her living and this is extremely difficult with the incubus of a child - not to speak of an illegitimate child’. Affiliation orders were ‘difficult to enforce’. The JCWSSW was of the opinion that illegitimate children start with a handicap. Owing to the circumstances of their birth, their heredity, the state of mind of the mother before birth, their liability to hereditary disease and mental weakness, we do not get, and we could not expect to get, the large percentage of healthy vigorous babies that we get in normal circumstances. This was noticeable in the institutions we visited.

5.92 While some of these comments are open to criticism, many of the recommendations were enlightened. They believed that mothers should be given charge of their child, feeding, washing and nursing the baby, under supervision. They claimed that in smaller institutions, ‘mothers can look after their own babies to a large extent. We found in these institutions, as a consequence, that the babies were brighter and more like normally born babies’. They were in favour of mothers keeping their babies but they noted that ‘economic difficulties and public opinion are too strong’, so they suggested that the money paid to institutions ‘for the upkeep of the child’ should be given to the mother to enable her to support her child, though they conceded that it would be difficult ‘to induce the mother to take and keep the child in the face of public opinion on illegitimacy. Only the strong-minded, or those with the strong urge of maternal affection will do it’.

5.93 This wide-ranging report highlighted the importance of ante-natal care. It suggested that hospital almoners should ensure that unmarried mothers who gave birth in regular maternity hospitals should have ‘a proper place to which to take her child’. Unmarried mothers who kept their children should be visited at least monthly by a health visitor in the early months. Children who could not remain with their mother should be boarded out and monthly payment to foster mothers should be increased to the rate paid for children in institutional care; regulations governing children placed at nurse should be tightened. The JCWSSW ‘strongly urge[d] that
the parent, unless special circumstances exist, is the right person to look after the child. Every effort should be directed towards securing this’. Where that was not possible ‘the next best alternative’ was legal adoption, which, in their opinion was ‘urgently needed’.64

5.94 This is the first report written in Ireland to advocate keeping mother and baby together and it suggested financial measures that might make this feasible. At this time Regina Coeli (see chapter 21) was the only Irish institution that encouraged unmarried mothers to keep their offspring.

5.95 Commenting on the report of the JCWSSW, Miss Litster noted that it was only possible to provide unmarried expectant women with adequate ante-natal care if they were admitted well before giving birth – she recommended at least three months beforehand. The women who went to private maternity homes, ‘for the most part working girls shop assistants, clerks, nurses or teachers’ found it difficult to leave work until late in pregnancy, because they had to save the cost of the maternity home; the ‘outfit for the baby and probably an adoption fee as well’. In light of these financial pressures and their determination to conceal their pregnancy, she concluded that they were unlikely to have adequate ante-natal care. Many women in county homes and private maternity homes were anxious to return to work as soon as possible after the birth. She agreed that

Our institutions are undoubtedly too large. The routine, discipline and supervision necessary render it almost impossible to give any individual attention. As a result children are generally kept away from their mothers, mother and child living practically separate lives. The smaller home catering for say 30 would, however prove more expensive to run. Before the unmarried mother can keep her own child with her and maintain her place in the life of the community, a great change in public opinion will have to take place. At present, in this country, society is opposed to the unmarried mother. Few people will knowingly employ her. Then there is the problem of finding a room in which to rear her child. A married couple with children find it difficult to procure rooms at a reasonable rent. The unmarried mother is not wanted

64 Department of Health, RM/ARC/0/489391: Joint Committee of Women’s Societies and Social Workers, ‘Memorandum on Children in Institutions, Boarded Out and Nurse Children’, June 1943; see Chapter 32 for a description of their role in promoting adoption legislation.
as a tenant. She is forced to take a room in the worst locality at an exorbitant rent.\

5.96 Miss Litster described the Regina Coeli ‘experiment’ as ‘not...generally successful’. She had helped a few mothers who were not in Regina Coeli to keep their baby. They went out to work and placed the child in a day-nursery, but ‘No permanent success attended these efforts. As soon as the children were at an age to be admitted in an Industrial School steps were taken by their mothers to have them admitted’. She conceded that if things had been easier for the mothers - if they were not living in unsuitable basement rooms or the top floor of a tenement, struggling to prepare food and do laundry in wartime conditions, they might have fared better. It would appear that she was sympathetic to the proposal of the JCWSSW to give mothers financial assistance to enable them keep their children, but she suggested that the scheme might be better run by a charity rather than ‘under official direction’. She was also in favour of legal adoption.\

5.97 Miss Litster made additional comments in a later, undated file. She conceded that the optimum size of mother and baby homes would be ‘say up to 30 patients’. However, the overheads in smaller homes would be considerably higher and ‘the cost of maintenance to the Local Authorities would be double or treble the present charge’. She suggested that it might be best to put the question of smaller homes ‘into the category of desiderata for the present’. Some charitable group might consider establishing such a home, but ‘That is, however, a matter for Catholic Social Service’.\

5.98 She criticised the requirement that women who were being maintained by a public assistance authority should remain in these homes for two years after giving birth. It might have been helpful if Miss Litster had been aware that the duration of stay in the Congregation of the Sacred Hearts’ mother and baby home at Highgate had been reduced from two years to six months in 1940 at the behest of the Westminster Archdiocese. She mentioned the number of Catholic women who contacted Bethany Home seeking admission, because they would be in a position to leave in less than two years. In 1946 she noted that many Catholic ‘girls’

---

65 Department of Health, RM/ARC/0/489773.
66 Department of Health, RM/ARC/0/489773.
67 There had been a small Catholic home – St Gerard’s - that met these requirements but it closed in 1939 - see Chapter 27.
68 Congregation of the Sacred Hearts Chigwell, Annals of the Congregation 18 March 1940
contacted the Irish Church Missions - ‘an Evangelical Protestant Society’. The ICM had ‘certain attractions - mothers kept a short time only after confinement and there is little chance of their being recognised while there’. She believed that there was a need for more such homes.69 A conference had taken place about two years earlier where the Mother General of the Irish Sisters of Charity, the Sister in Charge of St Patrick’s Guild, the Secretary of the DLGPH, and Miss Litster discussed a proposal to establish an additional maternity home in Dublin but the project fell through. She noted that ‘a home in which infants may be received without their mother is even more necessary’.70 In 1943, Archbishop McQuaid of Dublin asked Catholic voluntary organisations to explore the possibility of setting up a home where the infants of unmarried mothers could be kept without their mothers, but the Catholic Social Welfare Bureau and the organisations consulted were of the opinion that children should be placed with temporary foster parents while long-term arrangements were being made.71

5.99 Miss Litster referred to the practice in the Sacred Heart homes of giving women a ‘house name’ to protect their identity (Women in Tuam and Pelletstown retained their names). She noted that ‘this precaution is frequently nullified by the presence of other inmates from the same district’; she suggested that local authorities should be ‘more elastic’ in the choice of homes and the Mother Superior might be given discretion to transfer a woman to another home in order to preserve her privacy.

5.100 Although Miss Litster acknowledged that Irish mother and baby homes were too large and she was concerned about overcrowding, she described them as ‘a considerable advance on the old system of sending them [first-time mothers] to County Homes…Subject to admissions, organisation, staffing and boarding-out being properly controlled, the institutions will serve an excellent purpose and should conduce to the moral rehabilitation of a considerable number of mothers’, though some might develop ‘contrary tendencies owing to their finding themselves in the company of such a large number of persons in a similar predicament’. She recommended that an additional mother and baby home should be established to accommodate women who were currently in county homes; she suggested that several neighbouring counties might come together to establish such a home. All

69 For details about the ICM see Chapter 22.
70 Department of Health, RM/ARC/0/489778, Litster 21/2/47
mothers admitted to public assistance institutions should be screened for venereal disease.

5.101 Miss Litster focussed on reform, not radical change: reducing overcrowding through 'a more vigorous boarding-out system' (when children were boarded out their mothers left the homes). She noted that the department believed that the high death rate in Bessborough was ‘at least partially attributable to overcrowding’. She was keen that controls should be imposed on the admission of private patients to the homes run by the Congregation of the Sacred Hearts and a system put in place to track what happened to the children of private patients when they left the home – they were generally placed at nurse. She recommended that the Children Act 1934 should be revised to bring all children requiring the guardianship of public authorities under one central authority - this would include children in orphanages and residential schools, boarded out children and children placed privately at nurse. There is no indication that this proposal was considered: it would probably have triggered a clash between church and state, since it envisaged the inspection of private institutions that were not in receipt of public funding. In 1940 Emmanuel Home in Avoca, County Wicklow - a children’s home that accommodated many children who had previously been in Bethany challenged the right of the DLGPH to carry out an inspection on the grounds that children placed there were not maintained for reward. The Sacred Heart Home in Drumcondra, (which was not associated with the Congregation of the Sacred Hearts of Jesus and Mary) also refused to register under the Children Acts despite pressure to do so from the Dublin Commissioners. In 1941 the Bishop of Cork had objected to Bessborough being asked to supply the names and addresses of private patients – he warned them ‘not to do anything that would be a violation of Canon Law. And it would be a distinct violation of Canon Law and of natural justice to publicise the fact of a secret illegitimate birth, with the mother or father’s name without the permission of the mother and father.’

5.102 In 1947, when the Irish health and welfare services were undergoing major changes, Miss Litster again made the case for extending the remit of the Department of Health’s children’s section, because ‘the mortality rate amongst illegitimate infants in Eire stands too high’. She acknowledged that efforts were

73 Department of Health, RM/ARC/0/489773.
74 Department of Health, RM/ARC/0/489773.
being made to reduce infant mortality by ‘strict supervision over children’s homes’, but work was needed on ‘outside institutions in a field hitherto untouched’. Children placed privately at nurse, and unmarried mothers who had taken their children home should be closely supervised. ‘No statistics of mortality amongst these infants are available, as distinct from the general body of statistics. They belong to a section of humanity more than most open to abuse and neglect’.75

5.103 Her goal was to bring together all the organisations working with unmarried mothers and their children to create a central advice bureau ‘if the Catholic authorities can be got to agree’. The proposed organisation would be similar to Britain’s National Council for the Unmarried Mother and her Child.76

5.104 There was no prospect that the Catholic hierarchy would have agreed to this proposal. In February 1947 the Taoiseach received a copy of a letter written by an unnamed Catholic bishop to a ‘prominent Catholic lay man’ (also unnamed). The document that survives in the Department of Health archives is a statement headed ‘Re Church Missions to Roman Catholics’; this may have been accompanied by a letter, which is not in the files. This document appears to have been prompted by reports that the Irish Church Mission was planning to buy a property in the Dublin suburb of Blackrock for use as a children’s home. It was known as The Boley.77 The document claimed that it was ‘practically certain’ that the new home would accommodate the children of Catholic unmarried mothers. It alleged, incorrectly, that the ICM did not accept the children of Protestant unmarried mothers and that furthermore ‘there are no Protestant children for such homes’. The document called for legislation that would make it unlawful for a child to be raised in a religion different to his/her mother’s unless the mother herself raised her child in a different religion. It also alleged that Protestant children’s homes were not inspected, that they did not keep records of children in their care, and that local authorities sent children to institutions and foster homes irrespective of religion. ‘I think that according to our present law and its administration, a Mohammedan could open an institution, take destitute children, bring them up as Mohammedans without suffering any interference from the public authority’.

75 Department of Health, INACT/INA/0/474129.
77 The Irish Church Missions was established in the nineteenth century to convert Roman Catholics to evangelical Protestantism. See Chapter 22.
5.105 The department dismissed all the allegations. The Public Assistance Act 1939 precluded local authorities from sending Catholic children to Protestant children’s homes. Protestant homes received funding in the form of grants under the Maternity and Child Welfare scheme in a similar manner to Catholic institutions. They dismissed the proposed legislation to limit a mother’s right to have her child raised in a different religion and they pointed out that Bethany Home (which the document regarded as an Irish Church Missions Home) had agreed some years earlier not to admit Catholic mothers or babies. In the course of this statement, the department noted that in the Public Assistance Section of the Department of Health, which was responsible for boarded-out children, the ‘three lady out-door Inspectors’, including the head inspector, were all Catholics; the head inspector (Miss Litster) had converted to Catholicism ‘a considerable number of years ago’. The principal officer was a Catholic; the assistant-principal was a ‘non-Catholic’.

5.106 It would appear that the author of the statement about the Irish Church Missions homes was aware of Miss Litster’s remarks about the attractions of ICM homes for Catholic mothers because a postscript conceded that there was a need for a home that would offer Catholic women the same secrecy as an ICM home and that there was a need for a home that would take children to two years, ‘the age of adoption’, especially as the number of unmarried mothers ‘of the better class’ was increasing. The department suggested that these were matters for the ecclesiastical authorities, though they would give ‘all possible assistance’ if these institutions were established.\(^78\)

5.107 The Department of Health appears to have considered some of Miss Litster’s proposals. In January 1948, a memorandum written for the secretary stated that, on the question of shorter stays in mother and baby homes, ‘there is little we could do as regard extern institutions’; he suggested that Miss Litster might discuss the matter ‘with the authorities of the institutions concerned in order to obtain their views’. The department could make a recommendation to local authorities that mothers should be permitted to leave the institution ‘in order to take up employment but that they should be obliged to contribute towards the maintenance of the child’. As to Miss Litster’s suggestion that an outside body should take responsibility for interviewing expectant mothers and arranging for them to enter a mother and baby home, the department noted that ‘Action on this matter has been deferred for years in the hope that religious bodies or voluntary organisations

\(^78\) Department of Health, RM/ARC/0/489778.
would do something about it but this hope is obviously in vain and I think the problem must be faced’. There were plans for the establishment of regional health authorities and this could be included in their remit (regional health authorities were not established until 1970). The department agreed that a national uniform rate of payments should apply to foster parents; at this time payments ranged from 5s to 7s 6d a week but this modest proposal was not implemented.

5.108 A handwritten note to the secretary stated that Miss Litster’s proposals were necessary though some would require legislation. Pending legislation he suggested issuing a circular to local authorities asking that County Medical Officers of Health be given responsibility for supervising the work of public health nurses; ‘each County Manager and CMOH should enlist through the Bishop of their area – the assistance of the Church in placing these children. In this matter nothing will be achieved without such active considerations’. Miss Litster was asked whether she had any observations on the proposal to enlist the aid of the bishops; she was in favour. As an interim measure she suggested that children could remain in the special mother and baby homes without their mothers as happened in Pelletstown and Tuam. However, she stated that, ‘We might, however get very much better results by starting afresh than by amending existing legislation’ - responsibility for unmarried mothers and their children was ‘too scattered’ - it should be possible to ‘devise a simpler code, which could be framed to take in all children needing the guardianship of public authorities’.

5.109 The department was aware that the mother and baby homes were working at or above capacity in the 1940s and there was a need for additional places. Although conditions in the mother and baby homes merited severe criticism, the alternatives - county homes (see chapter 10) and private nursing homes - were undoubtedly worse. The McAlpine home in Dublin’s Seville Place had a long history of delivering the babies of unmarried mothers and placing them at nurse or in an unofficial ‘adoption’ for a fee. Mothers paid up to £50 to place their child and the McAlpine home retained a substantial share of this money before handing the infant and the remainder of the money to a foster mother. A 1947 file stated that Miss McAlpine and her daughter’s practice was ‘getting as much as they could from the mother and giving as little as necessary to the foster mother’. The home was the subject of several unfavourable reports by the department’s inspectors,

79 Department of Health INACT/INA/ O/474129.
80 Department of Health INACT/INA/O /474129.
beginning in 1938. Following a number of court cases, the proprietor finally surrendered her maternity home licence in 1949. In 1947, by which time the proprietor had been in court on a number of occasions and was continuing to challenge the efforts of the Dublin board of assistance to close this maternity home, a Department of Health official noted that

the official channels are quite unable to cope with the problem of unmarried mothers & illegitimacy. All accommodation is completely full up and those engaged either officially in social work or on a voluntary or religious basis are at their wits’ end to secure some place for women to stay and to place the babies. Until some attempt to improve facilities is made, illegalities such as this case will continue to occur. What is important is the very high death rate amongst illegitimate babies. It is all very well to close this place down, because the proprietor is breaking a law set up to protect infant life, if there is at the same time a serious dearth of accommodation, leading to and in fact the cause of a great number of infant deaths. If her home is closed down, then someone else will start another of a similar kind. Unmarried mothers are usually so desperate that they are not responsible for their actions and I must say that Miss McAlpine’s ‘crime’ does not under all the circumstances of the problem of illegitimacy seem so serious.  

5.110 On 30 January 1948 the Mother General of the Franciscan Missionary Sisters and the Mother Superior of Portiuncula Hospital in Ballinasloe met the Minister of Health, Seán MacEntee, to discuss the possibility of opening a mother and baby home. They ran homes in Britain, and they favoured discharging mothers three months after the birth: ‘the mother should be not alone sufficiently trained in its care, but should have acquired sufficient attachment to the child to ensure that the latter should be well looked after…Their aim was to get these persons back to a normal existence and a normal occupation as quickly as could be arranged’. They were opposed to large mother and baby homes; they regarded 40 women in one home as ‘too high’. 

5.111 A draft circular to be issued by the Minister for Health stated that the existing arrangements for unmarried mothers and their children were under consideration: ‘The mortality among such mothers and children is unduly high. It was vital to ensure that the ‘welfare and education of illegitimate children are safe-guarded’. 

81 Department of Health, CCP/IMP/0/46037.
82 Department of Health INACT/INA/0/474129
This circular summarised many of Miss Litster’s recommendations: shorter stays in specialist homes; screening for venereal disease; improved allowances for foster parents; and sending women who might be admitted to a county home in a neighbouring county. It is unclear whether this advice was circulated to local authorities.

5.112 Despite the impression that some changes in the regime for unmarried mothers and their children were being considered in January 1948, very little happened. A general election later that month brought an end to 16 years of Fianna Fáil governments. Dr Noel Browne of Clann na Poblachta became Minister for Health. Although he is remembered for his efforts to promote a Mother and Child scheme to improve maternal and infant health, there is no indication that he gave any consideration to the specific needs of unmarried mothers or their children, despite the fact that mortality of ‘illegitimate’ children was much greater than children in Dublin’s poorest tenement homes.

5.113 The post-war reforms had only a minor impact on provision for unmarried mothers. The 1951 White Paper on County Homes prompted renewed efforts to remove unmarried mothers and their children from the county homes and this was gradually achieved over the following decade. Efforts to increase the numbers of children boarded out by local authorities, or to ensure that children were boarded out at an earlier age, were less successful (See Chapters 10 and 11). The introduction of legal adoption from 1953 changed the outcome for most children born in mother and baby homes.

5.114 Over-crowding in mother and baby homes, and the requirement that mothers remain for up to two years, were all linked with the key question: who would look after the children? In 1949 Dr Cullen, the medical officer at Castlepollard - who appears to have been very actively engaged with the home - suggested that the department consider establishing homes or orphanages to accommodate children aged between nine months and six to seven years, who were born in mother and baby homes. In response Miss Litster noted that the decision to retain mothers in homes for two years ‘was decided by the Community [i.e. the Religious Order] in consultation with an inspector of the Department.’ [There is no indication of the identity of this inspector but it was probably Mrs Crofts.] The congregation believed that this was the shortest period ‘within which any reformative effective might be expected’. She continued:
The attitude of society in this country towards the unmarried mother is at the root of the idea of retention for a long period. Unmarried mothers here are persons to be punished. In the Homes a great deal of emphasis is placed upon penance and it is small wonder that girls come to look upon them as places of punishment. Any girl in these Homes speaks quite casually of ‘doing my term’. The result is that once the two-year period has passed, continued detention is a cause of discontent.

5.115 She suggested that the maximum length of stay should be nine months, but given that local authorities did not place children in foster homes until they were at least two years of age, some alternative arrangement would be necessary for the children. In the years immediately following the end of the war, mother and baby homes were under considerable pressure from the department to reduce overcrowding, and to ensure that there were no children over two years old in the homes. The suggestion by the JCWSSW that unmarried mothers should be given financial support to enable them to keep their children was not given serious consideration.

5.116 In 1951 officials in the Department of Health rejected the Regina Coeli model of enabling unmarried mothers to raise their child(ren):

There is a very good reason to doubt the wisdom of encouraging and contributing to the further development of the accommodation for unmarried mothers and children, as at present organised…when the children are older serious difficulties must be expected. There will be problems of segregation of sexes and the consequent need for more accommodation. Each ‘household’ in the group is abnormal in so far as it lacks a father and a concentration of such ‘households’ with adolescent children and in restricted accommodation will be in danger of becoming a slum, in spite of the best efforts of the voluntary workers.

5.117 Yet they noted that members of the departmental committee on the reconstruction of county homes were favourably impressed by the excellent spirit of the members of the Legion of Mary and by the pleasant relationship between the voluntary workers and the residents. The atmosphere in the Hostel was considered to

83 Department of Health, CCP/IMP/0/45492, 3 June 1950.
be in many ways superior to that of the usual institutions from the point of view of the happiness of the residents, but the members of the Committee were unanimously apprehensive of changes that must take place as the children grew older.  

5.118 This report reveals an incapacity to think creatively about alternative arrangements for unmarried mothers and their children. It acknowledges the ‘excellent spirit’, the better atmosphere in Regina Coeli and then dismisses these households as ‘abnormal’, and predicts future difficulties that could be forestalled by expanding the accommodation given to each mother and her child(ren) while retaining the model of group apartments.

5.119 Given the absence of legal adoption in Ireland, the pressure coming on mother and baby homes and local authorities to find foster homes for children, plus the fact that American couples were seeking to adopt European children, it is not surprising that the Mother Superiors of mother and baby homes welcomed US adoption. The department’s determination to reduce the numbers of children in mother and baby homes may explain why no official objection was voiced to US adoptions.

5.120 The mid-twentieth century marked a peak in state-regulated adoptions, and at this time social workers believed that adoption offered the most appropriate ‘solution’ for the children of unmarried mothers. Legislation governing legal adoption in Ireland was finally introduced in 1952 the second latest country in Western Europe; the Netherlands introduced legal adoption in 1956.

Conclusions

5.121 The sharp rise in infant mortality during the early and mid-1940s resulted in greater scrutiny of the public health system and conditions in mother and baby homes. The lack of files relating to these homes in the 1930s makes it difficult to determine whether these shortcomings were new or existed from the inception. There is some limited evidence that would support the latter opinion. In 1932, shortly after the opening of Sean Ross, the annals of the Congregation of the Sacred Hearts recorded that ‘babies in Roscrea [are] not doing well’; a Sister was dispatched from Liverpool for a month to try and resolve this.  

In 1937 Mrs Crofts - who appears to have been well-disposed towards the congregation - suggested that some of the

---

84 Department of Health, INACT/INA/0/435392.
85 Congregation of the Sacred Hearts, annals, May 1932.
Sisters should be sent to the Children’s Hospital Temple Street for training - it is unclear whether this would be a short course or the formal training for a children’s nurse. This indicates that Mrs Crofts was aware of their lack of professional training. The records of the congregation relating to the Irish mother and baby homes refer to the chapel, meetings with the bishop, the sale or purchase of property but not to conditions in the homes, very rarely to the infants and never to the mothers. Sister Martina was appointed to Bessborough in 1922 and she remained for over 20 years until she was in her 70s. Her long service in one institution was inconsistent with the congregation’s regulations stipulating that heads of houses should not serve for more than six years - exemptions to this rule required a dispensation from Rome.

5.122 The wartime crisis in infant mortality resulted in improvements within Bessborough and presumably in other homes, together with proposals for major reforms in health services for mothers and children. The outcome was a much better system of maternity and infant care for mothers and children which was undoubtedly of benefit to the poor. Better healthcare, coupled with improvements in food supplies, better housing and sanitation together with mass immunisation and new drug therapies transformed the outcomes for Irish infants, though neo-natal mortality, (the first month of life) proved more resistant to improvement, and not just in Ireland.

5.123 Unmarried mothers and their children shared these health gains. Penicillin was first used to treat infants in Bessborough in April 1946. Infant mortality in the Bessborough home (i.e. the section that accommodated children who had been discharged from the maternity unit) fell from 40% to 8% in the period April to September 1946. But the system that had emerged in the 1920s and early 1930s was not altered. The only new feature was adoption: babies who were adopted by US couples and the introduction of legal adoption in Ireland.

5.124 The creation of a separate Department of Health appeared to signal a substantial expansion in the role of central government but decisions relating to unmarried mothers and their children remained primarily a matter for local authorities and religious/charitable agencies. The shortcomings revealed by inspections of Bessborough and the appalling death rates of early/mid-1940s appear to have

86 Congregation of the Sacred Hearts, annals, 4 Jan. 1937.
87 Congregation of the Sacred Hearts, council minutes, 23 Sept. 1936.
been forgotten and forgiven, perhaps because infant mortality was falling sharply. After 1949 (the date of Miss Litster’s last commentary quoted above), nobody appears to have queried whether special homes, run by religious sisters, at ratepayers expense, were the most appropriate way to provide for an unmarried mother and her infant. The religious sisters were generally viewed in a positive light - a department of health memorandum in December 1949 about a possible increase in capitation rates in mother and baby homes captures a widely-held attitude:

We should not be niggardly in our approach to this question while bearing in mind at the same time that the Exchequer has to pay a portion of the cost. The nuns in charge of these institutions are doing their work well. They do not receive any salary or remuneration for their work. (they were paid in Pelletstown which was not funded by capitation payments) They are continually pinching and scraping to make ends meet and if this institution had to be maintained by local authorities themselves, I am perfectly satisfied that the cost would be very much higher.\(^\text{88}\)

5.125 Evidence from county homes, and the lack of concern shown by local authorities for the welfare of boarded-out children in their care, does not suggest that placing these homes under the control of local authorities would have offered a better solution. It is equally fanciful to suggest that mother and baby homes or other services for unmarried mothers and their children should have been provided directly by a government department. In Britain and the Netherlands at this time, mother and baby homes were run either by local authorities or voluntary groups, which generally had a religious ethos.

5.126 Nevertheless this chapter raise serious questions about governance, and the relationship between private institutions - such as the three homes run by the Congregation of the Sacred Hearts - and the state, whether local or central. Regulations with respect to numbers were regularly flouted. Such irregularities were not unique to mother and baby homes; inspection reports on private nursing homes suggest similar infringements. Although local authorities provided significant funding they appear to have shown little interest in what happened in these institutions; a lack of records makes it difficult to determine whether Dublin and Galway health authorities carried out regular inspections of Pelletstown and

\(^{88}\) Department of Health, INACT/INA/0/464172.
Tuam. In 1941, a DLGPH official conceded that ‘apart from the contractual rights of the local authority inherent in the agreement and the powers of the Minister…we have no powers of control or scrutiny of accounts etc. so that we know nothing about the financial position of the community or the Institutions’. More detailed scrutiny of the three homes run by the Sacred Hearts Congregation would have threatened a dispute between church and state and it would have challenged the prevailing mindset of the time that these Sisters - despite their apparent lack of professional qualifications - were best placed to manage the care of unmarried mothers and their infants. The 1947 ‘letter’ forwarded by the Taoiseach’s department suggested that denominational tensions and fears that Catholic infants would be raised as Protestants remained a critical concern for at least some sections of the Catholic hierarchy, and that a more interventionist Department of Health would face difficulties asserting their authority. Although the health crisis of the Emergency years resulted in major reforms to Irish health services, and especially those providing for pregnant women and babies, provision for unmarried mothers and their children remained largely as it was in 1939, despite evidence that it demanded radical rethinking.

89 Department of Health, CCP/IMP/0/45492.
90 Earner-Byrne, Mother and Child
Chapter 6: Post War Years

Introduction

6.1 The years from the late 1940s until the mid-1960s are now recognised as a conservative period in western Europe and North America. Most countries experienced a marriage boom; couples married in their early twenties, and the falling birth-rates of the 1930s were reversed. The number of ‘illegitimate’ births fell. Families, where the man was the breadwinner and the woman remained at home caring for children were regarded as the ideal. Adoption was seen as the ‘solution’ to births outside marriage and childless couples. The number of children being adopted rose in the UK and in the United States, peaking in the mid/late 1960s. Ireland’s marriage pattern was different; it was only in the 1960s that Irish couples began to marry in their twenties, but Ireland shared in the post-war social conservative values.

6.2 The introduction of legal adoption in Ireland with the Adoption Act 1952 transformed the outcomes for the children of unmarried mothers. By the 1960s unmarried mothers were no longer spending long periods in county homes or mother and baby homes. In Ireland, as elsewhere, ‘illegitimate’ births, which had increased during the war, fell significantly. The numbers peaked in 1946 at 2,642 or 3.9% of total births; by 1950 this had fallen to 1,627 or 2.6% of births and it continued to fall. Part of the wartime increase was probably due to the fact that pregnant women faced difficulties in travelling to Britain and remaining there, but even allowing for that distortion in the statistics, the number of ‘illegitimate’ births undoubtedly fell after the war. The number of births in the major mother and baby homes1 peaked in 1946 and then declined, though not in proportion to the fall in ‘illegitimate’ births.

6.3 Social attitudes in Ireland and elsewhere were conservative and there is no evidence of any reduction in the stigma associated with unmarried motherhood until the late 1960s. A much higher proportion of Irish unmarried mothers were admitted to mother and baby homes during the 1950s and 1960s than in the 1930s or 1940s. The introduction of legal adoption and a reduction in the length of stay

---

1 The statistics relate to Kilrush, Bessborough, Sean Ross, Castlepollard, Bethany, Denny House, Tuam, Pelletstown and Dunboyne. Regina Coeli is excluded because it admitted a more diverse range of mothers and babies, so these figures underestimate the numbers of ‘illegitimate’ births associated with mother and baby homes. The figures record all babies born to women who were in these homes, whether the birth took place in the mother and baby home or elsewhere.
may have persuaded more women or their families to seek admission to these homes. In 1950, 498 babies, or 30.6% of registered ‘illegitimate’ births, were born in mother and baby homes. By 1961 this had increased to 52% of ‘illegitimate’ births. A majority of ‘illegitimate’ births took place in mother and baby homes in 1965, 1966 and 1967. The number of births in these homes peaked in 1967, when 821 babies were born. There are no comprehensive statistics for the number of unmarried mothers who gave birth in county homes. However, on 31 March 1953 there were 318 unmarried mothers in county homes and 488 in ‘special homes’, the term used by the Department of Health to describe mother and baby homes. The number of women in county homes declined during the 1950s. The removal of unmarried mothers from county homes, (which had been government policy since the 1920s) and the admission to mother and baby homes of women on a second or subsequent pregnancy contributed to the increased percentage of unmarried mothers in the special mother and baby homes. However, the steady rise in the number admitted to mother and baby homes in the 1960s happened some years after the disappearance of unmarried mothers from most county homes.

Mortality and health care

6.4 Infant and child mortality fell sharply in the late 1940s and continued to fall. The gap between the death rate of ‘illegitimate’ children and the national average narrowed, as did the gap between urban and rural mortality, though infant mortality among city children and ‘illegitimate’ children remained high by international standards. The improvement in neo-natal mortality (first four weeks of life) was much slower than the improvements for children aged between one and 12 months.

6.5 No single factor accounts for the significant decline in infant mortality. By the late 1940s penicillin was in general use, and the survival rates among infants who had contracted pneumonia and other serious infections, such as gastro-enteritis, showed a marked improvement. There was substantial investment in water, drainage and housing, and a major construction programme for hospitals and county homes, though the impact of these investments would have been gradual. Part IV of the Health Act 1947, which related to infectious diseases and infestation, gave the Minister of Health power to define infectious disease and make

---

regulations to prevent their spread. Regulations introduced the following year provided the basis for nationwide programmes of immunisation against diphtheria, whooping cough and later polio, provided by local health authorities, free to all children. By 1952 almost 60% of pre-school children were being immunised against diphtheria, though rates varied, with over 90% being immunised in Cork city and Louth, but only 44% in Dublin city and 19% in Limerick city. Nationwide immunisation programmes reduced the incidence of infectious disease in the community, with direct and indirect benefits to children in mother and baby homes.

6.6 The decline in infant mortality in the mother and baby homes followed a very similar time-line to national trends, which suggests that at least part of the decline was due to changes within the wider society, but improvements within the mother and baby homes were also important. The introduction of isolation units for mothers and infants limited the spread of infectious diseases; the establishment of St Clare’s as a specialist infant hospital for infectious disease helped to reduce mortality in Pelletstown and Regina Coeli (see Chapter 2). The reduction in overcrowding and measures to break up the large infant nurseries were also important in infection control, and the ending of wartime shortages improved the nutritional status of pregnant women. The critical scrutiny of infant mortality and conditions in Bessborough during the war years may have prompted the authorities in charge in Bessborough and the other homes to be more active in reducing and preventing infection. The Department of Health’s insistence on the appointment of qualified midwives and nursing staff was also important.

6.7 The General Registrar Office (GRO) described 1948 as ‘the healthiest ever recorded in Ireland’, with infant mortality at 49 per 1,000 live births, compared with 68 the previous year. Deaths from diarrhoea and enteritis among infants, who were under two years old, fell from 1,092 in 1945 to 340. The report for Cork Street Fever Hospital noted that, in 1941, gastro-enteritis killed 500 babies before their first birthday. Only 59 cases were admitted to the hospital in 1948 and eight died.

6.8 Maternity and child health was a priority in plans for an improved health service. In May 1948, the Minister for Health, Dr Noël Browne, established a consultative child

---

health council to advise him on measures that would reduce infant mortality and improve children’s health. They identified the high rate of infant mortality in Dublin city as the most urgent problem and they appointed a sub-committee to examine that topic. The sub-committee, chaired by the paediatrician Dr Robert Collis, consisted of doctors - including paediatrician Colman Saunders, a paediatric nurse Miss E Healy, and public health experts. They recommended that the child-health services of Dublin Corporation and the Dublin Board of Assistance should be consolidated. They determined that half of the city’s milk supply was unsafe, so a strategy to ensure the quality of infant milk was critical. They highlighted cases of ‘inanition’ - underweight babies, and the high death rate from infections as factors that were responsible for many deaths among the children of single mothers and Dublin tenement families; 90% of babies admitted to St Clare’s Hospital were reported to be underweight. They determined that breastfeeding was the most important factor in reducing neo-natal mortality, together with good hygiene and regular weighing of infants; artificial feeding should be used when necessary, and infants infected with diseases should be isolated.

6.9 The sub-committee identified the death rate of children born to single mothers, which was more than three times the rate for ‘legitimate’ babies, as a problem ‘to be faced resolutely if the general infant mortality rate is to be reduced’. Conditions in St Kevin’s – Dublin city’s equivalent to a county home and county hospital - were described as ‘quite out of date’. The nurseries were not constructed to prevent cross-infection, which meant that healthy infants became infected. St Kevin’s had no consultant paediatrician. Pelletstown, which was also under the control of the Dublin Board of Assistance, was ‘excellently renovated…structurally improved but dangerously over-crowded and with insufficient trained nurses’. They recommended the appointment of a consultant paediatrician; a specialist neo-natal unit should be established in St Kevin’s, all healthy ‘illegitimate’ children should be moved to Pelletstown, and all sick infants moved to children’s hospitals. The isolation unit at Pelletstown should be reorganised and staffed with qualified nurses, and the numbers in Pelletstown reduced by the earlier discharge of mothers. Responsibility for boarding out children should be vested in the health authority and inspection entrusted to a public health nurse. Regina Coeli was described as unsatisfactory; infant mortality there was three times the rate in Pelletstown. The hostel was ‘lack[ing] almost every proper facility in regard to both nursing and structure’ and it was utterly unsuitable for new-born infants. They claimed that infants in Regina Coeli were ‘not being properly cared for or
adequately nourished at present’. Dr Deeny, the department’s chief medical officer, responded to this report by suggesting that the real trouble with the high illegitimate death rate is the inability of the authorities to find suitable homes for the infants and to take reasonable care of them while they are with the mothers. It is useless for the Committee to talk about an early discharge of the mothers from St Patrick’s Home [Pelletstown] without suggesting a suitable means by which this can be achieved. A mother cannot walk out of the home and leave it [her infant] in the hands of the charity.

6.10 A new maternity unit opened at St Kevin’s Hospital in 1954, with a consultant obstetrician. Dr Victoria Coffey, who had been providing maternity care and care for new-born infants, was given responsibility for neo-natal cases and children in St Kevin’s. It is unclear whether her contract included duties at Pelletstown; however in 1960 when the number of children’s beds in St Kevin’s was severely reduced her duties were revised to include twice-weekly visits to Pelletstown.

6.11 Dr Deeny regarded boarding out as the best solution for the children of unmarried mothers but he claimed that the system had ‘broken down’ because of a shortage of suitable foster homes. He recommended seeking ‘the active intervention of the Church…and…a proper Adoption Act’. He claimed that the medical section of the Department of Health had approached successive ministers over the past seven or eight years and they in turn had made tentative approaches to the bishops, presumably regarding an adoption act, ‘but no concrete result has been achieved’. The Commission has seen no record of these interventions, which may have been oral. He suggested that a formal submission should be made to the bishops about adoption, because ‘an Adoption Act would do more to lessen infant mortality amongst illegitimate children than any other factor’.

Adoption

6.12 Legal adoption was introduced when the Adoption Act 1952 came into effect on 1 January 1953. This was many decades after it was introduced in Northern Ireland,

9 Department of Health, INACT/INA/0/541585.
England and Scotland. The Netherlands was the only other country in Western Europe without legal adoption before World War II; it was introduced in 1956.

6.13 The delay in introducing adoption and government pressure on mother and baby homes and county homes to reduce the number of children in these institutions meant that mother and baby homes probably welcomed approaches from American couples seeking to adopt children in the immediate aftermath of the war. The introduction of adoption in Ireland should, in theory, have brought an end to the practice of overseas adoptions, but they continued. In September 1953, the registrar of the newly-established Adoption Board, An Bord Uchtála, sought advice from the Minister of Justice about overseas adoptions. He was told that

> There seems to be no doubt whatever that, for the present at any rate, there are more children in the country available for adoption than there are suitable persons able and willing to adopt them. That being so a number of children are certain to be denied homes and family life, unless they are adopted by foreigners. Much as the Minister regrets that any Irish child should have to go abroad, he thinks that where the adopters are suitable a foreign adoption is to be preferred to the Institutional life here which might be the only alternative. Accordingly, as long as the supply of children for adoption here is greater than the demand, the Minister would not discourage suitable foreign adopters.\(^\text{10}\)

6.14 The introduction of adoption resulted in a fall in the number of boarded-out children and children placed at nurse. The number of young children in institutional care increased. By the mid-1950s St Patrick’s Guild (see Chapter 2) was keeping children in Temple Hill until they were adopted. Temple Hill was expanded, with the assistance of a substantial grant from the Irish Hospitals Commission. In earlier years St Patrick’s Guild had placed many children at nurse with families.\(^\text{11}\) Some adoption agencies did not have access to a specialist baby home. By the mid/late 1960s inspections of maternity nursing homes were increasingly turning up cases of infants being kept in private maternity homes without their mothers. Some of these children were born in the maternity homes; others were placed in these homes by their mother or an adoption agency, pending adoption. In 1968, having removed children from unregistered foster homes and a maternity home,

\(^{11}\) Department of Health, INACT/INA/0/435925.
the county medical officer in Waterford decided that children awaiting adoption should be kept in the county home.\textsuperscript{12}

6.15 The records of St Anne’s Adoption Society in Cork, which placed infants of Irish unmarried mothers repatriated from Britain, noted the resentment/disbelief of mothers that their infants could not be immediately placed with adoptive parents, as happened in Britain. The Limerick Social Service Council, which worked closely with the Limerick Catholic Adoption Society, arranged for ten couples with families to provide short-term foster care for infants following their discharge from a maternity home and adoption. They reported that this arrangement ‘enables the mother to return to her normal way of life with the minimum of delay and inconvenience’.\textsuperscript{13}

6.16 In 1955, there were 1,234 ‘illegitimate’ births and 786 adoption orders; 2,184 ‘illegitimate’ children were boarded out, and 582 children were resident in institutions that were certified under the \textit{Health Act 1953}. Department of Health inspector Alice Litster highlighted a ‘recent development…the committal of very young children to convent industrial Schools’.\textsuperscript{14} She was unable to determine the precise number of children under five being maintained by local authorities from the Department of Education, which was responsible for industrial schools. However, she discovered that in 1953, 26 children under five years, who were charged to Dublin Corporation, were committed to industrial schools; 33 were committed in 1954 and 34 in 1955.\textsuperscript{15} In March 1953 there were 389 children of unmarried mothers maintained in industrial schools, 284 in other institutions, and 2,284 were boarded out.\textsuperscript{16}

6.17 In 1960, there were 968 ‘illegitimate’ births and 505 adoption orders were made; the number of boarded-out children had declined to 1,861, and 232 children were maintained in institutions. By 1965, when 1,403 ‘illegitimate’ children were born, 1,049 adoption orders were made, and the number of children boarded out had fallen to 1,262; but the number maintained in institutions had risen to 515. There is no evidence that families had become more willing to accept an unmarried

\textsuperscript{13} \textit{Limerick Leader}, 13 Dec. 1969.
\textsuperscript{14} It is not clear that this was a very recent development. Very young children were moved from Pelletstown to industrial schools at least from the early 1940s – see Chapter 13.
\textsuperscript{15} Department of Health, INACT/INA/0/435925.
\textsuperscript{16} \textit{Report of the commission on emigration and other population problems, 1948—1954}, Appendix IV.
daughter and her child back into the family home, and economic conditions brought only a gradual improvement in the job prospects or wages of single women who might wish to keep their child.

6.18 Most of the early adoptions involved the legalisation of informal adoptions and the adoption by foster parents of children placed with them by either a local authority or a charity. The proportion of 'illegitimate' children who were adopted rose steadily during the 1960s. Statistics recording the final confirmed placement of children born in Bessborough show that just under 75% of those born in the 1950s were adopted (many of those children would have initially been placed with foster families); in the 1960s the figure was over 95%.

6.19 By the early 1960s an increasing number of adopting parents were middle-class, though farmers remained reluctant to adopt - only 80, less than 10% of the 840 adopters in 1963 were labourers, 84 were farmers; these figures were much lower than their share of Irish households. As Irish adoptions increased, the number of children adopted in the USA fell. One-quarter of children were placed privately with adopting parents, which was not illegal. In 1964, Michael Viney noted that a child born to an unmarried mother in Ireland had a four-to-one chance of being adopted; 40% of adopted children would be raised in prosperous middle-class homes. In 1958, a majority of adoptive parents were living in Dublin, but by 1969, 60% of adoptions were by rural couples. The Sunday Press quoted a spokesman for the Adoption Board who noted that ‘the rather conservative country people have accepted adoption’.

The Health Act 1953

6.20 The Health Act 1953 enacted a modified version of the contentious Mother and Baby scheme that was envisaged as a key element of the Health Act 1947. The legislation provided for a full maternity care service - either domiciliary or in a hospital or nursing home; free medical care for infants up to six weeks after birth, and a £4 cash grant for each confinement, plus free milk for pregnant or nursing mothers, and free milk for children up to five years. The act did not distinguish between married and single women. Earnet-Byrne notes that ‘the underlying assumption was that Irish mothers were entitled to care as citizens, not necessarily

---

as wives'.\(^{19}\) In 1954, the Assistant Secretary of the Department of Health instructed the Rotunda Hospital not to demand marriage certificates from pregnant women when they enrolled for ante-natal care. ‘The request for the certificate is an embarrassment to the single woman or the woman who married only a short time before the expected birth of the baby, if she wishes to conceal the fact, as she should be at liberty to do so’.\(^{20}\) Section 54 provided that a person who was unable to provide for their shelter and maintenance was eligible for institutional assistance in a county home or similar institution. Mother and baby homes were deemed to come under this heading (see Chapter 1). The *Institutional Assistance Regulations 1954* provided the details for the implementation of Section 54.

6.21 The *Social Welfare Act 1952* provided that women who had worked in insured employment for a designated period could claim a maternity allowance for 12 weeks - six weeks before and six weeks after giving birth. This payment was made to qualifying married or single women.

6.22 Although the *Health Act 1953* gave women the freedom to select where they would receive maternity care, in 1957 one member of a delegation from the Irish Medical Association, who met Department of Health officials to discuss the 1953 act, complained that the local health authority in Galway refused to admit unmarried mothers to Tuam until they had supplied details of the putative father, and an unmarried woman, who developed complications during pregnancy, could not be admitted to the Regional Hospital (formerly the Central Hospital) unless she was first admitted to Tuam, despite the fact that this delay presented risks for both mother and baby.\(^{21}\)

**Mother and baby homes**

6.23 All the mother and baby homes were overcrowded during the war years. The sharp fall in ‘illegitimate’ births eased the pressure on places. An inspection of Castlepollard in 1950 determined that numbers in the home were too high,\(^{22}\) but within a few years Castlepollard was complaining of empty spaces, and the Superiors of all the homes were becoming concerned about numbers and potential financial deficits. The numbers of women admitted to Pelletstown fell from 170 in the year ending March 1949 to 102 by March 1955; the number of women in

---

\(^{21}\) Department of Health, INACT/INA/0/427509.

\(^{22}\) Department of Health, NATARCH/ARC/0/413869.
Pelletstown at year end fell from 145 to 102; the numbers of children from 380 to 244.

Health and Mortality

6.24 Infant mortality fell significantly in the mother and baby homes in the late 1940s. When Castlepollard was inspected in January 1949, Miss Litster reported that of the 123 live infants born between 1 April 1948 and 21 January 1949 (there were six stillbirths), only one death was recorded in the maternity section - a twin weighing 3 lbs. 10 oz. at birth. Three older children died in the nursery, two of gastro-enteritis, one with haemolytic jaundice. The death rate of 3% was the lowest yet recorded in any of the ‘special homes’; it was one-quarter of the 13% mortality recorded for 1947-48.\(^{23}\) In the year ending 31 March 1951, 83 babies were born in Bessborough and a further 19 were admitted shortly after birth. One child died - the premature infant of a 16-year-old mother who was admitted in labour. Between 1 April and 7 November 1951 an infant and two older children died - from convulsions and measles.\(^{24}\) Regular inspections, isolation units, insistence on adequate professional staff, the provision of additional wash-hand basins and sanitary facilities and reduced over-crowding contributed to the reduced mortality, as did penicillin. But infant mortality remained significantly higher than in the general population and the death rate in Sean Ross was reported to be twice that in Castlepollard. An inspection of Pelletstown in 1951 noted that the death rate over the previous 12 months was 10%; between 1 April and 26 October 1951 it reached 27%. Miss Litster suggested that the institution should revert to earlier practices where mothers and babies were not admitted until they had been screened for venereal disease and tuberculosis and given a general clean bill of health.\(^{25}\)

6.25 By the 1950s the health care provided for mothers and babies appears to have been adequate and equal to, if not better than, that available to many married women. In 1964, according to the annual record of the General Medical Council. The only places outside Dublin with qualified obstetricians were Cork, Galway, Limerick, Sligo, Drogheda, Ballinasloe and Waterford. Inspection reports reveal the poor standards in many private nursing homes where married women gave birth in the 1940s and 1950s and it took many years of inspections to secure

\(^{23}\) Department of Health, INACT/INA/0/450464.

improvements. One nursing home in County Kerry transformed into a bed and breakfast during the summer months. The McAlpine home in central Dublin, which was discussed in the previous chapter, allegedly consisted of four beds for maternity cases. The house also accommodated two lodgers - a printer and an entertainer - plus parents and three children. In 1949, Miss Litster was uncertain where they would all sleep; she described it as a ‘spurious maternity home, all comers being welcome’. In the 1950s a midwife in the west of Ireland delivered babies in rooms above her husband’s public house without the appropriate maternity home licence. Baths, bathrooms and sanitary facilities were often inadequate; when maternity homes were first registered there were nursing homes where the only toilet was outdoors but local authorities were often reluctant to withdraw licences from homes with inadequate facilities. Most of the private maternity homes also accepted patients with chronic illnesses or in need of general nursing.  

6.26 In 1944, the medical officer attached to Sean Ross described the maternity hospital as inadequate, only equipped for normal deliveries. The matron wanted a new maternity unit with a labour ward, sterilising room, a theatre with connected ante- and post-partum examination rooms and additional equipment and instruments. The medical officer was a former assistant-master in the Coombe Maternity Hospital. An inspection in October 1955 expressed concern that the hospital was located close to the farmyard; an open drain/sewer ran nearby; antenatal patients were accommodated in converted coach houses with inadequate fire escapes. By 1954 Bessborough had a well-equipped maternity home with an operating theatre where caesarean sections could be performed. The visiting medical officer, Dr Sutton, was a qualified obstetrician. The visiting medical officer in Castlepollard was the local dispensary doctor, Dr Cullen; obstetric emergencies and caesarean sections were sent to Holles Street hospital. Dr Stuart, the visiting medical officer in Pellesttown, was a qualified obstetrician; cases requiring surgery were sent to St Kevin’s (gynaecology) or the Coombe (where Dr Stuart was a member of the staff). In 1945, the maternity unit in Tuam was described as ‘a new building…well-equipped for its purpose’. Central heating was installed around

1951, but the unit relied on an external midwife to deliver babies and the services of a local GP; the other homes had trained midwives on their staff. Inspection reports noted a lack of ante-natal care in Tuam. Women admitted to Bethany gave birth in a Dublin maternity hospital, as did the women in Denny House and Regina Coeli. By the 1950s the homes had isolation units, and it appears that new arrivals underwent Wassermann blood tests to detect cases of venereal disease (penicillin had a dramatic impact on treatment for VD). As the ban on admitting mothers on a second pregnancy was gradually relaxed (see below), the medical officer in Castlepollard argued that it was necessary to test blood groups including rhesus status, to alert him to the prospect of haemorrhagic disease.

6.27 Mother and baby homes benefited from child immunisation programmes, and from penicillin and other antibiotics. A letter from the Department of Health to all public assistance authorities, dated 2 May 1947, approving increased maintenance charges for Castlepollard, stated that:

These charges are intended to cover inter alia the cost of Wassermann blood tests, subsequent treatment of inmates affected with venereal disease, extra remuneration for the medical officer for carrying out such treatment and the cost of drugs, etc. The charges are also intended to cover the costs of immunisation and vaccination. [There is an inference that these services are new].

Infants were routinely immunised against diphtheria and whooping cough. In 1950, the visiting medical officer at Castlepollard wrote to the department requesting higher maintenance charges; he referred to the cost of penicillin, and drug treatment for cases of vaginal discharge, and the cost of inoculating children. Gastro-enteritis was now treated with appropriate drugs; he had recently found that streptomycin had proved effective in some cases. A year later he proposed that where a mother or infant maintained by a Public Assistance Authority (PAA) was being treated with a ‘special drug’ - such as aureomycin, streptomycin, procaine or penicillin - he would charge the additional cost to the PAA, but in order to treat sick patients in a timely manner, he proposed seeking advance approval to do this. The Department of Health rejected this proposal. The list of drugs indicates the range of modern medicines that were available to treat the diseases that were responsible for many infant deaths in the past. These medicines were costly. In

1954 special drugs administered to one child in Castlepollard cost over £6, which was equal to three weeks maintenance for a mother, or six weeks for a child. The Minister for Health had no objection to reimbursing this cost. But Kildare County Council refused to reimburse Castlepollard for the cost of dental work for a woman patient. The department overruled this decision.\(^{34}\)

6.28 Despite significant advances, infant mortality in mother and baby homes remained much higher than the national rate. In 1950, the main causes of death listed in Pelletstown included prematurity, syphilis, cardiac failure, pneumonia, congenital debility and inanition.\(^{35}\)

6.29 Department inspectors visiting Sean Ross in 1949 welcomed the fall in infant mortality, but they believed that more could be done. Miss Litster noted that the death rate at 12% included three infants who would previously have been classified as stillbirths; nevertheless the figures compared very unfavourably with Castlepollard. She complained that a woman with active tuberculosis had been admitted to Sean Ross; she had since been removed to the county home. The department’s medical inspectors decried the deaths from pneumonia, which the medical officer described as ‘accidental - not likely to recur’. The department claimed that they could be averted, ‘in these days of penicillin, sulphadimine etc. by greater vigilance by the nursing staff, so that treatment could be begun earlier’. In 1951, the chief medical officer noted that too many women in Sean Ross were giving birth shortly after admission; some arrived in labour, which contributed to the high rate of neo-natal death and stillbirths. He claimed that half of the mothers and infants left less than three months after the birth, which meant that infants could not be immunised; others left before receiving a second injection. The ‘known neo-natal death rate’ remained high at 84 per 1,000.\(^{36}\) The death rate in Sean Ross continued to cause concern. In 1959 it was 50 per 1,000 (the national figure was 32), which was described as ‘very high’. The department’s inspector Margaret Reidy recalled a report by Miss Litster in 1955, highlighting the deaths from viral pneumonia; she noted that no action appears to have been taken on foot of that report.\(^{37}\) In 1962, Miss Reidy noted that whereas Castlepollard and Bessborough transferred all seriously-ill infants to hospital, Sean Ross continued to care for them

in the institution. In 1962 however, deaths in Sean Ross were lower than in the other Sacred Heart homes.\textsuperscript{38}

6.30 An inspection carried out in Bessborough in 1961 concluded that ‘the hospital was clean and well-kept and records available and properly posted’. However the department noted that infant mortality was around 85 per 1,000 births, three times the national rate. It acknowledged that the rate for ‘illegitimate’ infants was higher than for the children of married women ‘but nevertheless - this figure is too high’. They suggested that this should be discussed with Dr Sutton - whether it happened is unknown.\textsuperscript{39}

Diet

6.31 By the 1950s infant/children’s diets in county homes and mother and baby homes were informed by modern nutritional science. In 1953 children over the age of three months in the three Sacred Heart homes were given daily doses of adexolin - which contains vitamins A and D3; children aged over six months received a spoonful of cod liver oil. Orange juice was mentioned in diets for children under six months; oranges featured in the diets of older children. Children aged nine months or older received 48 ounces of milk daily, which the department’s dietician described as generous. There was a concern to ensure that the milk was tuberculin-tested.\textsuperscript{40} Children were put onto solid diets and spoon feeding around six months, which was the recommended practice at this time.\textsuperscript{41}

6.32 In July 1954 when Bessborough underwent an inspection, dinner for the women consisted of beef stew, vegetables and milk pudding. The report noted that soup was frequently served especially in cold weather and stewed fruit when fruit was available. Breakfast consisted of porridge, bread, butter and tea, with an egg on Sundays and an occasional rasher. Supper consisted of eggs or salad, with bread, butter and tea. The inspector commented that it ‘appears to be nourishing’.\textsuperscript{42} Dinner in Sean Ross on the day of the 1954 inspection consisted of soup, meat and two vegetables, semolina and rhubarb. The evening meal comprised sausage, or black or white pudding, or salad or stewed fruit, plus tea, bread, and

butter.\textsuperscript{43} But a 1957 inspection noted that the Mother Superior had found it necessary to improve the diet; she was providing extra milk and butter and she planned other improvements both in the quantity and quality of food.\textsuperscript{44}

\textbf{Accommodation and amenities}

6.33 The 1950s brought long-overdue improvements to county homes, which continued to resemble Victorian-era workhouses. There was little investment in mother and baby homes probably because they had received substantial capital funding in earlier decades. In Bessborough the only major investment was £3,000 from the Hospitals Commission in 1953 for additional infant accommodation.\textsuperscript{45} In 1950, facilities in mother and baby homes, with the notable exception of Tuam, were far superior to county homes. They had running water, some form of heating, bathrooms and flush toilets (the list is basic). Inspectors who visited Pelletstown in 1950 were impressed by the cleanliness, but they noted that extra lavatories were urgently needed - there were only four lavatories for 140 pregnant and post-natal women. Floors in the women’s dining room and adjoining kitchen needed repair. There was woodworm in the floor of one of the women’s dormitories; the floor in the children’s dormitory was ‘bad’. The babies’ ward was too large, and should be divided. The inspectors could not see how children could sleep in such a large noisy place. Walls needed replastering. In 1953 the sleeping accommodation for women was overcrowded. An inspection in February 1960 reported that there was no heating in the bathroom attached to St Mary’s nursery, a 45-cot unit.

During the three-week cold spell which lasted from beginning of that month until a few days before my visit, it was not possible to use the bathroom and the children had to be washed in their cots. Infra-red heaters, however, had been provided but were lying in the stores awaiting installation. Washing such a large number of infants in their cots is time absorbing, arduous and unsatisfactory for staff and constitutes a certain risk for infants.

6.34 The inspector described the delay in heating this bathroom as ‘quite unnecessary’; some windows in the nursery needed repair and the room was ‘draughty’.\textsuperscript{46}

6.35 The determination to reduce infant mortality resulted in dedicated efforts to reduce overcrowding and divide large dormitories in order to reduce cross-infection. In

\textsuperscript{43} Department of Health, INACT/INA/0/464099.
\textsuperscript{44} Department of Health, INACT/INA/0/464172.

\textsuperscript{46} Department of Health, INACT/INA/0/467784.
1952 it was reported that the former long nursery in Bessborough had been divided into three smaller rooms, newly-decorated and with glass panels. Another room was equipped with playpens and play materials. Sleeping arrangements differed between the homes. Castlepollard had no separate night nursery for infants; babies remained with their mothers at night, whereas Bessborough had separate night nurseries. Infants in the Sean Ross maternity unit were kept in a nursery at night, which was described as overcrowded and inadequate in 1952. A comparative analysis of neo-natal deaths in the Dublin maternity hospitals in the 1950s noted that the lowest rates were in the Coombe, where babies slept in their mothers’ bed at night. Perhaps the absence of a night nursery helped to explain the lower infant mortality in Castlepollard. It also facilitated breastfeeding. However in Tuam and Regina Coeli, members of staff were concerned that permitting babies to sleep with their mothers might result in infant deaths (see Chapters 15 and 21).

6.36 Women slept in large dormitories with little if any privacy, no storage space and often inadequate facilities for washing, bathing and toilets. A reference to the 1956 purchase of storage household cabinets for Castlepollard suggests that the mothers might be getting presses or lockers. An inspection of Pelletstown in 1960 commented that ‘Neither of the adult dormitories afford privacy of any kind. The Sister-in-Charge considers, in this day and age, that this is retrograde and I agree with her wholeheartedly’; an official in the Department of Health added a handwritten note ‘Agreed’. In 1958, mothers in Bessborough were accommodated in a 12-bed unit for nursing mothers, presumably with their babies; there were three additional wards with 16, 24 and 48 beds respectively.

6.37 There were modest improvements. The wartime backlog of repairs was tackled and there is evidence of a greater awareness of children’s needs. Wartime concerns over rickets and a lack of vitamin D meant that Bethany, Bessborough and Sean Ross constructed some form of solarium. With reduced admissions it

became possible to provide playrooms and recreation room; several inspectors commented that rooms were being repainted in bright colours. By 1953 Sean Ross had provided a new recreation hall for the mothers, which was ‘large, equipped with tables and chairs, radio and piano, a raised stage for concerts and plays, book-case with books and magazines’. Minutes of the council of the Congregation of the Sacred Hearts of Jesus and Mary noted that this was erected ‘at the expense of the government. They were also hoping to secure government funding for improvements to the nurseries at Castlepollard and Bessborough’. The Sean Ross refectory, the former recreation hall, was ‘somewhat dark, being semi-basement. Fluorescent lighting is being installed and mirrors placed on the walls to create an effect of brightness’. The maternity hospital beds had new interior-sprung mattresses (older mattresses were probably filled with straw). In 1958, women in Sean Ross slept in five dormitories each with eight to 14 beds. These were in converted stables, but were described as ‘clean, comfortable and centrally heated’. There were four nurseries, three held 30 cots, a fourth had 24 cots; they were described as large, bright and airy. However the large numbers in each nursery would have made it difficult to control infection. In 1965, Sean Ross proposed to provide cubicles in the women’s dormitories.

6.38 Castlepollard got a new dining room (there were formerly two shifts for meals), which Miss Litster described as ‘admirably designed…airy, bright and attractive’; the women sat at tables for four. In 1958 Miss Reidy reported that the children had ‘a plentiful supply of toys and playthings’ and the mothers had a television. They must have watched programmes broadcast from Britain and Northern Ireland, because the Irish TV network did not open until 1962. Dunboyne - a new mother and baby home (see below) - also had a television in the 1950s.

6.39 Sean Ross opened a small kindergarten unit for the older children - three years and upwards in 1953; this was run by a Sister who was a qualified kindergarten teacher. It was equipped with coloured alphabet bricks, beads, plasticine, colour and number charts and low tables. There were 16 children in this group - most would be adopted in the USA. Bessborough had a playroom for older boys whose ages ranged from one to four years.

6.40 When officials from the Department of Health visited the three Sacred Heart homes in 1964 they reported that ‘

We were impressed by the standards of maintenance of buildings and equipment etc.; by the bathing and sanitary facilities; by the kitchen equipment etc. in all three institutions. The grounds too are in all cases very well cared for’. 59

6.41 But in 1965 the Mother Superiors of the three homes told the department that beds in the women’s dormitories were so close together that there was no room for lockers or wardrobes. 60

6.42 Major improvements were not being made to the mother and baby homes in the 1960s because the Department of Health was considering closing one or more homes. Improvements were delayed until the 1970s when several homes had been closed. In 1971, accommodation for women in Bessborough, the only Sacred Heart home remaining, consisted of one room with 12 beds; one with six beds; five cubicles with four beds each; five cubicles with three beds each. The cubicles were built of ‘light wood’. There were only four baths, one shower and six WCs for potentially 55 women. The description is cursory but it appears that the wash-hand basins were communal and there is no indication that they were individually screened – there were seven in one wash room; five in another. The maternity section consisted of six two-bed rooms with wash-basins and built-in cupboards, and three, five and six bed units. 61 Miss Reidy interviewed eight ‘girls’ individually and reported that ‘all seemed generally satisfied with conditions in the Home’, though ‘Dormitory accommodation, in certain units, affords insufficient privacy’. 62 Irish Times journalist Mary Leland, who visited Bessborough in 1969, described ‘bright clean rooms for two and three, and even some for one girl alone’, which does not tally with the inspection report above. 63 In 1973, department files indicated that the congregation had spent approximately £50,000 from its own funds on improvements; they sought £13–£14,000 from the department and some money was provided from the Hospitals Trust Fund. 64 By 1974 the women had single cubicles equipped with lockers and wardrobes (similar to boarding school

dormitories) and although there do not appear to have been additional bathrooms, the numbers had fallen significantly, which would ease that problem. The dining room was ‘colourfully decorated’, with ten tables each seating four and there was a TV room, a recreation room, a smoke room and a room where women could play records.\(^{65}\)

6.43 The worst living conditions were in Regina Coeli and Tuam. In 1955 it was estimated that Regina Coeli required major reconstruction costing £155,000. A staircase collapsed the following year, injuring some voluntary workers who were members of the Legion of Mary. In 1957, an architect’s report concluded that although measures might be taken to make the building less dangerous, ultimately it would be necessary to demolish most of the building.\(^{66}\) Regina Coeli did not receive capitation payments for unmarried mothers or children. It was routinely supplied with worn/used towels, sheets, pillow-slips, blankets and bedspreads and kitchen utensils, furniture and surplus clothing discarded by St Kevin’s Hospital - the fact that these donations were welcomed indicates the spartan conditions. By 1963 the survival of Regina Coeli was in jeopardy. The Minister for Health, Seán MacEntee, stated that it would be ‘a grave misfortune’ if the hostel could not survive; it was ‘a feature of the Social Services of Dublin which would be irreplaceable by other methods’.

6.44 1963 was the crisis year. During the summer, three city-centre tenements collapsed with the loss of four lives. During the course of emergency inspections of vulnerable buildings, Regina Coeli was condemned as unsafe, and the Dublin Health Authority ordered the evacuation of the 250 residents.\(^{67}\) The Legion of Mary was offered alternative accommodation in the former Crooksling sanatorium in North Dublin. Frank Duff resisted the proposal to close the hostel,\(^{68}\) and a compromise was reached that involved demolishing part of the building and erecting chalets in the grounds as temporary housing. At the time there were 54 single mothers and 90 children in Regina Coeli. Frank Duff asked Dublin Corporation to provide flats where mothers and children could move after a time in Regina Coeli, but there was an acute housing crisis, with homeless families living in squalid accommodation in the former Richmond Barracks, and Dublin Corporation was giving priority to housing families with four or more children, so it

\(^{67}\) The hostel was also home to older and vulnerable women.
\(^{68}\) Cork Examiner, 5 Aug. 1963.
was unlikely that his request would be met.\textsuperscript{69} The difficulties that the mothers in Regina Coeli faced in keeping their children should not be underestimated. When Miss Litster reviewed data on younger children committed to industrial schools in the years 1953-55, she discovered that a large number came from Regina Coeli and Sancta Maria hostels, though the Legion of Mary tried to dissuade mothers from doing so.\textsuperscript{70}

6.45 Miss Litster reported that some mothers preferred Regina Coeli to the conventional mother and baby homes, because they could smoke, make tea for themselves and go out to the cinema.\textsuperscript{71} This reference to making tea indicates the institutional regime in the other homes. By the 1960s conditions appear to have been relaxed. In 1964, journalist Michael Viney visited one of the Sacred Heart homes. He reported that the women could smoke, but were expected to cut down; they bought and wore makeup and boyfriends could visit.\textsuperscript{72} Denny House also facilitated visits by boyfriends by this time.

6.46 Conditions in Tuam were primitive until the end. There was almost no capital spending in the 1920s and 1930s (in contrast to Pelletstown and the three Sacred Heart homes). The only section that was modernised was the maternity unit. In 1953 Miss Ashe, a member of the visiting committee, described the Tuam home as ‘a disgrace’. She claimed that the Sisters had been trying to get hot water installed but had failed to do so.\textsuperscript{73} In the post-war years, Galway County Council attempted to give the Tuam home to the Sisters of Bon Secours but they refused to take charge of the home until it had undergone major improvements.\textsuperscript{74} The home was eventually included in the Department of Health’s county homes improvement scheme. Improvements were estimated to cost £150,000 but an economic crisis in 1956 resulted in severe cuts in capital spending on health and housing, and the unwillingness of the Bon Secours Sisters and the local authority to end the practice of keeping children in Tuam until the ages of six or seven (in contrast to all other homes), meant that investment was postponed (see Chapter 15). When a delegation from the Department of Health and the local authority visited the Tuam

home in November 1959 to discuss the planned reconstruction, they described it as
poorly maintained, uncomfortable, badly heated...totally unsuitable buildings...a typical Workhouse building (with some later additions including a maternity unit) which has received the minimum of maintenance over a long period of years, and that coupled with the negligible heating arrangements, has resulted in a very deteriorated building.

6.47 They contrasted the conditions in the county home at Loughrea, which showed the ‘good effect achieved by consistent maintenance and improvements’. In Tuam ‘throughout the years since the adoption of the building for its present purpose maintenance appears to have been minimal’; the only money provided to the home was via a capitation rate. Money was first allocated for maintenance in 1957, and the annual grants were small - ranging from £660 to £2,700, sufficient to paint, replaster and refloor a number of rooms and purchase new sanitary equipment. The heating was ‘most inadequate even though the day was not particularly cold’. Some rooms had stoves, some were heated with open fireplaces; some children’s day rooms had small radiators that were filled with water that was heated on a stove or on the open fireplace and then poured into the radiators. The day rooms had a minimum amount of furniture and play facilities. The room for slightly older children contained a rubber ball and two seats, no floor covering; children aged one and two years were in their bare feet. The dormitories were a major fire hazard; children slept on the second or first floor in large workhouse wards with no subdivision, many wards had ‘absolutely no heating’, no floor covering and no furniture other than beds and cots. Access was by ‘the typical stone stairways common to all County Homes with a very dangerous turn near the top in every case’. There were no washing facilities or toilets on the first or second floors; facilities on the ground level were described as very poor. Hot water was only available at three locations apart from the laundry: the kitchen, a kitchenette in the maternity block and a ward ‘which supplies a bath’; the water came from small domestic boilers.75

Second-time mothers

6.48 The numbers in mother and baby homes fell sharply in the 1950s. In 1950 there were 135 women and 139 children admitted to Castlepollard; the relevant numbers

75 Department of Health, INACT/INA/0/443008
in 1956 were 113 and 89. Similarly, Pelletstown had 137 women and 370 children admitted in 1950; this reduced to 89 and 213 in 1956. The numbers in Bessborough went from 116 and 98 in 1950 to 76 and 68 in 1956. In Tuam, the numbers decreased from 33 and 222 to 36 and 181 and in Sean Ross from 149 and 134 to 130 and 117.

6.49 In 1952, the Department of Health noted that the falling numbers in Castlepollard had resulted in higher unit costs. Lower occupancy prompted the Congregation of the Sacred Hearts of Jesus and Mary to consider relaxing their rules against admitting women on a second pregnancy. In 1952 however, the council of the congregation decided not to accept ‘second offenders’.76 The Superior General in Chigwell informed Miss Litster that having considered all aspects of the question they had ‘decided to leave it alone and see how things turn out’. She added that ‘The three Superiors in Eire are a bit alarmed as their numbers are so low’; she wondered ‘if there are first offenders who are not willing to go to our Convents or should we be thanking God that the numbers are less’. Miss Litster noted that the proposal to admit second-time mothers had originated with the Superior General and it was evident that the Mother Superior at Castlepollard had resisted the suggestion. Miss Litster believed that it would be a retrograde step to admit second-time mothers to Castlepollard.77

6.50 Given the Department of Health’s determination to remove all unmarried mothers from county homes, some provision had to be made for women on a second or subsequent pregnancy. When the county managers from Cavan, Louth, Monaghan, and Meath visited Castlepollard there was a discussion about the Sisters ‘doing something about “seconds”’. The Congregation of the Sacred Hearts of Jesus and Mary began to explore the possibility of opening a separate home for these women. In 1953 they inspected properties near Drogheda ‘on the quiet’, but it appears that Cardinal D’Alton, the Archbishop of Armagh (Drogheda was in his archdiocese) refused permission for a home in his archdiocese when he was approached; approaches to the Dublin Archdiocese were also unavailing. The congregation contacted the Diocese of Meath - where Castlepollard was located - and they investigated the possibility of buying Dunboyne Castle. In 1955 the auditor for Castlepollard, who was concerned at falling numbers and a rising deficit, suggested that they admit second-time mothers. The Mother Superior

76 Chigwell, Congregation of the Sacred Hearts, council minutes, 27 June 1952.
77 Department of Health, NATARCH/ARC/0/404806.
agreed, provided that women were not sent to a home where they had previously given birth.\footnote{Department of Health, INACT/INA/0/465642.}

\subsection*{6.51}

In 1956 Dr O’Higgins, the Minister of Health wrote to the bishops of Cork, Killaloe and Meath to ascertain their views about the homes in their dioceses accepting women on their second pregnancy. He proposed that second-time mothers would be admitted prior to the birth and discharged when the baby was six months old. Bishop Kyne of Meath was willing to leave the decision to the Sacred Hearts congregation; Bishop Rodgers of Killaloe agreed that these mothers should not be in the county homes; decisions as to length of stay should be determined with reference to individual cases, but he believed that two years was unnecessary. Bishop Lucey of Cork wanted second-time mothers to undergo a rehabilitation stay of at least 12 months and he was opposed to them mixing with first-time mothers. The minister wrote to the Superior General in Chigwell, reporting these views and outlining his proposal. The Mother Superiors of the Irish homes suggested that second pregnancies should be spread among the three homes. But the congregation was unwilling to take care of the babies when the mothers were discharged. The only alternatives were foster homes or sending the infants to industrial schools.\footnote{Department of Health, INACT/INA/0/464172.} There are indications that the Congregation of the Sacred Hearts was keen to open an institution in the Dublin area, and it considered opening a children’s home as the first step to establishing a home for mothers and babies.\footnote{Department of Health, INACT/INA/0/465642.} The matter drifted. The mother and baby homes began to accept some second-time mothers in order to fill vacant spaces, though no draft agreement existed that the homes would accept these women.\footnote{Department of Health, INACT/INA/0/464172.} By 1959 mothers on their second pregnancy were accommodated in all three homes.\footnote{Department of Health, INACT/INA/0/465642.} Miss Litster noted that because none of the Mother Superiors of the three Irish homes was willing to state that they would admit second-time mothers ‘as declared policy’, though they would take an occasional patient, health authorities could not be instructed to send mothers who were pregnant for the second time to these homes.\footnote{Department of Health, INACT/INA/0/464172.}

\subsection*{6.52}

The Department of Health noted that some health authorities only sent second-time mothers to the special homes when requested to do so on the mothers’ behalf.
and some mothers refused to go ‘because they believe they would be compelled to work very hard while there’. (This might reflect their experience on a previous pregnancy). They preferred to give birth in the county home and leave with their child after a short period.\textsuperscript{84} In 1963, Monaghan County Council informed the department that it was their practice to treat ‘second offenders’ locally. An official in the department reported that Monaghan’s policy reflected the personal attitude of the chief medical officer, which the official described as having ‘an overtone of moral stricture which I find rather distasteful’. He continued,

the Monaghan practice deprives a girl of the possibility of reformation evolving from the missionary efforts of experienced Nuns and other moral welfare workers who staff the special Homes. There is also the consideration that hundreds of Irish unmarried mothers migrate each year for the express purpose of having their babies surreptitiously abroad, with resultant serious problems. Any practice calculated to increase this sad human traffic is to be looked at askance.\textsuperscript{85}

\textbf{6.53} A new mother and baby home opened in Dunboyne in October 1955 (see Chapter 24) to cater for women giving birth to a second or subsequent child, who were funded by PAAs in the north-east - counties Meath, Westmeath, Cavan, Louth and Longford. Monaghan was originally included on that list but withdrew (presumably a reflection of the attitudes cited above). Dunboyne was run by the Good Shepherd Sisters. Meath County Council renovated and equipped Dunboyne Castle. Women did not usually give birth in Dunboyne; a total of 8 babies were born there – cases where it proved impossible to get the women to hospital in time. There was at least one trained midwife on the staff, and a local doctor attended the home. In the early years mothers were admitted to St Kevin’s Hospital, but at a later date they went to Holles Street and attended ante-natal clinics in that hospital. By 1958 Dunboyne was overcrowded - in marked contrast to the other mother and baby homes - and admission was restricted to mothers from the north-eastern counties. When the other homes admitted women on a second pregnancy, Dunboyne began to admit first-time mothers. In 1963 a modern extension was added, which a later inspector described as ‘institutional’. However living conditions were much better than in other mother and baby homes. The dormitories consisted of one six-bed room with partitioned cubicles, two four-bed rooms, two two-bed rooms and three single rooms. All the rooms had wash-hand

\textsuperscript{84} Department of Health, INACT/INA/0/465642.
\textsuperscript{85} Department of Health, CCP/INA/0/483137.
basins, and the four-bedded rooms had bathrooms and toilets attached. A separate sanitary unit contained five bathrooms, nine toilets and a visitors’ toilet. The women had a television room, a smoke room, a records room, a dining room, two parlours for visitors, and a launderette for their personal laundry - sheets and other institutional laundry were sent to an external laundry.  

Although Dunboyne Castle was purchased, renovated and equipped by Meath County Council in 1957, the Good Shepherd Sisters were responsible for its management. These arrangements reflect a continued willingness to devolve care for unmarried mothers and children to religious orders. Dunboyne was an extern institution and was funded on a capitation basis. Like the Sacred Heart homes, the Good Shepherd Sisters had considerable freedom with respect to staffing. A Meath County Council official noted that ‘it is desired to give the Order as free a hand as possible in the appointment and employment of staff so that they would be in the position of other voluntary institutions both in this regard and in the purchase of supplies.’ Because Dunboyne did not initially register under the Registration of Maternity Homes Act 1934, even though it should have, it was not inspected under this Act (see Chapter 24).

In 1966 two British social workers travelled to Ireland to investigate facilities for unmarried mothers. At the time one-sixth of unmarried mothers in England and Wales spent time in a mother and baby home and 148 of the 172 homes in England and Wales were run by voluntary organisations, which generally had a religious/denominational ethos. The percentage of English unmarried mothers in mother and baby homes was similar to the proportion of white unmarried mothers in the United States in those years; few black women were admitted to mother and baby homes. (There is information about a small number of black women who were admitted to Pelletstown in chapter 31). A majority of Irish unmarried mothers were in mother and baby homes, and Ireland had much fewer homes, but they were much larger. One of the visitors, M J Farrah, published an account of their visit in a British social work journal. She noted that the ‘pre-confinement stay’ in Irish homes was not limited, in contrast to most homes in Britain.

87 Department of Health, INACT/INA/0/538518.
88 Thane and Evans, Saints? Sinners? Scroungers, p. 156.
post-natal stay was ‘governed by circumstances, and not by rigid rules’. She noted that the homes were much larger than in Britain and the buildings looked institutional, though
great efforts have been and are being made to divide the large dormitories and nurseries into smaller units. Where alterations have been completed, and new wings added, the decoration is light and all furnishing modern. Gone are the long tables in the dining rooms, and in their place small tables with three or four places at each. We saw television rooms which could be cleared to make a dance hall, or divided up into two or three smaller recreation rooms by the use of sliding partitions.

6.56 She remarked on the ‘atmosphere of freedom and friendliness, and the girls appear to be as happy and relaxed as they are in our Homes over here’. In 1968 Jill Nicholson published a survey of British mother and baby homes, which according to one reviewer presented a ‘gloomy picture’. Inspector Margaret Reidy claimed that Irish homes ‘afford a higher degree of comfort’ than the description given of the British homes, though she may have overstated her case when she quoted a mother that she met some months after discharge: “I was never so happy in my life as I was during my stay at X. The nuns are wonderful and so understanding and did everything possible for me”.

Length of Stay

6.57 In 1949 the medical officer of health at Castlepollard commented that it is a depressing prospect for these girls to know they have to remain for two years irrespective of their behaviour…From the moral point of view it is my opinion that if these girls are going to mend their ways, the twelve month period is more beneficial than the two years. The discontentment created by detaining a girl for two years or longer outweighs in my opinion the possible benefits.

6.58 There is considerable hypocrisy associated with the judgement that women should remain for two years in a home in order to be ‘rehabilitated’. These rules did not apply to private patients - who were quite numerous in Bessborough. In the 1940s

91 Department of Health, CCL/INA/0/523143 has a copy of British Hospital Journal and Social Service Review 19 July 1968, with review by Barbara Kahn, of Jill Nicholson, Mother and Baby Homes, a survey of homes for unmarried mothers (London, 1968).
92 Department of Health, INACT/INA/0/450464.
these mothers left shortly after birth and sometimes without their infants. When a new Mother Superior put a stop to this practice (see Chapter 18) they continued to leave shortly after giving birth and they placed their infant at nurse either privately or through a voluntary organisation. More humanely this long stay did not apply to women whose babies were still-born or died shortly after birth.

6.59 Miss Litster suggested that women should stay for a maximum of nine months. This would result in ‘a more willing spirit among the inmates’; earlier discharge after birth might encourage women to enter the homes at an earlier stage in pregnancy to ensure ante-natal care. But earlier discharge of mothers meant arrangements to provide care for babies when they were nine months old had to be made. If babies remained in a mother and baby home unaccompanied, it would be necessary to recruit additional staff, ‘since mothers left behind are found unwilling to care for the babies of discharged mothers’. She suggested that mothers who were willing to remain as domestic workers or nursery staff should be paid.\footnote{Department of Health, INACT/INA/0/450464.} Following an inspection of Castlepollard in 1950, Miss Litster commented that ‘The tendency is growing for patients to apply for admission when confinement is almost due, and to leave at an early date after confinement, taking their babies with them, or placing them at nurse [more probably the latter]. Seven patients were admitted in labour.’\footnote{Department of Health, CCP/IMP/0/45492.}

6.60 A memorandum submitted by the Department of Health to the Commission on Emigration and other Population Problems in 1953 describing the arrangements made by Public Assistance Authorities for unmarried mothers and their children, stated that it was the practice for local authorities to board out the children of unmarried mothers at about two years of age. This results in a stay of two years in an institution for the majority of the mothers. There is, however, no general rule to determine the length of stay, which varied with the requirements of individual mothers as assessed by the authorities of the institution in which they are accommodated. There are no legal powers to restrain an unmarried mother from leaving a Home at any time with her child. The Matron of a Home would as a matter of course take steps to ensure that the child would not be exposed to danger through lack of means or any other cause on the part of the mother.\footnote{Report of the commission on emigration and other population problems, Appendix IV}
6.61 The introduction of legal adoption does not appear to have resulted in an immediate fall in the length of time that women remained in a mother and baby home. In the 1950s just under 19% of women remained in a mother and baby home for 700 or more days (approximately two years) after the birth of their child. This was fractionally higher than in the 1940s (17.47%), but many of the early discharges in the 1940s were due to the high rate of infant mortality. By the 1960s, when the overwhelming majority of infants born in mother and baby homes were being placed for adoption only 2.47% of mothers spent 700 or more days in a home after the birth of their child.

6.62 In the 1940s the average length of stay in Bessborough for mothers, whose children did not die, was 341 days; it was marginally longer, 360 in the 1950s, but it fell to 156 days during the 1960s. The picture was similar in the other homes run by the Sacred Hearts congregation. As women were admitted approximately two months before giving, birth, by the 1960s women were remaining for 2-3 months after the birth of their child. The report of a 1955 inspection of Denny House stated that

In this Home, as in all other mother and baby homes, it is now found difficult to induce the mothers to remain for more than a month or two after the birth of the baby...As only 42 of the days spent before confinement rank for recoupment under Mother and Child Welfare Grants, the decrease in average number of days spent before confinement is possibly of financial advantage to the Home.96

6.63 Women went to considerable efforts to shorten their stay in a mother and baby home. St Patrick’s Guild placed babies at nurse, and for adoption. Despite the fall in ‘illegitimate’ births during the 1950s, the number applying to St Patrick’s Guild rose. In the years 1943-45 an average of 500 mothers (or family members) applied to St Patrick’s Guild; in 1953 they received 674 applications, rising to 793 in 1954 - which suggests that a majority of single women giving birth that year (total registered ‘illegitimate’ births: 1,330) contacted St Patrick’s Guild. However they only ‘settled’ 150 of the 793 who applied - the babies were adopted or boarded out. Miss Litster, who compiled these statistics, noted that ‘There is a tendency amongst expectant unmarried mothers in Dublin to avoid PA institutions

96 Department of Health, CCP/INA/0/483137.
for mothers and babies both because of restrictions on personal freedom and because of the long period of retention’.  

6.64 The Department of Health files contain letters demanding that a woman be permitted to leave a mother and baby home. A Cork priest wrote to a TD on behalf of a woman who was in Sean Ross, asking for her release. He explained that ‘she was one of the mainstays of her parents and before this crash was very helpful to them’. Whether this letter reflects a genuine concern for this woman (the family do not appear to have been willing to accept her child), or her parents’ need for financial or personal support is unclear. In 1961 a Wicklow councillor complained about the length of stay required in Sean Ross. When the Department of Health analysed data on duration of stay for 16 Wicklow patients in Sean Ross from 1956 to 1961, the average was nine months after childbirth. One mother of a still-born infant was discharged after 11 days; the longest stay was two years and seven months; this case concerned ‘a delicate infant whose mother was commendably anxious to be with him until he was fit for discharge for adoption’. A 1964 memorandum noted that nothing in the Health Act 1953 or the 1954 regulations empowered the mother and baby homes to detain a woman. However, there was a provision in the regulations (article 10) requiring that women who intended to leave should give reasonable notice of that intention to the Mother Superior of the home or an appropriate officer. The memorandum stated that despite the absence of any legal powers of detention the Sisters running these homes were ‘understandably reluctant to consent to the immediate departure of an unmarried mother after her confinement - leaving the Nuns literally holding the baby’. The author warned about ‘the experienced unmarried mother’ who might plan to abandon her baby in the home, and mothers who gave false names or misleading information. He suggested that mothers should remain in the home for a sufficient period to provide for ‘moral rehabilitation’; ‘in the case of a hard-bitten patient’ this might involve a lengthy stay. It was agreed that the department inspector would examine length of stay during her next visits to these homes. The official concluded by noting that

In general, the arrangements for coping with the difficult and delicate problem of unmarried mothers appear to be working well; and it seems certain that any

97 Department of Health, INACT/INA/0/435925.
98 Department of Health, INACT/INA/0/464099

29
attempt by the Department to interfere with the existing machinery would involve exchanges with the higher ecclesiastical authorities.\textsuperscript{99}

6.65 By 1964 the Cork Health Authority had arranged for Bessborough to keep children who were awaiting adoption (without their mothers).\textsuperscript{100} It would appear that Bessborough was reluctant to agree to this. The Mother Superior discussed the matter with the local authority, and she reported to the congregation’s council in Chigwell that there were ‘difficulties in this work but Mother Lucina has been advised that if we do not take this work, we shall eventually have no work in Cork’.\textsuperscript{101} In the following year the Department of Health claimed that the average stay in the Sacred Heart homes was three months.\textsuperscript{102} Women admitted to Pelletstown in 1967 remained for periods ranging from ‘a few days to about twelve months’. Women, whose children were being adopted and who could afford to pay for them to be maintained in Temple Hill or a similar institution pending adoption, could leave shortly after giving birth; poorer women might have to remain until the child was placed with adoptive parents. Pelletstown gave ‘preference for speedy adoption’ to first-time mothers, which meant that mothers on a second or subsequent pregnancy might have to remain for up to 12 months. Mary Frances Creegan suggested that this practice was ‘based on a now out-of-date concept of the function of a Mother and Baby Home’, moral rehabilitation.\textsuperscript{103} Statistics compiled by the Cork Health Authority in 1969 relating to women that it had supported in mother and baby homes over the previous 18 months suggested that 26% remained for less than four weeks; a further 26% spent four-eight weeks, and 28% spent eight-12 weeks.\textsuperscript{104} (These statistics only apply to women maintained by the Cork Health Authority, for that reason it is difficult to compare them with the Commission’s database, but they are consistent with the institutional data). The days of mothers remaining for two years were over, but as before, the length of stay was determined by financial circumstances.

Closing mother and baby homes

6.66 The Department of Health began to consider the possibility of closing one of the Sacred Heart homes in the mid-1950s. They monitored numbers in the homes and

\textsuperscript{103} Mary Frances Creegan, ‘Unmarried mothers: an analysis and discussion of interviews conducted in an Irish mother and baby home’ (M.Soc.Sc., UCD, 1967), see Chapter 13.
\textsuperscript{104} Department of Health, CCL/INA/0/488712.
in 1958 they determined that ‘one of these institutions is surplus to requirement’. The decision to close Tuam was not part of that process, however when the committee on county homes reviewed the various options for rebuilding or renovating the appalling facilities in Tuam, the secretary of the department suggested that Tuam should be closed and the children accommodated in other mother and baby homes. This decision was contested by the Archbishop of Tuam and local politicians. A deputation from Galway County Council consisting of the TDs who were county councillors and the county manager met the Minister for Health to express their opposition to the proposed closure. Tuam closed in 1961 - see Chapter 15. The council accounts for 1961 recorded a decrease of £9,250 in spending on unmarried mothers and children.

6.67 The department monitored the accounts submitted by the mother and baby homes, knowing that sustained deficits would inevitably trigger demands for higher maintenance payments. In 1960/61 (the date is unclear), it noted that the Sacred Heart homes had an accumulated deficit of almost £20,000; however, the imminent transfer of 117 children from Tuam to these homes ‘should have an appreciable impact on the financial deficit’. The decision as to which home would accept the children ‘must presumably be left to the nuns’. Forty-one children were transferred to Sean Ross; the congregation was given a higher capitation grant in respect of these children, who were presumably older and without a resident mother.

6.68 The determination to close one of the Sacred Heart homes was motivated by a variety of factors: rising maintenance costs, evidence of vacant places and an urgent need to provide additional accommodation for children with special needs. In 1958, the Irish ambassador to the UK, Hugh McCann wrote to the Superior General in Chigwell on behalf of the Irish health authorities asking if she would consider administering a home for ‘mentally defective’ children in Ireland. At this time the proposal appears to have been that the congregation would take over an under-used orthopaedic hospital. However, in the same year the department determined that one of the mother and baby homes run by the congregation should become a home for ‘mental defectives’. Bessborough was described as ‘ideal for this purpose’. The official suggested that it would not be advisable to

109 Chigwell, Congregation of the Sacred Hearts, annals, 29 July 1958.
approach the congregation without first informing the Bishop of Cork, Dr Lucey; ‘the best way of clearing the desks would be for somebody from this Department to have a chat with the Rev Canon Bastible and if necessary with His Lordship to acquaint him of our proposals and to ascertain his reactions’. If the department spoke to Bishop Lucey no record of this meeting survives (Bishop Lucey’s papers were destroyed on his instructions after his death). The closure of Tuam may have delayed a decision. In 1964 the department wrote to the Superior General in Chigwell stating that the three homes had shown a steady decline in occupancy rates; all the mothers and children could be accommodated in two homes. She replied that the matter would be considered by the council of the congregation.

A team of departmental officials visited the three homes with a view to determining which was best suited to accommodating children with special needs. They recorded ‘our very favourable impressions of the calibre of the nuns we met in the three homes; in each case we met most of the members of the communities and we were very impressed by their general outlook and their willingness and ability to discuss with us a wide range of topical subjects’. All the homes were suitable, but they selected Sean Ross because it was the biggest, ‘on the grounds that it will provide the greatest measure of relief for the greatest number of persons’. The officials may have been deceived by the ‘general outlook’ of the Sisters and ‘their willingness and ability to discuss a wide range of topical subjects’, because the congregation was not willing to transfer any mother and baby home. The Superior General contended that all three homes were at full capacity in September 1964. She claimed that the department’s statistics on occupancy were incorrect and she produced alternative estimates, which they queried. Her statistics showed, correctly, that the number of women admitted was rising, but women and infants were staying for much shorter periods - so turnover in beds/cots was much greater than in the past. At this meeting, a Sister from one of the Irish homes suggested that they should retain the three homes and reduce the numbers in each home in order to give women more space. The department agreed that if one home closed they would fund some modest extensions to the remaining homes in order to improve conditions for the women.

When Bessborough applied for a modest capital grant in 1965, the department deferred a decision because they were determined to transform one home to accommodate people with intellectual disabilities. They noted that there appeared to be 'some doubt also as to whether this Order has been inclined to be fully co-operative' about that proposal.\textsuperscript{113} It was agreed that the Superior General of the congregation would meet the department on 2 March 1966 to discuss a change of use for Sean Ross. However, on the morning of the proposed meeting the department received a telephone message from Sean Ross reporting that Bishop Rodgers of Killaloe had visited Sean Ross that morning and had heard for the first time of plans to change its use. The record of the phone call stated that 'he had been impressed by the increase in the number of baptisms in recent years', which appeared to imply that it would not be possible to change the use of Sean Ross. ‘The suggestion was then made’, presumably by the congregation, that the meeting should be postponed. It is highly improbable that the timing of the bishop’s visit and the phone call was accidental. Minister for Health Seán MacEntee contacted Bishop Rodgers and explained that any decision about a change of use was at a discussion stage, and it would be premature to discuss the matter with the bishop. A representative of the department travelled to Ennis and presented Bishop Rodgers with statistics of bed occupancy rates and evidence that mothers and babies were staying in the homes for a shorter period. Bishop Rodgers countered that if one of the homes was to close, it should not be Sean Ross. The matter dragged. Further research confirmed that two homes were sufficient to meet current needs. The department contacted the bishops of the three dioceses in which the Sacred Heart homes were located. The bishops of Cork and Meath were willing to leave any decision to the congregation, but Bishop Rodgers remained recalcitrant. Further delays ensued because of the death of the Superior General in Chigwell and the election of her successor. The new Superior General acknowledged that two homes were sufficient and ‘subject to the relevant diocesan approval, and subject to ratification by the Council’, the congregation would be willing to run a home for children with special needs in one of the former mother and baby homes.\textsuperscript{114} Officials again visited Bishop Rodgers, who was accompanied by the chaplain to Sean Ross and a priest who arranged adoptions of Sean Ross children. The report of the meeting, which lasted over an hour, noted that ‘it was mainly a repetition of the points and arguments set out above…telling the Minister his Lordship’s attitude was that he could have any

\textsuperscript{113} Department of Health, INACT/INA/0/463707.
\textsuperscript{114} Department of Health, INACT/INA/0/455744.
home he liked so long as it was not Sean Ross'. The official noted that although the bishop 'did not budge an inch I had the idea that he was a bit shaken' when presented with data as to numbers and length of stay, which he had misinterpreted.

6.71 If Bishop Rodgers was ‘a bit shaken’ he did not change his stance. In 1966 the Minister of Health, Donough O'Malley wrote an apologetic letter to the bishop in the hope of reaching a decision on Sean Ross. Bishop Rodgers protested about the fact that a religious order in his diocese ‘should have been asked by a Government Department to give up work for which they had been admitted into the diocese’; he alleged that the need for Sean Ross was ‘more pressing and urgent than ever’. He questioned whether a stay of three months (now the norm) was sufficient for the moral rehabilitation of the mothers and the physical well-being of the children.\footnote{Department of Health, INACT/INA/0/455744.} In November 1966 however, the council of the Sacred Hearts congregation agreed that Sean Ross should be used for mentally handicapped children, if the diocesan bishop gave his permission.\footnote{Chigwell, Congregation of the Sacred Hearts, council minutes, 12 Nov. 1966.}

6.72 The death of Bishop Rodgers and delay in appointing his successor postponed the decision for over a year. When officials met the new bishop, Dr Harty, in January 1968 he appears to have placed no obstacles to the change of use. The department travelled to Chigwell to meet the Superior General (she had decided not to travel to Ireland because of a foot and mouth epidemic in England). Admissions to Sean Ross ceased in October 1969; the last mother and baby left shortly before Christmas and the first ten children with special needs were admitted in January 1970.\footnote{Chigwell, Congregation of the Sacred Hearts, Roscrea annals, 1969-85.}

6.73 The closure of Castlepollard was much more sudden. The finances of the Irish mother and baby homes may have been a factor because the congregation reviewed the attached farms and investigated the possible sale or lease.\footnote{Chigwell, Congregation of the Sacred Hearts, annals, 11 May 1968.} The Superior General visited Castlepollard in 1969. The annals record that the Sisters described their work as ‘rather heavy going, but it is quite clear that mother and baby homes are on the way out’. When the congregation’s decision to close Castlepollard became known, a local priest visited Chigwell in an attempt to change their mind. The annals noted that ‘They clearly do not realise the
hardships the sisters have and do encounter’. The Castlepollard medical officer was ‘quite stunned’ to hear that the home would close. He claimed that admissions were increasing; they had doubled in the previous six months. The Bishop of Meath informed the Mother Superior that he had received many representations about the closure of the home. The care of single expectant women remained ‘an urgent pastoral problem’ that could not be adequately handled by social services; women needed a choice of homes in order to maintain their anonymity. He suggested that the Superior General might consider replacing the Mother Superior in Castlepollard with a Sister who would give more consideration to the question of closing the home. A note in the annals dated September 1970 recorded that discussions had been held with the community in Castlepollard, and ‘nearly all agreed they could not go on’. The Superior General met the bishop to seek his approval to close the home; the annals record that ‘Although he was kind and understanding and he agreed there was nothing else Reverend Mother could do, he rather gave the impression that some pressure would be upon us, and we may not find it easy to move’.119 Following negotiations with the Department of Health, the hospital was sold to the Midland Health Board for use as a long-stay unit for adults with intellectual disabilities.

By 1970 Bessborough was the only remaining Sacred Heart Irish mother and baby home and the annals reveal that they considered closing Bessborough. In February 1971 the Superior General visited Cork and discussed ‘the work with the Sisters - the Sisters feel there is no future in the work’. She agreed to meet the bishop to inform him of this. Bishop Lucey told her that there was ‘a great need for the work the Sisters were doing, carry on, update what you have, you will never have big numbers but the Sisters are needed in Bessborough’. The annals record that ‘The Sisters were very happy to accept this decision thank God’.120

Conclusions

By the mid-1960s the overwhelming majority of babies born to Irish single mothers were being placed for adoption. This was a consequence of societal attitudes and the covert and occasionally overt pressures exercised by families and by figures in authority. In 1967 two-thirds of the 100 women in Pelletstown who were interviewed by Mary Frances Creegan planned to have their baby adopted but would not marry the father of their child; two women planned to have the baby

120 Chigwell, Congregation of the Sacred Hearts, annals, 10 and 11 Feb. 1971.
adopted and would marry the father of their child; nine planned to keep the baby and marry the father. She estimated that 12 of the 100 mothers had the means to keep their infants - either because they were marrying the child’s father or because their parents would accept mother and baby back home. Within a few weeks of these interviews she discovered that at least two women who had planned to keep their baby had changed their minds. She suggested that ‘These, together with some of those who had already decided on adoption, were possibly cases where adoption was forced on the mother by social and financial circumstances’. As examples of these social pressures she cited the case of a couple who planned to marry but had decided to place their child for adoption ‘for fear of the social disgrace which would result if they acknowledged that they had had a child before marriage’. Other couples planned to set up home away from family and friends in order to conceal the birth of a child before marriage; one couple planned to pretend to adopt their child at a later date. She concluded that ‘whatever the success or failure of adoption, the decision of many mothers to give up their parental rights is a response, in great part, to the failure of society to offer the help which every unsupported mother needs to help her to bring up a child without a father’.  

6.76 Single women continued to conceal their pregnancy from family and friends, and a breach of confidentiality could give rise to acute distress. In 1962 the CPRSI (the first port of call for many pregnant single women) agreed with the City and County Managers’ Association that they could make arrangements for women to be admitted to mother and baby homes without first having to contact the local authority to agree liability. The CPRSI emphasised that ‘by approaching the Society rather than the local authority the girls had, in effect, made it clear that they did not wish to have arrangements made for them at local level and wanted the Society thereafter to make all necessary arrangements for them and for the child on a basis of absolute confidence’. In 1966 the CPRSI contacted the Department of Health in relation to a young woman who lived with her married sister and brother-in-law in a Co Louth town. She had arrived at the CPRSI offices ‘in a very nervous and apprehensive state’; she was anxious that her sister should not know about her pregnancy. The CPRSI reassured her that all involved in a professional capacity - including the secretary of Louth County Council, ‘would strictly honour her confidence’, and she was admitted to Bessborough. Some

weeks later (before her baby was born), her brother-in-law visited the CPRSI offices and reported that a county council official had called to his home and informed him and his wife that their sister/sister-in-law was expecting a baby in Bessborough - they were under the impression that she was in London. The official had called, on the instructions of the county secretary, to inquire whether the woman’s family could contribute to the cost of her maintenance. Louth County Council claimed that failing to make inquiries as to a family’s means would ‘appear to be at variance with the Council’s obligations to protect the financial interests of ratepayers’. The fact that this house was in a local authority estate should have indicated that they were not in affluent circumstances. In another case an official of Louth County Council had contacted the mother of a pregnant woman who was repatriated from England. The CPRSI understood that ‘Mrs F became hysterical, left her young children unattended, and rushed to Dublin to see her husband who works…there’. He made inquiries and informed his wife that the official had the wrong address (which was untrue). The department was concerned at these reports because they had understood that local authorities would not divulge confidential information of this nature. The department commented that ‘the whole system and method of helping unmarried mothers in this country must break down completely unless we can guarantee to these mothers that their parents, relatives and neighbours will not be informed…Secrecy is absolutely vital’.123

6.77 By the late 1960s fostering (boarding-out) was no longer seen as a long-term outcome for the children of unmarried mothers. In 1968 a department inspector claimed that she had ‘reason to believe’ that the Longford county medical officer exerts pressure on unmarried mothers to allow their children to be adopted by intimating to them that there is no alternative; boarding out is not even mentioned. I have drawn the Department’s attention to the misuse of the Adoption Act on previous occasions, and in relation to other Health Authorities, and my views have been endorsed by the recent letter to the Minister by an unmarried mother living in Dublin.124

6.78 In a lengthy memorandum, that was headed ‘Children in Care’, dated 15 November 1968, Miss Clandillon stated that

123 Department of Health, HPO/INA/0/425641.
124 This letter has not been identified however this is a reference to it on at least two files of the Department of Health Department of Health, INACT/INA/0/449929.
No guidelines have been given to health authorities as to when the mother should be advised to place her child for adoption or when the child should be boarded out…As far as health authorities are concerned adoption would, in general be the more satisfactory course (if regard is not had to the over-riding needs of the parents and the child), as it obviates the need for continuous supervision of the child and with the termination in many cases of boarded-out allowance or cost of institutional maintenance, is a financial saving to the authority. Miss Murray, following her inspection recently of the Dublin Health Authority scheme, has reported that undue pressure is being brought to bear on mothers of illegitimate children to have their children adopted and that the health authority threatens to withdraw their support in any cases where the mother refuses to agree to adoption. Whilst not wishing to consider the merits of adoption as against the merits of boarding out, it seems clear that any mother who wishes to retain her illegitimate child should be assisted by having him boarded out or otherwise provided for in accordance with her wishes e.g. kept in a nursery while she is at work during the day.  

6.79 The proportion of ‘illegitimate’ children who were adopted reached a peak in the late 1960s. This was also around the peak of adoptions of children born to single mothers in England - though the proportion of English adoptions was significantly lower than in Ireland, and many English children were adopted by their natural parent. The number of adoptions continued to rise into the 1970s, though it fell as a proportion of total ‘illegitimate’ births. Some children were deemed ‘unadoptable’ – i.e. not accepted by adoptive parents. They included children with special needs; children of mixed race; children of mothers who were deemed to have an intellectual disability or mental health issues, however the evidence presented in chapter 31 indicates that many of these children were adopted. Despite this evidence there are indications that some adoptions were delayed or even abandoned in cases where a child suffered from quite minor, curable conditions. Michael Viney quoted a priest, who was involved with adoption: ‘We still haven’t reached the stage where the adopters’ first motive is to give a child a home. They want the perfect child, who doesn’t have red hair or a squint or a crooked toe’. One adoption society reported that a baby girl who was born with a dislocated hip - which was eminently treatable - could not be adopted, even after

125 Department of Health, CCL/ INA/O/523143
the hip had been rectified. Adoption societies were unwilling to offer children for adoption if there was a family history of mental handicap or inheritable illness. A mother whose infant was not deemed adoptable might be kept in a special home much longer than a mother whose child was placed for adoption. In 1964 a Kerry doctor contacted the Department of Health with regard to a woman who had given birth in Bessborough. He described her as ‘rather defective herself but can manage satisfactorily under care’; her six-week-old infant was described as ‘defective’, there was no hope of adoption. The maternal grandmother wished to bring her daughter home (without her child) because ‘the young man of the house is now about to settle’ and the grandmother wished to have her daughter back home as soon as possible, lest a daughter-in-law might veto her returning at a later date. There are two features of this case - first the conviction that this six-week-old infant could not be considered for adoption - at this age it would have been difficult to determine the child’s intellectual state - a medical official in the department raised this point. This suggests that the infant was condemned as ‘mentally-subnormal’, because his mother was ‘rather defective’. (See chapter 31 for further discussion of such cases). There was a shortage of places for children/infants with special needs, and Bessborough refused to keep the infant without the mother. The fact that all institutions that might be suitable for this infant (if he had special needs) were run by voluntary bodies meant that the minister had no authority to order them to provide a place. It would appear that the mother was condemned to remain in Bessborough, though the long-term outcome is unknown.

6.80 The second point concerns the potential opposition that the older woman might face in bringing her daughter home. A mother wrote to Fr Good in 1967 about her daughter who was six months pregnant: ‘I am afraid the brothers will give her a beating and of course she would deserve it if they did but the [quiet] way is the best way’. She asked him to assist her daughter because she was ashamed to speak to her local priest.

6.81 During a 1969 debate on provisions for unmarried mothers at the Cork Health Authority (CHA) one member said that his only criticism was the six-month delay before children were placed for adoption. A report drawn up by the CHA

manager stated that they were arranging 60-70 adoptions each year. Over the previous 18 months, the CHA had been responsible for the admission of 146 women to mother and baby homes; 80 went to Bessborough. It was now standard practice for a local authority to pay for maintenance in these homes without carrying out any inquiries into her financial circumstances. The children’s officers had worked with 37 women who remained at home and gave birth in a maternity hospital or nursing home, and contacted the CHA to discuss future arrangements for their child.\textsuperscript{131} Children’s officers visited all unmarried mothers, who accepted their visit, to discuss future arrangements. Where women wished to keep their baby they would arrange for a mother and baby to receive Home Assistance (see Chapter 1); 53 Cork unmarried mothers were receiving home assistance in 1969. In the case of women whose children could not yet be adopted because of medical concerns, the CHA had set up a network of short-term foster homes, where children were cared for, while they underwent specialist medical treatment. This meant that a mother was not forced to remain in a mother and baby home for an uncertain period. By 1969 they reported that no baby was being maintained in Bessborough by the CHA, who was old enough to be placed for adoption and no mother ‘has to stay there longer than is strictly necessary’. CHA had engaged in ‘protracted negotiations’ with Bessborough over setting up a nursery where babies could be cared for pending adoption, at CHA expense, so far without success.

6.82 The manager of the CHA queried whether the structure and organisation of local authorities enabled them to act as effective adoption authorities ‘on a continuing large-scale basis’. There were no regulations governing the placement of children for adoption comparable to those that existed for boarded out children. If the CHA continued to engage in adoption they would have to recruit specialist qualified children’s officers who should be employed full-time on adoption and other aspects of children’s social work. The CHA children’s officers had asked for the assistance of a placement committee to assist in placing children for adoption.\textsuperscript{132} The Adoption Board was pressing all adoption agencies to establish such committees.

6.83 1968 can be seen as a turning-point. The number of births to single mothers was rising - it was the highest figure since 1950 (the low point was 1959). Infant mortality had fallen to 21 per 1,000, which was equivalent to Scotland, better than

\textsuperscript{131} It is not possible to compare these statistics with the data from the Bessborough institutional records; some of the children placed for adoption by the CHA would not have been in Bessborough, and many Bessborough children were not funded by the CHA.

\textsuperscript{132} Department of Health, CCL/INA/0/488712.
Northern Ireland but higher than England and Wales. The gap in infant mortality between Dublin and the rest of Ireland had vanished; infant mortality in Dublin was marginally lower than the national average. The commentary in the GRO annual report did not refer to the infant mortality of ‘illegitimate’ children, which suggests that it was no longer regarded as cause for concern. In 1968, 54 infants born to single women died - a rate of 34.6 per 1,000, which was dramatically lower than in 1948, and the gap between ‘illegitimate’ infants and all infants had narrowed considerably, nevertheless it was 160% of the national rate - a ratio similar to England and Wales. Women were being admitted to mother and baby homes in very large numbers - indeed numbers were rising, but they stayed for much shorter periods. Conditions in the homes had improved, but they continued to be regimented and institutionalised, and, with the possible exception of Dunboyne, they offered no privacy to the women. Almost all the babies born that year to unmarried mothers were placed for adoption, though that was about to change.
Chapter 7: Pregnant from Ireland

Introduction

7.1 When an unmarried woman discovered that she was pregnant, a common response was to flee from her home or place of work in the hope of concealing her pregnancy from her family and the local community. Women who confided in one or more family members were often encouraged to leave home. This was not a uniquely Irish response, and it happened before the foundation of the state. In the 1830s the Irish Poor Inquiry stated that most single women who became pregnant left their home. In France many single mothers travelled to Paris to conceal their pregnancy and get rid of their infant - using the notorious turning gates at foundling hospitals, or giving birth anonymously and leaving their child with the authorities.¹

In the United States women also sought anonymity in the large cities. In 1925/26 Mr Mac Lysaght, a commissioner for the Dublin Union, claimed that roughly 45% of the unmarried mothers in institutions run by the Dublin Union - which included Pelletstown - were women ‘who come up from the country in trouble’. Of the 110 mothers with infants in Pelletstown in 1926, 48 were from the Dublin Union area, 62 were ‘from the country’, though some had been living and working in Dublin before they became pregnant.²

7.2 Many pregnant single women travelled to Britain. It was an obvious destination. Emigration was a normal part of life for young women and men, so an announcement that a woman was travelling to work in Britain would not attract comment or intrusive questions. Many putative fathers also emigrated to avoid an affiliation order, pressure to marry, or the opprobrium of the women’s family and perhaps the wider community. The flight of putative fathers was generally uneventful; their past did not follow them to England. But pregnant Irish single women often found that England was less welcoming than they had hoped.

7.3 The number of pregnant unmarried Irish women who came into contact with British welfare services - both voluntary and public - was so great that they were commonly known by the initials, PFIs - Pregnant from Ireland. This chapter examines the history of PFIs from the 1920s until the early 1970s when it is transformed into a flight of pregnant Irish women seeking abortions. The emphasis

² Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, thirty-second day, 17 Dec. 1926.
in this chapter is on the relationships between British charities and local authorities, and Irish charities and the Department of Local Government and Public Health/Department of Health. The personal stories of the women are told in the next chapter, where they are interwoven with the stories of the other pregnant women who sought assistance from the department. Both chapters should be read in conjunction to get the overall picture.

**Church and State in Britain and Ireland and arrangements for PFIAs**

Pregnant women were travelling to England in the 1920s, and it is highly unlikely that this was a new development. In August 1921 a Jesuit priest, based in Bournemouth, reported that in the previous year, 12 Irish women had given birth in the local workhouse. Some had become pregnant in Ireland and ‘fled over there to hide their shame’. Evidence sent to Archbishop Edward Byrne of Dublin in the 1920s suggests that Irish women continued to give birth in English workhouses during that decade. The West Derby Union recorded a number of Irish unmarried mothers and there were Irish women in St Pelagia’s Home for unmarried mothers in London, which was run by the Congregation of the Sacred Hearts of Jesus and Mary. In 1923 the British National Vigilance Association wrote to the Irish High Commissioner in London, James McNeill, asking him to deal with the problem of Irish women coming to Britain - often without money, luggage or employment - and pregnant Irish women who were dismissed from pre-arranged jobs because they were unfit for the work. Jennifer Redmond noted that the years after independence ‘saw the emergence of a network of welfare organizations designed to help Irish women traveling to Britain and elsewhere’. They included the Legion of Mary, the International Catholic Girls’ Protection Society, Girls’ Friend Society and Irish Women Police Patron, the Catholic Women’s League, and the Port and Station Rescue Work Society. Lucy Desmond, who worked with the Catholic Aid Society in Liverpool, gave evidence to the Commission on the Relief of the Sick and Destitute Poor in the hope that this migrating trail could be brought to an end. Her society dealt with approximately 50 Irish women every year. She claimed that the numbers travelling to England were increasing. Women migrated ‘to hide themselves’, but as pregnant women, they found it difficult to get a job, and many

---

3 Dublin Diocesan Archives, DDA/AB7/b/Lay organisations, Box 2.
4 The official representative in Britain of all countries that were members of the British Commonwealth had the title of High Commissioner. When Ireland left the Commonwealth, Ireland was represented by an Ambassador.
women ‘drift into the Union as they have no money’. If they had some savings they would go to a maternity home (no details given), ‘and get through their trouble’. The Catholic Aid Society found it difficult to place these babies. The Liverpool Society for the Prevention of International Traffic in Women and Children told the Carrigan Committee (see Chapter 9) that they had met a total of 1947 Irish expectant mothers in the years 1926-30. The concerns expressed by British charities were echoed - and indeed amplified - by the Irish bishops, not just in the 1920s but in decades to come.

7.5 British charitable organisations exerted pressure on the Irish Catholic hierarchy to campaign for restrictions on the emigration of vulnerable young women - a cause that the Irish hierarchy pursued, without success, for decades. Irish government officials pointed out that most of these young women left Ireland with the consent of their parents, sometimes at their urging, and they could not be prevented from doing so. British charities (and via them the British authorities) put pressure on the Irish hierarchy, and the Irish State, to repatriate pregnant Irish women. Earner-Byrne notes that St Patrick’s Guild kept Archbishop Byrne of Dublin informed ‘regarding their rescue work and the situation of Irish unmarried mothers in Britain. The Archbishop also received correspondence from concerned charities in Britain requesting his assistance’. Earner-Byrne claims that Canon Craven of the Crusade of Rescue (an English Catholic charity for unmarried mothers), ‘adopted the issue of Irish unmarried mothers in Britain as a personal crusade the object of which was to force the Irish authorities and charities to assume primary responsibility for their citizens and flock’. He wrote regularly to CPRSI and St Patrick’s Guild, and sent a list of Irish unmarried mothers in Britain to the DLGPH inspector, Mrs Crofts. Redmond noted that, according to the records in the Dublin Diocesan Archives, Archbishop Byrne received communications from eight associations and institutions based in London, Manchester and Leeds. ‘In total 1,203 Irish women were noted as having been helped by these organizations…376 were reported as having become pregnant in Ireland, 155 became pregnant in

7 Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, eleventh day, 16 Sept. 1925.
10 Daly, Slow Failure, pp 281-3.
Britain, and the remaining 672 represented a combination of both categories’. Redmond highlights ‘the impressionistic and unreliable nature of the data’. The numbers assisted declined from a high of 318 in 1925 to 144 in 1929.\textsuperscript{12}

7.6 Material in the Archbishop Byrne papers suggests that a number of British poor law unions and several British Catholic charities were paying for the repatriation of Irish women by the late 1920s. In 1929 Canon Craven claimed that he was trying to get English Poor Law Guardians to send unmarried mothers back to Ireland, and they were willing to pay all fares and expenses, provided that he undertook to help end this emigration. He believed that sending these women back to Ireland would be ‘a good way of showing authorities in Ireland a sense of what was happening’. Canon Craven feared that the children would be adopted into non-Catholic homes. The West Derby Union was willing to pay the cost of returning pregnant women to Ireland, but this could only be done at the woman’s request, which seldom happened, ‘the reason is their people will not receive them’. The Liverpool and County Catholic Aid Society explained that it was the ‘sense of shame’ that caused Irish women to flee to England.\textsuperscript{13} Miss Cruice of St Patrick’s Guild asked Canon Craven to write a description of his experiences with Irish unmarried mothers, which she submitted to the secretary of the Carrigan Committee.

I can safely say that quite a large number of the applications I receive are from unmarried Irish mothers. Certainly it is true that never a day passes without one or more applications either by letter or in person being made here at my office. They come from all parts of the Irish Free State and among them are a certain number of girls of respectable parentage. The majority, however, are from the peasant or labouring classes. The larger number of these Irish girls fall in England. They are, however, a large number, which is certainly on the increase, who come here to England pregnant in order to get rid of their baby and hide their shame. To me the saddest part of the whole business is that these girls are ready and even determined to abandon their children without any regard to their claim to the Catholic Faith or any regard whatsoever to their future.

7.7 Canon Craven quoted a letter that he had received from a doctor in England, who was caring for a pregnant unmarried Irish woman:

\textsuperscript{12} Jennifer Redmond, ‘In the family way and away from the family: examining the evidence in Irish unmarried mothers in Britain, 1920s-40s’, in Elaine Farrell (ed.), \textit{She said she was in the family way}: Pregnancy and infancy in modern Ireland (London, 2012), p. 169.

\textsuperscript{13} Dublin Diocesan Archives, AB7/b/Lay organisations, Box 2.
The position as I understand from her is that she came to this country more or less to hide her shame, and being of decent parents she is anxious to get back again as soon as ever her trouble is over. Then what of the child? I have great fears for its salvation unless we can find some Catholic Convent or Institution willing to adopt it. I shall be glad of your counsel in the matter.

7.8 The canon described her attitude as:

typical. These girls seem to lack all sense of responsibility (and I assure you I am not exaggerating one little bit) they have no respect either for their religion or the Catholic priest. They will not go back to Ireland, nor will they take their parents into their confidence in order to obtain the assistance of their family. They come invariably in a blackmailing spirit saying to me ‘either you take the child or I’ll put it in a protestant home’. This is, I might say, the invariable rule of conduct with them. Many of them fall again, and I fear that there must be quite a large number of them on the streets of our big towns. In the course of my work I naturally meet a certain number of men and women who are doing rescue work of one kind or another. Everyone of these people whether Catholic or Protestant have the same story to tell; their hands are full of these Irish girls with their illegitimate children.¹⁴

7.9 In 1931 the English Catholic hierarchy contacted John Dulanty, the Irish High Commissioner in London, and he convened a meeting in the High Commission between representatives of the DLGPH and English Catholic welfare organisations. It was agreed that the High Commission would pay half the costs of repatriating first-time mothers, who became pregnant in Ireland. The scheme was to be overseen by an Irish committee, though Earner-Byrne notes that it was never established.¹⁵ This repatriation scheme is significant, because it brought Irish government officials - the London High Commission/later Embassy, and the DLGPH into direct contact with unmarried mothers. It was also the only instance where Irish embassies took responsibility for the welfare of a cohort of emigrants. A DLGPH memorandum dated August 1934 states that

In the case of girls coming from England information should be sent to Mrs. Crofts, Department of Local Government and Public Health, Custom House, Dublin at the same time as a request is made to the Irish Free State High Commissioner for repatriation. Arrangements will then be made to have the

¹⁴ National Archives of Ireland, JUS/90/4/6: Criminal Law Amendment committee (1930).
girl met at Westland Row Station by workers of the International Catholic Girls’ Protection Society, 42 Mountjoy Square Dublin. She will then be sent to the special Home for her county of origin for which application will be made through the Public Assistance Boards. Applications to Mrs Crofts should state full particulars of her name, age, home (Irish) address, the date she is alleged to have left Ireland, and the date the confinement is expected. If, for any reason, the girl does not wish to enter the special Home belonging to the area from which she comes, this should be stated, but this may lead to some difficulty and delay and should be avoided if possible.

7.10 Non-Catholic girls would be referred to two Rescue Societies in Dublin and a special home in Cork city - Braemar. They were also free to enter any of the Catholic homes where arrangement would be made for a clergyman of their denomination to visit them. The memorandum emphasised that these provisions only applied to women who were pregnant for the first time.16

7.11 In 1935 Mrs Crofts travelled to London and to Liverpool. She met individuals and agencies that worked with unmarried mothers and their children, including the Mother Superior of St Pelagia’s Home (run by the Congregation of the Sacred Hearts) and the secretary of the National Council for the Unmarried Mother and her Child (NCUMC). She reported that ‘In London the general view expressed by all whom I interviewed, with the exception of Canon Craven, was that the number of Irish girls who came to London pregnant had diminished considerably’. Canon Craven disagreed, but he did not supply any statistics ‘which would justify his attitude’. In the homes for unmarried mothers that she visited – apparently four homes in the London area and three in Liverpool - ‘there were very few Irish girls who had left this country pregnant but there were many who had become pregnant in England’. Statistics supplied by the Liverpool Society for the Prevention of International Traffic in Women and Children for the period April 1932 to 31 March 1934, recorded only four pregnant ‘girls’ arriving in Liverpool and five returning to Ireland, from a total of 584 women assisted by the society. Only four women from the Irish Free State had come to the attention of the Liverpool Women Police Patrols over the past year; only 17 of the 246 women admitted over the past year to Nugent House - a Catholic home in Liverpool which did require mothers to pay

16 Department of Health, NATARCH/ARC/401679.
for their upkeep - were from Ireland, 32 counties; three of the 83 women admitted to a home in Kelton, Liverpool, were Irish 'and these three fell in England'.

7.12 These exchanges hint at some of the political complexities - Canon Craven was probably exaggerating the problem to keep up pressure on the Irish government and the Irish Catholic hierarchy. In 1932 Edith Rose of the Liverpool Port and Station Work Society claimed that the Crusade of Rescue was 'grossly overstating the needs and numbers of the Irish expectant mother and baby in London'.

7.13 In autumn 1938, the DLGPH inspector, Miss Alice Litster, visited London where she met representatives of most of the institutions previously visited by Mrs Croft and representatives of London county council. She reported that the Cardinal’s (that is, the Archbishop of Westminster’s) Committee for Social Work in London had received 274 applications during 1937 from ‘girls’ of Irish birth; 89 had become pregnant in Ireland; 185 became pregnant in London or the surrounding area and 108 of the latter named Irishmen resident in London as the putative fathers. The number of PFIs seeking assistance in the period January to October 1938 was 48. On that basis Miss Litster suggested that the numbers were decreasing. In the six months ending 28 February 1938, only 12 PFIs ranging in age from 16 to 26 became chargeable to London county council. However ‘the greater number’ of mother and babies maintained in Catholic homes, supported by voluntary contributions, were ‘stated to be Irish’ - though most had become pregnant in Britain. Canon Craven continued to assert that the number of PFIs was ‘rapidly on the increase’, but yet again he provided no supporting evidence. Miss Litster commented that the statements in the document prepared by the Cardinal’s committee, ‘are, I believe, intended to make as strong a case as possible for a grant by our government in aid of the work done by the Cardinal’s Committee for Irish unmarried mothers in London’. The High Commissioner, Mr Dulanty, suggested that the Irish government should provide the committee with a small grant. Miss Litster noted that the Cardinal’s committee would welcome the formation of an Irish committee ‘charged with similar duties’.

7.14 Keeping up the pressure on the government, the Archbishop of Westminster, Cardinal Hinsley, wrote to Taoiseach and Minister for External Affairs, Éamon de

17 Redmond, ‘In the family way’, p. 170.
18 Department of Health, RM/ARC/0/489778.
Valera. He claimed that there were almost 100 single women who became pregnant in Éire, ‘whose purpose is to give birth to their child in one of our Public Assistance Hospitals, intending to leave the child in England as a charge upon the generosity of English Catholics’ - which would appear to suggest that substantial numbers of pregnant women were travelling to England - yet he went on to note that ‘a considerable number of Irish girls and young women fall into sin and become illegitimately pregnant in a short space of time after arriving in this country’. He dismissed reports of ‘white slavery’ suggesting that they became pregnant because ‘sheer weakness of intellect and character combined with inexperience is often the cause of their downfall. Girls of this type should not undertake the adventure of migration’. The English charities catering for unmarried mothers were under considerable pressure and were forced to send many pregnant Irish women to public institutions, which had resulted in a letter of protest from the chief public assistance officers of London county council. The London county council gave the Catholic homes in the Westminster archdiocese a weekly grant for each ‘inmate’, which barely covered the maintenance cost. Cardinal Hinsley wanted the Irish government to pay a similar grant of 5s a week. He also sought ‘more sympathetic co-operation from the Government and CPRSI’ in receiving the children of these mothers. There was an element of menace in the Cardinal’s letter; he ‘dreads the scandal to the faith as well as the discredit to Ireland - and consequently the harmful effect on relations between our two countries’ if these facts became known to English newspapers.

Miss Litster explained that if a woman was returning from England at the expense of a public assistance authority she would generally arrange to have her met at the boat or train. On some occasions the returning woman was only given the ‘bare fare’; she arrived in Ireland, with no money to pay her bus or train fare to her destination - a mother and baby home. In some instances she was ‘brought to the Mendicity Institute’ (a Dublin charity) who gave her her fare from the ‘Traveller’s Aid fund’. Miss Litster described this as ‘a loose and objectionable method of dealing with such a contingency’. She would like some society to deal with these cases, and arrange temporary accommodation ‘for girls who have returned hastily’. She often had to arrange temporary accommodation for the women in Dublin, generally in Regina Coeli (see Chapter 21), and after a few days in that hostel

---

20 Women being exploited for sexual purposes.

many women were ‘unwilling to go to an institution under the care of nuns’. They preferred ‘a certain “free and easy” atmosphere in Regina Coeli’.  

7.16 In the early months of 1940 the DLGPH contacted the CPRSI, who were based in Dublin, to see whether they would agree to assume responsibility for returning PFIs, and the CPRSI in turn approached the Catholic hierarchy. The CPRSI was concerned about the cost of undertaking these duties, and there is no evidence that the government gave a commitment to reimburse them. The department then contacted the Irish Catholic hierarchy asking them to take responsibility for the repatriation of PFIs. This request was supported by Joseph Walshe, Secretary of the Department of External Affairs. At some point in the early months of 1940 the CPRSI assumed responsibility for the repatriation of Irish unmarried mothers at the ‘special request of the Cardinal and Archbishops of Ireland’. The Irish High Commissioner contacted several English dioceses, in an effort to determine the numbers of unmarried Irish mothers and their children in England, and he forwarded the replies that he received to Dublin. The diocese of Southwark had received 160 applications from pregnant Irish women over the past three years; they claimed that 70 of those pregnancies began in Ireland. The Liverpool Catholic Children’s Protection Society reported that there were ten Irish babies in a home with a capacity of 40. Three of the Irish mothers had disappeared. ‘In many cases we are unable to secure sufficient information to arrive at any constructive decision. We know nothing of their background but they expect to be helped without question i.e. they expect to be relieved of their babies, and of course do not wish to suffer any personal inconvenience’.  

7.17 The number of women repatriated from England under the government’s scheme remained low until the summer of 1940. In the year ended 31 March 1939, 41 women applied for repatriation; 24 were approved. There were 37 applicants in the following year and 21 were approved. Pressure on the repatriation scheme increased significantly from the summer of 1940. The bombing raids on major English cities resulted in several mother and baby home being relocated from London to less vulnerable cities such as Oxford. With increasing numbers of civilian casualties, and some hospitals suffering bomb damage, an emergency scheme introduced by the Ministry of Health meant that wards formerly used for

24 Department of Health, RM/ARC/0/489778.
‘waiting unmarried pregnant women’ were requisitioned for other purposes. Unmarried mothers were being discharged from maternity homes shortly after giving birth, because of a shortage of places. Mrs Helen Murtagh, a Catholic social worker in Birmingham, claimed that 22 pregnant single women were ‘planted all over the city’; the majority were Irishwomen, who were long-term residents of Birmingham, and therefore eligible for UK local authority support services, but the resources were not available. She feared that these women, or more particularly their children, would be taken into care by non-Catholic charities, such as the Salvation Army or Church of England Homes. During the war British charities, social workers and local authorities became more determined to repatriate Irish women. There was a rise in the numbers of women ‘returning of their own volition or sent by societies’ to Ireland, including women who had been working for some years in Northern Ireland and women who were long-term residents of England or Scotland.

Most women were sent back to Ireland by the Westminster Moral Welfare Society. Although the society was instructed to refer returning women to the CPRSI, after two or three months, Miss Plater of the Westminster Moral Welfare Society stopped sending women to the CPRSI and referred them instead to St Patrick’s Guild. There is no indication as to why this happened. When a British welfare organisation contacted the CPRSI, the CPRSI gave the woman’s personal details to Miss Litster: her name, home address, and her circumstances, that is, her expected date of delivery, details of the putative father, whether the pregnancy happened in Ireland, and her occupation and perhaps some details as to her family. Miss Litster would check on ‘her bona fides’; contact the relevant local authority, asking them to agree to cover the cost of maintenance in a mother and baby home, and ensure that there was a vacancy. The CPRSI would meet the repatriated woman when she arrived and arrange for short-term accommodation in Dublin, if necessary, and her transport to the mother and baby home where she was booked. In November 1944 the CPRSI informed Coventry city council that they required three days’ notice of the arrival of a repatriated woman, and that they only looked after Catholic women. Women returning with an infant were asked to

bring copies of birth and baptismal certificates, plus a doctor’s certificate that
mother and child were free of disease.\footnote{29 Department of Health, NATARCH/ARC/0/404309.}

7.19 In June 1940 Miss Litster reported that, because of a shortage of accommodation
and the requirement to evacuate pregnant women from dangerous areas, women
in England, who would normally be kept in hospital for medical treatment and
childbirth, were being sent to Ireland. Little advance notice was given to the Irish
authorities so there was no time to arrange for their accommodation. She
complained that ‘often the onus is thrown on me of inducing them to seek
admission to an institution to which they were unwilling to go, and to find
accommodation for those who are obstinately determined not to return to their
native country’. The secretary of the DLGPH, James Hurson, told the CPRSI that
women were returning to Ireland without any advance notice; they had been told to
present themselves to the department’s inspector, ‘and apparently informed that
they would be accommodated in Dublin’.\footnote{30 Department of Health, RM/ARC/0/489778.} Ten pregnant women were repatriated
during the first two weeks of June 1940; three from Birmingham, the remainder
from London. A further three, who arrived with babies, were not deemed to be
destitute; the babies were ‘taken over by St Patrick’s Guild’.\footnote{31 St Patrick’s Guild generally required a payment from a mother, or a payment on her behalf, if they were to accept a child.} One of the pregnant
women had been in hospital in Britain because she had haemorrhaged, and it was
deemed unsafe for her to travel beyond Dublin - it was probably also unsafe for her
to have travelled to Ireland.

7.20 The scale of wartime repatriations seems to have taxed the capacity of the Dublin
charities. In March 1940, an unidentified person - probably a fellow senior civil
servant - wrote to Joseph Walshe, secretary of the Department of External Affairs,
enclosing two letters (which the Commission has not seen) from Frank O’Reilly of
the CPRSI. This official noted that ‘It looks as if the CPRSI regard the problem as
one involving considerable financial responsibility and likely to be too great for
them’. In June Frank O’Reilly wrote to DLGPH Secretary James Hurson quoting a
letter to the effect that Mr Hurson ‘expects us to accommodate anyone who may
come along, without any notice to us’. The CPRSI suggested that in order to do
this, they would need a hostel.\footnote{32 Department of Health, RM/ARC/0/489778.} Between 1939 and 1944 the CPRSI spent £630
on short-term accommodation and travel within Ireland for repatriated women, and
they sought a subsidy from the department, because they had taken on this role at
the request of the government. The DLGPH countered that they could claim for these costs, though probably not the cost of transport, under the National Maternity and Child Welfare scheme - which only covered half of the allowable costs. Yet despite the wartime pressures, a memorandum written in 1947 or 1948 stated that only 150 Irish women had gone through the CPRSI’s repatriation scheme since 1940; in 1947 a total of 1,538 Irish unmarried mothers applied to Catholic societies in England.

7.21 In 1947 Miss Litster noted that ‘Many of the welfare workers in Great Britain are so intent on getting rid of the Irish unmarried mothers that they are not straightforward in their dealing with them and us’. The societies that sent women back to Ireland were aware that there was no accommodation in Dublin for women who were not native Dubliners, other than Regina Coeli and ‘the type of accommodation offered in this hostel is not of that high standard of comfort obtaining in the small voluntary homes in Great Britain’. The special mother and baby homes only took first-time mothers; women on a second or subsequent pregnancy would have to go to their county home. Women who were admitted to Castlepollard, Sean Ross or Bessborough would be required to stay for two years after the birth of their child, unless they could make financial arrangements ‘for the child’s future or the Catholic Protection and Rescue Society accepts responsibility for boarding out the child at an earlier date’. She continued ‘Nevertheless, girl after girl has returned from Great Britain through these societies expecting that her baby will be “adopted” immediately and that she will be able to return at once to her work on the other side. This makes the problem of dealing with the repatriate doubly difficult’. She claimed that women who had gone to England ‘to avoid local knowledge of her condition’ were reluctant to return to Ireland. In England she would stay in a home for three to six months; have no difficulty in having her child adopted - at no cost (whereas in Ireland she would have to pay to have her baby placed at nurse), though the adopting family might not be Catholic.

7.22 The number of repatriated PFIs increased significantly during the 1950s - at a time when the total number of ‘illegitimate’ births in Ireland was falling - and they continued to rise in the 1960s; the peak year was 1967.

7.23 The primary reason why pregnant women travelled to England was to protect their privacy. An application to a local health authority for financial support in a mother and baby home often meant that a woman’s pregnancy became known, and the long stays in Irish mother and baby homes were also a factor. The annual report of the CPRSI in 1952 stated that

Apart from the services of a few voluntary societies in Dublin, such as ours, all of which are constantly in financial difficulties, the only facilities available for the unmarried mother are County Homes and the three special Mother and

\textsuperscript{36} Garrett, ‘The abnormal flight’, p. 337. Garrett does not give a number for 1966.
Baby Homes. The local authorities maintain the girls in these institutions, and a girl has little chance of going free until she has remained almost two years with the child in the institution. How can any girl remain such a long time out of touch with her home and her friends and still preserve her secret? The result is an abnormal flight to England with the consequent danger to both mother and infant.

7.24 Another annual report, also quoted by Garrett, though no date is given, stated that

In no other country in the world has the unmarried mother to remain for two years in a Home with her child. A few months is regarded as sufficient to allow the mother time to decide on the future of her child and is also believed to be adequate in helping her towards moral rehabilitation. Any longer period is regarded as punitive and it is becoming increasingly obvious that our girls will not submit themselves voluntarily to punitive treatment.

7.25 The CPRSI believed that many women went to England because of the requirement to spend two years in Irish mother and baby homes. The introduction of legal adoption in Ireland does not appear to have reduced the numbers travelling to England. In the mid-1950s 61% of registered cases recorded by the English Catholic Rescue Society related to women who were born in the Republic of Ireland. As mentioned above, the highest number of repatriates was in 1967. While many women decided to travel to England on discovering that they were pregnant, others were persuaded, or contrived, to do so by family members or the father of her child. In 1936 the journalist Gertrude Gaffney wrote a pioneering series of articles on the Irish in Britain. One focussed on PFIs. A priest in England told her about the daughter of a ‘well-off farmer. When her people discovered her condition her mother had given her enough money to get to London and told her she never wanted to see her again’. In 1954 and 1955 women were reported as having been advised to go to England by a doctor, and a priest respectively.

7.26 Women also came under pressure to return. Garrett’s researches in the archives of the English Catholic Rescue Society reveal that “the possibility of returning to

---

37 The CPRSI does not mention the local authority homes in Pelletstown and Tuam.
40 Irish Independent, 15 Dec. 1936.
Ireland” was addressed during a woman’s initial interview with one of the caseworkers'. Some women came under considerable pressure to consent to repatriation: notes relating to one woman stated that ‘if she failed to co-operate “I shall insist on you going back to Ireland straightaway’. In further correspondence the social worker threatened that if the woman failed to attend an ante-natal appointment she would inform the woman’s family of her pregnancy, and her employer - which might result in her losing her job. This story ended reasonably happily, if that is possible, because the woman’s mother suggested that she return home, and she was accompanied by her sister. Garrett concluded that ‘Case files reveal that staff at the ECRS were not only intent on delineating the choices (or lack of choices) they viewed as available to these unmarried Irish mothers, they were apt, in some instances, to pressurize them if alternative more independent courses of action were embarked on’.41

PFIs and the Department of Health index cards

The Commission has had access to three large files consisting of index cards containing details of unmarried pregnant women or recent mothers, who came into contact with the women inspectors in the DLGPH/Department of Health in the years 1944-61. There are a total of 2,291 cases, and 1,162 of these relate to repatriation. The woman’s age is recorded on 90% of the files. One in ten of the repatriated women were pregnant for a second or subsequent time.

---

42 Unless otherwise stated the case histories cited in this chapter are taken from Department of Health, RM/ARC/0/489984; Department of Health, RM/ARC/0/489986; Department of Health, RM/ARC/0/489989.
7.28 The agreement reached in 1931 provided that the Irish government would only assist in the repatriation of women who became pregnant in Ireland, but they were frequently prevailed upon to assist women who became pregnant in England, including some who were long-term residents. In 1952 the British embassy contacted the Department of External Affairs asking whether the Dublin board of public assistance would keep an Irish mother and her English-born baby. This ‘girl’ had written to London county council saying that she would not be kept in Ireland. The British Embassy was anxious to know the Irish policy with regard to repatriation of unmarried mothers. This woman had been in England for over a year before the birth of her daughter, so she was not eligible for repatriation. She returned to Dublin and was sent by CPRSI to a hostel in Cork Street for one night and from there to St Kevin’s (the Dublin Union). The CPRSI promised to take her child ‘as soon as possible’ meanwhile she was admitted to Pelletstown and from there wrote letters to Catholic and Protestant charities in England and London county council.

7.29 Many pregnant Irish women who travelled to Britain (most pregnant women went to England), found it to be a less than friendly place. Women who had recently arrived were denied treatment under the British National Health Service. While free treatment under the NHS was, in theory, available to all legal residents (a category that included all Irish citizens), some services, such as ante-natal clinics, and maternity hospital care, were provided by local authorities, who did not necessarily follow NHS/Department of Health guidelines, and they may have imposed their own restrictions, for example, giving priority to local women, irrespective of medical need. Some NHS hospitals may also have discriminated against certain categories of patients - black women, or single women.43 In 1968 an article in the Irish periodical *Woman’s Way* quoted a social worker with the NCUMC:

> The average Irish girl in Britain is the working class manual worker and is employed behind a bar or as domestic help. Her environment is often bad, possibly long hours in a smoky club listening to bawdy language. The girls have little money. They send part of the wage-packet home to the parents and if the girl finds herself with a child she fears that any lessening in the sum sent home will arouse at least suspicion. Money is one of the big problems.

---

43 The Commission acknowledges the assistance of Professor Pat Thane and Professor Roberta Bivins in clarifying this matter.
CHAPTER 7 PREGNANT FROM IRELAND

facing the girls. Another is somewhere to live that will be morally and physically healthy.

7.30 The social worker explained that most Irish unmarried mothers did not qualify for a bed in an NHS hospital, and the emergency bed service was ‘far from satisfactory’. English mother and baby homes were booked in advance so Irish women ended up being placed through an organisation that provided welfare for the homeless, or in an institution; both were ‘grim alternatives’.

7.31 If women contacted the NCUMC before travelling to Britain, they were dissuaded from travelling, though this was often difficult.

In the first letter I tell the girl whom she can contact for help in Ireland; in the second I try to persuade her out of fears about the way she will be treated if she stays; in the third I tell her that she will not be eligible for a hospital bed in England and won’t be able to get financial help at the time she needs it most. I’m afraid that the letters have become rather stereotyped because I have sent so many.44

7.32 Little is known about the attitude of the staff in English Catholic charities or British welfare services towards unmarried Irish women, other than the evidence presented by Garrett, which is cited above, but given the acknowledged existence of prejudice against Irish emigrants it is highly unlikely that unmarried mothers did not experience some hostility/prejudice on occasion. The Catholic church in England came under considerable pressure to cope with the influx of Irish emigrants during the 1950s - creating additional demands on church space, Catholic schools and other services, including mother and baby homes and adoption services.45 In the mid-1950s, 61% of the almost 800 expectant mothers that were referred to the English Catholic Rescue Society were from Ireland.46 The pressure on resources, and fears that Catholic women and children would end up in non-Catholic institutions, were key factors in their wish to repatriate Irish mothers and children. In 1963, Fr Good, director of St Anne’s adoption society in Cork, advised a priest seeking information about facilities in England for pregnant Irish women ‘to try his best to stop her from going to England, even if this is what the parents want. She will be sent back in some publicity if she contacts a Catholic society…they are

44 Woman’s Way, 19 July 1968.
46 Garrett, ‘The hidden history’, p. 27.
getting more ruthless than ever in recent times at returning them before birth’.  

Thirty-one of the 100 unmarried mothers in Palletstown, who were interviewed by Mary Frances Creegan in 1967, had returned from England; 26 had been repatriated, five returned on their own initiative; 16 of the repatriated women had not wanted to return but the welfare agency had given them no alternative. Several had been living in England for a number of years. Creegan cited one extreme case, where a woman, who had been living in England with an older sister since the age of eight following the death of her parents, was sent back to Ireland by an English welfare agency. She knew nobody in Ireland.

7.33 As Creegan discovered, many women returned unwillingly. In 1952 a priest who interviewed an Irish nurse working in Lancashire, claimed that she was the only Irish woman he had interviewed who was willing to return. She became pregnant in England, by an Irish man, and was not technically eligible for repatriation, but she had to leave her job and hospital accommodation because of her pregnancy. At this point her pregnancy was reported as Irish - not the only occasion that records were changed to enable a woman to qualify for repatriation. One Monaghan woman threatened to commit suicide if she was returned to Ireland, but she eventually agreed to travel if absolute secrecy was guaranteed - she was sent to Sean Ross. Some women were apparently more than willing to come home. One 18-year-old factory worker, who was referred by the Southwark Rescue Society in 1950, had been in London for more than two years. She was described as ‘depressed and anxious to embark’. Her only living relative, a sister, was aware of her pregnancy. A young woman who married her husband one month before her first child was born, probably around the age of 16, left that child with her parents, and went with him to England where she gave birth to a second child. He deserted her, and mother (now pregnant again) and baby ended up in a Salvation Army hostel. She wanted to come home with her child. It is unclear what happened. The public assistance authority approved her admission to Bessborough, but there is no evidence that she went there - and it is unlikely that she would have been accepted, as a deserted wife. A woman who had worked for several years in a Birmingham factory, and became pregnant by an Englishman who was reported to be in Korea (presumably in the armed forces), came to Dublin of her own accord and contacted a priest at Westland Row church asking for

47 Cork Diocesan Archives, St Anne’s Adoption Society, Box 8.
assistance. The Family Welfare Bureau referred her to the CPRSI who arranged a bed in Cork Street Hostel and her admission to St Kevin’s. A young Mayo woman repatriated from Scotland with her infant and sent to Castlepollard left on the same day and was reported to have returned to Scotland with her child.

7.34 When a 25-year-old nurse discovered that she was pregnant she went to England, where she had trained, and contacted Catholic welfare societies. She reported that they were ‘no help’, so she returned to her married sister in Dublin and attended the Coombe hospital for ante-natal care. She was admitted to Castlepollard. A Galway woman working in Salford who became pregnant there, was sent back by a local Catholic welfare worker, because ‘amount on insurance card would not entitle her to admission to Mother and Baby Home at £3-3-0 weekly’. (for mother plus child) She went to Tuam where the maintenance payment had recently been increased to £1 a week for a mother or a child in August 1952.  

7.35 A woman who was deaf and an orphan gave personal details that the local authority dismissed as incorrect, but the Crusade of Rescue was determined to return her to Ireland regardless. Canon Craven of the Crusade of Rescue recommended Bessborough because it appeared that she was from Co Cork - but the department inspector disagreed, presumably to protect her identity. The sister of a 16-year old who went to England pregnant, told the Westminster Crusade of Rescue that their mother had sent all the girls to England as soon as they could earn. The CPRSI were not keen to take care of this pregnant teenager; they described her as ‘of very low intelligence’.

7.36 There are many instances where one or both parents, a sister or aunt, accompanied a pregnant woman to England with the intention of making arrangements for mother and baby. A father accompanied his pregnant 16-year-old daughter to London where she gave birth in St Pelagia’s Hospital and remained with her; that pregnancy resulted in a court case in Ireland. In another case where arrangements were in train for a pregnant woman to return to Bessborough, her father called to the secretary of the CPRSI and explained that he would take full financial responsibility; she gave birth in a nursing home in London; the baby would be placed in a Catholic home. One mother brought her pregnant 18-year-old daughter to England, but was later persuaded to agree to her return.

49 Capitation rates given in chapters 15 (Tuam) and Castlepollard (20) confirm the figure for Tuam, but they suggest that the figure for Castlepollard was £2 for a mother and £1 for an infant.
7.37  The files of St Anne’s adoption society in Cork (see below) record the story of ‘A simple Irish girl’ who ‘has been co-habiting on and off with a fellow countryman, who has several other friends’. They had three children together; the youngest was in care in England. She was living in a Good Shepherd Hostel. Fr Hall of the Clifton Rescue Society reported that ‘the authorities in Britain feel that her going home is the best solution’. The woman was unwilling to return because her family believed that she was married. Fr Hall reported that ‘at the moment the English authorities feel that […] may be beginning to weaken in her opposition to returning home, but it appears to them to be the only solution as they understand she has been rather promiscuous in addition to her association with one individual on a permanent basis’. The priest from her home parish, who had obviously been contacted, told Fr Hall that ‘it would be a tragedy’ if she returned home. There was nobody at home except her father ‘who is aged about 70 and whose mental age is 7 and who, obviously is ignorant of his daughter’s bad behaviour. Her return here would only mean a transfer to another Good Shepherd convent eventually’.\textsuperscript{50} It is not known what happened beyond this point.

7.38  An Irish woman who gave birth in an English mother and baby home was being sent back ‘at once, as accommodation required in home’. She was unwilling to return. One 20-year-old, who was described as a ‘difficult girl’, was returned to Ireland by the matron of a council home in Middlesex and arrangements were made to admit her to Castlepollard. She obviously returned very late in pregnancy because, while in Regina Coeli, pending transfer to Castlepollard she had to be admitted to St Kevin’s hospital for the birth of her child. It was then determined that she had become pregnant in England and the county manager was no longer willing to pay for her maintenance; it is unclear where mother and baby went. One woman who had gone to England and gave birth there - she and her baby were living with a married sister - wrote to the CPRSI asking to return; a priest in her English parish wrote with a similar request on her behalf. Canon Flint (Birmingham) described one woman who was sent back and was admitted to Regina Coeli as ‘running from one hostel to another in England’ - from Regina Coeli she was sent to Bessborough. A woman who had gone to England indicated that she would not return if she was sent to a county home - she was admitted to Castlepollard.

\textsuperscript{50} Cork Diocesan Archives, St Anne’s Adoption Society, Box 8.
7.39 A Leitrim woman who went to England pregnant and was working as a domestic servant in the bishop’s house in Birmingham was sent to a convent by one of the priests when it was discovered that she was pregnant. These Sisters sent her back to Ireland to Henrietta Street Hostel and from there she went to St Kevin’s. Another woman, who married a man who was not the father of her child (the putative father was a married man resident in Ireland), a month before giving birth in England, wanted to send her child back to Ireland and would pay 10s a week towards his upkeep. There are also cases where arrangements were made for a mother and child to return to Ireland, but the mother changed her mind - one opted to stay in a home run by Sussex county council.

7.40 Several women were repatriated at a very late stage in pregnancy and in circumstances that presented a serious risk to health. One woman became extremely ill on the boat returning from England, and refused to travel beyond Dublin. When the Sligo health authority was asked to agree to maintain her in Pelletstown, they contacted the department asking whether it was an approved institution. A Waterford woman, who had left home on discovering that she was pregnant, went to Cork and then to England; she was repatriated by the Crusade of Rescue - without any advance notice to the Irish authorities – and ended up in St Kevin’s hospital needing medical treatment. She was later sent to Sean Ross. In 1948 a woman returning from England went directly from Westland Row station (now Pearse Street station) to Holles Street hospital because she was haemorrhaging and gave birth there to a 2.5 lbs baby, who apparently survived. A Donegal woman who went to Glasgow in 1956 was returned to Ireland the following day and admitted to Regina Coeli - her baby was born one week later. Another woman sent back from England went home rather than to Castlepollard as had been arranged; her baby was born the day after she returned, in a local district hospital. The pressures to return mothers and babies to Ireland were particularly strong when it appeared that the child might have special needs. The mother of a pregnant 20-year-old with Down syndrome ‘rushed’ her to London when she became aware of her pregnancy, probably by a married neighbour, but she was sent back to Ireland.

**The children**

7.41 Earner-Byrne suggested that the government handed responsibility for repatriated pregnant women to Catholic charities. In theory that may have been the case, but in practice Miss Litster, the chief inspector in the DLGPH, was a pivotal figure in
that process. She found emergency accommodation for women who arrived in Dublin, often without money, and without either the department or any charity having advance notice that they were coming. She contacted the local authorities to arrange for them to take financial responsibility for supporting these women, and she worked closely with the charitable organisations to secure placements for the mother and her child. The department was also the first point of contact for UK local authorities who were arranging the adoption of children of Irish mothers who may have returned to Ireland. For example, Northampton diocese Catholic charities were trying to locate a Galway woman to secure her consent to adoption - but this was difficult because ‘Parents PP and neighbours unaware of child’s existence’. In this instance the department inspector asked the secretary of the department ‘for permission to act as representative of Northamptonshire Co. Council and interview mother’. The minister approved this suggestion. In the case of a Galway woman who had given birth in Birmingham and returned to Ireland in 1950, leaving her child in the care of a Birmingham Catholic welfare society, the department and the CPRSI tried to trace the mother to secure her consent to adoption.

7.42 The department generally enlisted the local children’s officer - if she existed - to handle the paper work and secure the mother’s consent. In 1952, for example, the children’s officer of Middlesex county council sought the assistance of the Department of Health in securing a mother’s consent to an adoption. They checked whether the adoption ‘was sponsored by a Catholic Welfare Society and if assurance can be given that adopters are Catholic’. The department inspector informed the English authorities in confidence that the mother had been a TB patient for some years; she also interviewed the mother (presumably having been satisfied that the infant was being adopted by a Catholic family), and witnessed her signature on the forms. When one mother’s signature was required to consent to the adoption of her child in Scotland a female county council official contacted the mother, indicating that she had a query in relation to the woman’s social insurance, and asking her to visit her office. Many of these requests were highly sensitive, because the mother might be living with her parents, who were not aware of the child’s existence. When the local authorities in Kerry were contacted by Warwickshire county council in 1960, seeking to get a mother’s consent to adoption, (the mother was presumed to be living in her parental home), the county

51 Department of Health, RM/ARC/0/489433.
52 Department of Health, RM/ARC/0/489433.
manager contacted the department indicating that he was unsure ‘what line to take…as obviously I do not know whether this adoption is or is not desirable from our point of view’.\(^{53}\) Quite what is meant by ‘our point of view’ remains a mystery.

**Returning children to Ireland: family, foster-care, and adoption**

7.43 One aspect of the PFI story that has largely gone unnoticed was the return to Ireland by British social services and British Catholic charities of children who were born in Britain to Irish mothers. Ireland was not the only immigrant community that was targeted in this manner. The Colonial Office provided escorts to bring the children of unmarried West Indian immigrants, many of them working in Britain’s NHS, back to the West Indies, placing them with the woman’s family.\(^{54}\)

7.44 The CRPSI annual report for 1955 noted that London county council ‘had so many Irish babies abandoned or left in their care’ that a London county council children’s officer was appointed to spend six months each year in Ireland ‘trying to get homes for these babies’. The children’s officer in question was Miss Harris; she had formerly worked with the Crusade of Rescue. Her official position was child-care officer, employed by Westminster city council. In the 1950s her Dublin office address was South Anne Street - the offices of CPRSI. Garrett has described the background to this ‘Daring Experiment’. In 1954, London county council set up a sub-committee to tackle a crisis in two residential welfare nurseries, where children aged under three had been placed, because of a shortage of foster care places for infants. The children’s officer reported that many of the children in one nursery had Irish Catholic mothers, so the committee determined that a child welfare officer from London county council children’s department should be authorised to travel to Ireland to visit the families of the Irish mothers whose children were in this particular nursery with a view to the children being sent to these relatives in Ireland. The children’s officer consulted the Home Office, to confirm that it was not illegal to transfer children to Ireland. But the Home Office believed that payments for foster-care in Ireland should only be made in ‘exceptional circumstances’. The children’s officer discussed this plan with Catholic charities in London, during the course of their regular meetings, and it was decided that the matter should be organised by London county council and not by a voluntary organisation. In February 1955 London county council officials travelled to Ireland to check out children’s homes and foster homes and investigate the possibility of grandparents

\(^{53}\) Department of Health, RM/ARC/0/489433.  
7.45 Garrett notes that the reports associated with this visit and the proposal to repatriate the English-born children of Irish mothers presented an image of Ireland as ‘backward, traditional and pre-modern’. They suggested that Irish children in care in England were ‘somehow “out of place”’. The inspector, almost certainly Miss Harris, suggested that further work was needed in Ireland but it ‘might be expected to produce satisfactory results both in terms of “child care” and financially to the Council”’, and these actions might deter PFIs. If it became known that children born in Britain to Irish mothers would be sent back to Ireland (to their families) parents might be less willing to encourage their daughters to travel to Britain. The London county council files record that this welfare worker had developed a method of ‘getting the grandmother to consider taking an interest in her daughter’s illegitimate child’; she would also work with the CPRSI or parish priest to find foster homes. The long-term goal was to have these children placed with grandparents or other relatives. It is not certain that all the infants in care were the children of single mothers but they probably accounted for the overwhelming majority. By the spring of 1956, 48 children had been returned to Ireland: six were under two years; 18 were in the range two to five years; 15 aged between five and 11; five were aged 11-15 and four were over 15 years. Garrett highlights the fact that the repatriation had been extended to older children; London county council recorded no information about the country of birth of the children and how long they had lived in England. ‘Significantly also no information is provided on the question of parental consent or on how the views of children were obtained on plans to remove them to Ireland’.  

7.46 By 1956 it was believed that there was a case for London county council welfare officer spending six months of the year in Ireland, and it appears that she secured an office in the CPRSI headquarters. The Irish authorities gave her a petrol allocation at a time when it appeared that petrol would be rationed following the Suez crisis. Some mothers refused to have their children sent to Ireland - probably because they feared the consequences of their family knowing of a hitherto-concealed pregnancy and child. It is obvious from occasional references in the files that Miss Harris was well-known to the Department of Health inspectors. A file

on boarded-out children in Kilkenny dated 1959, records: ‘Nice little fair haired lad…Came through Miss Harris. Ask Miss H. about baptism’. By 1964 a total of 298 children had been removed to Ireland under London county council scheme. These placements continued until at least the late 1960s. In 1953 Minister for Health, Seán MacEntee, was questioned in Dáil Éireann about a report that London county council had two officers ‘permanently stationed in Ireland for the purpose of tracing the grandmothers of illegitimate children born of Irish mothers in London and that the grandmothers are generally delighted to have the children in question transferred to their care in this country’. The minister replied that the newspaper story was ‘substantially accurate’. He stated that the department had no formal contact with London county council officers; children who were placed with close family members did not come within the remit of the Children Acts and therefore they were not the concern of the local authority or the department.

7.47 Other evidence suggests that the relationship between Miss Harris and the Irish authorities was more complex. In 1968 Miss Clandillon visited a three-bedroomed council cottage in Donabate, which was without running water or mains drainage. The cottage was the home of a widow and her teenage son and daughter. It also contained two brothers who had been boarded out by the Dublin health authority and three children that were repatriated to Ireland by the London Crusade of Rescue - two babies and an 18-month-old child, who was described as ‘coloured’. In 1965 this woman had answered an advertisement seeking a foster mother, which had been inserted in an Irish newspaper by Miss Harris ‘acting in a voluntary capacity as a liaison officer for Canon Harvey, Crusade of Rescue, London in a scheme for the repatriation of young children born to Irish mothers in London’. The Crusade paid foster mothers £2 a week; it also covered the cost of clothing and medical expenses. The children were brought from London by their mothers and met at Dublin airport by Miss Harris or her assistant. This cottage and a house in Dundrum were being used by Miss Harris and her assistant for short-term foster care. Over the previous three years, the Donabate widow had fostered approximately 40 Crusade of Rescue children; a maximum of five children at any one time. Miss Harris had also placed children occasionally in Madonna House, a children’s home in the Dublin suburbs. Miss Clandillon noted that Miss Harris had placed ‘a big number’ of children with relatives in Ireland; the majority were

56 Department of Health, RM/ARC/0/489311.
57 Garrett, "Daring Experiment", p. 87.
58 Dáil Debates, 14 March 1963.
maintained by Westminster city council, though some were being maintained by the Irish health authorities. She was concerned that the Donabate cottage breached a departmental regulation that children who were boarded out (i.e. maintained by the health authority) and children at nurse (i.e. maintained by a charity or a person) should not be in the same foster home. The Dublin children’s officer was concerned that there were too many children in this house. It also emerged that Miss Harris and her assistant did not inform the local health authority in advance when children were being placed or removed from a foster home. Miss Clandillon’s report is dated 5 April 1968; her inspection was undoubtedly prompted by a story in the English newspaper The People, on 31 March 1968, which carried the heading ‘AMAZING TRAFFIC IN BABIES EXPOSED’. It reported that an unmarried Irish mother in London had gone to Ireland to reclaim her child who had been sent to Ireland for adoption by Westminster city council, and she had found him ‘in a “baby farm”’ - the Donabate cottage described above. The People claimed that there were nine babies in the house, and they quoted the foster mother: ‘I like to have a good selection here...so that when people come they have a few to choose from for adoption’. Minding these children was her livelihood. The child of the young woman who returned looking for him had been in this cottage for six months, according to the article. They described the conditions as:

appalling. The stench was awful. Cobwebs hung from the ceiling. And cots in what Widow X called ‘the nursery’ were covered in dirt. In one battered pink cot was an 18 month old coloured boy lying on a torn and pitted foam mattress. There were no sheets on the mattress and the only covering was a tiny piece of blanket in one corner. A six-month old baby was in a cramped Moses-type basket. Another in a carry cot inside an ordinary cot, had his own sick all over his clothes. It had caked dry on him.

7.48 The foster woman alleged that Miss Harris did not inspect the house before placing babies there. She explained that she kept the children warm and fed. ‘It’s just as though they were in hospital. They just lie in their own cots quietly and are no trouble at all’. Miss Harris told the journalist that ‘The conditions at her home are not 100 per cent, but you can’t judge these things by English standards’. Some statements in this article are open to query. The foster mother had no role in placing these children and no autonomy as to the number of children left in her

---

59 Department of Health, RM/ARC/0/489693.
60 The People, 5 April 1968.
care - so comments about a ‘selection’ for adoptive parents are not credible - these decisions rested with Miss Harris. However the remarks about ‘English standards’ are consistent with Garret’s evidence taken from London county council records.

7.49 The blurred lines between Westminster city council and the Crusade of Rescue are highlighted by the fact that the short-term foster homes in Dublin were visited by Miss Cutting, Deputy Children’s Officer for Westminster city council, though it would appear that the children had been repatriated by the Crusade of Rescue.61 Miss Clandillon explained that ‘for many of these children non-Catholic adoptions were in view. To try to prevent such arrangements being made Miss Harris approached relatives living in Ireland with a view to finding homes for the children with them’. Not all of these arrangements went smoothly. One child was returned to live with his uncle in Limerick - but when the child arrived the uncle ‘made some difficulties’; he was disappointed that he would not receive financial assistance, so the child ended up in the City Home.62 Miss Harris obviously worked closely with the Irish health authorities. There is a record of her approaching the health authority about a 16-year-old boy who was being fostered by his aunt; the local senior assistance officer described him as ‘unmanageable’.63

7.50 The repatriation of children in care by English local authorities was not confined to London county council. In 1960 the children’s officer in Middlesex contacted the department about a two-year-old boy, whose mother had placed him privately with a foster mother. He was taken into care when his mother failed to keep up payments. The Middlesex children’s officer asked that his maternal grandmother in Wexford should be visited to explore the possibility that she might take the child. The department contacted the Wexford children’s officer. Miss Clandillon suggested that if the maternal grandmother was unwilling to take him, the local authority might consider placing him in foster care in Wexford, ‘where we would be sure that he could have a Catholic home’; although the English social worker had mentioned the possibility of placing him with Catholic foster parents she was of the opinion that this would be difficult to achieve.64 When the child’s grandmother was contacted it emerged that ‘this woman was not even aware of the child’s existence’; the child’s mother had broken all contact with her mother, and with two sisters who were married in England. Perhaps it is no surprise that the

61 Department of Health, RM/ARC/0/489693.
62 National Archives of Ireland, HLTH/MA124/38.
63 Department of Health, RM/ARC/0/489311.
64 Department of Health, RM/ARC/0/489433.
grandmother ‘absolutely refuses to have anything to do with the child [...]’ and states that she is not interested in where he goes or who takes charge of him’. The Wexford children’s officer paid a second visit to the grandmother, but she resolutely refused to have anything to do with her grandson. The Wexford health authority agreed that he might be placed in Wexford with foster parents.65 A Meath woman was sent back to Ireland with a day-old baby; shortly afterwards an application came before the courts to have her child admitted to an industrial school (presumably initiated by the mother). The children’s officer in Buckinghamshire forwarded several queries concerning maintenance payments that were not being met. One related to a mixed race child placed in private foster care by an Irish mother; in a second case both the mother and the putative father (who denied paternity) had committed to making payments. The Irish address that Buckinghamshire had for the mother was incorrect – possibly deliberately so. One foster mother, caring for a child who was described as ‘very disturbed’, had returned to Ireland to care for a sick relative, bringing the foster child with her; the Department of Health was asked to report on his well-being.

7.51 In 1960 Miss Clandillon was asked to trace relatives of an Irish woman who was the mother of three ‘illegitimate’ children. Her eldest child, a daughter, was raised by her parents; the other two were raised in Britain (details not given). The two younger children, who were in regular contact, were in their teens and they were seeking information about their family. Miss Clandillon contacted the children’s officer in Galway but noted that ‘If the grandparents are still alive they would probably be in their seventies and the shock of finding out that their daughter had two other illegitimate children might be serious’. She suggested that the eldest girl who had been raised by her grandparents might be contacted with the hope that she might write to her half-sisters. ‘We have had similar cases from time to time. The urge to find some family ties is very strong in the unfortunate children who have been reared in institutions’. It transpired that the grandmother was ill but she was being cared for by her daughter, the mother of the three children. This woman had married and given birth to a fourth daughter from this marriage. Miss Clandillon arranged for the daughters in England to write to their mother, describing her as a ‘slim attractive woman with brown eyes and greying hair, and with a quite pleasant manner’.66
7.52 In the 1950s and the 1960s St Anne’s adoption society repatriated the British-born infants of Irish mothers, placing them with adoptive parents in Ireland. In 1957 under the headline ‘For Export Only’ Babies - the *Sunday Pictorial* wrote that the London county council children’s department was sending babies to Ireland for adoption because ‘No Catholic adopters can be found for these British babies over here’. This article stipulated that ‘an abandoned or unwanted child MUST be placed in a home where the religious beliefs are the same as those declared by the child’s mother’, so if children were being adopted into non-Catholic homes it would appear that this was done at the wish of the mother. The *Sunday Pictorial* asked whether ‘it was right that their religion should deny the right to a home with willing adopters of any faith’.

7.53 St Anne’s Adoption Society was founded on 7 October 1954 by the Cork diocese ‘as a distinct but subsidiary body to St Patrick’s Orphanage Committee’. St Patrick’s orphanage committee had been running children’s homes in the Cork area for approximately 150 years. By the early 1950s the demand for places in orphanages was falling. An undated file, titled ‘The history and development of St Anne’s Adoption Society’, described ‘adoption as the way of continuing the work that charity had been doing for 150 years’. Having learned that a considerable number of children of Irish unmarried mothers were being lost to the faith in England, the orphanage committee decided to rescue these children, and to explore the possibility of placing them for adoption. This brief history noted that the English Catholic hierarchy was putting considerable pressure on the Irish hierarchy ‘for help in regard to huge number of Irish girls giving birth to babies in England’. There were insufficient Catholic families in England seeking to adopt a baby, prompting fears that mothers would place their children for adoption with Protestant societies, or local authorities that would permit their adoption into non-Catholic families.

7.54 Bishop Lucey of Cork sent the secretary of St Patrick’s orphanage to England to explore the feasibility of bringing the English-born babies of Irish unmarried mothers back to Ireland for adoption. In October 1954, working with the Crusade of Rescue, he arranged for five Irish mothers to bring their babies to Cork for adoption through St Anne’s adoption society; St Anne’s was recognised by the

---

67 *Sunday Pictorial*, 14 April 1957. Section 1 (3) b of the British 1948 Children Act stated that children who could not be cared for by their parent should be placed in the care ‘where possible [of] a person of the same religious persuasion as the child or who gives an undertaking that the child will be brought up in that religious persuasion’.
Adoption Board in November 1954. In 1955 Fr James Good became director of St Anne’s adoption society and he held this position until 1967 though the files suggest that he continued to be involved with the society beyond 1967. St Anne’s expanded, to the point that it was repatriating around 100 babies every year. Infants were generally brought back from England by their mothers, and they were placed in a nursery run by the Sisters of Mercy, St Marie of the Isles, while adoptive parents were identified. There was a maximum of ten children in this nursery at any time. In 1959 Fr Good noted that approximately 40% at any time were unsuitable for immediate adoption - either because they were too young, or they had medical problems. St Anne’s did not publicise the fact that the children that they were placing for adoption had been born in England. In 1961 Fr Good explained to another priest that

> While we welcome publicity with a view to enlisting an increase in applications for adoption, we do not seek too much of the limelight, as some of the aspects of our work would better remain unknown. We do not divulge that the babies are born to Irish unmarried mothers in England - mainly as it may sow doubts of paternity in prospective adopters. We do explain in confidence to priests every aspect of our work, but we would hope that the information would not be made public.

Canon Harvey of the Crusade of Rescue explained that they gave priority to babies whose faith was believed to be ‘in immediate danger’. If a mother could not be persuaded to bring an infant to Cork, they would arrange for somebody to accompany the child. He noted that one woman was willing to bring her baby to Cork, but she was fearful that she might be recognised on the journey. Mothers were instructed to keep in regular contact with the Crusade of Rescue until the child was finally adopted. An undated note written by Mrs Wrenne, of St Anne’s adoption society, suggested that it would be extremely helpful if the mother brought baby clothes, ‘tied up in a separate bag or parcel’, not mixed with her own clothes. They should also be asked to supply a dozen cloth nappies for the baby, to reduce the cost to the society; ‘it would seem to me that many of the girls coming over would not suffer any hardship if they were held responsible for providing at least the necessities for their babies’.

However, Fr Good subsequently told Canon

Harvey that they did not wish mothers to buy ‘any clothes whatever when bringing their babies to Cork’, though they would be happy to receive any clothes that the mother might have. Mrs Wrenne arranged to meet the mothers when they arrived in Ireland though the arrangements did not always work smoothly. On one occasion Fr Good informed Canon Harvey that it was a ‘complete chance’ that two mothers were met in Cork - they had travelled on a later train. These mothers claimed that they had been told that they would be met off the boat at Rosslare by a lady - but they had to travel alone to Cork.

7.56 An undated memorandum headed ‘Irish unmarried mothers, child born in England’ noted that these children were British subjects and could not claim Irish nationality under the Irish Nationality and Citizenship Act 1935 ‘on the grounds that his father was Irish, because he is filius nullius. He can however acquire Irish nationality aliunde’ - by another means. The Irish Nationality and Citizenship Act 1935, unusually at this time, enabled a child to claim Irish citizenship from their mother. A mother could consent to have an English-born child returned to Ireland and there was nothing in the Adoption Act 1952 to prevent the child’s adoption in Ireland.

In 1956 Fr Good wrote to a number of dioceses in England, Scotland and Wales, outlining the work of St Anne’s adoption society and some key requirements, if they were to accept a child:

- Baby must be born of an Irish mother and an Irish or English father. It must be illegitimate and this must be clearly proved. We cannot, therefore, take 1) the child of a married couple, 2) the child of a married woman even though she is not married to the father, 3) any child in whose case there is a likelihood of marriage between the father and mother.
- Baby must be healthy; a recent medical certificate was necessary.
- The society is principally interested in those children whose Catholic faith is in danger. We are, however, prepared to accept any children recommended to us by an English Rescue Society.
- Travel arrangements. We usually prefer to have the mother bring her baby personally to Cork. The English Society takes care of the arrangements as far as the arrival in Cork. After that our society takes responsibility. The baby is put into our nursery where it will remain for perhaps up to three

months pending acceptance for adoption. The mother is kept in a hostel at our expense for a day and is then free to go to her home in Ireland or to return to England.

- Before final acceptance of a baby by this society we like to have on hand its birth and baptismal certificates, adoption forms A and E and the actual certificate of the mother’s blood test.

- When the child is accepted for adoption we expect the English Society to obtain the mother’s signature to the consent if she is still within its area.

- Our usual acceptance of babies is from four months to 2.5 years. We have, however, made some exceptions. Happy to clarify points as needed.

- It makes no difference to us whether the mothers are pregnant from Ireland or have become so in England.76

7.57 Fr Good claimed that St Anne’s had successfully placed older children, who were in English council nurseries, with Irish families.77 By 1961 he reported that St Anne’s was ‘giving serious help to half a dozen English societies’.78 St Anne’s came under pressure from English rescue societies to accept some very young children, who were deemed unsuitable for immediate adoption.79 But by 1966 there were only three children in the society’s nursery, and the flow of babies from England was drying up - primarily because St Anne’s was unwilling to take children at a very early age. Canon Harvey explained that

We find also that the biggest obstacle to persuading Irish girls to use the Cork scheme is that they are not free from their responsibility for the child physically, even if we can find them foster parents when the child is perhaps a month old. They react sharply against the need to return from their work where they are not properly re-established, in order to take the child to Cork. They also react sharply at having to see the child again physically and handle it. This latter aspect of the Cork scheme has attracted criticism from workers dealing with unmarried mothers who are non-Catholic, but with whom we try to retain good relationships so that Catholic girls are referred to us.80

7.58 By the mid-1960s mothers returning to Cork with their babies apparently expected that St Anne’s would have already identified adoptive parents, and they disliked

the fact that the baby would spend some time in a nursery.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 3, 9 July 1966, 12 July 1966.} English law provided that a woman could sign forms consenting to adoption when the infant was six weeks old, and the child had been placed with adoptive parents. In Ireland a mother had to wait until the child was three months old.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 9, folder marked ‘Dept. of Justice’.} On this, and several other occasions in the records of St Anne’s adoption society, Fr Good complained about the difficulties in persuading a mother to wait until her child was three months old before bringing her/him to Cork.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 3, 1957.} A further complication was the difficulty in finding the mother to sign the final adoption consent form because she might have returned to England and/or changed her address. It would appear that some women placed their infants with St Anne’s until they had determined whether to bring up their child, or make some other arrangements; St Anne’s was adamant that only women who had decided on adoption should be sent to Cork. Fr Good believed that some women were of the view that they had three to six months to decide whether to place their child for adoption.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 17.} From the mid-1950s there are frequent references in the St Anne’s records to ‘unadoptable’ children - children with special needs, both physical and intellectual. In 1954, before the society was established, Monsignor Barrett offered some advice:

\begin{quote}
Word of caution: if you accept children into your home who might for one reason or another later prove unsuitable for adoption you might very shortly find yourself with a full house which would put a closure on your admissions that would be a tremendous drawback and it would be so difficult to guard against.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 12, 28 Sept, 1954.}
\end{quote}

In 1957 Canon Harvey complained ‘that your medical man or adopters obviously expect the perfect child. That condition does not prevail here’.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 3, 1957 folder.} St Anne’s feared becoming ‘a dumping ground for unadoptable children’ sent by English charities and they threatened to return such children to England.\footnote{Cork Diocesan Archives, St Anne’s Adoption Society, Box 17.} They made efforts to prevent such children being sent to Ireland but noted that they had no control over the medical examination that was performed before the infants travelled to Ireland and ‘many deficiencies have been brought to light by [Dr X] in his examination of the children in the nursery’. The English societies were slow to agree to the children being returned because they claimed that their nurseries were
overcrowded 'and that in any case these are Irish children, and that therefore the responsibility should rest on the Irish authorities'. The county managers of the counties where the birth mothers had once lived were also reluctant to assume financial responsibility, though 'In recent years, all the county managers have been accepting responsibility for children, natives of their county, abandoned in the care of London County Council'. This arrangement appears to have happened following an agreement between London county council and the Department of Health. Arrangements were made for the Cork health authority and matron of Midleton hospital to care for the 'unadoptable' children in St Anne’s nursery.88

7.60 In the late 1960s it was decided that, because of the 'evolving culture' in England, probably a reference to the English Abortion Act 1967, St Anne’s should also repatriate pregnant women. Initially this was done in conjunction with Bessborough. St Anne’s developed a family placement service, similar to Ally (see Chapter 12). In the 1970s St Anne’s ceased accepting babies from England - presumably because the numbers had fallen sharply, and the society became a regular adoption society placing children who were born in Ireland for adoption by Irish families.89

7.61 In 1970 Canon Harvey wrote a long letter to Fr O'Mahony, (who had succeeded Fr Good as director of St Anne’s) where he reflected on the fall in the number of mothers and babies being referred to St Anne’s adoption society. He suggested that this reflected changing attitudes on the part of Irish pregnant women travelling to Britain. ‘Girls have become more sophisticated…Fairer to say that they are much more knowledgeable about changes in the practice of adoption societies on both sides of the Irish Sea’. He noted that ‘women’s periodicals have done a lot to inform all women about adoption’. Mothers were now very anxious ‘about the suitability of potential adopters'; some were willing to remain in England and raise their child…From the time when the Irish girl was often content to remain in a mother and baby home here for six months pending vacancies in Ireland we have now progressed to a situation where in a dire emergency we can, in fact, put the girl on the same day’s plane and telephone Dublin to say she is on her way’. ‘The main resource we offer to Irish girls ante-natally is repatriation to conditions which satisfy social workers in England as being non-penal’. He noted that emigration in

CHAPTER 7 PREGNANT FROM IRELAND

general was falling, some women were ‘availing of abortions’. Many adoption
societies had long waiting lists of prospective parents but no children for adoption.
Their major challenge was placing mixed-race children.  

7.62 In 1967 a British social worker published an article about Irish unmarried mothers
in a British social work journal, which was designed to inform British social workers
about provisions in Ireland and the needs and attitudes of PFIIs. The article
claimed that an Irish ‘girl’ ‘is usually convinced that everything can be arranged for
her over here with the utmost speed and secrecy, and that all she has to do is to
have her confinement in hospital and then “they” will arrange the adoption of her
baby. She then plans to return to Ireland after her “holiday” or to remain over here
to work’. The author MJ Farrah and a colleague spent some time in Ireland in
1966 to learn about the services available for unmarried mothers. She claimed
that many of the women travelling to Britain were not aware of services in Ireland;
the main motivation behind them travelling was ‘fear of social ostracism’ if their
pregnancy became known. In the same year the Irish hierarchy wrote a pastoral
letter on Emigrant Problems. It made reference to unmarried expectant women
who travelled to Britain, where they were ‘exposed to exceptional dangers.
Anything we can do to keep them at home and help them must be done with great
sympathy and fatherly understanding, but it is imperative that we should spare no
effort to provide for them here in Ireland’. 

7.63 While PFI cases were the subject of extensive consultation between church
organisations in Britain and Ireland, and the issue was well-known to Irish public
servants, the topic did not receive much public attention until the 1960s, with the
notable exception of the Gaffney article quoted earlier. A 1968 article by Michael
Keating in Woman’s Way claimed that almost every boat carrying passengers to
England would have a young pregnant woman on board. He suggested that ‘as
many as 500’ Irish single mothers travelled to England every year, ‘fugitives from a
society they believe to be cold and without understanding and they are fleeing from
Ireland’s most dangerous weapons - the whispered insinuation and the glance
through curtained windows’. He quoted Fr Feargal O’Connor, UCD lecturer and
Dominican priest, who founded Ally, an organisation that placed pregnant

emigrant problems (1967).
unmarried women in private homes, who claimed that ‘we still force these girls into isolation, into loneliness…Social attitudes in this country are very much anti and to this extent unchristian. When it comes down to personal involvement with the problem, then in fact, it is taboo’. Keating noted that Ireland was the only country to have the distinction of a tag, such as PFI. He also quoted criticism by Sean D Loftus, a lecturer in Bolton Street College of Technology, that London county council was caring for people such as ‘the 14 year old Irish unmarried mother of twins’.

One aspect of the problem is very clear - many Irish girls go to Britain unprepared. Piccadilly is a cold cross-roads for the Irish unmarried mother. Most of the girls do not qualify for a maternity grant or a hospital bed. They arrive in London, not realising that 26 insurance stamps (that is 26 week’s work in England) are needed to earn these benefits. Ignorance of the realities of Britain’s social services complicates the problem for the girls; the candy floss gives way to cold facts. Some of the girls go to England when they are about two months pregnant and take up a job. This enables them to accumulate the necessary stamps for hospital and maternity benefits. They work as waitresses, factory hands or domestic help - jobs which are soul-destroying for many of them. Others take work in hospitals where the routine medical check-up will uncover their secret…The problems of the Irish unmarried mother in Britain are great and are complicated by emotional undercurrents. One Catholic social worker in London says, ‘The fear in these girls has to be seen to be believed. What sort of society do you have in Ireland that puts the girls into this state?’

This fear increases to the stage at which a girl will invent stories of how she became pregnant. She will lie about her religion, say that her parents are dead and tell other falsehoods. London can be a lonely, soulless city for immigrants. Many living in squalid bedsitters look to their own kind for affection.

A welfare officer says, ‘The average Irish girl is used to the warmth and affection of a big and close-knit family. Can you wonder that when she gets here she seizes what affection she can - at whatever cost?’

The Irish unmarried mother is often pregnant within two months of arriving in Britain. Ironically, that great day for the Irish, St Patrick’s Day, shows a sudden peak in the year’s illegitimacy graph in Britain; three applications in
two days to Southwark Catholic Rescue Society dated back to the festivities of 17 March.93

7.64 Keating cited statistics compiled by the Redemptorist Record, which suggested that Irish women accounted for 8% of pregnant single women, whereas the Irish-born only constituted 5.4% of the population.94 “The facts are”, says Father Lionel Munns of the Southwark Catholic Rescue Society, “that at this office we never find a girl initially willing to return to Ireland before the birth of her child. Only a great deal of hard work on the part of our staff and the fact that we can reassure them that they will obtain help and sympathy, enable us to persuade them to do so”. However Keating noted, that ‘There is rarely some smoke without fire. A social worker I spoke to in London very recently was disturbed that two girls whom her society had repatriated, returned again to England with alarming stories of conditions in the mother and baby home to which they were sent to Ireland’.

Conclusions

7.65 Fleeing to England was the common response of many Irish people to personal difficulties - it happened in cases of marriage breakdown, family disputes, and lack of job opportunities. England was a common destination for ex-prisoners, young men and women who were discharged from industrial schools and mother and baby homes. It appeared to offer readily-available employment, and anonymity - escape from neighbours, family or a troubled past. Given that emigration to England was a common experience, it is not surprising that many pregnant Irish women followed that path. However all commentators suggest that many of the pregnant Irish women in England became pregnant in that country though many of their children were fathered by Irishmen. While it is suggested that young Irish women living in British cities had an above-average rate of ‘illegitimate’ pregnancy this assertion has not been tested.

7.66 The experience of Irish women who sought assistance from English charitable organisations and public services was probably mixed. While English society was less censorious about pre-marital pregnancy than Ireland, much of the greater tolerance was found in the families rather than the wider society. Mass emigration from Ireland placed a considerable burden on English Catholic charities, and they

94 Irish women could have constituted a higher percentage of young adults, so these statistics do not prove that Irish women were more likely to become pregnant outside of marriage.
were determined that as far as practicable the responsibility for unmarried mothers and their child(ren) should be transferred to Ireland. British local authorities shared that determination, and the collaboration between London county council and the Crusade of Rescue in sending Miss Harris to Ireland to place English-born children with family members is evidence of this.

7.67 The number of pregnant single women travelling to England to give birth fell sharply in the 1970s. In 1976 one Irish woman in London, who styled herself as Mrs, but was obviously pregnant by a man not her husband, contacted the Department of Social Welfare seeking an E112 form – the form that entitled a person to emergency medical treatment in another EEC (now EU) country. She was seven and a half months pregnant but could not access ante-natal care because she was not entitled to it under the NHS and, although she was booked into the Middlesex Hospital for the birth, she would have to pay, which she was incapable of doing. She had been working in a factory in provincial Ireland, and had travelled to England while pregnant. The department explained that the E112 would not cover maternity care. They suggested that she contact the Crusade of Rescue in London, who would assist her to return to Ireland, where the CPRSI would make ‘all the arrangements necessary for you…and at no cost to yourself’. This woman was unusual in 1976. By the 1970s most pregnant Irish women travelling to Britain were seeking abortions. The number of abortions carried out on women giving an Irish address rose from 578 in 1971 to 2,185 by 1977 - and these figures were undoubtedly an under-estimate, as many women used British addresses. In 1980 Dr Andrew Rynne estimated, that allowing for this under-reporting, the number of abortions equalled the number of recorded ‘illegitimate’ births in Ireland.

Chapter 8: Profile of unmarried mothers in the mid twentieth century

Introduction

8.1 One of the serious shortcomings of the material that is available to the Commission is the absence of the mothers' voices from the time they were pregnant and making decisions about their children and the shortage of contemporary information about their lives, the circumstances of their pregnancy, and the attitudes of family and putative fathers. This absence is especially noteworthy for earlier decades because the mothers who came to the Commission inevitably were pregnant in later years. Some stories emerge occasionally from the registers of the institutions under investigation, but these are not common. This chapter attempts to provide some impressionistic evidence about the mothers. What happened when they discovered that they were pregnant? What action did they take? Where did they go to seek help? How did their family and the father of their child respond on being told that they were pregnant? What choices, if any did they have? This chapter summarises the stories of many women - the large number given is an attempt to capture the similarities and diversity of the experiences of pregnant single women, and their families in the Ireland of the 1940s and 1950s.

8.2 The core information comes from the files and case-notes kept by inspectors in the Department of Local Government and Public Health/Department of Health over roughly a twenty-year period from 1940-1961.¹ There are over 2,000 card index notes relating to women who were pregnant or had recently given birth. In some cases the women contacted the department; in other cases the department inspectors were contacted by a charity, such as the Catholic Protection and Rescue Society of Ireland, or by a maternity hospital, or a family member. Some relate to women who were repatriated from England (see chapter 7); the remainder were women who had not left Ireland. The overwhelming majority were not natives of Dublin, though some women lived and worked in Dublin. This information is supplemented with occasional pieces of information from other contemporary sources.

¹ Department of Health, RM/ARC/O/489984; RM/ARC/O/489986; RM/ARC/0 489989 These records contain the names and sometimes the addresses of the women.
8.3 There are some limitations with these records. The information on these cards was written by the department inspectors. They generally give us the woman’s story from becoming pregnant to her admittance into a mother and baby home or some other ‘solution’ to her pregnancy. They rarely tell us anything about her experience in a mother and baby home, or a maternity hospital. The inquiries that were conducted into a woman’s history could be extremely intrusive. One woman, who went to England pregnant and returned of her own accord, informed the CPRSI that she had a miscarriage some years previously in Glasgow. When she arrived at the department she carried a letter stating that she needed a VD inspection; the CPRSI would bring her to Dr Steevens’ Hospital and ‘will try to have her kept as widow patient’; meanwhile she was staying in Cork Street Hostel. Social workers attached to English charities appear to have frequently contacted a woman’s parish priest - one file noted that they were doing so to ‘find out the family background’. Some details came from meetings between a department official and the woman, but the source was often a Catholic welfare organisation or an almoner in a Dublin hospital, and therefore the information might come with certain inbuilt prejudices and attitudes. Despite these shortcomings, this is an extremely valuable source, given the dearth of contemporary evidence. The case histories are of women from modest family backgrounds - women engaged in lower-grade service employment, the daughters of labourers, farmers and tradesmen; women who lacked financial means or social/family support. Women from professional and prosperous business families also experienced crisis pregnancies but few appear to have sought assistance from the department inspectors, though many would have visited the offices of St Patrick’s Guild or the CPRSI. Their stories are missing here; likewise the stories of Dublin-born women.

8.4 When Bessborough (see Chapter 18) opened in 1922, the women and children who were admitted came via the county home; they had to enter the county home before being sent to Bessborough. Women admitted to Pelletstown in the early years had to first go to the Dublin Union (see Chapter 13). By the late 1920s the local authority had granted permission to dispensary doctors to send a woman to Bessborough, without first requiring her to enter the county home, and in time women were also admitted if they had a letter from a local authority member or senior officer or occasionally from a priest.

8.5 These entry methods required a woman, or a close relative, to approach either the local authority, the dispensary doctor, or a local priest, and to inform them of her
pregnancy, which often meant that her circumstances would become known locally; and some family members would be aware of her pregnancy. The position may have been somewhat different in Dublin. Given the size of the city, in theory at least, it should have been possible for a pregnant single woman who lived in Dublin, to make arrangements, with less prospect of her pregnancy becoming widely known to neighbours, family and friends. It is also possible that Dublin working-class families may have been more willing to support a pregnant daughter, so that she was not forced to leave home. The three Dublin maternity hospitals admitted single women, and had done so for generations. There is evidence that the city hospital in Galway and the county hospital in Kilkenny - to take two examples - did not welcome single mothers, and they were probably not atypical - many women had to give birth in the county home. Some single women admitted to Dublin maternity hospitals claimed that they were married, sometimes giving the name of a married sister - an indication of the stigma associated with an unmarried pregnancy.

8.6 During the 1930s, (as explained in Chapter 7), an inspector in the DLGPH became involved in making arrangements for women who were repatriated from England, either pregnant or with a young infant. It appears that women in similar circumstances who had not travelled to England began contacting the Custom House (the headquarters of the DLGPH); alternatively welfare workers in Dublin hospitals or Dublin-based charities contacted the department on their behalf in an effort to secure their admission to a mother and baby home. These files begin in the early 1940s, so there are no means of knowing whether Irish-based women were contacting the department in earlier years. The fact that these women, or somebody working on their behalf, contacted the department reflects the difficulties that Irish unmarried mothers faced in finding an institution that would admit them without demanding payment. Some women made contact because they had nowhere to go; some because they were unable to circumvent the system, which required the authorisation of a local authority for their admission to a mother and baby home. Miss Litster, a department inspector, handled many sensitive cases, such as a woman with a positive Wassermann test - who had to be admitted to the Lock Hospital; cases where a mother was suffering from TB, and a bed had to be secured in a sanatorium, but she would only be admitted when arrangements (unspecified) were first made for her child.
CHAPTER 8 PROFILE OF UNMARRIED MOTHERS IN THE MID TWENTIETH CENTURY

Flight
8.7 Miss Litster’s account, written in 1945, sets the context for these stories. Numbers of expectant mothers drift to Dublin every week, hoping to find a home willing to receive them and to keep the baby later. The main object of most of them is to get back home or to work as quickly as possible so that a prolonged absence will not be remarked upon and suspicion aroused. They are recommended in Dublin to different societies. An expectant mother coming to Dublin…may go from one Society to another and find that none can aid her because they have no institution or home in which to house her before confinement and that nothing can be done to secure the baby’s future unless she can find a large sum of money. If the Societies get in touch with me, I try to persuade the girls to seek admission to one of the Special Homes and am frequently successful. Many however will not. These girls often disappear and it is fairly certain that they have sought shelter from the Irish Church Missions.2

8.8 Women often turned up at the offices of the DLGPH in the Custom House, penniless and homeless. Many were given short-term accommodation in Regina Coeli (see Chapter 21), while arrangements were made to secure their admission to a mother and baby home. When Regina Coeli was full they were sent to the night shelter in Cork Street; if the night shelter had no vacancies, they went to other hostels. The CPRSI arranged short-term accommodation for repatriated women in a nursing home on the North Circular Road run by a Mrs Farrell and that home continues to feature in many case records during the 1950s. In 1947 Miss Litster explained that ‘placing applicants for admission to maternity homes is now practically whole-time employment’. She asked the department to examine whether it would be practicable to establish a bureau - away from the Custom House - under either the department or the public assistance authority, working in close conjunction with the various social service societies, ‘to cope with the ever-increasing numbers of applicants for admission to maternity homes’.3

8.9 Many of the women who turned up at the Custom House were referred by almoners in Dublin maternity hospitals or by charitable organisations including the Legion of Mary. Women were also referred by welfare officers in the British armed

2 Department of Health, RM/ARC/0/489778.
3 Department of Health, INACT/INA/0/474129.
forces or welfare officers attached to British factories. One woman was referred to St Patrick’s Guild by an Oblate father in whom she confided when he was giving a mission in her home town; she contacted the Custom House and was later admitted to Castlepollard. One pregnant woman in 1947 was referred by a female member of staff in the Bank of Ireland - the woman worked in the staff restaurant; another was sent by a welfare officer in CIÉ - the national transport provider. The files contain several referrals by the Church of Ireland Moral Welfare Association in Belfast and the Legion of Mary hostel in that city. From 1942, all men and women from independent Ireland had to apply for a permit to take up employment in Northern Ireland. Women who might have been living there for several years lost their residency rights if, as commonly happened, they were dismissed from their job because they were pregnant. There are several instances of women turning up unannounced at Sean Ross or another of the special homes, having been dispatched there by an English Catholic charity, without any provision being made for their maintenance. Miss Litster then had to contact the relevant public assistance authority and persuade them to assume financial responsibility. In 1951 one woman from Offaly, who was pregnant for the second time (by the same man) was reported to have come to Dublin, where she ‘went to women on stalls at [Nelson’s] Pillar for advice. One took her home and gave her her bed’. The woman was then admitted to the Coombe Hospital. A 16-and-a-half-year-old pregnant woman travelled to Dublin and went to Archbishop’s House seeking assistance. She was referred to Pelletstown, who in turn sent her to the Dublin Union. Her parents were separated; when the department arranged for her to go to Sean Ross, her mother declined ‘on grounds that girls had to work there’; she was admitted to Castlepollard. A 16-year-old school girl travelled to Holles Street alone by bus (a journey of more than 50 miles) to give birth. Her baby weighed 6lbs; the file noted ‘Girl said to have been normal in appearance, neighbours do not suspect’. Her mother placed the baby with a foster family, and she apparently returned to school.

8.10 The department in later years provided travel vouchers covering the cost of fares to special homes, but on many occasions Miss Litster, or another department inspector, had to give mothers the cost of their bus fare and some money for food; they often found it difficult to secure reimbursement.

8.11 Personal impressions, and representations by priests, nuns or doctors, appear to have played a key role in the decisions made by charities such as St Patrick’s
Guild or the Rotunda Girls’ Aid Society, on whether to accept an infant for placement. A pregnant shop assistant (putative father a commercial traveller) was described as ‘lovely girl, nicely mannered’; St Patrick’s Guild agreed to accept her baby ‘after a month or two’, meanwhile the woman who was in Cork Street Hostel would be admitted to Sean Ross. By contrast another was described as an ‘ordinary working-class girl’. In 1947 Fr Murray of the Rotunda Girls’ Aid Society explained to the department that

I try to help a decent class of girl, a ‘first offender’, whose fall was due mainly to ignorance or weakness. By a decent class of girl I mean one of a good family whom it will be possible to rehabilitate in her former position in life. All my foster-mothers are selected with a view to final adoption and I always give them my assurance that the mother was a ‘first offender’ of respectable parents and that her child is perfectly healthy…I have found by experience that my foster-mothers are most particular about the health of the baby and the respectability of the mother, they always require at least a brief outline of the mother’s history.4

8.12 There are instances where a priest referred a woman to the CPRSI, who then sent her to the department; it would appear that the CPRSI determined whether to assist a woman based on her family circumstances - sometimes on the basis of respectability rather than money. St Patrick’s Guild accepted only women who could pay for their child to be placed at nurse. In both instances the intervention of a local priest or doctor could prove vital in persuading these societies to support a mother or child. The notes on a young woman who went to Manchester recorded that she ‘made favourable impression of [sic] welfare society in Manchester’. The file of one young Mayo woman states that her local parish priest was ‘interested in case, some hope of marriage’. Her parents were described as ‘decent people, big family’.

8.13 Random letters in Bishop of Galway Michael Browne’s archives record a pregnant woman who was ‘recommended by a local doctor, family of girl paying for child’ (June 1939). In another case, ‘the Jesuits in Galway…seem to have taken a great interest in the case from the beginning’ - this woman’s child was placed with St Patrick’s Guild and arrangements were made for adoption by a bank manager and his wife. But a Galway woman, who wrote to Miss Cruice (St Patrick’s Guild)

4 Department of Health, CCL/INA/0/478958.
seeking assistance for her sister, was referred to her parish priest and advised that her sister should go to Tuam. A woman wrote to Miss Cruice asking her to accept ‘a young girl of 18 years who is expecting to become a mother in October. Her parents are very poor and it is a friend that is helping her. I know the terms are £1 a week. Would you be kind enough to reduce it to half if possible? I will take her up next week if you would kindly let me know as soon as possible’. She received a blunt rejection, as did a local priest who contacted Miss Cruice about the same case. This young woman explicitly stated that she did not wish to go to Tuam. It is also evident that Miss Cruice kept parish priests informed about any pregnancies among unmarried women in their parish - and any details that she had as to a putative father.5

8.14 The women who were rejected by St Patrick’s Guild were initially referred to the Dublin Union, but as Dublin increasingly refused to take in women from other parts of Ireland, they were sent to the Custom House. Some made their way independently to Regina Coeli and the hostel contacted Miss Litster, who interviewed the mothers and might make arrangements for their admission to a mother and baby home. There were also referrals by Church of Ireland clergy; the department referred these women to Bethany. In 1947 Regina Coeli referred a woman on her third pregnancy. She was not a Catholic and had been refused admission by Bethany and the Irish Church Missions (ICM), but following Miss Litster’s intervention, the ICM agreed to accept her. Miss Litster also received requests for assistance from pregnant women who were natives of Northern Ireland, but she had to point out that they could not be maintained by a public assistance authority.

8.15 Several files note that a woman is ‘anxious to get away [to a special home] as soon as possible’ - presumably to avoid her pregnancy becoming known. One woman, who arrived at the Custom House from a provincial town, three months pregnant, was advised to get a job in Dublin and contact the Custom House at a later stage in her pregnancy. A woman from Northern Ireland, who had been working in the Dublin area for a short time was described as ‘getting very restless in St Kevin’s…appears anxious to get rid of baby and go back to work’. Some women attempted to remain at work as late as possible in their pregnancy in order to have some money; the pressures of concealing a pregnancy at work added to the strain.

5 Galway Diocesan Archive, Bishop Michael Browne Papers, B/12/139.
One young woman working as a domestic in a Dublin nursing home, who came to the department offices roughly six months before the baby was due, was reported to be in ‘anxious mental state’. The staff of the nursing home were not aware of her pregnancy; she was described as very unwell and taking medication to control vomiting. One 17-year old became pregnant by a fellow-worker, a porter in the institution where she worked. He had been warned that she was under age and he would lose his job ‘if he brought her into his flat’. She was described as ‘slim and pretty; very haggard, admits to tight lacing…anxious to work as long as possible’. She had moved to a domestic servant job in a private house. Several women were anxious that their employer should not know of the pregnancy - perhaps because they hoped to return to work there, or would need a reference to secure future employment elsewhere.

8.16 The story of flight and admission to several institutions gives some insight into the difficulties that a single woman faced when pregnant. One young woman, who had gone to England when pregnant, gave birth in the school where she was working as a domestic servant. A woman who suffered from epilepsy, who had travelled to England when pregnant ‘would not be accepted in an English hospital’; she was admitted to Sean Ross. One 19-year old who went to England pregnant was described as ‘destitute’. Several pregnancies were detected when women underwent a medical examination preparatory to taking a job in England, or during the medical inspection that Irish emigrants had to undergo during the war years in order to secure a travel pass. It is not clear whether these women were aware that they were pregnant before they underwent the medical, but the diagnosis inevitably meant no job, or dismissal from a job - and no alternative other than returning to Ireland.

8.17 One woman, who had spent much of her childhood in an industrial school, was dismissed from a domestic position in a Mercy convent in Cork when it became known that she was pregnant. Another domestic servant, 19 years old, working in a private home in Limerick also lost her job in similar circumstances. A Longford woman who worked as a domestic servant in a large country house in Northern Ireland had her residence permit withdrawn when her pregnancy became known; she came seeking assistance in Dublin. The putative father was a prisoner of war. Another young woman lost her job in St Michael’s Hospital Dun Laoghaire because of her pregnancy. She had been raised in an industrial school; her only relative was a married sister, who was unwilling to keep her, perhaps because her...
husband was unemployed. The matron of St Kevin’s Hospital gave a pregnant wardsmaid, who had worked there for nine years, a week’s notice of dismissal when she became aware that she was pregnant. The department tried to arrange a medical certificate from a doctor in the Coombe which would mean that she did not lose her nine years’ service (presumably pensionable). A 20-year-old waitress was dismissed by the manageress of a Dublin golf club when she was discovered to be pregnant; her mother would not help and her step father was described as ‘antagonistic’. A student nurse in an English hospital had to leave the hospital and her accommodation when her pregnancy became known. In the case of a barmaid who went to England when pregnant, the file noted that ‘Patient must return to Ireland immediately as she has no means of support and will not be kept in her lodgings any longer’. She was admitted to Castlepollard. A woman working in an isolation hospital in Essex had to leave her job (and living accommodation) two to three months before her baby was due; she was seeking information about homes in Ireland. The assistant matron contacted the CPRSI but claimed that this woman was finding it difficult to get a place in a mother and baby home; she announced that she might place her child in a Protestant home - which may have been a tactic to persuade the CPRSI, whose mission was to rescue Catholic children from proselytization, to assist her; a place was found in Castlepollard.

8.18 Some employers showed more compassion. The matron of the Rotunda was willing to re-employ a woman who had been working in the hospital and gave birth there - the Rotunda Girls’ Aid Society was arranging for the child’s ‘adoption’; this was prior to the introduction of legal adoption. There are many cases of pregnancies among women working as domestic servants in private homes. This is not surprising; domestic service was by far the largest employer of women, especially those without educational qualifications or skills. Some employers dismissed a servant on discovering the pregnancy, others kept the woman until the birth, and there were some who took mother and baby back following the birth. A family doctor whose servant left his employment when she became pregnant, without informing him of her pregnancy, intervened to find a place for her in a special home, and assumed responsibility for bringing her there. One pregnant domestic servant, who was referred to St Patrick’s Guild by her employer, returned to that house - in a very affluent part of the city - following her discharge from Holles Street; mother and baby were later admitted to Castlepollard. Another employer who was ‘going away…was anxious to have her [a pregnant servant] fixed up before she leaves’. A Mayo woman, who worked as a domestic servant in
a large house in the south Dublin suburbs, had to leave her employment when it emerged she was pregnant. She did not have an insurance card, and she claimed that her employer had stopped doctors’ fees out of her wages. The department was contacted about this case by a Dublin woman, who employed her sister as a servant. A later report indicated that this sister had intervened and ensured that the employer stamped the insurance card; she also pressed for the repayment of money stopped for medical expenses. One woman - described as a mental nurse - is reported as having been promised ‘her employment back’ after baby’s birth’, and the employer of a domestic servant in a provincial town arranged that her sister in Dublin would give the pregnant woman a temporary home until other arrangements were made.

8.19 Women who wished to keep their child found it almost impossible to find accommodation. One woman travelled from Tipperary to Dublin ‘of her own accord’ attending ante-natal clinics at the Coombe Hospital and giving birth there. She lived with her widowed mother in one rented room in Tipperary, and claimed that the landlord would not permit a baby in this flatlet. She was anxious to keep her baby - meanwhile she was admitted to Sean Ross.

8.20 It was not uncommon for women to spend time in two or three institutions. One pregnant woman from Cork, who was sent to Miss Litster by Regina Coeli, was willing to be admitted to Sean Ross, but when she was examined in the Rotunda the doctor deemed it too risky for her to travel, unless she did so immediately. As her public assistance authority had not yet approved her admission to a home, she had to remain in Dublin. She gave birth in the Rotunda, was discharged with her baby to Regina Coeli and went from there to St Kevin’s while Miss Litster tried to secure approval for mother and baby to go to Sean Ross. A woman who arrived at Regina Coeli was reported as having been refused treatment in the Rotunda Hospital because it was her second pregnancy, so she had to apply for a ticket of admission to St Kevin’s. One woman who went to England pregnant and returned of her own accord wandered around Dublin in an advanced stage of pregnancy. She contacted Gloucester Street convent who directed her to St Kevin’s; she gave birth the next day. Another woman who had been two years in Gloucester Street convent but was then taken home by her mother, returned to the convent allegedly of her own accord when she became pregnant - it was her first pregnancy. The

6 Now Sean McDermott Street; this was a Magdalen laundry.
convent sent her to St Kevin’s but the department arranged for her transfer to Sean Ross. A Wexford woman who went to London was sent back the same evening, and admitted to Regina Coeli in an advanced stage of pregnancy. She then left Regina Coeli and turned up at her local presbytery where the priest arranged for her to be admitted to Sean Ross. She called into CPRSI the following day and told them that she would not stay in Regina Coeli; the CPRSI suggested that the authorities in Regina Coeli ask her to sign a statement that she had left at her own risk, because they believed that the birth of her child was imminent. One young woman who was being sent to England by an employment agency was discovered to be pregnant, so did not travel. She was admitted to Castlepollard but was promptly sent to Dublin because she wanted to smoke - she was refused admission to her local county home - where she had previously been an ‘inmate’ (uncertain why) and was finally sent back to Castlepollard. A medical examination of a PFI, carried out in St Kevin’s hospital revealed that she had a previous pregnancy, so she could not be admitted to Castlepollard as planned.

8.21 The journey from Dublin to a mother and baby home in an unknown part of Ireland must have been a harrowing experience for a pregnant woman or a mother and infant. It would have been especially so in wartime conditions, when buses and trains often ran late. There are occasional reports of women being accompanied by a representative of the Dublin Union or the CPRSI - this generally applied to younger women (under 18) or women who were viewed as ‘simple’ and in need of assistance, or at risk of flight. Some women were transported in an ambulance - which would have brought a patient to Dublin for medical treatment but on many occasions they travelled alone, subject to the curious stares of fellow-travellers. Older residents of Castlepollard say the Dublin bus would stop at the gate of Manor House without comment. One young woman who was working in Belfast for over a year ‘without a residence permit’ was being sent to Regina Coeli by the Belfast Legion of Mary. The department phoned asking that they send a description of the ‘girl’ and the time of the train to Regina Coeli. Women who were brought to the train station or bus depot often failed to take the bus or train or disembarked at a different stop and disappeared. A young Mayo woman repatriated from Scotland with her infant and sent to Castlepollard left on the same day and was reported to have returned to Scotland with her child.

8.22 Some women left mother and baby homes with their infant. They often ended up in Dublin seeking assistance and were admitted to another institution. A native of
Mayo who returned from England and was admitted to Castlepollard - following a plea from Miss Litster that she not be sent to Tuam - left and came to Dublin, giving birth in the Rotunda. She placed her child with St Patrick’s Guild without giving an address, and returned to England, but was returned to Ireland the same day ‘when her passport was examined’. Back in Dublin ‘she made a scene at Marlborough Street’ (perhaps at the offices of the RGAS) and was admitted first to Regina Coeli and later to St Kevin’s. At this point she agreed to be transferred to Tuam with her child. One woman who had pleaded not to be sent to her local county home was admitted to Bessborough but ran away and was then admitted to Regina Coeli. A Limerick woman working for a few months in Dublin, and admitted to St Kevin’s and from there to Pelletstown, was reported as wanting to go to Sean Ross. An ambulance was duly arranged to bring her there, accompanied by the matron of a county hospital, because she was advanced in pregnancy, but the pregnant woman then refused to travel and the doctor insisted that she not be subjected to pressure. It was alleged that ‘influence has been brought to bear on her’ since going to Pelletstown. The Mother Superior in Castlepollard wished to send a woman away ‘because of recalcitrance’, but her baby was delivered in the home. A native of Leitrim who had been working in Belfast was admitted to Castlepollard in 1946 and left three months later. The Mother Superior at Castlepollard contacted the International Catholic Girl’s Protection Society to meet her (presumably off the bus) but she evaded them and disappeared. She came to Regina Coeli two months later, ‘penniless and verminous’; mother and child had to be sent for ‘cleansing baths’. The child was admitted to St Clare’s Hospital (see Chapter 2), suffering from gastro-enteritis. His mother disappeared, reportedly travelling to England to take up nursing but she was admitted to St Kevin’s Hospital as a temporary patient some months later; her son was also admitted to this institution. A young woman, who was referred to Miss Litster by Regina Coeli and given temporary accommodation in Cork Street Hostel while arrangements were made to admit her to Bessborough, was ‘seen off’ on the Cork train by a worker in the hostel but failed to arrive - Bessborough had sent someone to meet her at the train. In some cases personal resistance was finally overcome. One 20-year-old woman who refused to be admitted to any home and was supported by her mother in this decision, was sent with her child from St Kevin’s to Castlepollard, under an escort arranged by the Dublin Union. A woman who left Regina Coeli without her two months old son, who subsequently died, was traced by Gardaí to the Good Shepherd convent in Limerick (a Magdalen laundry). A file on a woman who gave
CHAPTER 8 PROFILE OF UNMARRIED MOTHERS IN THE MID TWENTIETH CENTURY

birth in Holles Street and was removed with her child to St Kevin’s noted ‘parents writing abusive letters to girl and demanding removal of child’.

8.23 One of the longest files concerns a woman who is described as a ‘cripple’. She was sent from Sean Ross to Holles Street where her baby was born. Sean Ross refused to readmit her and her child. Mother and baby were removed by ambulance from Holles Street to the county home, but her mother was determined that they should not remain there, and she sent a telegram stating that she was bringing them back to Holles Street. The CPRSI met the grandmother and another daughter in Dublin and tried to agree a solution. Meanwhile mother and baby remained overnight in a private house in Dublin ‘but won’t be kept tonight’. The grandmother explained her reluctance that they should be in the county home was because they had ‘a lot of cousins’ in that town. A priest in Westland Row church arranged for St Ultan’s Hospital to take the baby for a month, after which St Patrick’s Guild agreed to take charge. The child’s mother returned home.

8.24 Some women who were admitted to Regina Coeli while arrangements were being made for their admission to a mother and baby home, refused to leave that hostel, because they had greater freedom (including freedom to smoke); some refused to enter any institution run by religious sisters. For women who had grown up in country areas, religious sisters were strange, rather frightening creatures; they would have been more familiar to women who had attended school in towns or cities - though they might also have feared them because of their experiences at school. A file suggests meeting the mother of an infant, who was born at home ‘to find out if she is now willing to go to Manor House’ but she did not attend the arranged meeting. There are also cases of pregnant women, admitted to Castlepollard or another home, leaving after a few days, with no record as to what happened next; where did they go?

Privacy/secrecy

8.25 Most women who came into contact with the Custom House were determined to keep their pregnancy a private matter - not known to parents or family, not known to the local doctor or priest, and, occasionally not known to the staff of their local council. Many files emphasise that parents did not know and were not to be told. This is often underlined. However, it appears that English and Irish charities might contact a parent(s) in cases of teenage pregnancies, and English Catholic charities often contacted a woman’s parish priest to find out some information about her
family background. The file on one 17-year old who went to England, while pregnant, to help a married sister who had had a nervous breakdown recommended that the English social worker should inform her parents ‘in view of the girl’s age’. Arrangements were made for her to go to Castlepollard. Parents might know of the pregnancy and be equally concerned about keeping it a secret from neighbours and the local community. The parents of one pregnant woman were employed by a local priest and feared that they would lose their employment if he discovered that their daughter was pregnant.

8.26 This desperation to preserve secrecy is evident from the case files. Several women initially gave false names, incorrect home addresses or personal stories that turned out to be untrue: for example claiming that parents were dead - presumably to prevent them being contacted. Before agreeing to pay for a woman’s maintenance, the public assistance authority would check out these details, often reporting that there was nobody of that name at the address given. It is highly probable that these inquiries would have made her pregnancy known in the locality. In one case a woman, recently arrived in Dublin from Clare, and staying in a bed and breakfast, was referred to the CPRSI, who noted that she ‘told so many obvious lies that the Society sent her away’. One 17-year old ‘had told a lot of lies and denied pregnancy but people [her parents] have got the name of man responsible’. A woman who gave birth in Holles Street in 1957 did not admit that she was not married until after the birth. She had been working in England for two years, came to Dublin pregnant and attended ante-natal sessions. She did not wish to part with her baby, so plans were afoot to send her to Bessborough. Her widowed mother declined to help. A woman admitted to the Rotunda from Bethany, under a false name, somehow came to Regina Coeli, where a social worker suspected that she had given a false name. A priest in the town, where her ‘married sister’ was alleged to live, reported that the ‘married sister’, who was in reality her mother, ‘had a daughter who “got into trouble”’; the priest had assumed that she was in the county home. Arrangements were allegedly being made for her baby to be adopted by a couple travelling to Arabia. When one county secretary was unable to identify a woman’s family he made further inquiries in the next county. The almoner in St Kevin’s subsequently phoned to say that the woman had admitted that her story - a dead mother, pregnancy resulting from a sexual assault - was untrue. The county secretary travelled to St Kevin’s to question this woman, and discovered the name of the putative father, a local businessman, who had written promising to contribute £50 towards the child’s
adoption. In another case the mother of a child who was in Regina Coeli disappeared while her child was in hospital for treatment, and it was discovered that the personal details that she had given were false.

8.27 One of the most elaborate cases of deception concerned a young woman who arrived at the Custom House allegedly accompanied by her stepbrother, who then brought her to Castlepollard and paid for her maintenance. He claimed that the matron at the Lourdes Hospital in Drogheda (her home town) had told him that £30 would arrange an adoption. He paid £50 to St Patrick’s Guild before the baby was born. The woman’s mother, who had been reported as dead, then arrived from London and announced that the supposed stepbrother was ‘no relation’. This young woman gave birth in the Coombe and went home with her mother, but the latter contacted the Custom House and explained that her daughter did not want to part with her baby and was ‘in bad hysterical condition’. She sought advice about pursuing the putative father - presumably the man who had presented himself as a stepbrother - for maintenance; the department referred this woman to a solicitor.

8.28 Families often sought to conceal a daughter’s pregnancy from the local authority, while simultaneously needing to arrange for them to pay for her maintenance in a mother and baby home. The file on one Kildare woman, the daughter of a labourer, noted that her father ‘knew some employees in the County Council offices’; he was ‘extremely anxious that the matter should be treated very confidentially’. Several women had relatives working for the local authority and were concerned that their pregnancy would be known. In one such case the woman did not want any address given in the accounts from Castlepollard. Another asked that only her initials should be used on forms and accounts.

8.29 One woman refused to attend her local dispensary doctor for medical examination - which appears to have been demanded before the public assistance authority would agree to pay for her maintenance in Castlepollard; she feared that her ‘condition would be broadcast’ if she did. One woman gave birth at home - her parents were reported as unaware that she was pregnant; her mother assisted at the birth, which took place without any medical attention. The mother gave the infant a private baptism; the birth was not registered, and the department, who learned about this case from the CPRSI (though details are not given), noted that some family members were ‘not aware of the presence of baby in the home’. This baby died. There were probably many similar stories that have not been recorded.
A doctor contacted the CPRSI about a Mayo woman, but she did not wait until arrangements had been made, turning up at the society's offices. The woman feared that Castlepollard would write to her parish priest; she lived at home and her parents were not aware of her pregnancy.

8.30 This determination that a pregnancy should not be known to neighbours meant that many women refused to enter particular mother and baby homes. Reasons commonly given were that the woman had a cousin in this home or knew of a girl from their parish who was an ‘inmate’. Many women refused to go to the county home or to a mother and baby home near their home because they feared discovery. As the local authority in Galway would pay only for women who were admitted to the Children's Home in Tuam, and all ‘inmates’ were from either Galway or Mayo, more women refused to go to Tuam than to any other home. One young woman from Galway with a temporary address in Cork Street Hostel, ‘does not want to go to Tuam on any account says an aunt lives there and she would be recognised in the Home’. A mother left the Tuam home with her baby and settled in Dublin (it is possible she was a live-in domestic servant), but she was evicted when her child became ill. Having tried and failed to get admission to Regina Coeli and long-term support from a charitable agency (though CPRSI provided short-term assistance), mother and baby were forced to return to Tuam. Files record Tipperary women who were unwilling to be admitted to Sean Ross, but would go to Bessborough; a Meath woman who would not go to Castlepollard if anybody from her home area was there. A woman from Cork was reported as saying that ‘she will do anything rather than go to a home so near her own home’. One 20-year old who had returned from England and was admitted to Regina Coeli was sent to Castlepollard without waiting for the county manager’s approval because a married woman from the same parish had arrived into Regina Coeli and the young woman ‘became hysterical on seeing her there’. The father of one woman, a night-watchman had to pay the Dublin Health Authority 10s a week for 12 weeks towards the cost of his daughter’s stay in Braemar House (Cork) because she wished to leave Dublin. By contrast a woman in her mid-thirties, who was admitted to Castlepollard, which was quite a distance from her home, was unhappy there, and asked for a transfer to an institution in her own county. She was physically handicapped and needed assistance, so arrangements had to be made to escort her to Dublin and place her on a train. She was met by ambulance at her destination.
The local authorities

8.31 One of the main tasks for department officials was to secure the agreement of the local authority, after 1942 it was the county manager, to pay for a woman's maintenance in an approved home. This was often a complex and lengthy process. Many women who were not repatriated probably ended up in the Custom House because the department was seen as the only agency that could persuade an unwilling or unsympathetic county manager. County managers often disputed liability - based on the address, or whether the woman had lived and worked outside the county of her birth. The files record many disputes over townlands and county boundaries: disputes between South and North Tipperary; between Limerick city and county, and between Cork city and the three districts in the county - all trying to evade financial liability. Local officials often made detailed inquiries in a locality in order to determine whether the woman had given a correct name and address - a process that might well betray her pregnancy.

8.32 When the department contacted Donegal county council asking them to assume financial responsibility for a woman who had given birth in England, they responded by sending detailed forms which she should complete. The department phoned asking them to withdraw the forms, and then phoned the English welfare agency asking them to elicit further details from the woman; it is uncertain whether Donegal accepted responsibility. In one case where a woman had left Limerick - the file stated that she had had an unhappy home life, the city manager disputed liability for her maintenance. It was quite common for a county manager to suggest that a woman whose case was referred to him should be maintained by the Dublin health authority. When a local priest contacted the county manager seeking financial support for a Galway woman who went to England when pregnant and was being returned to Ireland, the county manager suggested that if she remained in Dublin for a short time the Dublin public assistance authority would look after her; the file indicates otherwise. When the Offaly county manager refused to accept financial responsibility for a woman, it was suggested that she should be put on a bus to Tullamore and instructed to present herself to the county home. The file noted that 'the Department can have nothing to do with this; she must act on her own responsibility'. The county manager in Meath refused to pay for one repatriated woman because she had been working in Dublin for some years before going to England. One of the most outrageous attempts to evade financial liability concerned a 17-year old who had been born in Dublin and brought to Donegal as an infant, where she was raised by her grandparents; her parents
had gone to England and apparently abandoned her. At approximately 17 she went to work in Sligo, became pregnant by a local man, and was admitted to the county home. The Sligo authorities put her in an ambulance and sent her to St Kevin’s hospital with a note stating she was ‘a case for Dublin’.

8.33 Efforts to determine which county was liable for maintenance could be extremely intrusive. In the case of one domestic servant referred to the Customs House by the CPRSI, information was sought as to whether ‘pregnancy is the result of association in Leix [sic] or Kilkenny, and how long she has been employed in Co Leix’. It was determined that ‘pregnancy occurred 5 miles from home’ - in Kilkenny. The woman was then sent to Sean Ross.

8.34 In one case of a woman returning from England, the Roscommon county manager refused to pay for anywhere except the county home. After several letters Miss Litster persuaded him to agree a ‘swap’ with the county home in Longford. Given these protracted negotiations, and the unsympathetic response perhaps it is not surprising that when authorities in Birmingham were contacted to arrange for the woman’s return to Ireland they reported that mother and child had disappeared. Another Roscommon woman on her second pregnancy was unwilling to go to the county home because a cousin was a nurse there. The county manager agreed that she could be admitted to the Longford county home but he demanded that she travel by train to Roscommon station, where she would be collected by ambulance and brought to Longford - arrangements that made no practical sense, and appear to have been designed to punish or humiliate the woman. Roscommon insisted on a similar arrangement in the case of a Roscommon woman who was returning from England and was to be admitted to Sean Ross. She had to travel from Dublin, to some point in the county where an ambulance could collect her and bring her to Sean Ross. A 35-year-old Donegal woman, pregnant for the second time, refused to go to a county home and declared that she would go to England if she was not admitted to a special home - the county manager relented and she was approved for admission to Castlepollard. By 1957 the convention that only first-time mothers were accepted in mother and baby homes was breaking down.

8.35 There were particular difficulties for women from more comfortable family backgrounds, whose parents were not aware of the pregnancy and were not to be told, because the county manager might refuse to maintain her in a special home, arguing that the parents should pay. One woman had travelled to Nottingham,
pregnant, and was about to lose her accommodation (and presumably her job). When the county manager was asked to assume financial responsibility in a home, he reported that the family were ‘comfortable’ with over 100 acres of land valued at £37 (presumably the rateable valuation); the household included a six-year old ‘ailing child’, this woman’s child. It is unclear what happened. With county managers disputing financial liability, department officials and those associated with various charities had to interview women, often on several occasions, in order to ‘disentangle stories’ and determine which local authority was liable. On the other hand, some managers accepted financial responsibility for women from comfortable family backgrounds. One woman with a clerical job, whose father was ‘said to hold a high position in the Garda’ was maintained by her local authority in a mother and baby home - this was all brokered by Fr Barrett of the CPRSI. In one unusual case a woman friend and work colleague kept a pregnant woman in her flat. This pregnancy was diagnosed when the woman was being treated in a Dublin hospital for varicose veins. Her friend contacted the CPRSI, who contacted the relevant local authority - but the county manager disputed the address given as not in the county; and noted that the woman’s family was ‘fairly well-to do’, i.e. that they should pay for her maintenance in a home. The woman was determined that they should not be informed. The desperation is captured in the note on this file ‘Can anything be done?’ An official in the Department of Health persuaded the Dublin health authority to pay for this woman, who was allegedly a nurse in their employment, but Dublin then disputed the personal details given. After a lengthy correspondence, Dublin did pay her bill in Sean Ross and the CPRSI arranged for the baby’s adoption.

A summary of this work written by Miss Clandillon in 1970 noted the difficulties in persuading local authorities of the need to maintain confidentiality. When one 20-year-old woman, the daughter of a county council labourer in Meath, whose parents were unaware of her condition, was being repatriated from England, an assistance officer turned up at her parents’ home demanding payment for her maintenance in Sean Ross. The department inspector asked a senior official to raise this behaviour with the county manager. One 18-year-old Galway woman had gone to England when she discovered she was pregnant: her mother knew of her pregnancy, her father did not and the putative father, a local man, had gone to America. The woman and her married sister in England were anxious that she should not go to Tuam, which was close to her home, so the department contacted the county manager (without divulging her name) to secure agreement for her
admission to a special home. He replied that he ‘cannot justify extra cost of maintenance in extern home and presumes girl cannot contribute to difference’. The CPRSI attempted to secure the necessary money from her married sister, and they were willing to take the baby ‘at a few weeks old’, which would reduce the expense. It is unclear what happened. Another county manager told the department that he would pay transport costs to Castlepollard, but not to any other home. The woman, who had returned from England, travelled to Castlepollard by bus. When one Wexford woman was admitted to St Kevin’s Hospital pregnant, the Wexford county manager demanded details of her parents’ circumstances, and whether they knew of her pregnancy ‘so that the usual investigations can be made’. She was admitted to Castlepollard, but he refused to pay for her maintenance. A woman who had been working in England for four years, and returned home to Wicklow to care for her mother and find a job locally became pregnant. The county manager disputed liability on the grounds that she had only recently returned to the county.

8.37 The file on one baby born in Castlepollard to a woman who lived on a small farm with her widowed mother and brothers - the latter did not know about the baby, though her mother did - noted that her baby was boarded out in Westmeath for £2 5s a month. Two local officials were alleged to have visited the baby’s mother, who was described as ‘not very sound mentally’, and persuaded her to give an undertaking that her sister who worked in Dublin earning 35s a week would contribute 5s a week towards the maintenance of the baby. This sister contributed £1 a month but Westmeath then demanded an additional £1; the woman claimed that ‘threats were made of making trouble for the baby’s mother if she didn’t pay’. The local NSPCC officer was making arrangements for the child’s (age not stated) admission to an industrial school. This confrontation probably occurred because the child was boarded out in Westmeath, whereas the mother’s home address was in Offaly.

8.38 The department approached the Galway county manager asking him to agree that a baby with a serious medical condition, the ‘illegitimate’ child of a Galway woman who was a domestic servant in Dublin, could be treated in the central hospital in Galway. The mother planned to resume her job in Dublin, but the county manager refused to assist, leaving the department trying to persuade St Kevin’s Hospital to take the baby. In the case of a young woman from Wexford, who had worked as a domestic servant in Dublin for four months and for a previous 15 months in
Wicklow, Wexford refused to assume responsibility. Wicklow also tried to avoid paying for her upkeep in Castlepollard. In 1950 the county manager of Cork would admit a woman who was being repatriated from Birmingham only to the west Cork county home; he justified this decision (which was contrary to the department’s policy that unmarried mothers should not be in county homes), because, he claimed it was impossible to get paid help for the county home. This unfortunate woman was willing to go to any home provided that her relatives were not informed. In 1955 the county manager in Louth refused to admit a woman and baby returning from England to any home other than the district hospital in Drogheda or Dundalk, which was also contrary to department policy. When asked for an explanation, he replied that he would reconsider the decision if he received a “firm undertaking” from the CPRSI to assume responsibility for the baby when it was six months old. In the event, an English Catholic charity arranged for the baby’s adoption, relieving the county manager of all charges. A Tipperary county manager tried to send a mother on her second pregnancy to the county home in 1959, which was also contrary to government policy. When the department contacted the county manager in Wicklow about an 18-year-old woman from that county who had been referred by St Patrick’s Guild, they noted that the county manager ‘does not consider family worth helping - standard poor, sister had forced marriage in April’. Sister Elizabeth of St Patrick’s Guild suggested that in view of her age it would be better to send this woman to Castlepollard or Sean Ross, rather than the county home, and the department inspector agreed to write again to the county manager. When the Carlow county manager was asked to take financial responsibility for a woman who was a native of that county and had been living there when she became pregnant, he demanded to know the whereabouts of the putative father; it was reported that he had disappeared when informed of the pregnancy. One file records a complaint from Fr Barrett relating to a woman being repatriated from England, who did not want her parents informed of her pregnancy; the Longford county manager had contacted her mother ‘on question of maintenance’. The Monaghan county manager refused to assume financial responsibility for a PFI unless he was given the name of the putative father; the English social worker who was dealing with this woman reported that she was unwilling to divulge it. In the case of one woman from Clare who gave birth in Birmingham, having left Ireland when pregnant by a local man, Fr Barrett phoned the department to report that the mother and child welfare committee in Birmingham were ‘worried about girl. Had stopped a letter from her mother to girl telling her that 3 [underlined in original] gentlemen had been out to her house and
had informed her of daughter’s condition - she was not to return home ever!’ The department informed Fr Barrett that they would write to the county manager seeking an explanation.

8.39 Galway was the local authority that showed the greatest determination to extract financial contributions. When they were contacted about a woman who was returning from London having gone there pregnant, the ‘county secretary agreed [to accept financial responsibility] but mentioned that family circles might be investigated and contributions asked’. The department stressed that this woman’s parents were not aware of her pregnancy and should not be informed. When one Galway woman was being repatriated from Birmingham, Canon Flint was informed that ‘there is no alternative to the Children’s Home Tuam’. On this occasion the county manager ‘agreed to admit to Children’s Home provided girl disclose name of father of the child with view to proceedings for maintenance’. The department inspector advised a representative of the CPRSI, who was arranging for mother and baby to return home - it was her second child - that ‘if girl presented herself to Children’s Home Tuam she would probably be admitted but there would be no use in asking County Manager beforehand’. These files contain a limited number of cases where politicians became involved. General Sean MacEoin, a Longford/Westmeath TD, intervened ‘to vouch for bona fides’ of one woman. Longford had refused to pay for her upkeep in a mother and baby home, but the county manager subsequently agreed - presumably as a result of political intervention. One woman who had been in Castlepollard with her infant, left the home and took up employment as a domestic servant for a county manager; he placed her child in the county home. Her mother informed the department that the county manager had written saying that if her daughter left his employment she would have to remove her child. A further letter from the same woman stated that she was satisfied with the position.

Families

8.40 The most common response of a family member(s) to news of an extra-marital pregnancy was a determination to protect the woman’s reputation and that of her family. Some women travelled to Dublin or to England, determined that their families would not know about the pregnancy; others confided in one or two close relatives. Most of the women whose case notes survive left home; the collection contains very few Dublin women. The most desperate women were those without families - daughters of unmarried mothers, former ‘inmates’ of industrial schools or
former foster children. In a number of cases, both parents had died, and the 
pregnant woman had no immediate family to whom she might turn in search of 
advice or assistance. One woman working as a domestic servant in Drumcondra 
went to High Park Convent (a Magdalen asylum) seeking advice. One of the 
saddest stories concerns an 18-year old, who was pregnant for the second time. 
She had sought admission to Pelletstown, apparently on her own initiative; they 
sent her to the CPRSI. She had been raised by named woman (address given) 
and thought that this woman was her mother, but was never told that she was a 
foster child. Her first baby, born in Sean Ross, had been adopted. She did not 
wish to marry the father of her second child and had not informed him of her 
pregnancy. She was given temporary accommodation in Regina Coeli pending 
admission to Castlepollard. A 21-year-old woman, born in the Wicklow county 
home to a single mother, went to England and gave birth there; mother and child 
returned to the county home where she was born. A 24-year-old factory worker 
who was pregnant in England had been in St Vincent’s convent Limerick (an 
industrial school) until she was 14 years old. She was unable to read or write. She 
hoped to marry the father of her child and was trying to locate her baptismal 
certificate. A 19-year old who returned to Ireland of her own accord, when she 
discovered she was pregnant, could not read or write. The eldest of eight children, 
she claimed that her parents kept her at home from school to mind the other 
children. One woman’s file stated that her baby was due around the same time as 
her mother’s ninth child.

Concealment

8.41 A constant theme, especially from women who had gone to England, was that their 
family should not be informed. Other women had informed one or two family 
members of their pregnancy, but were adamant that other relatives should not be 
told. The sister of one 18-year-old woman planned to persuade her to inform her 
parents, but the department inspector suggested that ‘it would not be wise for this 
to be done without her consent’. One woman who had been keeping house for 
three bachelor brothers would rather withdraw her application for assistance from 
the public assistance authority than have them informed of her pregnancy. She 
was in difficult circumstances, now living with a married sister; her brother-in-law 
refused to let her remain in his house. One pregnant woman thought that her 
mother might have detected the pregnancy ‘but became tearful when it was 
suggested she should tell her definitely’. All communication with one woman had 
to be sent to a local priest, who was ‘helping the girl’. She lived with her parents
who were unaware of her pregnancy. A 19-year old who gave birth in her home had succeeded in concealing her pregnancy until the birth. The married sister of one pregnant woman who was staying with her in Dublin was ‘in a panic to get her away before her condition becomes apparent’. A nurse in a mental hospital was sending money home to support her widowed mother and did not wish her to know about the pregnancy. The cost of her stay in Sean Ross was met by the Dublin health authority; her child was taken by St Patrick’s Guild.

8.42 Some parents were supportive. The mother of one pregnant 18-year old contacted the CPRSI to say that her daughter had returned home and was being cared for by her local doctor, so she no longer needed a place in a mother and baby home. This mother thought they might contact the society at a later date (presumably about adoption). A 16-year-old girl who ran away from home on discovering she was pregnant was brought by the Gardaí to Gloucester Street Magdalen Home; they sent her to St Kevin’s. When her father was contacted (presumably by either the Gardaí or the authorities in St Kevin’s) he came to Dublin to bring her home (she was only three months pregnant), until she went to Sean Ross. Some women asked a social worker, Miss Litster or another third party to contact their parents and ask whether they would take her home.

Rejection

8.43 Reports of sympathetic parents are outweighed by stories of rejection. A Clare woman who returned home from England pregnant, asked to be admitted immediately to a mother and baby home because her mother would not keep her at home. One woman was ‘turned out of her house by step-father - a publican with £5’; the putative father denied responsibility. A priest from the Oblate Order contacted St Patrick’s Guild on her behalf, and the county manager agreed to pay for her maintenance in Sean Ross, leaving the possibility of extracting a contribution from her family to a later date. A 20-year-old woman from Cork, who was returned to Ireland, had previously lived in her family home with her father and a married sister (there is no information as to whether the married sister’s husband and/or family lived there); her sister and father ‘put her out’. A woman, whose mother was dead and whose father had remarried, gave birth in her aunt’s home, but when another niece returned from England, her aunt refused to let mother and baby stay. She dispatched them to Dublin to the new mother’s sister; she refused to help, and sent mother and baby to St Kevin’s. The CPRSI agreed to take the baby in about two months. One woman whose parents disowned her when they
discovered that she was pregnant (the father of her child wanted to marry her but she refused - it is unclear whether this affected her parents’ attitude) was sent to England by her local doctor and priest, but was returned home within two weeks, and admitted to Castlepollard. A woman, who was living at home with her widowed father and her brother and his wife, was admitted to Holles Street with a threatened miscarriage; her brother refused to let her return home. She went to Castlepollard. One mother, who knew of her daughter’s pregnancy, ‘refuses to have anything to do with her’.

8.44 One of the most harrowing stories (not from these files) concerns a young woman who gave birth in the county home in Wexford in 1960 and left with her seven-week-old baby to return home. She returned to the county home having slept in the fields with her child for two nights; her family refused to let her into the house. A 20-year-old woman travelled to Dublin ‘having been turned out of her home by her father on discovery of her condition’. The mother of a two-month-old baby who was in St Kevin’s agreed that her mother could be informed of the birth; she wrote to Fr Barrett rejecting her daughter and grandchild. A happier story concerns a shop assistant who was living in Dublin with her two sisters. She left them a note stating that she had gone to work in Belfast. When they discovered through a friend that she was pregnant, and in a Dublin nursing home, they visited her. Less happy was the experience of an 18-year old from near Tuam. The English authorities wrote to her parents informing them of her pregnancy. Her mother refused to have her daughter home, and insisted that she should not be admitted to Tuam. The county manager would only agree to this if her parents agreed to pay £1 2s 6d (presumably per month) - which was the difference between rates in Tuam and in a special home. He insisted on a signed undertaking from her mother before authorising this. It is unclear what happened.

8.45 Some families may have rejected a pregnant daughter because they lacked the means to assist her, or were unwilling to do so, because they were poor and with large numbers of dependent children. The mother of a pregnant 16-year old was reported as ‘having very little means at her disposal and is unwilling to take other members of the family into her confidence’. This woman’s sister told the department inspector that Fr Barrett would not take the baby; they referred her to St Patrick’s Guild. Some of the women who contacted the Custom House are

7 Department of Health, INACT/INF/0/499216.
recorded as one of 11, 14, even 16 children - many still at home, and it would have been difficult to welcome a daughter and her child into such crowded and often impoverished households.

8.46 The file on a Kerry woman living with her widowed mother and brother on a small farm - her five sisters were all married - recorded that mother and brother were aware, ‘but have done nothing’. The woman was admitted to the Rotunda. After the birth, the almoner contacted her local parish priest and they tried to place her baby with one of her married sisters, who was childless, but the file recorded ‘not much hope’. Mother and baby went to Dunboyne. One woman, who had gone to England aged 15 to work as a domestic servant, and remained there for approximately five years, returning pregnant to Ireland, was reported to have ‘lost touch with her family for years - did not know how many brothers and sisters she had at home’. She alleged that her parents were not interested in her. The father of her child, described as non-Catholic, paid her fare to Ireland; she was admitted to Sean Ross. The file on one 19-year old who had given birth at home noted ‘Conditions unpleasant for her at home’. The county manager was reluctant to agree to pay for her upkeep in a special home. A local priest brought her to the offices of the CPRSI. He reported that ‘set up at home very bad - girl’s father does not speak to any of the family and she is afraid of what he might do to the baby’. This priest contacted the county secretary who approved her upkeep in a special home. The woman indicated that she wanted her baby to be adopted.

8.47 One of the most disturbing cases concerned an 18-year old who was in Regina Coeli. She had been living at home with her parents in provincial Ireland; when she informed them of her pregnancy, ‘Her own father (a Civic Guard) beat her badly’. Her mother sent her to an aunt in Dublin, but her aunt refused to keep her - hence her arrival in Regina Coeli. They referred her to the Rotunda. When she was examined, the hospital insisted that she remain there until her baby was born. The department suggested that one of the Regina Coeli volunteers should suggest to her father that he should ‘approach the Co. Manager and make arrangements [for admission] to Castlepollard’; the local authority required him to pay 10s weekly towards the cost.

**Family Strategies**

8.48 While some women went to England or to Dublin to prevent their families knowing of the pregnancy, others travelled with the advice and assistance of family
members. A Sligo family sent their pregnant daughter to England, where she gave birth, ‘to get child adopted’ but she was returned and admitted to Castlepollard. This was not an uncommon story. A 20-year old went to England in 1957 accompanied by her mother; her father was said to have ‘disowned her’. A mother who travelled to England with her pregnant daughter and tried to ‘make arrangements there’ - her husband did not know of the pregnancy - returned to Ireland with her daughter having failed to do so. The daughter was admitted to a special home. One of the oldest women was a 45-year old, with an elderly mother and brother who were described as ‘very poor’; the woman was described as a cripple; the putative father was a migratory worker, roughly 20 years younger. When her mother and brother became aware that she was pregnant they sent her to Birmingham, where a social worker with a Catholic charity arranged for her to return to Ireland by plane. She was admitted to Castlepollard, and it was discovered that she had TB. The Sisters wanted her to be moved to a sanatorium, but the medical officer sent her to the Coombe Hospital, where her baby was delivered by caesarean section. Mother and baby returned to Birmingham where it was reported that her married sister would take her child. It emerged that the infant had cerebral palsy, so the mother returned to Ireland to care for her elderly mother and asked that her child be returned to Ireland. It is unclear what happened to this child.

8.49 The parents of one woman who became pregnant by her second cousin encouraged her to go to England, but the Catholic Welfare Society told her that they would be unable to arrange adoption because of the relationship between the infant’s parents. They tried to send her back to Ireland to give birth, but she refused to travel. One of the most unusual cases concerns a 19-year old who went to her great grandfather in Liverpool. Her widowed father was aware of the pregnancy but refused to permit her to bring her child home because there were seven children resident in the house. Her great grandfather urged a priest in Liverpool to arrange for the baby’s adoption. The woman was described as ‘a decent respectable girl’ but easily influenced.

8.50 A family member, most commonly the mother, might contact agencies such as the CPRSI seeking advice and assistance. This was especially common in cases of teenage pregnancy. The mother of a 15-year-old girl, one of ten children, contacted the CPRSI; the file noted that the family were farmers and would be in a position to pay for the adoption. One 79-year-old father accompanied his pregnant
daughter to England. He had hoped to trace the putative father but failed to do so and was returning to Ireland. Father and daughter were staying with another daughter, in one room; this daughter had recently been discharged from a sanatorium. A small farmer, the father of 14 children, brought his 24-year-old pregnant daughter to Dublin where he assumed that arrangements would be made for her care; she claimed to have been assaulted. A mother travelled to England to bring back her pregnant daughter, who had been diagnosed with a heart condition; she also brought back a second daughter, who was working in England. Another mother contacted the department seeking her daughters’ admission to a mother and baby home; she did so to avoid having to send her to the local dispensary doctor - which was the normal channel for admission. The mother of a Cavan woman asked the Sisters of Killeshandra convent to contact the department on her daughter’s behalf, perhaps because her husband was not aware of the pregnancy.

8.51 Mothers were the family members who were most sympathetically disposed towards a daughter’s pregnancy, but they often had to face a hostile husband or son. One woman, who wanted her daughter and baby to be admitted to the local county home, would try to persuade her husband ‘to take her home, he is not disposed to do this at present’. The note on one file states: ‘Father old. On his death mother will allow [...] to take child home’. The department hoped that a young epileptic woman would be taken home, the mother indicated that she would ask ‘brother [presumably the brother of the pregnant woman] if he would consent’ to this. In the case of one child, born in Sean Ross, who was described as ‘retarded’, the maternal grandmother was willing to take the child but a son who lived with her ‘threatened to walk out of the house if the child was taken over the threshold’. The infant was eventually given a medical certificate, apparently clearing the infant for adoption in the USA. By this stage the maternal grandmother was no longer willing to accept her daughter (without her child) back into her home. In 1967 the mother of a pregnant unmarried woman wrote to Fr Good, of St Anne’s adoption society, because she was too ashamed to contact her local priest. In the course of telling him about her daughter’s pregnancy, she wrote that: ‘I am afraid the brothers will give her a beating and of course she would deserve it if they did but the [quiet] way is the best way’. 

8 Department of Health, INACT/INA/O/464099
9 Cork diocesan archives, St Anne’s adoption society, box 3.
8.52 The matron of Pelletstown was contacted by the local priest and the mother of a pregnant 17-year-old woman, who explained that she was partly dependent on her daughter’s wages to run the home. Arrangements were being made for her baby to be adopted.

8.53 Some parents sent a pregnant daughter to live with a married sister, or a married aunt in England or in Dublin, and some pregnant women did likewise without informing their parents of the pregnancy. A Kerry woman, who went to her sister in Birmingham, had not told her parents she was pregnant and did not wish them to know. Her sister wrote and told them. A Donegal woman, described as ‘a bit simple’, was brought to Glasgow by a married sister when it emerged that she was pregnant. When the baby was several months old this sister brought mother and baby to the local Catholic welfare society, hoping to arrange an adoption, but they suggested that the baby might have special needs. A woman who went to her aunt’s house in Leicester, apparently without telling her that she was pregnant, was asked to leave. A 15-year old who was sexually assaulted was sent by her parents to her married sister in England; she contacted the London county council who took her into care and were arranging for her to be escorted back to Ireland by Miss Harris (see Chapter 7). Another 17-year old, who had been sent to her sister in England, was returning, because there was no room for her. A brother was escorting her back to Ireland. This was not an uncommon story - there was an acute housing shortage in England in the aftermath of the war, and Irish families may not have realised that married couples might be living in cramped accommodation with no space to keep a pregnant sibling. Another woman who was staying with her sister had to leave because the landlady objected to her being there. She had been engaged to the father of her child, who now refused to marry her. One woman who went to her married sister in England was told that her brother-in-law would not allow her to stay. A 17-year old was sent to an aunt in Lancashire, who immediately contacted the local Catholic welfare society, and planned to accompany her back to Ireland. A woman, who arrived in London accompanied by her sister, who brought her to their brother’s house, was immediately sent back to Ireland with the same sister - who was returning to her work. A woman, who had been working in England for some time, but became pregnant when home on holidays, was brought back to Ireland by her brother who worked in England. He was ‘very anxious about her - not too sound mentally’; he had to return to his job in England. She was placed in a psychiatric hospital, having originally been destined for Sean Ross.
A woman who was sexually assaulted while working in Belfast, went to America 'knowing she was pregnant', but returned to Ireland some months later - her brother paid her fare. Her parents were dead but her siblings in Ireland were not aware that she had returned. The parents of an 18-year-old woman died shortly after she had been admitted to Sean Ross. The department contacted the county manager, asking for her child to be taken into care so that she could return home to mind her younger siblings - there was a family of eight.

**Putative fathers, and a possible marriage**

Most files record information about putative fathers, though not the names. They were farmers’ sons, labourers, factory workers, commercial travellers, plus an occasional married man or older man. Files from the early and mid-1940s record putative fathers who were in military service, in Ireland or Britain; including members of the American or Canadian forces; one woman named a German prisoner of war, who was held in Ireland. In at least one case where a woman repatriated from England in 1944 named the putative of father as an army private based at Finner Camp in Donegal, the department wrote to his commanding officer.

Many pregnant women went to England, as did many of the putative fathers. Some men went to avoid the anger and retribution of the woman’s family and perhaps that of the local community. Emigration also meant that they could avoid interrogation by local authority officials and demands for a contribution towards the cost of maintaining mother and child. Stories of men accompanying a pregnant girlfriend to England having promised to marry her, only to abandon her there, are all too common. In one case the father of the putative father, a cattle dealer, gave the woman £50. One woman went to England believing she was pregnant and was followed by her boyfriend. She was not pregnant but became pregnant in England. The file on a 17-year old who was admitted to a county home, noted that ‘girl appears to have been completely taken in by put. father who has since had to marry another girl’.

England was not the only bolt-hole. Other men emigrated to Canada or the USA. In one case where a wedding had been arranged three months earlier, 'on the eve of the wedding the putative father absconded to England’. A farm labourer followed the mother of his unborn child to England, apparently anxious that they marry, but changed his mind. She returned to Ireland and went to either
Castlepollard or Bessborough. When the daughter of a small farmer in Kerry announced that she was pregnant, the putative father, a local farmer ‘said he was sorry but he had a girl in America whom he intended to marry’. A woman who gave birth to a still-born infant in the local hospital later went to England pregnant, with the father of her child, who abandoned her. Her mother was aware of this second pregnancy but her father did not know - he was reported as having been very upset over her first pregnancy. This woman was reported to be living in a very bad area.

8.58 One of the most common reactions, throughout history, to the pregnancy of an unmarried woman was to arrange for her to marry the father of her child. Some files note that the couple married, and plans for the woman’s admission to a special home are dropped. One man was willing to marry, but would not accept the baby - an indication of the stigma associated with fathering a child outside marriage. One woman was engaged to marry a man who was not the father of her baby; her fiancé was aware of the pregnancy but would not take the baby; neither would her family. The RGAS hoped to arrange an adoption ‘fairly quickly’. The department suggested that she go to Regina Coeli until the adoption was arranged because they believed her local authority would dispute maintenance, presumably because her family was described as ‘fairly comfortable’. The more relaxed regime in Regina Coeli also facilitated continuing contact between the woman and her fiancé. In one case where a woman who gave birth in England, having lived there for several years, was returning to Ireland, the file noted that the putative father was prepared to marry her ‘but there is a temporary estrangement’, and the ‘county manager fears sending her to Castlepollard will impede their getting together’. He would prefer that she remain in Regina Coeli - a decision that also relieved him of the cost of maintaining her.

8.59 In some instances a woman’s parents or a local priest tried to arrange a marriage; likewise English Catholic welfare societies. Several files record that the father of the putative father ‘would not agree to marriage, matter in the hands of a solicitor’; such cases were almost invariably initiated by the woman’s parents. One woman who had gone to England disclosed that the father of her child was a temporary national teacher in her home parish; the parish priest met the young man, but he refused to marry her - it is unlikely that he secured a permanent post in that parish. When an Irish woman working in England became engaged to the father of her future child - an RAF officer - her parents made contact with him independently
and discovered that he was married. One Irish woman in Birmingham gave birth to two children by the same Irishman. The first child was adopted through Birmingham social services. Canon Flint tried to arrange for their marriage, but the file noted ‘no hope now’; she was repatriated to Ireland on her second pregnancy. Her mother was aware of the first child but not of the second pregnancy. The mother of one pregnant woman acknowledged that the name and address given to the almoner in the Rotunda was incorrect. This mother was keen to institute proceedings against the putative father; her daughter who was now in Castlepollard eventually divulged details. The parents of one woman contacted the department to secure her admission to a mother and baby home, but the last record on file stated that their daughter had divulged the name of the father of her child and a marriage was being arranged.

8.60 Cases where the woman’s parents were utterly opposed to marriage are at least as common as reports that her parents were trying to arrange one. The widowed mother of one pregnant woman dismissed the putative father as a ‘featherhead’ and indicated that she would not agree to their marrying; the family - farmers - was described as ‘quite comfortably circumstanced’. The mother of one 23-year old would not permit her to marry the 18-year-old father of her child; both went to England, but she was returned and was admitted to Sean Ross. The parents of a 29-year-old pregnant woman originally opposed her marriage to her 19-year-old boyfriend, however the young man, who worked in England, visited on several occasions and they eventually agreed. The fact that he was Protestant, and she was apparently Catholic, may have also been a factor in their opposition. One 20-year-old woman who went to England with the father of her child - a next-door neighbour - was uncertain about marrying him because her parents were opposed to their marriage and were not aware of her pregnancy. One woman was living with the father of her child - a widower; they had arranged to marry and had bought a wedding dress and furniture but she was now unwilling to marry him ‘as he has begun to ill-treat her’ so arrangements were made for her return to Ireland.

8.61 In one case neither set of parents would agree to marriage. The woman and man were only children; the putative father was unemployed and he was unwell, probably suffering from TB - many Irish families would have ruled out marriage in a case of TB. The woman was sent to Dublin by a Dominican priest in Cork; she was ‘absolutely without money’, living in a bedsit but had nothing to eat. The department asked this priest to contact the county manager. A further report
noted that ‘the girl is greatly disturbed’; her boyfriend told her that the priest had seen the county manager who stated that the board (presumably health authority) would have to be consulted. They feared that their fathers would learn of the pregnancy; the woman’s father was a friend of the manager. The department contacted the county manager - presumably to ensure confidentiality; he gave approval for her admission to Castlepollard or Sean Ross.

8.62 Social distinctions between families could prevent couples from marrying. Matchmaking and dowries had not yet disappeared in rural Ireland. Parents might oppose marriage if a proposed spouse or a family member suffered from TB, physical or intellectual disability or mental illness. One 19-year old, the son of a ‘well to do farmer’, admitted paternity of a child whose mother was the daughter of a local gardener and lodge keeper but he later denied paternity when his father was present. A man was willing to marry a 16-year-old woman, who was pregnant with his child. She was described as crippled because of contracting polio; however the file notes that ‘parents consider marriage unwise in view of her crippled condition’. The pregnant daughter of a labourer had been ‘keeping company’ with the 22-year-old son of a guard and a teacher - his parents objected to the relationship. The young couple went to Birmingham, presumably because of the pregnancy, and lived together as a married couple. The girl’s parents addressed letters to her as Mrs X. Her parish priest (in Ireland) tried to persuade the woman to return following the birth of their child and enter a special home. He claimed that her parents would press her to return - but it is unclear what happened. The opposition of the young man’s parents probably reflected the fact the woman was only 16-years old and a labourer’s daughter. In the case of one pregnant woman, who was described as ‘a cripple…uses a crutch’ the putative father, a lorry driver, would not marry her. (It may be that her handicap was the reason.) The county manager was determined to pursue this man for maintenance. In one case where a marriage had been arranged the putative father had a nervous breakdown and was admitted to a mental hospital. When the woman visited him after the birth of their child, she determined that it would be unwise for them to marry. The CPRSI took her infant. The file noted - underlined ‘People not to be informed’. Another couple planned to marry but the putative father had TB and a doctor advised that they postpone any decision. A nurse in a sanatorium, who became pregnant by a patient, was ‘terrified in case he may find out’. She was staying with the proprietor of a Dublin nursing home, who claimed that the ‘girl is not very responsible, stays out late at night…perhaps it might be
better for her to remain a few months with baby’. She was admitted to Sean Ross. The couple had arranged to marry, but the wedding was deferred when the man had to return to the sanatorium. Meanwhile the woman’s sister had written to a priest who knew about the pregnancy, urging that they should not marry. Records indicate that the child was adopted.

8.63 The file relating to a Kerry woman who came to Dublin and lodged in a private house, when she discovered that she was pregnant, stated ‘no chance of marriage’, and arrangements were made for her admission to Bessborough. But a representative of St Patrick’s Guild phoned some days later and reported that a marriage had been arranged and cancelled the Bessborough booking. A further entry noted that the records almoner in St Kevin’s reported that the woman had been admitted and ‘there was apparently no question of marriage’. In another case a marriage was arranged for a 21-year-old pregnant woman, but not with the putative father. In the case of a woman who became pregnant in England the putative father would marry her but only in a registry office. One case concerned a widow with children, and the putative father, her brother-in-law who was a widower with children. The initial report stated ‘no question of marriage’, but a later note stated that ‘PP has arranged marriage and obtained dispensation’. A file on the 19-year-old farmer’s daughter, whose child was fathered by the son of a neighbouring farmer, notes, ‘advised informing the PP and trying to arrange marriage, otherwise parents to get in touch with Manor House’ [Castlepollard]. One woman went to England with the father of her child, who promised to marry her, and was living with him when the child was born, but he had no intention of marrying. The English social worker who met the couple reported that ‘the girl feels let down’, and was willing to enter a special home. The Wexford county manager inquired whether her family could contribute to her maintenance; the department confirmed that the parents were not aware of the baby; they persuaded the local authority to pay for her maintenance. A pregnant woman who was referred to Miss Litster, but did not keep her appointment, turned up five years later (no explanation given). She had married the father of her child; they were now parents of four children, ‘poor but happy and children are well and healthy’.

8.64 One putative father was the woman’s widowed brother-in-law. The parish priest reported that there was a prospect of marriage, but the man went to England. The pregnant 18-year-old woman told an almoner in St Kevin’s that there had been no arrangements for marriage and her parents would not permit her to marry her
brother-in-law. This report suggests that there was a disagreement between her parents and the priest; the woman’s views are not stated. There were other cases where the putative father was a brother-in-law.

8.65 A 40-year-old farmer would not marry the local woman who was pregnant with his child, but he appears to have been in contact with the local priest and doctor. Another man paid for the woman to travel to England and promised to marry her, but was recorded as having no intention of doing so. An ‘older’ woman (35 years) became pregnant by a married man, who brought her to England and ‘parked her with relations of his own’, before returning to his wife in Ireland. A Cork woman who had been living in England with the father of her child and was pregnant for a second time, was reported to be willing to return to a mother and baby home provided that she could bring her first child. When one woman told the father of her child that she was pregnant he gave her £10 and suggested that she should ‘go away’.

8.66 Many men abandoned long-term girlfriends on discovering that they were pregnant. It may be that the rate of non-marriage in such circumstances was higher in Ireland than elsewhere. A 39-year-old woman, who fled to London, had been ‘keeping company with man responsible for 9 years’. He also left the country when he learned of her pregnancy. She was admitted to hospital in London suffering from extremely high blood pressure; instructions were given that she was not to be given any exciting news. Her baby was born by caesarean section and adopted in Cork. She returned to her job in a Dublin department store, which had been held for her by the employer. Another pregnant assistant who travelled to England, by agreement, to meet the father of her child - a shop assistant from the same town - who had agreed to marry her in England, could not find him when she arrived. Her story was not unique.

8.67 Some putative fathers were unable to marry the mother of their child because they were unable to support a wife and family, or did not own or control the family farm. In the 1950s Ireland had the lowest rate of marriage in the western world and the latest age of marriage. One man told the woman that he could not afford to marry her. A 20-year-old woman went to England with the father of her child at an early stage in her pregnancy, and lived with him there. He told her that ‘he can’t afford to marry’, so the Birmingham Catholic Welfare Society determined to return her to Ireland. This was a tragic family - her mother was in a mental hospital and two
family members were being treated for TB. There are cases where a couple had two ‘illegitimate’ children; some of these men were married, others were single, yet files record no prospect of marriage, as in the case of a 19-year-old Limerick woman. The file on a 20-year-old shorthand typist reported ‘had hopes of marriage but man now unwilling’.

Some women were unwilling to supply any details about the putative father of their children or they were unable to do so. One explained that she had been home from England at Christmas, and was drinking in a public house with two men - she did not know which man was the father of her child. A farmer’s daughter who became pregnant by the son of the next door neighbour was determined that neither family should know of the pregnancy. Several women claimed that the putative father had been killed in an accident - some specified road accidents; such stories may reflect an unwillingness to divulge a name; some may be true. One woman reported that he would have married her, but was killed. One woman had ‘narrowed down to two’, the possible fathers. One file noted that the putative father was ‘usual behind a bush’. Several women said that they became pregnant by men they had met at a dance. Such stories would have confirmed the worst fears of many priests, who thundered about ‘the devil at dances’ and similar themes. One putative father was reported to be ‘engaged to another girl apparently in same condition’. Several men had given the women false names or false addresses; others met them always at a cinema or a public place and the women did not know their address. The putative father of the unborn child of a Kildare woman who was physically handicapped, arranged for them to marry, but then went to England. Her mother informed the Gardaí. The local doctor who examined the woman referred to a ‘bottle of pills’ produced by the PF. This woman’s widowed mother was willing to raise her child but sought ‘Assistance’ (presumably home assistance). One 20-year old who was in America for two years became pregnant by a college student (described as not coloured), and came home because her father was ill. She went to London but returned to Ireland. Most women knew the identity of the father of their child, who was often a long-term boyfriend.

It was quite common for the putative father to deny parentage. A building worker, who followed a pregnant woman to Dublin and visited her in hospital, when interviewed at his place of work, apparently by a department inspector, said ‘plenty of others as well as me’. There are many stories of duplicity, family opposition to a
marriage and other domestic dramas. In the case of one pregnant woman, working in Dublin who had been admitted to Castlepollard, her parish priest interviewed the putative father and reported that his parents opposed the marriage, but he was willing to marry her and had asked for her discharge. However no marriage materialised - the next report indicated that he had left the country.

**Complex Stories**

8.70 A number of pregnancies were the result of sexual assault; some were incestuous, and in other cases either the woman or the man was married. Some of the most difficult cases concern pregnant widows, who probably suffered a higher level of social ostracism than a single woman. There were several cases of women who were living with a married sister and became pregnant by their brother-in-law. A number of men, or more unusually women had entered into a bigamous marriage. Some putative fathers paid for the woman’s maintenance and the child’s ‘adoption’. One married man was recorded as in good standing. A married woman, who gave birth to two children who were not her husband’s, was maintained in a private nursing home in Dublin by the putative father.

8.71 One woman returned from England with her four children to be admitted to a county home - her ‘common law’ English husband and father of her children was in prison. One woman was brought to St Patrick’s Guild by the mother of the father of her child - a married lorry driver, who was separated from his wife, and childless - he had served time in prison. He had ‘installed her in a flat in Rathmines’. This woman was described as willing to go to a special home but ‘does not wish to part with her baby at present’. A young woman who had been living in London for two years was admitted to St Pelagia’s Home, pregnant - her baby was ‘coloured’. The home was run by the Congregation of the Sacred Hearts but, in contrast to their Irish homes, they allowed women to leave the home on outings. While in St Pelagia’s this young woman became involved with a married man in his fifties. His wife and family contacted the Crusade of Rescue, claiming that the marriage was breaking up because of her, so they determined to send her back to Ireland ‘immediately because of moral situation’. She was sent to Dublin at short notice and admitted to Pelletstown while arrangements were being made for her to go to Bessborough. It is unlikely that she was permitted ‘outings’. One married woman who was pregnant by a man who was not her husband was referred by a local priest to St Rita’s, Sandford Road (Mrs Keating’s nursing home - see Chapter 2). She had to pay £3 3s a week for the maintenance of her child, who was described...
as ‘mentally deficient’. The department explored possible homes for the child; the baby was sent to Stamullen (see Chapter 2) where the county manager would pay for his maintenance, after some delay because of his state of health and lack of vacancy. A married woman, mother of two ‘legitimate’ children, whose husband was in the British army, had an extra-marital birth. The authorities in Cardiff were concerned to repatriate her because they feared she would abandon her third child. Some married men were prepared to make a contribution towards the cost of adoption; one Galway man stipulated that his wife must not be informed. One married man ‘of good standing’ who was the putative father of the child of a woman being repatriated was contacted by the CPRSI and asked to pay for her accommodation as a private patient in a mother and baby home.

8.72 A young widow with one child, whose husband had committed suicide, fled to England pregnant, leaving her child with her mother. She stayed with a relative but after the birth it emerged that she was suffering from TB. English and Irish Catholic charities, the department and the county manager were all involved in making decisions in this instance. It was arranged that the woman ‘a stretcher case’ would travel to a sanatorium in Ireland, accompanied by a Red Cross nurse; an ambulance would meet them at the boat. Her mother would be paid to maintain her child; however her child was boarded out, after a short stay in a district hospital. This was one of several cases where the personal tragedy of an extra-marital pregnancy was compounded by TB. One woman who had given birth four years previously and was living with her child in Regina Coeli contracted TB and had to be admitted to a hospital close to her family home. The department arranged for the care of her child while she was in hospital; her parents were not aware of the child.

8.73 A young Irish woman, who left her husband with whom she had two children, went to London to live with her married sister and had a child by her brother-in-law. When her sister learned of this child’s parentage she arranged for him to be taken by London county council. The mother was reconciled with her husband in Ireland, and he was aware of the child’s existence, ‘and would have it here only for his mother who lives with them and will not have the child about the place at all’. It was hoped that he could be boarded out nearby until his mother died.10

10 Cork Diocesan Archives, St Anne’s Adoption Society box 12.
The mother of one 22-year-old repatriated woman in Regina Coeli had to be contacted to sign papers committing her to a psychiatric hospital. It is unclear whether her mother had been aware of her pregnancy. The department went to considerable efforts to have her child admitted to Stamullen, to the point of asking a county manager to get a Stamullen child boarded out to make way for this infant. By the mid-1950s Stamullen had emerged as the institution where infants whose mothers could not care for them were sent; such as the one-month old child of a TB sufferer with one lung, who was returned from England, who needed medical attention.

Some of the most complex stories relate to women who were separated from their husbands. One 39-year-old Cork woman, mother of three children, had been separated for five years. One child was being raised by her mother, two by her husband. The county manager reported that she was also the mother of three ‘illegitimate’ children and there was a suggestion that local clergy had asked her to leave the country; Cork was prepared to accept responsibility. She was referred to St Patrick’s Hospital, Fermoy. One young woman who became pregnant at the age of 17 had married the putative father ‘against priest’s advice’. Her child was born prematurely and died; ‘she left her husband and returned to her mother’. She went to England on a second pregnancy but was sent home with her child to a county home. A woman on her third pregnancy was living with an elderly man who survived on home assistance. She had applied for home assistance as the man’s wife but his actual wife was living in the next county. A pregnant woman, described as ‘simple’, who had been separated from her husband for ten years, had arranged to marry the father of her child, assuming that her husband was dead; she had then discovered that he was alive.

One of the longest files concerns a young woman, described as a children’s nurse, who gave birth in England. She returned to Ireland with her child and stayed in the Gresham and Royal Hibernian hotels (two of the most expensive hotels in Dublin) and placed her infant in Stamullen. She returned to Dublin at a later date when her child was ill and brought him to Temple Street Hospital for treatment. When he was returned to Stamullen she was reported as going on a pub crawl with a taxi driver and was arrested for stealing in a hotel, winding up in Mountjoy. The last report stated that a wedding with the putative father had been arranged and the couple were emigrating to Australia. It is unclear what happened to her child.
CHAPTER 8 PROFILE OF UNMARRIED MOTHERS IN THE MID TWENTIETH CENTURY

Sexual offences

8.77 Three sisters from Cavan were described as ‘on the streets’ in London. One was admitted to Castlepollard with her baby; another gave birth in London, the putative father was Turkish, a third was reported to have married an Iraqi (outside the Catholic Church) and was living in Baghdad. The London Catholic Welfare Society contacted the family’s parish priest in Cavan. A 16-year old was charged with indecency in a public place in England; her probation officer contacted her parish priest in Ireland who described the family background as ‘not good; father useless’; the family was large, her mother refused to permit her to come home, saying that she could not control her; she was admitted to St Anne’s Kilmacud (a reformatory and industrial school).

8.78 A small number of cases concerned statutory rape - where the woman was under the age of 17. An 18-year-old girl, who had been in a foster home but was now working as a domestic servant, became pregnant by a 30-year-old neighbour of her foster home. The file recorded that she had sexual relations with him ‘before she was 16 and even before puberty. She says she never told her foster-mother thinking it was no harm’. This man had recently married another woman who was also pregnant. The young woman refused to go to Sean Ross, because there were ‘local girls’ in that home; she was admitted to Castlepollard. A teenager who was attending a technical school was assaulted on her way home by the son of a well-known horse dealer.

8.79 A 21-year-old woman accused her father of being the father of her child. She had been interviewed by detectives and court proceedings were imminent. She had reported the incest to a missionary priest who ordered her to leave home ‘at once’. The father of a 14-year-old pregnant girl was serving a term in Mountjoy prison for incest. A mother brought her 17-year-old pregnant daughter to the CPRSI. The father of her child was reported to be her 22-year-old brother. The woman’s father was not aware of the pregnancy. The mother was anxious that her daughter should be admitted to Bessborough; she was also concerned for another 14 year-old daughter at home.

8.80 St Patrick’s Guild would not take babies born from incestuous relationships for adoption. A 20-year-old woman, pregnant for the second time fled to Wales, but was thrown out by her landlady. Her baby was born in Wales. This was a case of incest; a local priest interviewed her brother who denied paternity. Mother and
baby returned home, but her mother refused to let her stay. One woman who gave birth at the age of 15 - a court prosecution of the putative father collapsed - was described as giving trouble; she had apparently beaten her mother and would not come in at night - so she was brought to the Magdalen laundry in Donnybrook. Her child was placed in Stamullen pending adoption.

Religious and moral concerns

8.81 Religion and sectarian divisions permeate all aspects of the history of Irish unmarried mothers, and they feature in many of these files. The mission of the CPRSI and St Patrick’s Guild, and British societies such as the Crusade of Rescue was to prevent Catholic infants becoming Protestants and to rescue women who were believed to be in danger of losing their Catholic faith. Those who worked with single mothers and their children appear to have been on the alert for indications that a Catholic mother, or more probably, a Catholic infant, was being handed over to a Protestant charity. When one young woman gave birth in the county home in Trim, her father contacted the Irish Church Missions to arrange for them to take her child, but this became known and his parish priest contacted the county manager. It was suggested that the grandparents might foster their grandchild and be paid for doing so through home assistance. The parish priest agreed to keep an eye on this case. A child, placed at nurse in Dun Laoghaire by a Catholic mother through the Irish Church Missions, was taken from the foster home to a Catholic orphanage; this appears to have happened because of a watchful neighbour. A number of Catholic women, who had previously been supported by the ICM, were admitted to mother and baby homes; some defied that process. A Catholic Monaghan woman, who was brought to the ICM by the Protestant father of her child, came to the attention of the authorities when her child, who was born in the home of an ICM foster family, was treated for scabies. She went to Sean Ross presumably with her baby, but returned almost immediately to the ICM home; arrangements were then made to admit her to Bessborough, but her ICM house-mother reported that she and baby had left for Belfast.

8.82 In 1946 Miss Litster noted that many Catholic women were admitted to homes maintained by the Irish Church Missions. She noted that ‘the information available’ suggested that these mothers ‘have tried and failed to obtain help from Catholic sources’. Bethany Home had agreed some years previously not to admit Catholic women or Catholic babies, ‘and apparently have kept that agreement…I do not think that the Irish Church Mission [sic] seek out Catholic unmarried mothers. On
the contrary, the mothers seek out the Irish Church Missions and ask to be admitted.\textsuperscript{11} Miss Cruice, the former Secretary of St Patrick’s Guild had arranged a meeting between Miss Litster and representatives of the Irish Church Missions. Reverend Coates, Director of the ICM, was willing to give an undertaking not to admit any Catholic mothers or babies ‘provided he were given assurance that any who appealed to the Missions for help would receive shelter and help from Catholic sources, and would not be told to apply for admission to a County Home’. According to Miss Litster, ‘that assurance, as things stand, cannot be given’.\textsuperscript{12}

8.83 Mrs Glover, the Bethany matron, referred a number of women to St Patrick’s Guild. In 1951 a department inspector interviewed a woman who had given birth in the Bethany Home. She admitted that she was a Catholic but had presented herself to Bethany as a Protestant; she had worked for a Methodist family who believed that she was a Protestant. Her employer appears to have assisted her in securing an affiliation order in court. A Catholic woman was a domestic servant for the widow of a Protestant clergyman, who referred her to the Magdalen Asylum (later known as Denny House). They sent her to the CPRSI. One mother and baby were sent by a senior assistance officer attached to a local authority, to Castlepollard, with instructions that ‘Baby was to be baptised Catholic and adopted into Catholic family’; the woman and her parents were Protestant and would pay for adoption. The Mother Superior asked that she be referred to a Protestant society; the department contacted the Church of Ireland Moral Welfare Committee.

8.84 One woman was engaged to the Protestant father of her child but her parish priest in county Monaghan would not give her a letter of freedom permitting her to marry him. Her child was born with cerebral palsy; her boyfriend was paying the bills but ‘his people have more or less put him off the marriage’. The child was diagnosed as ‘mentally defective’. One pregnant woman who was referred by her local priest was engaged to marry a Protestant, but the file noted that the marriage would not now take place - it is not known what happened to prevent the wedding. In another case the putative father was Protestant and the woman Catholic; he was travelling to Dublin to see her. The St Vincent de Paul Society, who were in contact with the woman, were keen that she go to Castlepollard before his visit, but the woman was not willing to leave until she had met him. A later note stated that the woman had ‘Promised to give up P.F if he does not agree to condition for

\textsuperscript{11} Department of Health, RM/ARC/0/489778.
\textsuperscript{12} Department of Health, RM/ARC/0/489778.
marriage’, presumably either to raise the child as a Catholic or that he become a Catholic. The woman travelled to Castlepollard. A woman who was admitted to a county home as married and a Protestant, left shortly after the birth with a man who claimed to be her husband. It emerged that she was single and a Catholic. They were traced (unclear by whom) to a guesthouse in Limerick and the infant was baptised by a local priest. St Patrick’s Guild took charge of the baby. A Mayo woman in a ‘non-Catholic home in London’, contacted a London Catholic welfare worker; instructions were given that she return immediately to Ireland - the woman was unwilling to go to Tuam, but the Mayo county manager would maintain her in Castlepollard.

8.85 A woman left Castlepollard with her new-born baby and went to CPRSI in Dublin. When they contacted Castlepollard the Mother Superior demanded that she return. The woman refused, stating that there was a prospect of marrying the father of her child who was in England. She also refused to go to Sean Ross, so she was sent to a nursing home on Dublin’s North Circular Road, which the CPRSI used as a short-stay home for unmarried mothers. She then went to the Protestant Adoption Society representing herself as Protestant, but they contacted the CPRSI seeking information. The ultimate outcome for mother and child is unknown. A Monaghan woman, who went to the Irish Church Missions and was received into the Church of Ireland, subsequently disclosed that she was pregnant. She then went to the CPRSI and explained that she had married the father of her child in a registry office. Arrangements were made to bring her by ambulance from the Rotunda Hospital to the county hospital in Monaghan.

8.86 In 1958 the department was contacted by phone from Regina Coeli. One of the workers had learned that a 19-year-old Wicklow woman was in Bethany and due to give birth. The Legion of Mary worker phoned Bethany, who confirmed that she was in the home ‘with her mother’s consent’ and she was ‘received into their church before she was admitted’. Regina Coeli referred the case to the CPRSI who suggested they contact the department. Bethany reported that this woman had one child in Pelletstown, and she intended removing that child to Bethany, but when Regina Coeli contacted Pelletstown, they had no knowledge of any child with the woman’s surname. Following lengthy efforts to contact the mother of this young woman, two members of the Legion of Mary went to Bethany to meet her - she apparently answered the door. The file notes that ‘Girl was abusive at first had been “instructed” by Irish Church Missions in January - said
she was desperate. Broke down finally and said she would come back; her three-month-old daughter had not yet been baptised. The legionaries left mother and infant in Bethany promising to call again; she wanted her baby adopted ‘does not want her committed or sent to foster home. Said she would like to make a fresh start if room could be got for mother and herself…Told by Bethany to “be strong” against Legionaries’. The Legion of Mary tried to involve the department, but although they referred this case to the assistant secretary there is no indication that the department took any action.

8.87 One 20-year-old woman travelled to England with the putative father, ‘who is said to be divorced’; they planned to marry in a registry office, but as she was under age she required parental permission. The CPRSI accepted responsibility for her baby. A woman was ‘sent over hurriedly 4-5 days ago’ to Regina Coeli when a British Catholic charity discovered that she was making arrangements to transfer her baby to a Church of England home. Some months later when the child was eight months old a priest intervened to try and get mother and child out of Castlepollard. A 20-year old woman was ‘sent back by nuns there - had been keeping bad company’. The father of her child was married and was reported as trying to divorce. She wished to return home and was put on the bus to Roscommon by the CPRSI but she wrote to them the following day saying that her father would not keep her; she was staying nearby with her grandmother. Her behaviour was described as ‘unbalanced’; the CPRSI agreed to make arrangements for the mother and her unborn child. An Irish woman was living in London with the putative father of her child. The file noted that he was not a Catholic and there was no prospect of marriage. He accompanied her to the Crusade of Rescue in Westminster. Their landlady, a Catholic, later rang the Crusade of Rescue and said that the story that her parents were dead had been concocted. The woman was under age, one of nine children; both parents were alive. She claimed that the ‘putative father helped her to invent the first story - of good family himself and thinking of his own ends’. The woman was sent to Bessborough.

8.88 The CPRSI assisted any case where there appeared to be a risk that a child would not be raised as a Catholic. A Donegal nurse, who had worked in Glasgow for seven years, and became pregnant by a named non-Catholic man, was assisted in going to Castlepollard. It is unclear whether Donegal public assistance authority paid for her stay; however they paid for her child's treatment in Coole orthopaedic
hospital. Catholic charities in Britain invariably treated cases where the woman was co-habiting with the father of her child as urgent. A file on one case - where the couple had gone together to England when she discovered she was pregnant - noted that it was ‘desirable to remove her from his bad influence’. One Offaly woman, whose first child was being raised by her mother, was described as ‘a weak type in moral danger’. She was in England ‘with father of both her children and his wife who does not know position’. The Offaly county manager agreed to her going to Dunboyne but he was prepared to maintain her and her child there for only a few weeks because of the cost. She had been living and working in England for five years.

8.89 The threat to place a child in a non-Catholic family was an effective means of securing the support of a charity such as the CPRSI. A 19-year-old woman was living in a non-Catholic nursing home; this case was described as ‘urgent’. An 18-year-old who had been a domestic servant in a Protestant house in Ireland was sent by her employer to the latter’s sister in England when it emerged that she was pregnant. An English Catholic charity expressed fears that she would ‘avail of Protestant Rescue’ - though that may have been a strategy to encourage prompt action by the Irish authorities.

8.90 A Cork woman in her late thirties, whose first child was born in England and adopted through the Crusade of Rescue, faced difficulties in placing her second child, and she was reported as arranging a non-Catholic adoption. She was immediately sent to a special home in Ireland. A Monaghan woman threatened to give her child to a Protestant home, possibly because her local public assistance authority had refused to maintain her in a special home. One woman whose baby was born in Sean Ross took the child to her mother in London. The Mother Superior of Sean Ross wrote to an English Catholic charity expressing her doubts about the baby’s religious welfare and an unidentified priest agreed that there was danger, so mother and child were returned to Sean Ross. The file noted that the baby ‘does not appear to be an adoptable baby, may prove to be MD [mentally-defective]’ so arrangements were being made to place him in an institution.

8.91 The Department of Health was the contact point for English local authorities and English Catholic adoption societies who were processing the adoption of English-born children of Irish mothers. Many mothers appear to have returned to Ireland without signing consent papers. The department was also the contact point for
English local authorities and Catholic charities in cases where an Irish mother had given birth in England and disappeared. The department, and most especially Miss Clandillon, was concerned about possible adoptions by non-Catholic families. When she was forwarding a query from Lanarkshire to the children’s officer in Wexford she noted that she was ‘not altogether happy about the case…we are not given the names of the proposed adoptors [sic], nor is their religion stated’. The form that had to be signed noted that the mother had already given consent - this was merely a confirmation. She continued:

If you are not satisfied that the adoptors [sic] are Catholics and if the mother is willing to withdraw her consent it would be advisable to refer the case to Catholic Protection and Rescue Society. In these circumstances it would be best not to return the forms to [a Lanarkshire official], until the Society has had time to act. We had a case some time ago in which the mother had given her consent to the adoption of her baby by non-Catholics. Catholic Protection saw the mother and she agreed to travel over for the hearing with somebody from the Society who briefed a lawyer there. The upshot of the case was that the baby was brought back to Ireland'.

8.92 At no point in this letter is any consideration given to the interests of the child - who might have already spent some time with adoptive parents. The wishes of the mother are also treated with scant consideration. A similar obsession with religion occurs in the case of a woman who had a child, presumably in Ireland and later married in England. Her daughter had been boarded out with a family in Ireland for many years; her mother and stepfather called to see the teenager, and her mother was anxious to take her to live with them when she reached the age of 16 (and would no longer be in the care of the local authority). Miss Clandillon was ‘rather worried about the matter as it is not clear whether the marriage took place in the Catholic church or whether […] are suitable people to have the care of […]’. She contacted a parish priest in Manchester, near where the mother and stepfather lived, seeking information. This is another example of the blurring of the line between church and state.

8.93 The files record strong prejudice against Irish women in Britain associating with men from ethnic minorities. The CPRSI feared that a Monaghan woman who had recently given birth in London and was scheduled to return to Ireland might no

---

13 Department of Health, RM/ARC/0/489433.
longer be willing to enter a mother and baby home ‘because she had got in touch with a coloured man’. A pregnant woman who had recently arrived in England was described as working in a ‘low type of café frequented by coloured men. Not given time to go to Mass’. The English Catholic welfare society was ‘anxious to get her out of these surroundings as soon as possible’. A woman who was repatriated from Lancashire was reported by a religious sister, who worked with the local Catholic welfare society, to be living in ‘a mixed lodging house, where she shares a room with three other girls and coloured men are among the lodgers’.

### Outcomes for the children

**8.94** In the majority of cases, family assistance did not extend to welcoming the new mother and baby back to the family home. While women entered mother and baby homes prior to giving birth, others only went to these homes after the birth - an indication that for many women the real problems began following their discharge from a maternity hospital or nursing home. Some women gave birth at home and were then admitted to a mother and baby home, as happened with a young woman who was keeping house for her widowed father, a farm labourer, and four brothers. Her local priest had contacted the CPRSI seeking a place in a mother and baby home. It is not clear if her father and brothers wanted her and her baby to leave home or if this was done on the initiative of the priest. This was one of several cases of babies born at home ‘who will not be kept at home’. The mother of one single mother wrote to the department stating that ‘her husband is aware of the existence of the baby and is willing to forgive her but will not accept baby’. Some files indicate that parents were prepared to take mother and child and provide for them - but that might mean placing the child at nurse. One father dispatched his daughter to England with her new-born child, only to have her sent back by an English Catholic charity. However when this widowed father was contacted he agreed that mother and baby could come home - she was accompanied by a welfare worker to make sure that all was well.

**8.95** Another widower, whose daughter had been housekeeping for him, was willing to have her return home, but without the baby. That was all too common. Equally, if not more common were statements such as ‘parents know about baby but are unwilling to take mother and baby home’. In another case it was reported that the woman’s mother, ‘a widow has no home to bring her to’ and counties Meath and Dublin disputed financial liability.
A number of women were pregnant for a second or a third time. There are many instances where a woman’s family was raising her first child, but seemed unable or unwilling to take a second baby. One Louth woman, who was pregnant for the second time by her employer, gave birth to her first child in her parent’s house without medical care. She told the CPRSI that she ‘does not know what parents did about it - they said it was stillborn’. Her parents were not aware of the second pregnancy. They were described as small farmers; the 25-year-old putative father was supporting his parents so could not marry. She was sent to Dunboyne. The parents of a 21-year-old woman, on her second pregnancy, were raising her first child. They knew of her pregnancy, but ‘have turned her out’, so she went to London. A woman pregnant for the second time (there is no information as to the whereabouts of her six-year-old daughter) reported that her parents had prevented her marrying the father of her first child. The father of her second child was English and Protestant and she had approached the Protestant Adoption Society who referred her to CPRSI. She is described as wanting to go to Bessborough. If a pregnant woman had a married sister, she was often contacted by the Catholic charities to see whether she would take the baby and there are reports of children being adopted by a married, childless sibling or an aunt.

Some parents who were raising a daughter's first child were unwilling to raise a second or subsequent child. The mother of a woman, who was pregnant for a second time, contacted the department and asked that she be sent to a mother and baby home. In both cases the father was their next door neighbour - he was paying £1 maintenance for the first child, who was being raised by her maternal grandparents. Payments had ceased and the putative father was being brought to court. The grandparents were unwilling to raise a second child, because their home was crowded - with parents and six resident children (mainly adults). The woman was admitted to Pelletstown. In the case of one woman, pregnant for the second time, whose three-year-old child was being raised by her parents, the father of her first baby was reported to be anxious to marry her, but he did not know about her second baby. It appears that this child was placed in a district hospital in Louth. There are several cases where a woman, pregnant for the second time, had been working and contributing towards the upkeep of her first baby. One Longford woman, repatriated in 1944, had given birth in Sean Ross in 1936. She had taken up a domestic service job in Dublin, having agreed to pay Longford county council 5s a week towards the upkeep of her child, who was presumably boarded out. In 1947 she is reported as unemployed and owing them
£6; Longford enlisted the assistance of the NSPCC in securing the arrears. She decided to have her child committed to an industrial school, which would relieve her of financial responsibilities but may not have been in the best interests of her child. A 34-year-old Donegal woman was pregnant for the fourth time: two children were at home with her mother, a third had been ‘adopted’ in Dublin. She had arranged with the midwife and doctor for a home birth, but her mother was ‘anxious to get her away’. A factory worker, who lived with her widowed father and brothers, and her first child, believed that she would have to arrange for her second child to be adopted. She was being admitted to a special home; and expected that the neighbour who minded her child while she was at work would continue to do so while she was in the mother and baby home.

There is evidence of growing resistance/impatience at the requirement to remain in a mother and baby home for two years. One woman wrote to the Taoiseach, John A Costello, asking that her daughter be permitted to leave Castlepollard and leave her baby behind. Many mothers wanted to place their child either in a home or with a family and return to paid employment, but the system frequently did not facilitate this. A domestic servant who made this request was sent to the county home in Wicklow prior to taking paid employment in the county sanatorium. The aunt of a woman admitted to Sean Ross explained that the woman’s mother was anxious to have her daughter released home for a week’s holidays; and this was arranged. They were also trying to have her baby placed at nurse, but could not afford the £100 fee. Miss Litster pressed for arrangements to be made that would enable the woman to return home. One woman from Wicklow, who was referred to the CPRSI by a local priest, had been planning to travel to England. She was reported to have agreed to remain in Ireland if she could go to a home in Dublin. ‘Appears she had heard stories of length of stay in Roscrea and Castlepollard and knew girls there’. Her family were aware of her pregnancy and they could visit her if she was in Dublin. The local authority ‘could not see any reason for maintenance in St Patrick’s Navan Road’ (Pelletstown) - the department tried to change their mind, but the outcome is not recorded. The aunt of one woman who was in Pelletstown wrote to the minister asking that she should not have to remain for 12 months in the home ‘as her help was required at home’. The department suggested that her aunt should take the baby, but she was afraid that the neighbours would know that it was her niece’s child. The aunt later decided to adopt the baby. A woman who had been in the county home in Stranorlar with her three-year-old son contacted the department because ‘she was anxious to get out’.
This woman wrote regular letters to her mother, who was in Gloucester Street Magdalen Home, threatening to take her child to England. The authorities told her that because she was a native of Sligo she would have to return there if she wanted her son ‘fixed up’. Further ‘frantic’ letters followed from the woman saying that the matron of the Donegal county home would not let her leave without her child. Mother and baby were finally transferred to Sligo; the woman went to her aunt; her child to Nazareth House, and her mother who had been in Gloucester Street left the convent after 12 years there. Women were obviously conflicted about future arrangements for their baby, and some changed their minds; it is impossible to establish whether this happened because of pressure being brought to bear on them, by family or by the authorities in the mother and baby home. One mother in Sean Ross was noted as having told the Mother Superior that she was unwilling to have her child adopted, but she told the department inspector ‘that she was anxious to have him adopted’. A file relating to a woman from the west of Ireland who gave birth in Belfast City Hospital described her as ‘not willing to be separated from her child’, and arrangements were being made for her to be admitted to Castlepollard; however a further note indicated that her baby was being admitted to Nazareth House and the mother was not going to Castlepollard. Another file notes that the mother was ‘not at all interested in child’. A woman who had been repatriated from England and admitted to Sean Ross ‘panicked about adoption of baby and left Sean Ross, turned up at CPRSI who promised to take child at three months if she went to Manor House’. The file notes, ‘Sending her by bus’. Some women in Sean Ross applied to have their children admitted to an industrial school so that they could then leave - see Chapter 19.

8.99 A small number of files indicate where the mother went following her discharge from a mother and baby home. One 19-year-old domestic servant, who had been working in Dublin, gave birth in one of the city’s maternity hospital; she and her child were sent to Castlepollard. Two years later, in 1946, she took up a domestic position in the Leopardstown hospital (a British military hospital), and from there transferred to a military hospital in England. When she left Castlepollard, her child went for a brief period to a county home, but she removed him and placed him at nurse in Dublin. The county manager agreed to pay for his boarding out in Dublin. This mother subsequently reclaimed her child and brought him to England.
Conclusions

8.100 The stories recounted above give some indication of the hardship, heartbreak and complexities associated with single pregnancy in the Ireland of the 1940s and 1950s. They highlight a number of key factors: the fathers of these children; families and the central role played by the local authorities. Religion is also central in a variety of ways: denominational charities in Britain and Ireland acted as advice and referral centres and their values often determined a woman’s fate, and the wish to ensure that a child was raised in his/her mother’s religion was implicit in the decisions made by department officials. Priests were often the first people to be contacted by pregnant women; the person who wrote or telephoned the CPRSI or the department, an indication of the lack of social services, and some distrust of local authorities - most especially women’s fears that their pregnancy might become known. The department was sensitive to the concerns of women who were desperate to keep their pregnancy private, and they were highly critical of local authorities who betrayed that confidentiality; they tried to meet the women’s wishes to go to a particular home or not to go to a particular home, but there is no sense that any alternatives were available to entering a mother and baby home, and placing a child for fostering or adoption.

8.101 The files reveal the gradual break-down of the rule restricting entry to special mother and baby homes to first-time mothers. One woman on her second pregnancy, who had left Ireland, wrote to Sean Ross asking to give birth there but wishing to leave when her child was three-four weeks old. It was suggested that she should be admitted to Dunboyne, which was originally opened as a mother and baby home for women on their second or subsequent pregnancy. By 1955 however it is evident that Bessborough and the other special homes were accepting some women on their second pregnancy, presumably because of falling numbers. However in 1957 Bethany refused to accept one Protestant woman, who was pregnant for the fourth time and Braemar House was likewise unwilling to admit her; the department hoped that Miss Litster might persuade them to change their mind when she visited Cork. A Leitrim woman in Birmingham was pregnant for the third time. Her first child was born in England and ‘taken by Birmingham Catholic Rescue’, because the mother refused to return to Ireland. Her second child was born in Castlepollard and boarded out by Leitrim. When she became pregnant for a third time she wrote to Sean Ross asking for admission, but the Mother Superior informed the CPRSI that as she had not lived in Leitrim for five years, the local authority was unlikely to accept maintenance charges. The
department proposed to contact the authorities in England to see ‘if other help forthcoming’. This woman gave birth to a daughter in England and again wrote to Sean Ross asking for admission. The department suggested that the Mother Superior might appeal to the local authority ‘on moral grounds’. This apparently proved successful. Her efforts to secure admission to a mother and baby home, and countless other stories in this chapter, call into question the widely-held opinion that women were sent to these homes against their will. Mother and baby homes were often the only shelter available to unmarried mothers.

As noted earlier, these files do not reveal any information about the women’s experience in a mother and baby home. A woman in Castlepollard was described as ‘very despondent’ when seen by the department inspector. The inspector asked a social worker to write her a cheerful letter; she is unlikely to have been the only woman in a mother and baby home who was depressed or ‘despondent’. In one case it is reported that a woman had received a letter from a man with an address in Kent advising her to abscond from Pelletstown. The department advised the Mother Superior and doctor to get an ambulance and send mother and baby to Castlepollard. A later report from Castlepollard said that ‘she gives great trouble to the sisters. Does not wish to part with baby’. This snippet appears to indicate that the woman’s letters were opened and read in Pelletstown, secondly that she was transferred to Castlepollard without regard to her wishes. A mother’s wishes were generally respected when it came to deciding which mother and baby home she might enter, but women had much less traction when it came to bigger decisions - about her future and that of her child. A Kilkenny woman ‘wanted a quick adoption at first’ but she was told that this was not possible, so she agreed to go to Castlepollard; the CPRSI was involved, as was the local doctor. Many files note statements such as father ‘anxious to have baby adopted soon after birth so that girl can return home’ which suggests that this critical decision was being made by a parent, not by the woman. ‘Girl anxious to keep baby’, recorded on one 1951 file is noteworthy - one of very few statements to this effect. Women could be subjected to the influence and advice of several individuals/agencies that might tug in different directions. The records on one woman note that a local priest was ‘instrumental in getting her away to England’ and he was annoyed at the ‘interference’ - by the CPRSI - because he had arranged for the baby to be admitted to Nazareth House. One woman who gave birth in Castlepollard ran away with her child and returned home - on foot. Her parents took charge of the child and the child’s mother - allegedly ‘of her own volition’ - went to the Magdalen
home in Donnybrook. But two years later she was reported to be ‘fretting after the child, would not agree to adoption; stated her father would be cruel to the baby. Said she wanted to go home at once; appeared to be on the verge of a mental breakdown’. The sister in charge in the Magdalen home arranged for her to return home for a brief visit. The department suggested that the woman needed a medical or psychiatric check-up, but there is no indication that this happened. The last report stated that she was at home, and wanted to find employment as a domestic servant close to her home and her child.

8.103 These diverse stories indicate that women who became pregnant outside marriage faced a series of crises: homelessness, loss of employment, destitution, possible rejection by their family. Mother and baby homes provided immediate relief from these challenges, but these women had little if any choice about the long-term future of their child. Few women at this time earned enough money to support themselves and their child, and even fewer would have had the confidence to withstand the opprobrium that they would face, from family, neighbours and society.
Chapter 9: Attitudes

Introduction

Unmarried motherhood has proved as problematic in Ireland as it has in most other European countries. Reflecting badly on the moral character of the woman, unmarried motherhood carried a stigma that was almost impossible to shake.¹

9.1 The attitudes towards unmarried mothers and their children and how they changed over time are illustrated throughout the Commission’s report. This chapter does not pretend to duplicate that information. It examines some of the broader aspects of that topic including Irish society’s attitudes towards marriage and sexual reproduction and the relationship between Catholic teaching, government and Irish society, as a prelude to exploring the attitudes towards unmarried mothers and their children in Ireland and internationally. In relation to Ireland the focus is on statements by national and local politicians, clergy, public servants and professional women and men. Chapter 8, which gives short case histories of many women who contacted the Department of Local Government and Public Health from the 1940s to the 1960s, contains extensive evidence about the attitudes and behaviour of families and putative fathers. The time period covered by this chapter is from the early-twentieth century until approximately the late 1960s. This cut-off date is determined by a major change in the nature of the evidence at that time. Until the mid-1960s, almost all the evidence comes from court cases, reports of local authority meetings, sermons, evidence to government inquiries, government files, and a small number of articles in periodicals and newspapers.

9.2 The most common public response to ‘illegitimacy’ in the past was silence - though that did not preclude gossip, ostracism and widespread censure. Most of the Irish material cited in this chapter comes from the 1920s and the 1930s; there was relatively little discussion of unmarried mothers in the 1940s or the 1950s, except in relation to adoption - and the focus in that material was on the children and would-be adoptive parents. At no time in the first 50 years after independence was unmarried motherhood a dominant preoccupation for politicians, churchmen, public servants or the media. Catholic clergy preached about the decline in moral standards but they rarely made specific reference to unmarried mothers; local

councillors denounced the cost of unmarried mothers and their children to ratepayers, and so-called experts expressed opinions about the intellectual, moral and emotional state of unmarried mothers and perhaps their children. Media coverage was generally indirect, likewise the references in Lenten pastorals, Dáil debates and other public fora. When a priest or a bishop thundered from the pulpit about the evils of modern life, ‘illegitimacy’ was generally mentioned only en passant in a litany of ‘occasions of sin’ that included dance-halls, cinemas, motor cars, immodest dress and immoral literature. References to unmarried mothers in publicly available media were limited until at least the 1960s and, with the exception of infanticide cases, they tended to be couched in indirect language, and they rarely provided any sense of the women and their stories: their voices are absent.

9.3 There is much more public reportage and debate about extra-marital pregnancy and about the treatment of the mothers and their children from the mid-1960s - this is discussed in chapter 12. By then attitudes were changing, and the expanding media coverage informed policy towards the mothers and their children. One underlying question is whether attitudes and practice towards unmarried mothers were significantly different in Ireland than elsewhere - and if so, what determined these differences? With that question in mind, this chapter opens with a discussion of Irish society and the Irish family in the early-twentieth century.

The family in early-twentieth century Ireland

9.4 Ireland was a predominantly rural and agrarian society until the 1960s. Provincial towns mirrored the structures and attitudes of farming Ireland - they were also dominated by family businesses, social gradations, and familial networks. In the decades after the great famine of the 1840s Irish society developed some distinct features - a sustained high rate of emigration; a pattern of late marriages and a low marriage rate, but those who married had very large families, particularly when the late age of marriage is taken into account. Approximately one in four adults aged 45 and older were unmarried and it would appear that only a minority of single adults were sexually active. At various stages during the years from the 1920s to the early 1960s fears were expressed about the low marriage rate and the reluctance of Irish men to marry. These were probably best encapsulated in the edited collection The Vanishing Irish, published in the mid-1950s, which warned that ‘Today Ireland is teetering perilously on the brink of near extinction’. Most of the blame was placed on ‘the strangest species on the face of the earth today [is]
the Irish bachelor’, who ‘Instead of engaging in the social life common to men and women in other countries, the Irish bachelors spend their evenings in “pubs”, engrossed in cards, drinking and endless chatter about horse racing’.  

9.5 Attitudes towards ‘illegitimacy’ and premarital pregnancy were shaped by a wider social system governing decisions about marriage, inheritance, emigration and authority within the family. Marriages were few and late because of a wish to preserve the family farm/family business and pass it intact to the next generation. Matchmaking and dowries formed an integral part of the marriage process and marriage was often linked with transfer of the family enterprise. Attitudes towards ‘illegitimate’ births and extra-marital sex must be seen in that context. One sociologist used the term ‘prolonged parental control’ when describing Irish families.  

Earner-Byrne suggested that the ‘very existence’ of unmarried mothers and their children ‘violated all understandings of family and morality…Understandings of sexuality and appropriate sexual behaviour in Ireland were informed by the cultural understanding of the family and its social status. There was little room for sexual individualism in a society that considered the family guilty by association with very real consequences’. 

9.6 In the 1930s a team of anthropologists from Harvard carried out a study of life in county Clare, and although some elements of their analysis are open to question, their research provides a framework for exploring attitudes towards the unmarried mother and her child and they identify features that might help to explain why Irish attitudes towards ‘illegitimacy’ might differ from those in other countries. In the Irish countryside, and to a lesser extent among small town businesses, inheritance was critical. By the 1920s most farmers owned their farm and they were determined that it should remain intact and in family ownership. Families were large but there was no automatic right of inheritance, for example, by the eldest son. Land almost always went to a son or nephew, not to a female relative. The father, and if he was dead, the mother, determined who would inherit. Arensberg and Kimball described the father as ‘the court of last resort, which dispenses punishment for deviations from the norm in all spheres’. They noted that ‘the

---

family relationships regulate sexual conduct…the technological training of the individual [in farming] goes hand in hand with the sexual. Marriage prohibitions, like the sanctions of the exercise of sexual rights in marriage, are part of and take their form in family groups. A son who deviated from acceptable norms - by marrying a young woman without a dowry or a woman from a less respectable family - perhaps the daughter of a farm labourer - would not inherit. Matchmaking was central to marriage among ‘respectable’ families in rural/small town Ireland. It involved assessing ‘the relative status of the families and any possible barriers to the union, such as consanguinity, insanity, or notorious crime in past ancestry’. Arensberg and Kimball cite the case of a man who eloped with a servant girl; his mother would not let him return home - she sold the farm. A daughter who married in a runaway match was disowned by her family. ‘A runaway match upsets the whole pattern’; it generally involved “‘marrying beneath’”; in such cases ‘the son is usually cut off and the daughter leaves a very good place for nothing but a cabin and they get none of the money’.

9.7 If a runaway match was punished in this manner, giving birth to an ‘illegitimate’ child was regarded as an even greater crime.

To “destroy a girl’s character” in the countryside is to upset the pattern of family and community life by overthrowing the possibility of an orderly change in farm succession. Much more than a shooting or a fight, a sexual irregularity which cannot be righted in a match is capable of destroying the intricate mutual obligation and expectancies of rural familism.

9.8 In some cases a match was hastily arranged for the couple; the alternative was ‘to expel the offenders bodily’. While expulsion was a more common fate for the woman, some men who were known to have fathered an ‘illegitimate’ child were forced to emigrate and lost their prospects of inheriting the family farm. Arensberg and Kimball claimed that such action would be supported by the community. The knowledge that a woman had an ‘illegitimate’ child would damage the marriage prospects of her brother(s) and sister(s). The ‘family’ often extended well beyond the nuclear unit, so knowledge or rumours of ‘illegitimacy’ among cousins, nieces or nephews could impact on a family’s standing in the community. Emigration was often the only option, though some men who were known to have fathered a child

8 Family and Community in Ireland, p. 208.
might manage to remain at home. There was a close association between a family’s standing and the sexual status of that family.\(^9\)

9.9 The late age of marriage reinforced the need for a stringent code of sexual relations; ‘the comment and attitude of the small farmers towards sexual behaviour cannot be divorced from their appreciation of status in family or community’. Arensberg and Kimball reported that

The farmers and their wives were full of animus against ‘the “crabbit” great “bucks” of lads who led girls astray and from whom the innocent were not safe’. However they also believed that ‘the pure young maidens are also not without blame’. On the specific topic of premarital intercourse and ‘illegitimacy’, ‘the question would arise. Would you believe such a thing could happen in Ireland? In such countries as England and America well it might, for there, the country people hear, the boys and girls just take a liking for one another and go off and marry and “never mind the money”. And we remember that in this case the “money” means the re-formation of the entire two families as well’.

9.10 They suggested that ‘country people’ did not explain premarital sex or ‘illegitimacy’ in terms of emotions, but rather that ‘young “bucks”’ tried deliberately to impregnate the girls and force marriages. They were motivated by greed for land and dowries. ‘Sex without familism seems beyond the country people’s imagination’. ‘Illegitimacy’ or premarital sex was identified with ‘the debased conduct of the lower ranks of the landless and disreputable of the countryside, the labourers of the towns, the runaways, remnants of broken households’.\(^10\)

9.11 A man or woman who was known to have been involved in a premarital pregnancy lost their standing within the community and were viewed as akin to the disreputable lower social orders. Earner-Byrne claimed that ‘sex outside wedlock demeaned the family and threatened the social order’. She further noted that ‘The issue of reputation was central to much of the social control exercised in Ireland. The fear of the loss of one’s reputation was based largely on the understanding of the family as a unit: if one member disgraced themselves the rest of the family was tarnished’.\(^11\)

11 Earner-Byrne, ‘Reinforcing the family’, p. 363.
9.12 Arensberg and Kimball are unusual in explicitly addressing the question of ‘illegitimacy’. Robert Cresswell’s account of Irish rural society in the 1950s, which was centred around Kinvara (close to where Arensberg and Kimball had conducted their field-work), does not mention ‘illegitimacy’. Sklar suggested that in Ireland ‘the problems posed by illegitimacy were aggravated because inheritance of property was the basis for a marriage and thus the basis also for maintaining or improving relative social and economic status. Lines of descent and inheritance had to be defined clearly and unambiguously so that families could assess with reasonable assurance whether a match would sustain or improve their social standing, and the legal status of an illegitimate child made such assessment difficult, if not impossible’.

9.13 Inheritance, dowries and matchmaking were less important in Dublin and other cities and large towns, and they had no significance for working-class families, but a family’s standing remained critical. Humphreys, who carried out field-work in the late 1940s and early 1950s, suggested that Dublin families kept a very close eye on their children’s potential marriage partners. The following quotation concerns the family of a skilled worker. ‘When a boy and girl began to take serious interest in one another, their parents, according to one of the Dunn’s neighbours, would investigate each other’s family “root and stock, seed, breed and generations”. The parents were less concerned about money, than “what sort of people they were”.

9.14 Some of the more thoughtful comments about Irish unmarried mothers were very critical of family attitudes towards an extra-marital pregnancy. In 1936 Gertrude Gaffney published a series of articles about Irish women in England. One article, which concentrated on pregnant single women, was titled, ‘Unchristian attitude of parents’:

All the priests, nuns, and lay people connected with rescue work in London spoke with great severity of the unchristian and inhuman attitude in Ireland towards the unmarried mother, and declared that this attitude made their problem so much more difficult and gave the girl or child very little chance of making good.

Mother’s Attitude

---

One priest told me of a girl brought to him who was the daughter of a well-off farmer. When her people discovered her condition, her mother had given her enough money to get to London, and told her she never wanted to see her again.

‘Can you imagine,’ he asked me, ‘any mother treating her child like that? I wrote to the priest about her. I wanted them to take the girl back again and let her put the child into a place where she could see her from time to time. But the mother would not have her. And I am sorry to say the priest took her side. Do you think that would have been the attitude of Our Lord?’

You can tell them in Ireland that what they want is more charity and more Christianity in their outlook on these matters.

We have no trouble at all with the English girls; their relatives will take both the girl and the child, and if the girl goes back to work they will bring up the child and give it the same normal existence as any other child. And the man will usually contribute something. The Englishman takes his responsibility in these matters. The Irishman gets off scot free; he has the same callousness as the parents and relatives, and everything is done to encourage that callousness’.  

9.15 In 1951 the gynecologist Bethel Solomons addressed the annual general meeting of the Dublin Magdalen Asylum (later known as Denny House), a mother and baby home that admitted Protestant women. He said ‘that there was nobody more neglected than the unmarried mother and he thought it was “disgraceful” the way parents treated their unmarried daughters. In his long experience of obstetrics he had seen many girls who would not “have gone to the bad” if their fathers and mothers had looked after them in their trouble’.  

9.16 The damage that an extra-marital pregnancy would do to a family’s social standing was undoubtedly a major factor in the reluctance of many pregnant Irish women to inform their parents/family and it might explain, but cannot justify, the hostile reaction that they often encountered if a pregnancy became known to a woman’s family or the local community. This hostility explains the quest for privacy - the tendency for women to leave home and move either to Dublin or to England. There is substantial evidence of this search for anonymity; pregnant women who were repatriated from Britain frequently refused to enter the mother and baby

---

home that was closest to their home (see Chapters 7 and 8). The wish for anonymity was also cited by the Congregation of the Sacred Hearts of Jesus and Mary as the reason why women were given a different first name in mother and baby homes. Although this explanation is disputed, it should not necessarily be rejected out of hand, and the practice of giving women a different name was not confined to Ireland.  

9.17 Within the family pregnant women appear to have found more sympathy from female relatives; or perhaps they were more inclined to confide in their mother or sister. Rattigan and Guilbride, both writing about infanticide, quoted women who expressed fears at the response of their brother(s) or father if they discovered her pregnancy - ‘afraid of her brothers to go home’. But they also record cases where pregnant women feared their mothers; some instances of sympathetic fathers and women who came under pressure from relatives to kill their infant. Shame was ‘one of the motivating factors in a number of cases involving relatives of the birth mother who assisted the infanticide; one mother explained that they had assisted in the infanticide in order “to shield her daughter’s shame”’. Rattigan noted that ‘in Ireland, and in rural Ireland in particular, the police pursued and investigated rumours about unmarried pregnant women…communities across Ireland felt they had the right to intervene and inform the authorities about unmarried women suspected of having killed an infant or concealed its birth. Sexual transgression was seriously frowned upon by most Irish people at this time. There appears to have been little sympathy for single women who became pregnant outside wedlock. Rural communities did not support such women; instead, they informed on them. In so doing they made clear their intolerance of such behaviour’.

9.18 One of the most common responses historically to an extra-marital pregnancy was for the couple to marry before the birth of their child. In 1939 the UK Registrar General estimated that almost 30% of all mothers were single when they became pregnant with their first child, though almost 70% of these women married before the child was born. Thane and Evans suggest that one factor in the rise in

---

17 Women in Pelletstown and Tuam used their own names; women in Denny House traditionally were not known by their own name; there is no evidence that this happened in Bethany. For the USA see Marian J. Morton, *And sin no more. Social policy and unwed mothers in Cleveland 1855-1990* (1993, Cleveland), p. 10.
19 Rattigan, ‘What else could I do?’ p. 188.
‘illegitimate’ births during both the first and second World Wars was the difficulty that couples might face in marrying - because of military service, or the death or imprisonment of the father.\textsuperscript{21} There does not appear to be comparable data for Ireland. In the years 1943-45, just under 7\% of married women who gave birth in Dublin city had been married for less than six months.\textsuperscript{22} Fr Anthony Gaughan, writing about his experiences as a priest in a working-class Dublin city parish in the early 1960s, claimed that ‘quite a few’ of the marriages at which he officiated were ‘ARPs - the sign we put after marriages where the young lady was already pregnant’.\textsuperscript{23} Given Ireland’s low marriage rate and the proportion of marriages that were dependent on inheritance or parental approval, Irish couples may have found it difficult to arrange a prenatal marriage; this is indicated in some of the stories told in Chapter 8. The reluctance of Irish bachelors to marry may have resulted in a lower proportion of post-conception marriages than elsewhere. However in 1966 the master of the Coombe Hospital, Dr Feeney, claimed that approximately half of 300 unmarried women who enrolled in the hospital’s antenatal clinic, (he does not give the time period) married before the birth of their child.\textsuperscript{24}

9.19 Given the stigma associated with births outside marriage, it is not surprising that impressionistic evidence suggests that the proportion of children of Irish unmarried mothers who were raised within the maternal family was lower than elsewhere. Lucy Desmond of the Liverpool and County Catholic Society told the Carrigan Committee that ‘The ordinary Catholic girl of this City [Liverpool] who falls does not run away from home - she goes into the institution and returns with her baby into the family circle again. The Irish girl, D.V.\textsuperscript{25} has the sense of shame and flees, but all this does not solve the problem’.\textsuperscript{26} In England in the 1930s and 1940s ‘many unmarried mothers and their children vanished from the official record through absorption into the mother’s own family’.\textsuperscript{27} In 1933 21\% of ‘illegitimate’ children in Manchester lived with their maternal grandmother. Thane and Evans relate the story of a grandmother who asked the National Council for the Unmarried Mother and her Child to arrange for her daughter’s baby to be adopted because she was

raising her five children and could not cope with an additional child. There would have been many similar grandmothers in Ireland. A survey carried out in England in 1945 of 7,500 children born in areas with high rates of ‘illegitimate’ births, reported that 81% of the infants remained with their mothers and 59% of these mothers were living with their parents. These statistics suggest that if an unmarried mother was to keep her child, she needed the support of her family, and a willingness to accept mother and child to live in the family home.

In Ireland neighbourhoods and communities were close-knit; it would be difficult to pass off a young child as the offspring of her grandparents; her/his presence would be a constant reminder of the family’s loss of status. Even if such prejudices could be overcome, Irish families were among the largest in the western world at this time. Most houses were small and they were often overcrowded, so an additional child would have been a major inconvenience and a drain on resources. Many families were poor. Marriage of the inheriting son was dependent on the house being cleared of non-inheriting siblings. In the early 1960s the Limerick Rural Survey reported that many farmers’ sons were unable to marry, even after the death of both parents, because they had a brother(s) and/or sister(s) living in the family farmhouse. An unmarried mother returning home with her child, and an ‘illegitimate’ child/grandchild as a long-term resident would have jeopardised an heir’s marriage prospects. Until the 1960s Irish couples married at a late age; around 29-30 for women and mid 30s for men - much later than in other countries, which again made it more difficult for an Irish grandmother to pass off a grandchild as her child and meant that in some cases the grandmother was dead or incapacitated.

Concern with a family’s reputation and an unwillingness to take a daughter and her child into the family home influenced decisions about a pregnant woman leaving her home and her local community and going to a mother and baby home. Nicholson’s 1968 study of English mother and baby homes noted that there seemed to be a regional difference in the prevalent attitude towards illegitimacy. All the factors which might reflect the force of social pressures were more marked in the south than in the north. There were proportionately more residents in the southern region than in the north who concealed their

---

pregnancy from their family...more likely to have moved away from home during pregnancy and less likely to return to parents on leaving Home. Less likely to have contact with friends and relatives.

9.22 She suggested that unmarried mothers in the south of England ‘had suffered more than those in the north from the social stigma’. In the north of England ‘unmarried mothers were left in no doubt of their neighbour’s disapproval and they themselves felt they warranted it. But with the disapproval of their conduct went sympathy...willingness to ease the difficulties...offers of practical kindness’.

31 In the United States in the 1950s black families were much more willing to accept the child of an unmarried daughter whereas ‘If a girl were white and broadly middle class...there was a pretty fair chance her parents would pack her off to a maternity home just before she began to “show”’. A family’s standing in the community, and with their friends and their local church was a key consideration.

32 Greenlees, writing about Scotland states that ‘throughout the twentieth century, family support was a crucial factor in enabling women to keep their baby, including acceptance of themselves and their baby and with practical financial support’.

Religion

9.23 The Irish Catholic church enjoyed a dominant position in Irish society until the closing decades of the twentieth century. In the decades between the end of the great famine and Irish independence the overall population almost halved; the number of Catholic clergy doubled and the number of religious sisters quadrupled. This expansion in the number of religious continued after independence; the peak was in the mid-1960s. Many Irish families had a close relative who was a priest, religious sister or a religious brother. In rural parishes the priest was often the best educated member of the community (and the best-educated member of his family); in provincial towns he belonged to the tiny educated and social elite. Their education and an attitude of assumed authority meant that priests were often viewed as community leaders. They were the managers of the local national school; commonly chaired the vocational education committee, determined whether a particular book was suitable for the public library, and they played a leading role in community development, and in securing government assistance - leading a delegation to Dublin seeking a new industry or a new school. Many

33 Janet Greenlees, Unmarried motherhood in Scotland during the twentieth century: Mother and Baby homes (Nov. 2015), p. 24.
families, faced with a pregnant unmarried daughter, sought their advice; files also indicate that some women confided in a priest rather than her family. So their advice was often sought and followed though it should be noted that only a small minority of women in the mother and baby homes give ‘religious’ as a referral pathway.

9.24 The nineteenth century was a deeply religious age, marked by increased church attendance, a ‘devotional revolution’ among Irish Catholics, and a militant evangelical movement among Irish Protestants - which has been described as ‘the second reformation’. Catholic and Protestant churches shared a common fear that people in need, especially unmarried mothers and their children, or impoverished widows and destitute married couples, would consent to their children being raised in a different religious denomination in return for economic assistance. 34 This denominational competition was a major impetus for the establishment of mother and baby homes and charities such as St Patrick’s Guild and the Catholic Protection and Rescue Society of Ireland.

9.25 During the nineteenth century the Irish Catholic church sought to overcome the discrimination that it had experienced under the penal laws. As part of that process it created an infrastructure of Catholic hospitals, orphanages, and other charitable institutions that were designed to ensure that Catholics no longer had to rely on Protestant charities. The British administration in Ireland was willing to delegate the running of institutions, such as industrial schools and nursing services in the workhouses, to female and male Catholic religious communities. By doing so it fostered a network of state-supported charitable institutions and state-run institutions, such as workhouses, where important roles, such as manager or matron, were delegated to members of religious communities. This network of state-supported, sometimes state-controlled (as in Kilrush, Tuam and Pelletstown) institutions, staffed and run by religious communities expanded after independence, and this gave the Catholic church, and Protestant charities the capacity to influence policy and practice within social and medical institutions. This delegation of responsibility for major aspects of health and welfare care also limited the capacity of government to implement change. For example, in the 1940s the Department of Local Government and Public Health (DLGPH) was

unable to secure the removal of a superior in Bessborough who appeared to be incapable of implementing appropriate standards of care; they were forced to wait until the congregation appointed her successor (see Chapter 18). In the 1960s the closing of Sean Ross as a mother and baby home and its transformation into a much-needed home for children with intellectual disabilities was delayed by a number of years because of the opposition of the bishop of Killaloe and the need to wait for the appointment of his successor who immediately agreed to these changes (see Chapter 19).

9.26 Religion played a central role in the lives of Irish people. Attendance at Sunday mass and other religious duties was almost universal and many Catholics participated in additional religious observances, such as religious retreats, sodalities, or daily mass during the penitential season of lent. There appears to have been little difference in religious devotion between rich and poor, young and old, male and female, rural and urban, and this gave the Irish Catholic church an unrivalled position of authority. The authority of the Catholic church undoubtedly increased after 1922. In 1911 Catholics constituted 74% of the population of Ireland; in 1926 they constituted almost 93% of the population of the Irish Free State.

9.27 Marriage, social life and often employment were influenced by religion. There was widespread opposition within both Catholic and Protestant families to inter-church marriages and the stories of unmarried mothers told in Chapters 8 and 12 suggest that some Irish children were born out of wedlock because of family opposition to religiously-mixed marriages. Instances of such opposition can be found in the 1980s. Schools were segregated on the basis of religion. Social life, including sports activities, drama groups, social outings and dances were often organised around the parish - both Catholic and Protestant. The segregation of religion and social life by religious denomination was designed to prevent inter-church marriages. The Adoption Act required children to be adopted into the same religion as the birth mother.

9.28 What role did the Catholic church play in influencing Irish attitudes towards ‘illegitimacy’? J H Whyte suggested that there was ‘a tradition of independence of clerical guidance on some issues’; many Irish people defied the Catholic church’s condemnation of agrarian crime, support for Parnell despite his divorce, and
involvement in secret republican organisations. K H Connell has argued that the Irish clergy, who were commonly the sons of modestly-comfortable Irish families - middling/strong farmers, small town businessmen, reflected and reinforced the values of those families in their sermons and general attitudes. The Catholic church and indeed most churches at this time condemned sexual relations outside marriage but in Ireland, Catholic church teaching may have been given additional weight by the social patterns of late marriage and matchmaking which put a high premium on preventing premarital pregnancies, or inappropriate contact between young people. Guinnane claims that ‘Connell viewed Catholicism primarily as something that helped young people to reconcile themselves to a life that was necessitated by other forces’. One factor that secured the high status and wide acceptance of the Irish Catholic church was the degree to which it reflected the society from which it came and the church’s support for key causes - such as national independence, or the importance of prudent marriages that protected a family’s property and good standing. According to Guinnane ‘few academic historians credit the Church with any ability to influence the demographic behaviour of Irish Catholics’ and his comment takes account of the strictures of Catholic clergy against inappropriate social contact between young men and women. Joe Lee, writing about Ireland in the late-nineteenth century commented that ‘The Churches, however merely reflected the dominant economic values of post famine rural society’. Sklar noted that ‘the Church’s position was influential in part because illegitimacy endangered the realization of social and material ambitions’, such as prudent marriage brokered by a matchmaker. These scholars suggest that the Catholic church did not independently determine Irish attitudes on sexual matters; it was influential because the attitudes that churchmen expressed and their strictures against early sexual adventures, and premarital sex, reinforced a set of values that met the needs of Ireland’s conservative, agrarian society. ‘Illegitimacy’ was deplored by most Irish families because it damaged the family’s standing and threatened the basic social fabric. Anybody who challenged the conventional attitudes towards extra-marital pregnancy would have faced the

---

condemnation of the Catholic church, whether this condemnation was meted out in private, or in public.

9.29 The foundation of the Irish Free State, with an overwhelmingly Catholic population, was seen by some Catholic churchmen and zealous lay people as an opportunity to create a modern Catholic state, introducing laws and practices that were consistent with Catholic teaching, not just on sexual morality, but on a wide range of social issues. In 1932, around the time of the Eucharistic Congress in Dublin, the English Jesuit periodical The Month wrote two editorials about Ireland. An editorial in January 1932 titled, 'Ireland’s Year', emphasised that 1932 marked the tenth anniversary of the Irish Free State, and the year of the Eucharistic Congress. It claimed that ‘the one interest is to see how a nation ninety-three percent Catholic has succeeded in embodying in its Government and its political conduct the principles of Christian civil, social and industrial life as taught by the Catholic Church’. It asked ‘whether the country is resolutely determined to recover its full Catholic heritage, whether those who through education, station or office, are the leaders of the people know in what directions they should lead, and are making reasonable progress. Never before in the world’s history has there been a people so united in their Catholic belief’. Their verdict was that the Irish Free State should ‘try harder’ to achieve a truly Catholic state and society:

Much remained to be done before the Saorstat can claim to represent, as it ought the political mind of a Catholic people - much in the way of suppressing excessive gambling, of purifying stage and cinema, of banning the propaganda of birth-prevents, of thoroughly Catholicizing its University education, and, in the economic sphere, of developing Irish industries and agriculture...The conclusion is that it will be an uphill struggle to create a truly Catholic state.41

9.30 In August, after the success of the Eucharistic Congress, The Month returned to this theme,

Does that mean that in Ireland there may ultimately emerge a wholly Catholic government one whose policy will always be in harmony with the moral law and whose legislation will never, even indirectly, make the practice of the Faith more difficult.42

---

41 The Month, Jan. 1932.
42 The Month, Aug. 1932.
This determination to enact legislation that would sustain the values of a Catholic society was most evident in relation to sexual and moral matters. In the first decade after independence, the Irish Free State passed laws to regulate access to alcohol, impose restrictions on dances and measures to implement the censorship of films and printed material. These campaigns were driven by a Catholic Action movement that saw the new independent Irish state as a sympathetic instrument for such legislation. Concerns about sexual permissiveness were at the heart of this wider moral panic; dance halls, motor cars, cinemas and evil literature were all seen as promoting a receptive attitude towards birth control which was linked with rising ‘illegitimacy’. The decision in 1930 of the Anglican Church (of which the Church of Ireland was a member) to withdraw its opposition to contraception for married couples appears to have prompted Pope Pius XI to write an encyclical on Christian Marriage - *Casti Connubii* - which was published on 31 December 1930. The encyclical reaffirmed traditional Catholic teaching on the indissolubility of marriage; the importance of conjugal chastity; hostility to contraception and abortion, and the submission of a wife to her husband. It made a brief reference to ‘illegitimacy’ in one of the final paragraphs:

> We are sorry to note that not infrequently nowadays it happens that through a certain inversion of the true order of things, ready and bountiful assistance is provided for the unmarried mother and her illegitimate offspring (who, of course must be helped in order to avoid a greater evil), which is denied to legitimate mothers or given sparingly or almost grudgingly.

The publication of *Casti Connubii* on New Year’s Eve 1930 almost certainly accounts for the fact that Catholic teaching on sexual morality dominated the content of the 1931 Lenten pastorals issued by Irish bishops. David Fitzpatrick noted that

> Of the twenty-six episcopal pastorals, twelve reaffirmed the sanctity of marriage or inadmissibility of divorce: eleven deplored the insidious effects of the press, wireless or evil literature; eight inveighed against the cinema or theatre; six warned of the dangers of dancing; four alluded delicately to contraception, abortion or infanticide; three condemned company-keeping;

---

44 *Casti Connubii*, para. 122.
while irregular unions and immodesty in female dress each provoked two admonitions.\footnote{David Fitzpatrick, \textit{The two Irelands, 1912-1939} (Oxford, 1998), p. 228.}

9.33 This ideal of legislation and social policy that was ‘in harmony’ with Catholic teaching was shared by many Irish people, including politicians and public servants. Most politicians and senior public servants in national and local government were Catholic and a substantial number were devout Catholics whose religious practice extended to active involvement in organisations such as the Society of St Vincent de Paul, confraternities, and the secretive Knights of St Columbanus. Many files seen by the Commission reflect an implicit, almost automatic assumption that public policy should be in line with the views of the Catholic hierarchy, or the religious sisters who were in charge of various institutions. Some accounts of Ireland in the early years after independence suggest that the Catholic church was imposing its views about sexual morality on the government and the wider society. It would be more accurate to suggest that a majority of politicians, officials, citizens and male and female religious, shared a common set of views on a wide range of moral issues, and many of these views were also shared by the Protestant community. The enforcement of censorship of books and periodicals was assisted by dedicated postal officials and customs officers who opened packages and travellers’ suitcases confiscating material that they deemed inappropriate. Many books that were subsequently banned were available for a short time in Dublin bookshops or the shelves of public libraries until a zealous member of the public reported them to the censor, having identified the offensive passages.

9.34 The \textit{Criminal Law Amendment Act 1935} prohibiting the sale, manufacture and distribution of contraceptives, and literature that provided information or instruction on contraception, was arguably the legislation that came closest to enforcing Catholic moral teaching. There were laws against contraception in many other countries at this time, but it was not uncommon for condoms to be available, ostensibly for public health reasons - to prevent venereal disease. No country complied with Catholic teaching on birth control in as dedicated a fashion as Ireland. The late-nineteenth and the early-twentieth century were a time of falling fertility within marriage throughout much of the western world. Couples appear to have made serious efforts to limit family size, and while Catholic couples were less
dedicated to this than Protestant couples, they were not exempt. The fall in family size in Ireland was much less than in other parts of Europe and North America, with the result that by 1961, despite the late average age of marriage, Irish Catholic couples had among the highest levels of marital fertility in the developed world. This was consistent with Catholic teaching promoting the merits of large families. Lack of access to contraception or an awareness of the possibilities of family planning served to perpetuate Ireland’s large families.

9.35 The church/state consensus on this matter is evident in the report of the Commission on Emigration and other Population Problems, which sat from 1948-54. It stated that the decline in family size was ‘unwelcome and every effort should be made to arrest it’. Without citing any supporting evidence, the commission stated that large families were only a burden for a relatively short time; there was no evidence that large families ‘makes for a general condition of poverty’; or that ‘our family pattern imposes an undue strain on mothers in general’, or that ‘apart from the increased risk associated with more frequent child-bearing’ that they had an adverse effect on the health of mothers; the number of families with a large number of dependent children - defined as ten or more - was ‘relatively few’. The chapter titled Population Policy faithfully and unquestioningly repeated Catholic social teaching ‘The primary purpose of marriage, in the natural order of things, is the birth and bringing up of children. The principle which rightly guides the normal Christian married couple in this matter is to have as many children as they can reasonably hope to bring up properly’. The Irish clergy, in contrast to their counterparts in other countries, were not in favour of Irish couples learning about the ‘rhythm method’ of family planning, despite the fact that in 195x Pope Pius XII had expressed his support for this method.

9.36 In 1960 Fr Barrett, director of the Catholic Social Welfare Bureau wrote that Irish children grow up in an atmosphere where purity and chastity are reverenced. The purpose of marriage, its obligations and its indissolubility are all recognised. There is a healthy reverence for the God-given power to share in the procreation of the human race. Immoral influence by press, radio and cinema are minimised by state control operated to a high standard of public

morals. (The prevailing criticism is exemplified by the frequent criticism of English newspapers circulating in Ireland because of their low standards of morality - although the editions are special Irish editions differing radically from editions on sale in England). The Irish Catholic thus grows up without significant exposure to the naturalistic theories of sex education which permeate the popular press in a country where the moral standards of the natives no longer reflect traditional Christian teachings. There is, indeed, in Ireland an extreme reticence, both in public media of communication and in private conversation, in relation to matters of sex.  

9.37 Mary-Claire Prendergast, a psychiatric social worker at St Patrick’s hospital in Dublin (a mental hospital) disagreed. She commented on the lack of sex education, and the ill-defined but powerful influence of atmosphere, which in Ireland excludes the subject of marriage from family and school, discourages somewhat any meetings between boys and girls, at home or at school, or anywhere else; jeers at fellows suspect of being ‘soft’ about the women, and writes off as ‘brazen hussy’ any girl showing signs of liking for the boys. The men have been heavily condemned for their marriage shyness, but they are only products of this extraordinary system, one would almost say conspiracy, which no more helped a boy mature into a man than it helped a girl mature into a woman… …the same soul-destroying attitude would again be apparent when the young woman would be expecting a child, and all she had been taught - or not taught - would make her half ashamed of the fact. She would regard it as slightly indecent to be seen in public; her efforts would be geared towards concealing the news as long as possible.

…Somewhere in our growing up we should learn the biological facts of reproduction and it is too sadly common in Ireland to find adults who just never did.

9.38 Evidence given by witnesses to this Commission and further evidence from the archival records suggests that a number of women, who became pregnant outside marriage, were ignorant about the process of sexual reproduction.

---

9.39 Article 41 of the 1937 Constitution of Ireland recognised the family ‘as the natural primary and fundamental unit group of Society’. The state guaranteed ‘to protect the Family in its constitution and authority, as the necessary basis of social order’, and to ‘guard with special care the institution of Marriage on which the Family is founded’. This constitutional protection given to the family based on marriage was copper-fastened by a constitutional prohibition of divorce. Under the constitution, the family and associated protection consisted of a married couple with or without children; it did not extend to a single woman and her child, or a cohabiting couple who were not married.

9.40 The struggle to protect Irish society from the evils of the modern world persisted into the late-twentieth century. Censorship laws were relaxed in the 1960s but the prohibition of divorce, contraception and abortion continued. The extent to which these restrictions succeeded in preserving Ireland as a living exemplar of Catholic moral teaching is open to question.

9.41 The existence within Ireland of unmarried mothers - even if the 'illegitimacy' rate was low by international standards - challenged the image of Ireland’s moral superiority, as did the number of pregnant single women who travelled to Britain. Between 1939 and 1942 the number of 'illegitimate' births registered increased from 1,761 (0.61 per 1,000) to 2,419 (0.82) and continued to rise, peaking in 1946 at 2,642 (0.9 per 1,000). Yet in contrast to the moral panic during the 1920s, this increase did not prompt a similar wave of Lenten pastorals and public denunciations. Luddy suggests that the increase was ‘due in no small part to the travel restrictions placed on Irish women during the war years’. 51 PFIs (Pregnant from Ireland) were a regular topic of debate and dispute between British and Irish Catholic clergy and charitable organisations, and the Irish government but, with the exception of the Gaffney articles discussed earlier, the topic remained largely hidden from the public until the 1960s, though PFIs raised serious questions about the success or otherwise of the efforts by church and state to maintain stringent moral standards on Irish society.

Providing for unmarried mothers: redemptive morality or social science

9.42 In the nineteenth-century and early-twentieth-century, institutions that were publicly-funded, such as the Irish or British workhouses, did not distinguish between unmarried mothers and other impoverished and needy women so unmarried mothers in a workhouse were not segregated or subjected to a distinct regime, though they tended to be viewed as ‘undeserving’ poor, in contrast to widows, who were regarded as meriting public support. By the end of the nineteenth century however, there was a widely-held belief that the ‘rescue’ or ‘rehabilitation’ of unmarried mothers should be carried out within a strongly religious environment; prayer and penance were central to the process. Special facilities for unmarried mothers were provided by charities, not by the state. Mother and baby homes were seen as places where women could be redeemed and offered the opportunity to repent and do penance for their ‘sin’ by working and praying. Redemption and religious practice were seen an integral part of the care and ‘rehabilitation’ of unmarried mothers, by Protestant and Catholic charities alike. There is a considerable similarity between the practices and attitudes found in Protestant and Catholic mother and baby homes or charities that worked with the mothers and their children. Mother and baby homes in Scotland were run by charitable organisations with a strong religious/denominational ethos. In the Netherlands, ‘This association between a single mother and a sinful life, or even prostitution, has continued to be the basis of all care provided to single mothers and their children up to the 1960s’. In the United States in the decades after World War II, two-thirds of the licensed maternity homes (the term used for mother and baby homes) were operated by religious charities. In 1956 there were 397 beds in local authority mother and baby homes in Britain and 1,666 beds subsidised by local authorities in voluntary homes that were run by religious charities.

57 Thane & Evans, Sinners? Scroungers? Saints? p. 107
A study of facilities for unmarried mothers in Toronto at the beginning of the twentieth century noted that ‘Unwed mothers, along with other female sexual transgressors, were variously depicted as irresponsible, led astray, driven by lust for material goods, or thrill-seekers. Some were deemed prostitutes while other cases were blamed on the influence of “keepers of houses of ill fame”, or by the “bad lot of Italians”’. That statement might equally have been uttered about Ireland at the same time with the obvious exception of the comments about Italians. Leanne McCormick noted that those in charge of rescue homes in Northern Ireland presented the residents as corrupted innocents. The terms used to describe women in the homes, such as ‘unfortunate creatures, unhappy sisters, fallen women, defiled, wreck’, all convey a picture of victims who were in this position due to their ignorance and trustfulness, often having been betrayed by wicked men. They were portrayed as pathetic, aimless women, who wandered the streets like ‘withered leaves driven in the wind’, or drifted about like ‘derelict vessels’. They had lost their sexual purity, and with it their sense of direction and purpose.

This moralising tone receded with the expansion in the number of professional social workers but many of the early social workers replaced moralising arguments with a belief that single mothers were somehow deviant - suffering from mental illness or of below-average intelligence. In the United States, according to Kunzel, “Feeblemindedness,” a diagnostic that enjoyed enormous popularity beginning in the 1910s, seemed to social workers to provide a useful explanation for out-of-wedlock pregnancy. She noted that ‘In some ways, the conceptualization of unmarried mothers as feeble-minded overlapped with the evangelical understanding of them as victims of seduction’. In 1917 it was claimed that only 14 of 138 unmarried mothers in Toronto General Hospital could be regarded as normal. At around this time a Canadian commission that investigated the care of the ‘feeble-minded’ and ‘mentally defective’ included unmarried mothers within its remit; it concluded that ‘feeble-minded’ women should be placed in institutions ‘to prevent them from producing other feeble-minded citizens’.

60 Regina Kunzel, Fallen women, problem girls: unmarried mothers and the professionalization of social work, 1890-1945 (Newhaven, 1993), pp 52-3.
62 Little, ‘No car’, p. 6.
9.45 Eugenics is the belief that mankind can determine the characteristics of a population through selective breeding including reducing the capacity to have children among those who were deemed to be physically or mentally unfit. The Commission has received one allegation of eugenical practice but it has no reason to believe that it was ever practiced in Ireland not least because the concept was at variance with the teachings of the Catholic church. In the early-twentieth century a number of countries legalised the non-consensual sterilisation of women who were believed to be ‘feeble-minded’ or behaved immorally, including unmarried mothers. In 1927 the US Supreme Court ruled that the State of Virginia could carry out the eugenical sterilisation of a young woman who had become pregnant following rape and was deemed to be ‘feeble-minded’. In 1968 a total of 27 US states had compulsory sterilisation laws. ‘The more recent application of eugenic legislation was punitive or economically motivated as in the case of women with illegitimate children supported by welfare payments’. Sterilisation particularly targeted black single mothers who were receiving welfare payments. In the aftermath of World War I, in order to protect society against ‘a visible dissolution of sexual morals among women’, the Danish authorities opened an institution on an island, close to Copenhagen, where ‘slightly imbecile, erotic girls’ were confined and sterilised. It was widely believed throughout Scandinavia that ‘the “degenerate” were more promiscuous, had more children and threatened social order’. In Switzerland, where compulsory sterilisations were carried out on the basis of agreements between local authorities and doctors, most sterilisations were carried out on ‘unmarried, socially deprived women with children born out of wedlock who were categorised as “maladjusted”, ‘sexually promiscuous’, ‘mentally disabled’ or ‘feebleminded’.

9.46 Spensky, writing about Britain noted that ‘Until the Second World War, unmarried motherhood had been considered as being the result of the seduction of an overcredulous girl, who was particularly weak in character, ignorant or mentally

---

defective’. In the aftermath of World War II, the explanation shifted somewhat from genetics to focus on social explanations; this has been described as ‘The pathologisation of unmarried motherhood’:

In this phase of social-scientific thinking bastardy was taken as a prime example of something which interrupted the proper functioning of social processes, and revealed a failure of social control, the control of individual behaviour by family and kin, by political and education authority, by all the influences which persuade most people to obey the established order. The conditions which were associated with high illegitimacy levels in any one locality tended to be thought of as pathological, and the individuals who engendered bastards as in some way victimized, disordered, even mentally abnormal.

John Bowlby, a leading authority of the time on early childhood development, stated that ‘It is the opinion of many social workers with psychiatric knowledge and experience of this problem that, with many girls, becoming an unmarried mother is neurotic and not just accidental. In other cases the girls are chronically maladjusted or defective’. However Bowlby distinguished between ‘socially accepted’ cases where an ‘illegitimate’ child might grow up with his/her mother and her parents, or with both parents in an irregular union, and the ‘socially unacceptable’ mother, with ‘a neurotic character’.

The argument that unmarried mothers were neurotic women who deliberately wished to become pregnant was expressed most vigorously by Leontine Young in her 1954 book Out of Wedlock which was widely-used in the education and training of social workers. She explored the reasons why single women became pregnant from a Freudian perspective and determined that ‘everything points to the purposeful nature of the act’ - i.e. a single woman became pregnant because of factors in her ‘past life, her home and her childhood’; she was undergoing some form of ‘pathological drama’. In the Netherlands, in the aftermath of the war, moralising arguments about unmarried mothers gave way to ‘sociopathology’.

---

70 Quoted in Spensky, ‘Producers of legitimacy’, p. 108.

72 Leontine Young, Out of wedlock (McGraw Hill, 1954), chapter 2 ‘Why does it happen?’ pp 21-39. The copy in UCD Library has a date stamp for 1970, which is the year when it was bought.
where unmarried motherhood was viewed as ‘part of a larger and alarming social problem’, and unmarried mothers were now cared for by ‘a multidisciplinary team with a psychologist, a social worker, a clergyman, a judicial advisor and a social psychiatrist as head of the team’.  

### Attitudes in Ireland

#### 9.49
The records of the mother and baby homes and government files almost always describe unmarried mothers as ‘girls’. This terminology was common in Ireland and internationally. Luddy stated that referring to ‘girl’ suggested that ‘Young women [in 1920s Ireland] were represented simultaneously as adults and as children’. The 1907 Vice-Regal Commission used the term ‘girl-mothers’.

#### 9.50
Some echoes of the ideas summarised above can be detected in Ireland. A former guardian of the Dublin Union submitted a statement to the Commission on the Sick and Destitute Poor (she also gave evidence in person), claiming, apparently based on her experience in the Dublin Union that:

> We are firmly convinced by what we have seen ourselves, that many of these girls and women are not normal. We would have every unmarried mother who seeks admission to a Maternity Home under the Local Authority examined by a mental specialist with a view to deciding whether or not after the birth of the child she is a fit person to take up again normal life or should she be subject to special care and control.

#### 9.51
Sir Joseph Glynn, who was involved with a number of Catholic charities, claimed that a single woman who fled to Dublin in order to prevent her pregnancy becoming known in her neighbourhood was only ‘burying her head in the sand’; it would be common knowledge. He suggested that many of these women were often ‘more sinned against than sinning’. However on another occasion he implied that they were ‘weak-willed’ if not ‘abnormal’.

---

74 This may reflect a common practice of restricting the designation ‘woman’ to women who were married or had been married. One definition given in the Oxford English Dictionary refers to ‘a female who has reached adulthood...a female person who is considered mature. Frequently contrasted with girl’.
75 Luddy, ‘Moral rescue and unmarried mothers in Ireland in the 1920s’, *Women’s Studies*, xxx (2001), p. 812. She suggests that ‘they were not deemed to be in need of protection’.

9.52 When Fr Richard Devane, a Jesuit priest who was a prominent commentator on social issues, was giving evidence to the Commission on the Sick and Destitute Poor, a member of the commission referred to the fact that some countries sterilised unmarried mothers to prevent further pregnancies. Fr Devane suggested that the same ends could be achieved 'by depriving them of their liberty'. He was presumably thinking of the Magdalen Asylums. Miss Fitzgerald-Kenney, a DLGPH inspector, asserted that 'the unmarried mother is not normal'; she claimed to be speaking from personal experience. 'The very shock of finding that is she is going to be a mother affects the child. That is a big handicap to begin with'; she suggested that many children suffered long-term damage as a consequence. She wrote about this topic in a number of annual reports of the DLGPH:

Many unmarried mothers have come to me for help, or in other necessity, and I would like to point out how sorely needed some work is for them. This is specially so when they have to make their own way. Usually it is difficult to know what plans will succeed with them. They agree regularly enough to fall in with ordinary healthy conditions of life; but often they run away from the smallest effort. To get any of the younger cases to face of their own choice anything they do not like to do will not usually succeed; with the older it is always useless. If we had guidance as to the history of each - family history, home conditions, motives of interest, employment, mental conditions - possibly much would be explained, now condemned wholesale as due to the girls own choice, and it would be found, I believe, that often they need personal service and individual handling. It is not enough, in my experience, to understand these mothers as ‘total personalities’ in the ‘total situation’ of unmarried mothers. Each wants straightening out singly.

9.53 On another occasion she commented on mothers of more than one ‘illegitimate’ child, women:

mostly older women, loving their children, perhaps, but perfectly indifferent about their own methods of life. These unfortunates regard their falls (for they are usually more than one) as unimportant. They have placed, perhaps, several illegitimate children in Industrial Schools or other places and are only waiting now until the latest child is old enough to be committed also. These women invariably take it as a right that well paid places should be found for

79 DLGPH, Annual report, 1932/3, p. 298.
them. Frequently it happens that little or nothing can be believed of what they say.

She claimed that first time unmarried mothers tend ‘to develop into the other’.  

9.54 Alice Litster, an inspector of boarded-out children, reported that in several cases in the past year she had come across boarded-out children who ‘are well looked after yet are without interest in school-work and are unresponsive to any stimulus and dismissed by their teachers as unteachable’:

   In these cases I have had to fall back for explanation upon that factor which I have possibly been too much inclined to disregard except as it manifests itself in pre-disposition to disease - heredity. The mothers of these children are, without exception, of a class frequently found in our Co. Homes, weak-minded, not mental defectives, but almost on the border-line of mental defect, and completely lacking in moral stamina…It is difficult to know how to deal with children of this type; they are apparently amoral; they are not amenable to kindness or discipline; they are almost inevitable delinquents.

9.55 She went on to comment in greater detail on the unmarried mothers in county homes:

   This type will present a problem even when, as we hope, special institutions are set up to deal with the unmarried mother. County Boards of Health and Public Assistance generally have dealt fairly and leniently with unmarried mothers with their first child, affording them the opportunity of rehabilitation by placing their children at nurse, and allowing them to leave the County Home to take up employment. In dealing with the class of women I have previously spoken of, the matrons of many of our County Homes are very strongly against affording any such facilities, and even where the women concerned have expressed their intention of taking out their children and maintaining them outside, have placed every obstacle in the way of discharge. It is practically certain that a woman of this type, allowed to leave the County Home, will return again in a short time. They are of weak intellect and completely lacking in moral fibre. If their children are placed at nurse, there is no obligation upon them to remain in the County Home and, indeed, no authority for maintaining them there, and they are invariably eager for the freedom of the outside world. A grave wrong is done to their children by

80 DLGPH, Annual report, 1933/4, p. 325.
retaining them in the County Homes, but retention of the children is the only means of securing their mothers from the danger which freedom spells to them. It is a question also whether a graver social wrong is not committed by allowing these women their freedom since freedom to them will undoubtedly mean the birth of another child whose chances of average health and intelligence are small. I have no solution to offer except one which is repugnant to me, that is, the power of detention in special cases, which would allow of boarding-out the children and at the same time keeping their mothers under control and discipline.\textsuperscript{81}

**Factors promoting unmarried motherhood**

9.56 In the first two decades after independence, according to Susannah Riordan: successive Irish governments came under pressure from an alliance of feminist, religious and social work organizations to introduce legislation that would give greater protection to children, girls and women from sexual exploitation...while campaigners had little sympathy with older women who were deemed to have embraced a life of immorality - the mothers of more than one illegitimate child, married women who became pregnant by men other than their husbands and women who were sometimes called ‘deliberate prostitutes’ - they sought to establish the fundamental innocence, victimhood and amenability to moral reclamation of the sexually-compromised adolescent. Their preferred narrative was one of seduction and betrayal, in which a girl, often a domestic servant, was impregnated by an older and more powerful man, perhaps her employer.\textsuperscript{82}

9.57 James Smith noted that Fr Devane was ‘unique among his religious brethren who appeared before the [Carrigan] committee’, because he referred to ‘“the dual standard of morality accepted in this country, as in perhaps no other; where the woman is always hounded down and the man dealt with leniently”’.\textsuperscript{83}

9.58 The belief that unmarried mothers were ‘weak-willed’ or ‘feeble-minded’ complemented the argument that the more lax nature of modern social life was a major factor in the rise in ‘illegitimate’ births. The stereotype of the

\textsuperscript{81} DLGPH, Annual report, 1931/2, p. 293.
\textsuperscript{83} James M Smith, Ireland’s Magdalen laundries and the nation’s architecture of containment, (Notre Dame, 2007), pp 10-11.
innocent/ignorant trusting young women who were preyed upon by men was dominant. Dance halls were places where young and unsuspecting girls are placed in great danger. They meet in these places young men of whose character and antecedents they know nothing. They leave the halls with them without supervision and without protection. Commercial dance halls are the hunting grounds for a certain type of man who wants more than dancing and invites the young lady out just for an innocent drink or a drive in his car.  

9.59 Such arguments featured in Lenten pastorals and church sermons, though it is important not to distort the picture. Sermons were delivered on these topics, but they were not weekly events, and references to unmarried motherhood were brief and indirect, not least because the congregation at Sunday masses included children and teenagers who should not be exposed to such concepts. It is probable that more explicit sermons were delivered at parish missions - where the attendance was confined to adults and there were separate missions for women and men. In 1938, Dr Michael Browne, Bishop of Galway, stated that:

No one who is aware of the facts can deny that late dances and especially the commercialised dance hall are a source of danger and of harm to young people. The Catholic clergy are aware of it because when the harm occurs, when shame and disgrace are brought on young people and on their families, it is to the clergy that they come with their complaints and sorrow. We see the wreckage.

9.60 He referred to the cost of maintaining unmarried mothers in public institutions and complaints by English Catholic charities about ‘the number of young women who come to them from this country to hide their shame’.  

9.61 The link between modern dance halls and ‘illegitimacy’ featured in comments by local and national officials. In the annual report of the DLGPH for 1933/4 Miss Fitzgerald-Kenney pontificated that

The causes leading to these lapses from virtue are perfectly evident to all who trouble to observe life around them: no parental control, cheap romantic fiction, cinematograph performances showing vivid scenes often of low vices under an attractive semblance, all night dances in halls or dance places

84 Connacht Tribune, 8 Oct. 1938.  
85 Connacht Tribune, 8 Oct. 1938.
conducted without supervision, harmful and dangerous friendships, not to speak of other occasions too well known to need particular mention…In truth, the fact is that we have no cause for surprise if the young and inexperienced fall an easy prey to the terrible temptations with which their path is strewn. It is hard to see how the young can be saved from these dangers, while those of mature experience, their parents, do practically nothing to help them. Too often they only throw up their hands in helplessness at the first encounter with a wilful child who sets out to defy them. It is the parent who holds both responsibility and authority and no plea of an emancipated age, or headstrong disobedience on the part of the children, frees them from the traditional obligation of parenthood. They cannot lay duty aside because they find it uncongenial.\textsuperscript{86}

9.62 In 1932 the secretary of the Galway Homes and Home Assistance Committee expressed the hope that the supervision of dance halls would reduce the numbers admitted to the Tuam home ‘considerably’.\textsuperscript{87} Limerick county council debated a motion that would require every dance hall to appoint a local supervisory committee of ‘responsible persons’ - approved by the parish priest. The proposer claimed that dance halls ‘have been a serious cause of the increasing laxness of morals in recent years and an important factor in a problem was that of unmarried mothers - which is causing anxiety to all serious minded citizens, and adding unduly to the rates already an almost intolerable burden’.\textsuperscript{88} In 1939 a Redemptorist priest, who was giving a mission in Westport, stated that modern dance halls were ‘more responsible than any other evil for filling up the County Homes of the country with unmarried mothers’.\textsuperscript{89} Rev. H.V. Gill, delivered a sermon on ‘The Home and the Regeneration of Society’, one in a series of Lenten sermons given in Limerick in 1935. He quoted from the encyclical \textit{Casti Connubii} about the ‘bountiful assistance’ given to unmarried mothers ‘and her illegitimate offspring’ (see 9.31). He claimed that ‘the Catholic Church is called narrow-minded and out-of-date because she absolutely condemns such practices’.\textsuperscript{90}
Denunciation

9.63 A number of witnesses to this Commission, who were relatives of women who gave birth in mother and baby homes, have claimed that the parish priest demanded that she leave the parish, or called out her name from the altar. The Commission has discovered some limited contemporary evidence regarding this practice. In 1927 a member of the county Galway Hospital and Dispensary Committee, which was discussing the case of two sisters who were allegedly pregnant by the same man, commented that ‘there was a time in Ireland when a parish priest would denounce the scandal from the altar and the culprit would be forced to leave’. In this instance it would appear that the ‘culprit’ who should be denounced was the putative father. A meeting of Galway Hospital and Home Committee passed a resolution:

That considering the prevalence of sexual immorality, as evidenced by the number of illegitimate births in the maternity hospital attached to the Central Hospital, this Committee deplores the departure of the old Gaelic tradition of purity, caused in our opinion, by the lessening of parental control and want of supervision on the occasion of dances and other such entertainments; and we most respectfully suggest to the members of the Hierarchy in this county to appeal through the clergy to the people for a return to the old Gaelic customs under which such scandals were practically unknown.91

9.64 ‘Old Gaelic customs’ presumably included denouncing unmarried mothers from the altar. A history of the Archbishops of Tuam records a minute of a 1934 conference which instructed that

Whenever an illegitimate birth occurs in a parish, and is publicly known, the scandal ought to be denounced without mentioning names, with a view to calling the guilty to repentance and as a deterrent to others. The denunciation ought to be in sorrow more than in anger and the preacher ought to point to the scandal as:

A grave sin against the sacrament of matrimony and against the sixth commandment,
A degradation to the family,
As a disgrace to the family,
As a sin against the good name of the locality

91 Connacht Tribune, 18 June 1927.
Not only is the general permission given, but a direction is also given to make this
denunciation. In a special case after consultation with His Grace the Archbishop,
the matter may be deferred for a time. But in every case the scandal is to be
immediately referred to the Archbishop.  

9.65 In February 1935, the parish priest of Westport wrote to the Archbishop of Tuam.
I have the very unpleasant duty to report to His Grace the Archbishop that an
illegitimate child was born to a girl named [full name was given] in this parish,
living about three miles from here. The child lived only a few days and was
not brought to the church for baptism. It was given lay baptism. The guards
exhumed the body and the medical evidence showed it died from natural
causes.
A denunciation will take place on Sunday next. I am told the alleged father denies
guilt in the matter.  

9.66 The Tuam Diocesan Archives contain a letter in 1936 from the parish priest of
Cornadulla, reporting that the reading of a letter ‘had a profound effect on the
congregation’. This letter is filed under ‘scandal in the parish’. Two other letters
survive from parish priests reporting the birth of an ‘illegitimate’ child in their parish
- one names the putative father, but noted that he denied paternity.  
Waldron’s
history of the Archbishops of Tuam states that the practice of reading such a letter
‘remained in common use until the 1950s and, of course, was a cause of great
pain, not just to the two persons directly concerned but to the wider families of both
parties’.  

9.67 In 1969 Woman’s Choice Weekly published an interview with an unmarried father,
whose child was born around 1961. He related how the local priest ‘gave a
disgusting sermon’ at mass about an extra-marital pregnancy in the community.
This man was present with his parents

with my face blushing right down to my collar. I owned up to being the father
and immediately the whole town was ready to lynch me. The parish priest
called round my house to see me. By this time my parents had told me to get
out, so I was in the middle of packing a suitcase when he came around. He

went on and on about the poor girl I had defiled and I knew right well that the minute he saw her he would call her a whore and a disgrace to her sex.

9.68 This man claimed that following the birth, his child was placed in an orphanage and the woman was sent to the ‘infamous’ Magdalen Home in Galway. In 1993 when it became known that Bishop Eamon Casey had fathered a son, a man wrote to the *Sunday Independent*, giving his name and address: ‘I remember sitting at Mass in a country church in the early 1950s, when a single pregnant girl in the adjoining pew was “read off the altar” to a hushed congregation and references to “the Devil visiting the parish” compounded the poor girl’s agony’.

9.69 Despite these stories of public denunciation, most Catholic clergy preferred secrecy, as did Irish society, if only to protect a family’s reputation. A letter from a parish priest in Cork to the Dublin archdiocese - a follow-up to a letter from a pregnant single woman - stated that she was ‘from a respectable family that lives in the mountains. Brother is in a missionary order. She has managed to keep lapse a secret’. He emphasised that the pregnant woman was protecting her brother, the priest and her ‘very worthy father’ from shame. In 1936 journalist Gertrude Gaffney claimed that Irish mother and baby homes were ‘so guarded that no lay person, who is not concerned with them knows of their whereabouts’, and this is confirmed by letters and newspaper articles in the 1960s that are cited in Chapter 6.

**Containment, segregation and classification**

9.70 By the 1920s as Kunzel shows, responsibility for unmarried mothers in the United States was passing to professionally-trained social workers and similar trends can be seen in Britain. Ireland had few social workers, and most of whose who were described as such had no formal training. So, responsibility for unmarried mothers, especially the younger first-time mothers, was left with what Riordan describes as ‘socially-engaged middle-class women’, a category that included the department’s inspectors, religious sisters, the women who worked with Catholic and Protestant charities and as visitors for the Dublin Union. She suggests that witnesses to the Carrigan Committee, which was established to address concerns about sexual exploitation of adolescents, ‘were keen to absolve the fallen girl from

---

98 Dublin Diocesan Archives, AB8/b/LII/C/100/4.
guilt. Responsibility lay rather with the predatory male and a society that maintained the sexual double standard; their solution for these young ‘fallen girls’ was ‘containment and religious discipline... because of a belief that the nun, like the social worker, had an intrinsic understanding of and sympathy for the “girl in trouble”’.  

First-time mothers

9.71 The distinction between ‘first offender’, ‘first fall’ and the mothers of two or more ‘illegitimate’ children was well-established internationally and in Ireland by 1920. It is important, both as a reflection of attitudes and because it had a major influence on policy. This distinction is firmly embedded in the report of the 1907 Vice-Regal Commission, which recommended that all women ‘on the occasion of their first lapse’ before giving birth should be sent to a designated institution, owned or run by a religious community or philanthropic persons in the hope that she might be ‘restored to the possibility of living a good and useful life’. One member of the Commission on the Sick and Destitute Poor divided unmarried mothers into the ‘unfortunate class’ - first-time mothers - and the ‘incorrigible class’.

9.72 There was a degree of sympathy shown to women who were pregnant for the first time. Rattigan argues that most single women who were tried for infanticide in the Central Criminal Court between 1922 and 1950 ‘fitted the stereotype of the infanticidal woman as young, unmarried, seduced and abandoned, driven to infanticide by shame and desperation’. Miss Fitzgerald-Kenney suggested that the existence of mother and baby homes had reduced the incidence of infanticide: ‘A girl tortured by her sense of shame will take almost any step to keep hidden from the public the knowledge of her fall. The fact she can turn to one of these homes in her predicament, gives her a loophole of escape’. Criminologist Ian O’Donnell commented that ‘all who killed infants received lenient treatment’. Most of those charged were the mothers of ‘illegitimate’ infants. Of those sent to trial approximately half were acquitted; most convictions were for manslaughter or concealment of birth; roughly half of those convicted received a short custodial

104 DLGPH, Annual report, 1934/5.
sentence. He claimed that it was ‘surprising how few mothers who killed their babies were deemed to satisfy the legal definition of insanity’. 105

9.73 Juries recommended mercy in every one of these cases; the judge endorsed their recommendations in all but one case. O’Donnell suggests that the leniency shown to all those who killed infants ‘resulted from the perpetrators following the rules of an intolerant and stigmatizing society…What saved these murderers was not so much their gender or relationship with the victim, but an unspoken acknowledgement that their predicament was a result of society’s moral strictures and a low value placed on infant life’. 106 The ‘murderous mothers were pitied but understood’ and ‘The more reflective government members must have appreciated that these women’s conduct resulted from profound shame at their failure to live up to the social and sexual mores that were privileged by the new nation. By reacting as they did, they showed a deep awareness of what constituted acceptable conduct in the austere doctrinaire Ireland that was emerging and for this reason it would have been hypocritical - to say nothing of being disproportionately severe - to make them suffer further’. 107

9.74 Ferriter detected ‘a degree of charitable thinking, perhaps even sympathy towards unmarried mothers’ in a 1929 memorandum presented to Cabinet.

Many unfortunate unmarried mothers are denied the shelter of their own families and it is possible that some of them, who might otherwise reform drift into the prostitute class in a spirit of despair induced by the hardships they suffer. 108

9.75 The distinction between first-time mothers and those with two or more children centred on the belief that ‘first offenders’ could be rehabilitated by the regime in a mother and baby home, whereas there was much less certainty that mothers who had given birth to a second or subsequent child were capable of rehabilitation. The term ‘rehabilitation’ continued to be used for many decades in relation to unmarried mothers; it was even used in Chains or Change - the manifesto of the Irish Women’s Liberation Movement.

108 Diarmuid Ferriter, Occasions of sin. Sex and society in modern Ireland (London, 2010), p. 133, the quotation is from National Archives of Ireland, TSCH/ S5931: Illegitimate Children (Affiliation Orders).
9.76 In 1928 Fr Richard Devane, wrote that:

The Poor Law Commission now proposes to group first offenders, or those amenable to reform, and to segregate the others, and deal with each case apart. The Commission is convinced that reformation must be based on religion, and gives the widest latitude to public bodies to deal with the problem accordingly. The Church has now a unique opportunity in this country for reclaiming these young girls, for the Commission practically suggests that they should be handed over to religious bodies to be dealt with, and reformed through ‘individual charity and sympathy’, based on religion…Here is an opportunity for nuns to exercise Christ-like charity towards their weak and unfortunate little sisters, to raise them up to virtue and self-respect, and save them from drifting further down the road to ruin. Little by little the poor are coming into their own…

… The Poor Law is being exorcised of the paganism in which it was originally conceived, and poverty in this Catholic land will, before long, be freed from the stigma of disgrace to which the destitute, forced to seek public relief, have been too long condemned. By this recommendation the unmarried mother who is amenable to reform may be boarded out in special institutions set up by the Church, and under the control of religious women, who will bring all the power of example and charity to bear on those young lives, and thus help to restore them again, as honourable members, to society and to the Church…it is further suggested that relief to unmarried mothers must have as a condition their being willing to agree to be detained, in case of a first offender for twelve months, of a second offender two years…These recommendations are conceived and put forward in a truly Christian spirit, and in them we see big possibilities for applying Christian principles to many different social problems with which we are encompassed on all sides and which have been passed on to us as an unfortunate legacy from those days when our people were denied any practical voice in the solution of such problems.  

This is an example of the determination to bring government policy into conformity with Catholic teaching.

9.77 It was widely recommended, internationally and in Ireland, that first-time single mothers should be segregated from mothers of two or more ‘illegitimate’ children.

---

109 His term for the Commission on the Sick and Destitute Poor.
It was also suggested that a first-time mother should remain with her child and feed her child until the infant was approximately one year old. This was often viewed as an integral part of the woman’s rehabilitation. Requiring a mother to care for her child at least until the infant was weaned, for perhaps a year, would give her a sense of maternal responsibility that would deter her from another pregnancy and perhaps encourage her to contribute to her child’s upkeep. Miss Fitzgerald-Kenney expressed the opinion that:

if the children’s mothers are available, they should not be separated from them until they are 2 years of age. If the mother is of unsuitable character she should be detained in the Home. If she can go and earn her daily bread in the world she should be encouraged to do so, but be influenced to keep in touch with her child, for all experience goes to prove that, if the affection for her offspring which nature has stepped in and exacted is kept alive through her contact with her baby during the nursing years she will keep straight for its sake more easily than for any other motive in life.\footnote{DLGPH, Annual report, 1931/2.}

9.78 Miss Cruice of St Patrick’s Guild did not believe that keeping mother and child together nurtured a maternal instinct. She claimed that ‘At Pelletstown and in various country Unions they drop the children just like an old garment. They never want to see them again. The children become a burden to them that they drop them and there is no more about it’.\footnote{Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, tenth day, 12 July 1925.} But her views would appear to have been the exception at this time.

9.79 It was widely believed that mothers who were permitted to abandon their child shortly after birth tended to become pregnant within a short period. Emily Buchanan, a member of the committee of the Nursery Rescue and Protestant Children’s Aid Society, believed that it was essential that mother and child must be kept together for at least nine months

the girls cannot possibly look forward to the birth of the children with anything but the most dreadful feelings. If the child is taken away, as is commonly done, the girl cannot have learned to care about it. She knows she has to pay for it. That position must be most demoralising for the girls and the result is that they get reckless very often and fall a second time.\footnote{Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, thirteenth day, 23 Sept. 1925.}
According to the annual report of the Nursery Rescue and Protestant Children’s Aid Society for 1931/2: ‘Facing out into a world, which all know is full of temptation, [the mothers] are strengthened to resist it by the love of their children, the necessity of paying towards their maintenance, and the knowledge that the Committee take a real interest in them and are ready to advise them in their difficulties’. The annual report for the previous year stated that

The Committee are most anxious to impress on the Church [the Church of Ireland] the two-fold value of the work for which they are asking assistance. The care of her child is one of the most important levers in the reformation of the mother, the love and regard for it acting as a deterrent should temptation assail her. At the same time, it seems a very doubtfully desirable arrangement that she should retain the charge of it personally, especially if a girl. As the child grows up, and learns something of life, it is inevitable that either a very painful situation must arise, or that the daughter must think lightly of her mother’s lapse, and therefore be herself more open to temptation. On the whole, the most beneficial system appears to be that adopted by this Society.

The implication was that a mother should care for her child for some time in order to aid her rehabilitation but her child should then be brought up in a more respectable family. There is no indication that any thought was given to the emotional consequences for mother or child of having a mother care for her infant only for them to part when the child was one or two years old. The belief that caring for her child for a time should form part of an unmarried mother’s rehabilitation was not unique to Ireland; it led to an insistence that mothers should remain in a mother and baby home for a minimum period after the birth. Nicholson described the idea that a mother should care for her infant before giving him/her up for adoption as ‘ambiguous maternity’.

Remaining in a mother and baby home for a specified period was deemed necessary to ensure that a woman underwent moral reform. Religion was an integral part of the process of moral reform, not just in Ireland. Nicholson’s 1968 book records that the matrons held daily prayers in all except two of the English mother and baby homes and all the women were expected to attend church

117 Nicholson, Mother and baby homes, p. 115.
Fr Devane told the Commission on the Sick and Destitute poor that all ‘first-fall’ mothers and some mothers of second children should be given every assistance to help them reform;

‘every effort should be made within whatever system is devised to bring religion to bear on their lives in an intensive form’. As part of this process, every unmarried mother should be deeply impressed with sin, so that with the royal sinner, her sin should in the future be always before her. The merely natural shame and disgrace will soon pass away when the child is placed at nurse: the only real deterrent will be to bring the spiritual side of her fall before the girl, and impress her in no superficial way with the guilt of her sin, and leave her with an abiding memory and sorrow.

He recommended that unmarried mothers should undergo ‘a few days of retreat in which, she and some others like her, should be gathered together, and made to think deeply on their sin, and to realise what a woman has done when she has lost her virtue and her honour’. He believed that this practice would prevent subsequent pregnancies. The chapters on the individual institutions record that women in Regina Coeli attended retreats; bible classes were among the religious activities in Denny House and a number of Bethany mothers underwent conversion. Prayer and regular attendance at mass and other religious services was part of the routine in the three homes run by the Congregation of the Sacred Hearts of Jesus and Mary.

There was a strong current of denominational competition among the charities that ran mother and baby homes and children’s homes or placed children with foster parents or adoptive parents, and this was not confined to Ireland. Vulnerable women and their children were seen as potential targets for conversion and evangelisation. The greatest rivalry was between Catholics and Protestants. In Ireland the primary motivation behind the establishment of St Patrick’s Guild and the CPRSI was to prevent the children of Catholic unmarried mothers being raised as Protestants; the chapters on Bethany and Regina Coeli suggest that denominational competition persisted until at least the 1940s.

---

119 Oireachtais Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, twentieth day, 5 Nov. 1925.
9.85 The Congregation of the Sacred Hearts of Jesus and Mary determined that some of the women admitted to Bessborough were more ‘weak-willed’ than others, and therefore needed to be kept in the home for longer ‘to safeguard them against a second lapse’. Miss Fitzgerald-Kenney regarded the Bessborough regime as highly successful; she claimed that few former Bessborough mothers had been admitted to county homes to give birth to a second child, and ‘of those who have fallen again the majority spent only a short period in the special home either because of the death of the first child or through the interference of their relatives’.

9.86 It was believed that it was essential to segregate first-time mothers, who were regarded as amenable to reform/rehabilitation, from women who had given birth to two or more ‘illegitimate’ children. The 1907 Vice-Regal Commission described the latter as the ‘more depraved cases’, ‘multi-generations of illegitimacy found in workhouses’. They claimed that in one workhouse they were shown ‘a baby, its mother, its grandmother and its great grandmother, or four illegitimate generations in the female line’. The Vice-Regal Commission claimed that such ‘confirmed immorality’ appeared to be ‘a tendency in Irish workhouses’ - though their commentary might suggest that society rather than the mother was responsible for this: an unmarried mother was often unable to return home ‘owing to the sentiment of aversion from immorality which is too strong in most parts of the country to permit her to face that and to return with her baby to her relatives, even if they would receive her’.

9.87 Because first-time mothers were regarded as susceptible to influence, whether positively or negatively, it was deemed vital that they should not come into contact with unmarried mothers of two or more children. Jennie Wyse Power, a member of the board of Dublin Union, claimed that the religious sisters running Pelletstown told her that it took a considerable time to undo the adverse influence on young single mothers of spending time in the Dublin Union in the company of women who had several ‘illegitimate’ children. The first report of the DLGPH covering the years 1922-25 described Bessborough as ‘a home for the reception and reformation of…first offenders. The Sisters believe they can influence these cases

best by keeping them dissociated from those who have lapsed a second time or oftener'. The DLGPH report for 1928/9 reiterated that Bessborough was ‘intended primarily for young mothers who have fallen for the first time and who are likely to be influenced towards a useful and respectable life’, going on to note that ‘It is now generally accepted that the number of unmarried mothers in county homes should be diminished and that encouraging results can be anticipated if special provision is made to help them’. The same report suggested that ‘By timely sympathetic help the mother, who is often friendless and inexperienced, can be protected from degrading influences and enabled to regain her footing in the world’ and this would reduce the number of mothers given birth to subsequent ‘illegitimate’ children.¹²⁶

9.88 There was some debate about the appropriate treatment of mothers who had given birth to a second child outside marriage. A number of people, including Fr Richard Devane, believed that some of these mothers might be worthy of rescue/reform. Jennie Wyse Power, who had first-hand experience of the unmarried mothers in the Dublin Union and Pelletstown, claimed that there were ‘some very good mothers in the second offenders’, though she agreed that ‘the persistent offenders’ and their babies should be kept in an institution for longer than at present.¹²⁷

9.89 The regime that was suggested for mothers who had given birth to more than two children, (and some mothers of two) was often punitive; references to ‘detain[ing]’ mothers, perhaps as a punishment, but more commonly to protect society from further immorality and local taxpayers from the cost of additional children. It was widely alleged that mothers of two or more ‘illegitimate’ children suffered from mental illness or intellectual deficiencies, which they might transmit to their children.¹²⁸ Miss Cruice claimed that ‘The other class of girl, the wanton girl, is mentally deficient. There is a slight mental deficiency in nearly every one of them’.¹²⁹ Fr Devane claimed that the problem of unmarried mothers with more than one child

cuts down the roots of the Poor Law System as she is in so many cases the prolific mother of degenerates; imbecility, insanity, venereal disease,

blindness, in a word a physical and moral degeneracy can to a considerable extent be referred back to her as a source. Deal with the radical problem and you deal with all the others to a considerable extent.

9.90 He described the unmarried mother who drifts back three, four, five times into the single nursery of the Workhouse, the women who are semi-imbeciles, or mentally deficient, who drift on to the streets or into the nurseries in workhouses, and especially those who have more than one child…These are not absolutely wicked but mentally weak and are simply a prey to everybody who wants to come their way…Their children come on the rates and it would be better to deal with them radically in some way. It is a big problem as there is a big principle involved, that of depriving the individual of liberty. But the individual is deprived of liberty in many ways, and in many cases, and it seems to me that something should be done with those people who drift on to the streets, who are continually drifting into the present workhouses, who are a burden on the rates, who are spreading diseases, creating degeneracy, blindness, insanity and everything else. Why should they be not taken up and hidden away for their own good and for the good of society? I think something in that way should be done and that such people should be committed to some central Home, or that the prostitute should be committed to a Good Shepherd Home. They are the mothers of those wasters that go backwards and forwards, like the case that came before the Vice-Regal Commission of a great-grandmother, grandmother, mother and child all being illegitimate and in the same workhouse at the same time.

The Vice regal Report on the Poor Law suggests that she should be regarded as an unfit guardian of the child and should be locked up while she is a burden on the rates. These mentally deficient women, whether ordinary single mothers or prostitutes, should be locked up for their own and the public good until they show sign of amending.

9.91 In 1935 the wife of a Church of Ireland rector wrote to the Irish Church Missions seeking a home for a woman who had recently given birth to her second child and was about to be discharged from Bethany. She described this woman as ‘[mentally] weak - quite soft, as people say, and is liable to get into trouble again

and again’. Her local clergyman and his wife were determined that she should not return to her native parish, ‘where she is only a beast of burden to her old mother and is at the mercy of any tramp who comes along’. This woman was ‘not a mental case, but…quite unfit for work as a ward maid’. She was ‘only fit for doing some farm work - on a farm where the people would understand her and care for her like they would a helpless animal’. The local bishop had suggested sending her to a Church Army Home [Salvation Army] in England - but they had declined to take her. The clergyman’s wife asked whether anybody was needed to clean shoes and scrub at the Fold, a children’s home.\footnote{Irish Church Missions, ICM/CF/0048. The Children’s Fold was a children’s home run by the Irish Church Missions.}

9.92 Miss Litster told the Commission on the Sick and Destitute poor that ‘the old offenders’, i.e. the mothers of several ‘illegitimate’ children, - who are ‘always a charge on the rates’ should be confined ‘for a sufficiently long period to enable you to do something with them’. She would send mothers, who left the county home with their child and then sent the child to an industrial school, to a Magdalen institution. She believed that very many of these mothers were mentally ill.\footnote{Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, ninth day, 15 July 1925.}

9.93 The secretary of DLGPH was opposed to letting unmarried mothers leave their children in order to go out to work, because that ‘relieves the mother of her responsibility’.\footnote{Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, first day, 27 May 1925.}

9.94 The chairman of the Commission on the Sick and Destitute Poor distinguished between ‘the woman or girl, who has fallen’, and ‘others who may be called continuous offenders’. One witness agreed that ‘where a woman has fallen more than a couple of times - put whatever limit you like on the number of her falls -
cases of that kind may be treated as quasi-criminal'; he agreed with the chair that such women were 'a possible danger to the community', and that it would be advisable to keep them in an institution for a period of time.\footnote{134}{Oireachtas Library, Commission on the Relief of the Sick and Destitute Poor, including the Insane Poor, minutes of evidence, fifth day, 23 June 1925.}\footnote{135}{DLGPH, Annual report, 1931/2.}\footnote{136}{Oireachtas Library, Commission on the Relief of the Sick and Destitute Poor, including the Insane Poor, minutes of evidence, first day, 25 May 1925; fourth day, 11 June 1925.}\footnote{137}{\textit{Nenagh Guardian}, 2 Dec. 1933.} The annual report of the DLGPH expressed the opinion that many mothers of more than one 'illegitimate' child 'appear to be feeble-minded and need supervision and guardianship'; some should be sent to Magdalen Asylums.\footnote{135}{An exchange at the commission reveals that one member of the commission and the secretary of the DLGPH concurred that 'the second class, the incorrigible class, are [as] more akin to criminals than the unfortunate class'; the questioner expressed the opinion that these mothers should be deprived of their liberty, though the secretary of the DLGPH was more circumspect, suggesting that second-time mothers should be required to stay for a longer period in an institution than first-time mothers. Another witness wanted to discharge some ‘very wicked’ mothers of several ‘illegitimate’ children as soon as possible to prevent them having a bad influence on other mothers.\footnote{136}{In 1933 Bishop Fogarty of Killaloe divided unmarried mothers into three categories: a large number who were ‘feeble or weak-minded sort…never be able to take care of themselves…easy victims to the wicked’. He believed that they should be placed in institutions under the care of religious sisters though he claimed that no such institutions existed. A second category were ‘naturally decent…who have fallen through accident or environment’. Sean Ross could deal with these ‘girls’. The third class were ‘women of a wild and vicious nature, who are a harmful influence wherever they prevail. They are neither amenable to religion outside, nor will they consent to abide permanently in religious institutions’; he noted that some of these women were admitted to homes run by the Good Shepherd Nuns (Magdalen Homes).\footnote{137}{This distinction between first-time mothers and women who were pregnant for a second or subsequent time remained powerful in Ireland until the 1950s when Dunboyne was established as a mother and baby home for second-time mothers, though from an early stage it also admitted first-time mothers.}
Unmarried mothers in national and local politics

9.96 Unmarried mothers did not feature much in the debates in Dáil Éireann except in the context of legislation on matters such as extending eligibility for funding from the Irish Hospitals Trust to mother and baby homes; the *Registration of Maternity Homes Act 1934*; the *Children Act 1934*, and the *Illegitimate Children (Affiliation Orders) Act 1930*. The 1930 Act was designed to make it easier for a single woman to secure support for her child from the alleged father. Earner-Byrne states that the Minister for Justice, James Fitzgerald Kenney, who introduced the legislation ‘presented a disturbingly misogynistic approach to welfare’, presenting the unmarried mother as ‘temptress and blackmailer’.\(^{138}\) Replying to the minister, Fianna Fáil TD Dr Conn Ward stated that

> I have had some opportunity of studying these people in the course of my professional work in institutions where these people are treated, and I want to say that it appears to me that the male section of the population will require some protection under the terms of the Bill. The vast majority of these mothers are more sinned against than sinning, we will all agree, but there is little doubt that some of them would use the powers conferred by this Bill for the purposes of blackmail…After the birth of the child the mother is an outcast to a certain extent, and she is in a desperate plight. Her disgrace has become public and her condition is such that it cannot become worse. People in such circumstances are liable to become the victims of unscrupulous schemers who have been known deliberately to select a victim.

9.97 He suggested that ‘in cases where it is possible, marriage is the best solution’.\(^{139}\)

Other speakers referred to the loss of reputation and financial ruin that a man who was named in court as a putative father would incur, and the dangers of malicious paternity claims. One senator categorised the women and men in such cases as the innocent girl who has been wronged; the girl who is well aware of what she is doing, but who made a mistake; the older woman who is alarmed at the poor prospect of matrimony, except by guile of some kind; the hopeless case…the girl who has had two or more children of which there is a considerable number, the dangerous woman, whom it is suggested, will make a living out of affiliation orders; and the blackmailer…

the simple boy who is led astray by sexual instincts and is probably not as much to blame as the girl, the marauder, the man who goes from town to town.

---

\(^{138}\) Earner-Byrne, ‘Reinforcing the family’, p. 363.
\(^{139}\) Dáil Debates, 30 Oct. 1929.
and leaves his mark; the innocent victim of blackmail, and finally, the selected one out of several sinners, who is selected because he has a long purse and is the most likely to be able to pay.  

9.98 The number of statements about unmarried mothers and their children in the Oireachtas debates is limited, and similar views to the above were uttered in other legislatures in these years. The Registration of Maternity Homes Act 1934 was designed to reduce mortality among ‘illegitimate’ infants because of a belief that many of these children were born and died in poorly-run private maternity homes. The Children Act of the same year was also motivated by a wish to save the lives of ‘illegitimate’ children. During the 1940s, 1950s and 1960s there were several debates and many Parliamentary Questions tabled about children in industrial schools. There is a marked contrast between the intermittent interest shown in these children and the silence concerning mother and baby homes. It is also noteworthy that the questions and debates about children in industrial schools never referred to the fact that many of these children were ‘illegitimate’ or the reasons for their institutionalisation.

9.99 Most coverage in local or national media that refers, even in passing, to unmarried mothers related to reports of meetings of local health authorities, court reports concerning attachment orders against putative fathers, and prosecutions for concealment of a birth or child neglect. A word search of the Cork Examiner from 1920 to 1960 under key words ‘unmarried mothers’ and ‘illegitimate’ produced 28 stories relating to infanticide or the discovery of dead infants; six stories - all in the 1920s - relating to Bessborough, or the cost of unmarried mothers to the various public assistance authorities; five stories about adoption - all in the 1950s, one court report of a sexual assault and one report relating to the Illegitimate Children Affiliation Bill. This coverage is typical of Irish newspapers at this time. The local newspapers contain extensive information about boarded-out children and children at nurse: advertisements seeking foster homes, reports of prosecutions for failure to register children at nurse or inquests on foster children who had died. Such stories should have been known to any regular reader of local newspapers and their circulation and readership was extensive. But there is no reason to believe that these reports, which often contained graphic details of neglect, prompted

140 Seanad Debates, 7 May 1930; The McGillicuddy of the Reeks.

anger or agitation over the mistreatment of the children or any reflections as to the circumstances of their birth.

9.100 There are more references to unmarried mothers in the years before 1942, because provision for unmarried mothers in mother and baby homes and county homes was the responsibility of the local health authority, and minutes of their meetings were commonly reported in the local press. After that date the key decisions were taken by the county manager and the managers’ orders were not reported in the local newspapers. Local authorities continued to have occasional discussions about boarded out children but there is less material than in earlier years. The most common theme in debates at local authority meetings concerned the costs to ratepayers of maintaining unmarried mothers and their children.

9.101 A number of comments made by councillors or members of local authority committees are offensive. One member of the Galway Hospital and Dispensaries Committee, who was complaining about unmarried mothers giving birth in the Galway Central Hospital, because this deterred married women doing so, suggested that ‘there should be a shed erected at the County Home’, to cater for them. The chair of the committee, Canon McAlinden replied that these women were not ‘hospital cases. They are coming in as refugees’.

In the following year the Galway newspapers were asked to publish a denial of a rumour that ‘coloured illegitimate’ children had been born in the Central Hospital. In 1931 the Galway Hospitals and Dispensary Committee reported that for the first time no unmarried mothers had been admitted to the Central Hospital during the previous month, presumably because births were now taking place in the Tuam Children’s Home.

The resident medical supervisor of the Limerick County Hospital at Croom complained that unmarried mothers in Limerick city and county were sent to give birth at Croom. He claimed that ‘both parties are a stigma to the institution. To me personally, all patients are the same, but I have reason to believe that a large number of married women are refusing to come here on account of what they consider as undesirable associates in the hospital’. The board of health decided not to admit unmarried mothers from Limerick city in future, allegedly because the hospital was overcrowded. In 1931 Macroom Cottage Hospital refused to admit an unmarried mother who was in labour with twins despite the local midwife

\[142\] Connacht Tribune, 8 Sept. 1928.
\[143\] Connacht Tribune, 8 Nov. 1928.

\[145\] Limerick Leader, 14 Aug. 1926.
determining that she was ‘in a serious medical condition’. The dispensary doctor announced that she could not be moved and the woman gave birth to twins in Macroom Cottage Hospital, (assisted by the doctor). Within two hours of the birth of the first baby, and little more than an hour after the second delivery, mother and babies - each weighing approximately 3lbs. - were placed in an ambulance and transported to Bessborough; one baby died and one survived. The medical officer justified their speedy transfer by citing a recent circular stating that all first-time unmarried mothers should be sent to Bessborough; he claimed that he had no alternative ‘from a moral and administrative point of view’. He expressed more concern for the well-being of the matron in the Cottage Hospital than the well-being of the mother. He claimed that: ‘The general experience is that if you keep such cases until they are up and around they will not then go into such a home as Bessboro’ but return home generally with harmful results to themselves and the child’. In 2018, an RTÉ radio documentary told the story of Peggy McCarthy, an unmarried pregnant woman with intellectual disabilities who was refused admission to hospitals in Listowel and Tralee (both in Kerry) in 1946, and died from eclampsia.

There were reports in local newspapers that some residents in county homes were unwilling to associate with unmarried mothers. A member of the North Tipperary county council complained that poor people entering the county home had to mix with ‘part lunatics and a lot of unmarried mothers’. In 1929 a member of the Galway Home and Home Assistance Committee commented on a visit to the county home in Loughrea that ‘at dinner time four girls were sitting at a table all by themselves’ - they were pregnant single women. He suggested that advantage was often taken of their ‘ignorance’; they were often ‘more sinned against than sinning’. In 1931, a member of Tipperary North county council objected to plans to send unmarried mothers to Sean Ross rather than to the county home because the latter was more expensive: ‘he did not see why the women should be sent to a mansion in Roscrea’. Another suggested that the superior facilities in Sean Ross would lead to a doubling in the numbers of unmarried mothers -‘Instead of having 40 cases you might have 80 if you send them to a place like Roscrea’. A third claimed that the council was ‘putting a premium on immorality by giving them free lodgings’, though a colleague expressed the hope that the women ‘might get

---

149 Connacht Tribune, 9 Feb. 1929.
reformed at Roscrea’.  

When the County Clare Nursery in Kilrush was closing a meeting of the Clare board of health was told that the ‘second-offenders’ were refusing to enter an (unspecified) institution, prompting a member of the board to comment that ‘It looks like a case of releasing the prisoners so’. A colleague suggested that these women would be ‘back again in 12 months’; they were ‘a dangerous type to have roaming the country’.

9.103 Occasionally the language used suggests a condescending sympathy, as in the Nenagh Guardian’s comment that Sean Ross was a shelter created out of ‘pity for the unhappy Magdalens of society’. One member of Limerick board of health described unmarried mothers as ‘unlucky women’ - adding that ‘After all these poor women were human beings: the welfare of themselves and their unfortunate blameless children was a matter for the State to attend to’. However, a 1924 paper presented by the Galway senior assistance officer to a DLGPH conference on ‘the administration of home assistance’ argued that ‘imbeciles and harmless lunatics’ should not be given home assistance - their proper place was ‘in some institution where they will receive suitable treatment’; if they were left in the community the ‘young girls might become unmarried mothers - a contingency doubly abhorrent, increasing the large number of imbecile children already in the country’. He believed that a high proportion of unmarried mothers in Co Galway were ‘mentally defective’. In a paper presented to Muintir na Tíre Rural Week in 1939, the assistant county medical officer of health for Kildare, who was a woman, argued that it is ‘highly desirable that unmarried mothers, some of whom are often of weak mentality, should not become the outcasts of society and add further to the difficulties of the situation’. She disapproved of unmarried mothers in county homes, and believed that special homes marked ‘a decided advance in the solution to the problem’. She suggested that the best outcome for the children was to be reared by their grand-parents, because many children were being fostered in unsuitable homes where the foster parents were only interested in the money.

9.104 Members of the Galway local authority directed considerable invective against soldiers or Gardaí who were alleged to have fathered ‘illegitimate’ children. A TD

152 Nenagh Guardian, 12 Sept. 1936.
154 Connacht Tribune, 12 July 1930.
155 Connacht Tribune, 26 Aug. 1939.
and local councillor complained about ratepayers being responsible for ‘the cost of these crimes’, suggesting that the women should be sent home to their parents.\textsuperscript{156} In the 1950s Galway county council rejected recommendations by Department of Health inspectors that they should appoint a dedicated children’s officer, because of the cost to ratepayers, and the fact that ‘there must be some limit to the number of officials appointed by the Council’ - ‘they would eventually have more officers than ratepayers in the county...if parish priests and local councillors took an interest in boarded out children there would be no need to appoint a children’s officer’.\textsuperscript{157} When this matter was discussed some years later, one councillor expressed disappointment ‘that so few had the courage or the humanity to support the weakest section of the community’, but this observation failed to sway the meeting.\textsuperscript{158} When the Department of Health presented Galway county council with a devastating report on the shortcomings of the boarding-out system in 1956, an editorial in the \textit{Connacht Tribune} commented that

One would imagine that all members of Galway County Council would have been shocked by the report which was before them last Saturday regarding the conditions in which some children are boarded out by the Council. There were some expressions of indignation, but the reaction in a general way suggested that the Council were more annoyed with the case that cruelty could arise in a system that they as a council administered than that a number of children were exposed to the cruelty of neglect and indifference.\textsuperscript{159}

9.105 This editorial was severely criticised by some councillors, which only served to trigger another editorial arguing that the \textit{Connacht Tribune} had highlighted the report for the purpose of arousing public opinion against the system that permitted the ill treatment of children born, as most of these children were, outside wedlock and who never knew a home other than a public institution. They have no father or mother to protect them, but the ratepayers, who undertake the expense of maintaining them while they are in the institutions, and to some extent after they are taken from the institutions, look to the Council to ensure that they are properly cared for and provided with some at least of the comforts to which all childhood is entitled.

\textsuperscript{156} \textit{Connacht Tribune}, 22 Feb. 1936.
\textsuperscript{157} \textit{Connacht Tribune}, 12 Dec. 1953.
\textsuperscript{158} \textit{Connacht Tribune}, 31 Mar. 1956.
\textsuperscript{159} \textit{Connacht Tribune}, 30 June 1956.
9.106 The editorial asserted that it was ‘not in the best interests of the children - or of the Council - to airily wave aside the Inspector’s report and say: “That could not happen here”’.\(^{160}\)

9.107 The good name of a community was regarded as important, and it is evident that it could be damaged by reports of ‘illegitimate’ births. The Galway Hospital and Dispensaries Committee received a letter from the parish priest of Carraroe, complaining about a reference at a previous meeting to an unmarried mother from Carraroe parish - he alleged that the woman had left Carraroe nine years earlier ‘and has not been heard of since’; an earlier report of a single mother from Carraroe related to a woman who had been working in Galway as a domestic servant for two years. He suggested that the people responsible for such reports should ‘verify their accuracy before casting at the doors of any parish such unsavoury fare’.\(^{161}\)

**Church and State: providing for unmarried mothers and their children**

9.108 There is a substantial literature about the relationship between church and state after independence, but it is almost entirely focussed on the national government. Very little has been written about the relationship between the Catholic church and the local authorities,\(^{162}\) a relationship that was much more overt and much closer than the relationship between the Catholic church and the national government. When county and district hospitals and county homes were being created out of the old workhouse system in the early 1920s many councillors preferred to appoint religious sisters as matrons, believing that they would be more effective.\(^{163}\) While the *Local Government Act 1898* excluded religious from standing for election, priests often served as chairs of local committees, including committees dealing with health and related matters. In the fraught climate of Ireland after the civil war, the clergy could achieve authority and consensus. Most matrons of county homes were religious sisters as were many of the matrons of county hospitals. When a matron who was a member of a religious order reached retirement age, the Department of Health contacted the superior of the religious order and invited her

---

\(^{160}\) Connacht Tribune, 11 Aug. 1956.

\(^{161}\) Connacht Tribune, 13 Apr. 1929.

\(^{162}\) J H Whyte’s coverage of the appointment of priests as chairman of vocational education committees, in Whyte, *Church and State in modern Ireland*, pp 37-8, is an exception.

\(^{163}\) Mary E. Daly, *The Buffer State*. *The historical roots of the Department of the Environment*, p. 77-8 noted that when the workhouses were being reconfigured under the First Dáil, religious sisters and lay nurses competed for positions as matron; in Leitrim a lay nurse became matron of the county home, and a religious sister became matron of the county hospital.
to nominate a suitable successor. The posts were not filled by the Local Appointments Commission - which filled permanent local authority posts, and the job requirements provided either that the candidate should be a registered nurse, or alternatively should have ‘resided [presumably meaning worked] for a period of not less than two years in a general, clinical or other hospital recognised for this purpose by the Minister’. The file relating to the appointment of matrons to Kilkenny county home indicates that these religious sisters held nursing posts in a variety of district hospitals and other nursing institutions before taking up the appointment as matron.\textsuperscript{164}

9.109 Local authorities commonly deferred to the advice given by various religious figures about the care of unmarried mothers and their children. Galway county council adopted, without question, the recommendation of the Bon Secours sisters who were in charge of the Tuam Children’s Home, that boys should be retained in the home until the age of five, girls until the age of seven and a half years and sometimes later,\textsuperscript{165} despite the fact that this was at variance with the practice in other local authorities and contrary to the wishes of the DLGPH that children should be boarded out at two years old. The practice persisted until the Tuam home closed, despite repeated efforts by departmental officials to bring it to an end (see Chapter 15).

9.110 In 1924 the \textit{Connaught Tribune} wrote an enthusiastic account of the Children’s Home in Glenamaddy, which was the forerunner to Tuam. This article reflects an unquestioning belief that the religious sisters knew best, together with the opinion that unmarried mothers should not go unpunished, and an awareness of the censorious nature of Irish society towards ‘illegitimate’ children.

\begin{quote}
Better a thousand times that these children should remain in some sort of industrial centre where they would learn a craft and be under the control of sympathetic sisters than they should be put to the shame that might be theirs in a home in the hard world outside, where they would learn their origin before they had been given the opportunity to outlive it and to form their character…One day these little mites, if they survive the rigours of life in such a home, will be projected into life. They will have to start with a heavy handicap. That handicap should be lessened as much as it is humanly possible to lessen it. Their care is a grave responsibility, and one cannot but
\end{quote}

\textsuperscript{164} Department of Health, INACT/ INA/0/448287.
\textsuperscript{165} \textit{Connaught Tribune}, 28 June 1930.
feel unbounded admiration for these wonderful, motherly nuns, who know every child by name...Whenever possible, mothers should be sent with their charges. It is the negation of justice that nameless little ones should be sent to a home, whilst the parents go free of responsibility.  

9.111 When a decision was taken to close the Clare county nursery in Kilrush, the Clare board of health sought the advice of the Bishop of Killaloe, Dr Fogarty about the appropriate treatment of unmarried mother and their children. They invited him to nominate a committee of priests that they could consult. Bishop Fogarty assured them that ‘the system selected by your Board could hardly be improved’ - sending first-time mothers to Sean Ross. The main difficulties concerned ‘how to treat those mothers after they leave Sean Ross, as second offenders are not admitted there’; no satisfactory system had yet been determined ‘not even the Nuns at Sean Ross, who have almost world wide experience in dealing with this problem’. 

9.112 On the question of whether children who were being raised without their parent(s) should be in an institution, or in foster care, until legal adoption became common, the Catholic Church and religious orders appear to have promoted the merits of institutional care and many local officials and politicians concurred. In 1937 the administrator in the town of Roscrea gave a sermon in St Cronan’s Church where he praised the Congregation of the Sacred Hearts who ‘gave their lives to this work of assisting the unfortunate Magdalen and her child when friends disown them and the world frowns on them’. He claimed that the Sisters gave the women ‘moral uplift’, and vocational training. He criticised local authorities for following ‘too slavishly the old workhouse tradition of boarding out the little children at too young an age’; he believed they should remain in the care of the religious sisters until the age of six.

9.113 The chief medical officer of North Tipperary was also highly critical of the practice of boarding out children. He suggested that ‘with few exceptions, the homes in which they are accommodated are not ideal. The child is given a minimum education and is usually unfit for any but unskilled labour. On the other hand, life for those children in large institutions, like the present industrial schools, would be equally unsatisfactory’. He qualified the latter statement by noting that the religious

---

166 Connacht Tribune, 21 June 1924.
167 Nenagh Guardian, 2 Dec. 1933.
sisters and brothers who ran these institutions ‘do for the children committed to them all that is within the power of the nuns and brothers who manage them to do’. He suggested that smaller homes, with a maximum of 20 children would provide ‘more of that family life which the children in the larger institutions lack; and they might serve as a place to which the children could have recourse in after life’. He expressed regret that children were not adopted, as happened in England but he viewed adoption as a charitable act.

If childless couples took unto themselves some of those babies whose parents do not provide for their future, there would be less reason to be concerned for the fate of the little ones, for persons who adopt children as a general rule treat them as if they were their own. There could be no greater work of charity than that of giving a true home to an infant whose misfortune it was to be born to parents who did not want it. Is there not something in the Gospel about doing for God whatever is done to one of his little ones?169

9.114 In 1943 the Joint Committee of Women’s Societies and Social Workers sent the DLGPH a lengthy memorandum setting out their findings and opinions on the treatment of children in institutions and children who were in foster homes. It concluded that

The majority of the children with whom we have been dealing are illegitimate. They are handicapped from the start; the circumstances of their birth and their heredity militate against them. We are told that a large percentage are subnormal, or mentally deficient. The aim should be to give them the normal conditions of the ordinary child i.e. a home with the parental affection and encouragement essential to the proper development of the child.170

9.115 Although the DLGPH and the Department of Health consistently pressed for children to be placed in foster care rather than in institutions, many local authorities continued to send children to industrial schools throughout the 1950s and 1960s often in breach of government regulations (See Chapter 11). In doing so they were more in line with the wishes of Catholic religious orders than government policy.

9.116 In 1945 reports of the circumstances surrounding the death of a foster child in Britain prompted an editorial in the Irish Times. It cited a case in Derry [Northern Ireland] where an ‘illegitimate’ infant, who had been boarded out with his mother’s

170 Department of Health, RM/ARC/0/489391.
sister was starved to death, and another case where a Westmeath woman was fined £10 for ill-treatment of a boy who had been boarded out with her by the local authority. The editorial suggested that ‘the system as a whole has little to recommend it’. Most of the children were orphans or ‘illegitimate’. The editorial urged ‘a searching attention to the credentials of would-be foster parents and a system of frequent inspection, preferably by women’. In 1946 the Irish Times reported on a speech by R.M. Smyllie (the paper’s editor) at the AGM of the Nursery Rescue Society, where he stated that ‘An attitude of scorn and patronage towards the unmarried mother was entirely wrong. The problem was a social problem, like TB or cancer, and must eventually be solved by State action’. His focus was on foster children. A second speaker at this meeting advocated the case for legal adoption. ‘We want a generous spirit of love and affection shown to our children, so that they may grow up to be useful and fine men and women. We cannot bring that about in Ireland if we have not legal adoption’.

By the 1940s there is evidence of public pressure for the introduction of legal adoption, and the topic received attention in the newspapers and in Dáil Éireann. During the 1948 general election campaign, John A Costello, who was elected Taoiseach in the inter-party government that was formed after the election, promised legislation on adoption. This appears to be the only occasion in the first 50 years after independence that any issue relating to unmarried mothers featured in an election campaign. Adoption continued to receive newspaper coverage throughout the 1950s and 1960s but the focus was mainly on the children and adopting parents. The Adoption Act 1952 is yet another instance where the state accommodated the views of the Catholic church (see Chapter 32).

There were repeated calls from English Catholic charities and occasionally from Irish politicians and clergy for the government to appoint a social worker to the London embassy to work with emigrant women. Such demands tended to blur the lines between material and spiritual welfare - with concerns being expressed about irregular attendance at mass, marriage to non-Catholics in civil ceremonies and unmarried mothers. In 1948 the government established a Commission on Emigration and other Population Problems. Two members of this commission

---

171 Irish Times, 16 April 1945.
172 Irish Times, 29 May 1946.
carried out extensive inquiries in Britain about Irish emigrants, and they sought information on pregnant Irish women. The published report does not contain any substantial information about Irish women who fled to Britain when pregnant; it dismissed, or perhaps evaded, the topic noting that for us as a Population Commission, the significance of the problem of illegitimacy rests primarily on the loss by emigration of many unmarried mothers who find it preferable for one reason or another to emigrate rather than to face all the circumstances of an illegitimate pregnancy and confinement in this country.

9.119 The report was the subject of extensive, mostly critical, commentary in newspapers and in Dáil Éireann but there is no indication that this statement about unmarried mothers was noticed. However, despite its inadequacy and brevity, the population commission had highlighted the fact that Irish attitudes towards an ‘illegitimate’ pregnancy, and conditions of ‘confinement’ were driving women to England.\(^{174}\)

9.120 The files relating to boarded-out children reveal instances where officials appear to have failed to distinguish between questions of child welfare and Catholic church teaching. In 1960 Miss Clandillon wrote to a parish priest in Lancashire concerning two sisters who had been in foster care in Ireland and were now working in England. They were aged 21 and 16 respectively so they were ‘free agents’ and no longer the responsibility of Irish social services. She asked him to send a priest to their address ‘to see whether the surroundings are suitable and whether the girls are attending to their religious duties’. She claimed that she was writing on behalf of their ‘anxious’ former foster mother. Miss Clandillon wrote to another parish priest in England to inquire about the mother of a girl, now a teenager, who was in foster care in Ireland. The mother had married and was living in England. She and her husband had visited her daughter and they planned that she would go and live with them when she reached the age of 16. Miss Clandillon was ‘rather worried about the matter as it is not clear whether the marriage took place in the Catholic church or whether the X are suitable people to have the care of Y’. She asked whether ‘the family is known to your clergy’. The department inspectors and local authority officials were particularly concerned about cases where a child born in England to an Irish mother was being placed for adoption. When Miss Clandillon received adoption papers from a Scottish local authority with a request

that she arrange for the mother, who had returned to Ireland, to sign them, she advised the local authority children’s officer to defer action, until investigations had been made as to whether the adopting family were Catholic. She noted that in a recent similar case, a representative of the CPRSI had travelled to Britain, and arranged for the child to be brought back to Ireland for adoption. She noted that the child in this Scottish adoption case appeared to be in his teens (unless as Miss Clandillon noted, the date of birth given was an error), which might mean that he had been living with the prospective adoptive parents for some time but that consideration does not appear to have prevented her from suggesting that their religion should be investigated.175

9.121 An article on lone mothers in twentieth-century England ‘challenges the notion that social attitudes became increasingly enlightened over the century’. Thane noted that there was ‘moral panic’ over teenage mothers in 1960s England because the ‘illegitimacy’ rate was rising; there were similar concerns in the United States.176 In Ireland, where the ‘illegitimacy’ rate remained significantly below the figure for the early and mid-1940s, there is less evidence of moral panic; throughout the 1950s most of the bishops were still preoccupied with the same kind of topic as had concerned them in previous years, and their attitudes on these topics had not changed. Indeed, the choice of subject sometimes showed a harking back, not just to the immediate past, but to the Ireland of pre-war years, such as the evil of dance halls’.177 Repetition of the same warnings for several decades probably blunted their impact.

9.122 The proportion of Irish unmarried mothers who gave birth in mother and baby homes was at its height in the 1960s and the overwhelming majority of the babies were adopted. By the end of that decade, however, the expanding numbers of social workers working with socially-committed clergy such as Fr Fergal O’Connor, were beginning to offer pregnant women an alternative to entering a mother and baby home in the form of family placements. By the late 1960s there is emerging evidence of a more sympathetic attitude towards unmarried mothers on the part of some Catholic clergy. This change in attitude reflects greater activism among some Catholic priests about social issues, such as housing, poverty, and rural decline, plus the fact that a growing number of priests had worked as pastors to

175 Department of Health, RM/ARC/0/489433.
177 Whyte, Church and state in modern Ireland, pp 303-4.
Irish emigrants in Britain, where they were confronted with a variety of personal and social problems, including unmarried mothers. The introduction of liberal access to abortion in Britain in 1967, and evidence that unmarried pregnant Irish women were seeking abortions in Britain, was also a factor prompting greater sympathy towards unmarried women who continued with their pregnancy. In 1969 Fr Eoin Sweeney, who had worked for some years as a chaplain to Irish emigrants in England, published a short paper in the Catholic journal *The Furrow* on ‘The pastoral care of unmarried mothers’.

The unmarried mother is not a prodigy. She has always been a factor in society, in every social category, and always will be. Education, profession or social status is not a guarantee against this misfortune. And the average girl to whom this happens is a perfectly normal girl, not a psychiatric case. However from the moment that she first realises her plight, she goes through a period of intense strain, sometimes verging on desperation.178

9.123 But efforts to establish a non-denominational council for unmarried mothers - an Irish equivalent of Britain’s National Council for the Unmarried Mother and her Child - were thwarted by a determination on the part of some Catholic clergy to preserve the status quo. In a memorandum sent to all the bishops and to the directors of Catholic adoption societies in January 1971, Fr Barrett, who was about to step down from his long involvement with the CPRSI and Catholic social services in the Dublin archdiocese, stated that a lay-run, non-denominational organisation would have an utter lack of understanding of the nature of the unmarried mothers’ problems. Neglect of her religious duties - Mass, the Sacraments and prayer - is very often the cause of her fall. Repair of that neglect contributes very much towards her rehabilitation.179

9.124 This reiteration of the links between religious practice and penitence restated the case for sending unmarried mothers to mother and baby homes. This argument was not unique to Ireland. Morton, who wrote the history of the Cleveland (USA) mother and baby homes, stated that ‘Because of the belief that conversion, whether religious or psychological, is best achieved within an institution, maternity homes remained committed to institutionalization long after it ceased to be

standard social welfare practice'\textsuperscript{180} The total number of women in Irish mother and baby homes peaked in the 1970s, though their stay was significantly shorter than in the past.

9.125 When Margaret Bramhall addressed a conference in Kilkenny in 1970 on the unmarried parent in Irish society she opened her speech with the statement that ‘Illegitimacy is a subject that until recently was rarely discussed in respectable society’\textsuperscript{181} and she informed the audience that she was not speaking about Ireland. By 1971 the Department of Health and local officials were taking steps to give pregnant women greater choice both in terms of the late stages of her pregnancy and future arrangements for her child. Thane and Evans, writing about England, suggest that changing attitudes towards single mothers from the 1960s onwards ‘owed little to conscious government action’.\textsuperscript{182} In Ireland, the silence in Dáil Éireann and the newspapers when the Unmarried Mothers Allowance was introduced in 1973 suggests that the government may have been in advance of public opinion (See chapter 12).

9.126 Attitudes towards unmarried mothers in Ireland reveal many similarities with those found elsewhere, but there were important differences. Irish families were less willing to provide a home and support to a daughter who had given birth outside marriage and her child. This was due to a combination of factors - large families, poverty, but above all a concern with respectability and a family’s status in the community. In the late 1960s the number of unmarried mothers who kept their child was substantially lower and the proportion of ‘illegitimate’ babies who were adopted was substantially higher than elsewhere. In 1971 Fr Barrett claimed that ‘Parents are not overly sympathetic to pregnant daughters and those allowing them to come home are very small’.\textsuperscript{183} Adoption was introduced later than in any other European country except the Netherlands, partly because there was limited demand (this was a factor promoting legislation for legal adoption elsewhere), and because of the need to enact legislation that accommodated the views of the Catholic church. Psychology and social work were disciplines that were slow to develop and they therefore had a minimal role in provisions for unmarried mothers before the 1970s. The decades after 1970 are marked by a determination to preserve the constitutional ban on divorce and the prohibition on contraception,

and the enactment of a constitutional amendment protecting the life of the unborn, but this rear-guard action to preserve Ireland’s distinct moral and legislative culture coincided with a steady rise in the number of unmarried mothers.
Chapter 10: County Homes

Introduction

10.1 The unmarried mothers and children who were in county homes have attracted much less attention than those in the mother and baby homes but there is conclusive evidence that they experienced much worse physical conditions than the women who were in mother and baby homes, with the exception of Tuam and Kilrush. In addition, the women in county homes had to carry out onerous and unpleasant work for which they were not paid, sometimes for several years.

10.2 County homes were the successors to the workhouses established under the Poor Relief (Ireland) Act 1838 to provide indoor relief for all categories of poor and needy - the aged and infirm, destitute, homeless, tramps, and single mothers and their children. The policy outlined by the First Dáil and the Irish Free State was to abolish the workhouses, providing for those in need in the community where possible, and creating specialist institutions for those who required institutional care. A number of workhouses, renamed county homes, would accommodate the aged and infirm and those with disabilities. Unmarried mothers would be sent to homes that were exclusively for them; children would be placed in foster homes, though it was unclear where unmarried mothers of two or more children would be accommodated. Yet despite this intent - which was frequently reiterated - until the 1950s, the county homes continued to shelter the same disparate categories of adults and children as were found in Irish workhouses before 1919 including substantial numbers of unmarried mothers and their children and children without their mothers. In 1927 a former clerk of Baltinglass Poor Law Union told the Commission on the Relief of the Sick and Destitute Poor that the county home was ‘practically the workhouse in another name’.

10.3 The major change after independence was that services were organised on a county basis; the 19th century poor law unions ignored county boundaries. Most counties designated a former workhouse as the county home. Cork, the largest county, was divided into three health districts: north, west and south, with their three respective county homes, in Mallow, Clonakilty and Cork city. There was no county home in Louth; the men, women and children who could elsewhere be

accommodated in county homes were maintained in three district hospitals. The pre-1922 financial and governance structures survived almost unchanged. Health and welfare services were funded by rates - a local tax on land and property - and they were overseen by a county board of health, consisting of elected councillors and a number of co-opted members. With finance and governance locally-based, practices varied between the various health authorities. Affluent counties were not necessarily more generous in providing for the needy. When Ireland was part of the United Kingdom the Local Government Board Ireland, based in the Custom House, oversaw the poor law system; it established regulations that applied to all unions; carried out inspections; applied sanctions for failure to observe regulations, and it authorised loans to poor law unions for capital expenditure. This administrative system survived after independence, with the DLGPH replacing the poor law commissioners. The Irish poor law/welfare system continued to be governed by pre-independence legislation until 1942 when the Public Assistance Act 1939 came into effect and which incorporated much of the earlier legislation (see Chapter 1)

Single mothers and children in county homes

10.4 A witness to the Commission on the Relief of the Sick and Destitute Poor (the 1927 commission) estimated that, in 1925, 1,000 of the 1,662 ‘illegitimate’ births took place in either a county home or a district hospital. Dublin was an exception; the majority of unmarried mothers did not give birth in a local authority institution; they gave birth either in the city maternity hospitals or in private maternity homes. The Dublin maternity hospitals appear to have been unusual in admitting unmarried mothers; elsewhere these women tended to be excluded from the main hospitals. Some women left the county home or district hospital with their baby shortly after the birth, others became long-term residents.

10.5 There were 772 unmarried mothers in county homes in 1926; 391 were mothers of two or more children. As the number of places in mother and baby homes increased during the 1930s, there was a gradual decline in the number in county homes. In 1939 there were 584 unmarried mothers in county homes; this fell to 582 in 1942 and to 450 by 1949. Unmarried mothers continued to be found in

county homes throughout the 1950s and occasionally in the early 1960s. On 31 December 1963 there were only three unmarried mothers in county homes - in Cashel and Midleton.⁵

10.6 During the 1920s and 1930s, the Department of Local Government and Public Health (DLGPH) inspectors made considerable efforts to have first-time mothers removed from county homes. In 1926 Miss Fitzgerald-Kenney urged the Kerry board of health and public assistance to send them to Bessborough because that would give the women a 'chance of reclamation'. The department issued a circular to all boards of health and public assistance in 1929, seeking information as to the number of unmarried mothers in county homes; local authorities were asked to submit those statistics on a six-monthly basis. The statistics were undoubtedly used to inform decisions about the need for additional places in special homes, and they enabled the department to monitor whether counties were implementing the policy of removing unmarried mothers from county homes. Donnacha Lucey documents a succession of letters to the Kerry board of health and public assistance in the early 1930s, all urging that unmarried mothers should be transferred from the county home to Bessborough. He describes the ‘DLGPH’s identification of women in county homes who it wanted sent to Bessborough’ as ‘thorough and systematic’.⁶

10.7 In the 1920s women from the South Cork board public assistance area, who were seeking admission to Bessborough, were first admitted to the Cork county home (which later became known as St Finbarr’s), and until a maternity unit opened in Bessborough in 1930 most of the women gave birth in the county home and were then transferred to Bessborough. In 1930 the Mother Superior in Bessborough explained that many women refused to go to the county home before being transferred. She suggested that they should be admitted directly to Bessborough with a note from a home assistance officer, a local authority medical officer or the Bessborough medical officer. The South Cork board approved this arrangement for their area; women from other health areas would first have to enter the county home.⁷ In the early years South Cork paid for the maintenance of women from outside their area in Bessborough; in December 1930 they wrote to the minister

demanding that the cost should either be a national charge, or local authorities should pay.  

Women were likewise admitted to Pelletstown in the 1920s and early 1930s via the Dublin Union and many women gave birth in the Union (see Chapter 13). In the 1920s a pregnant woman or mother of a new-born infant who sought admittance to the Dublin Union was interrogated by the porter about her circumstances, including the identity of the putative father of her child. In the Donegal county home in Stranorlar the storekeeper was rewarded for investigating the personal circumstances of unmarried mothers and eliciting payments towards the maintenance of mother and child from either a putative father or her family. Some of the women admitted to special mother and baby homes were subject to similar inquisitions by their local authority.

Records from the war years show that PFIs (women who returned from England either pregnant, or with a new-born infant), were frequently admitted to the Dublin Union for a brief period before being transferred to a mother and baby home. When a mother and child left Bessborough or the other homes run by Congregation of the Sacred Hearts, her child was often sent to the county home prior to being boarded out. The records of the Kilkenny county home at Thomastown reveal many instances of children, who were born in Bessborough or Sean Ross and maintained there by Kilkenny board of health and public assistance, being transferred to the county home, prior to boarding out. If, however, the child had special needs or some physical ailment he/she might remain in the county home for many years, and children who had been placed in foster homes might be returned to the county home at a later date (see Chapter 11).

Local authorities appear to have distinguished between the women who were admitted to special mother and baby homes and those who remained in county homes, and this distinction was not just between first-time mothers and women who were pregnant for a second time. Lucey suggests that 'similar to pre-independence workhouses, county homes were utilised mostly by poorer women who were more knowledgeable of the poor law system'. By the 1930s Kerry board

8 South Cork, Board of Health and Public Assistance, minutes, 31 Dec. 1931.
9 Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, fifth day, 23 June 1925.
of health and public assistance was maintaining women in Bessborough, including women from more comfortable families, who would not normally qualify for poor relief. ‘While unmarried mothers in county homes were invariably poor, more middle-class individuals were willing to turn to mother and baby homes’. The private (that is those owned and run by religious congregations such as Bessborough) mother and baby homes had the discretion to reject a woman or expel her from the home. In 1927, for example, the Sisters refused to re-admit a young woman who had recently left Bessborough in a fit of temper when asked to change sleeping apartments. The Sister reported that she had been ‘very unsatisfactory, insubordinate, and from our experience of her misconduct we consider her of a very low type. Owing to such bad influence with the other girls we think it advisable not to admit her’. This young woman was in the South Cork Union.

10.11 Local authorities had absolute discretion over whether they would pay for a mother and her child in a special mother and baby home. Women had no statutory entitlement to maintenance in a special home, and the files reveal some unseemly wrangles between different local authorities as to who was financially responsible for her maintenance. Some local authorities refused to send any women to special mother and baby homes, despite being repeatedly urged to do so by the DLGPH. In 1940, the department inspector Miss Litster reported that counties Kerry, Limerick, Roscommon, Louth and Wicklow refused to send any women to mother and baby homes ‘except by special arrangement’. Women in Mayo and Galway were sent only to Tuam; counties Donegal, Sligo and Wexford did not as a rule send women to special homes. In 1947 the Roscommon county manager refused to pay for a pregnant woman who was returning from England to go to anywhere other than the county home - which she refused to enter.

10.12 Until the 1950s, Pelletstown and Tuam, both under local authority control, and Bethany were the only mother and baby homes to admit mothers on a second or subsequent pregnancy, so most of these women had no alternative to the county home. For example, a woman whose first baby was born in Sean Ross was admitted to the Waterford county home on her second pregnancy. The mother

and baby home in Dunboyne, which opened in 1955 was initially designed to cater for mothers who were giving birth to a second or subsequent child. Women in bigamous marriages, widows and married women with extra-marital pregnancies were generally admitted to county homes, because they would not be accepted in the mother and baby homes. A file from the Department of Health concerns an Irishwoman whose English ‘common law’ husband was in prison. She and her four children were repatriated to a county home in Ireland.16

10.13 A woman’s family background, her employment and intellectual and physical capacities appear to have commonly been considered when a local board of health or a county manager was determining whether to send a woman to a mother and baby home or a county home. A report by the DLGPH in 1944 noted that ‘the mothers who go to County Homes are mainly drawn from the poorest class’ and they generally had one or more children.

Such mothers, unless their parents are willing to keep them up to a short time before confinement, go to their County Home fairly early in pregnancy. In most County Homes they receive adequate and nourishing food and extra milk. There is no need for any attempt to conceal their condition, and in general girls of this class are more philosophic, more willing to accept consequences, as inevitable, than those drawn from a class where appearances count for a good deal. They have no anxiety about getting back to their work which is often of a casual nature.17

10.14 The attitudes reflected in this report influenced decisions as to where a particular pregnant woman would be sent. Women from poorer families who contacted charitable agencies catering for unmarried mothers, such as St Patrick’s Guild, were commonly referred to a county home. Miss Cruice of St Patrick’s Guild told the Commission on the relief of the Sick and Destitute Poor that she would assist ‘a sensible girl who realises her fall and is anxious to regain her good name or to conceal the fact that she did fall…The other class of girl, the wanton girl, is mentally deficient. There is a slight mental deficiency in nearly every one of them. If I find that girl, a half lunatic in some cases…I try to send her to the Dublin Union’. She admitted that she would ‘coax’ ‘girls’ who lacked money to go into the Union.18

17 Department of Health, RM/ARC/0/489773.
18 Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, twelfth day, 22 Sept. 1925.
10.15 The county home was also the default institution for women who were rejected by the special homes, or transferred from these homes, because they had physical or intellectual disabilities, or they had contracted a venereal disease. One woman who was unable to walk - she was described as a ‘cripple’ - had been resident in Sean Ross before being sent to a Dublin maternity hospital to give birth (presumably for medical reasons). When she was discharged from hospital, Sean Ross refused to readmit her so she was sent to the county home - much to the distress of her family, who had several cousins who were ‘inmates’ in that county home.\(^{19}\) A 1949 report on the Wexford county home at Enniscorthy noted that there were two pregnant unmarried women in the home ‘both regarded as sub-normal…The number of mothers coming within this category appears to be on the increase. This bodes ill for the average intelligence of children in the County Homes’. There are several references in inspection reports of county homes to unmarried mothers who had tuberculosis,\(^{20}\) and there is some evidence that women with tuberculosis were excluded from special mother and baby homes.

10.16 In one case a county manager wrote to Miss Litster concerning an appropriate placement for a single mother. The woman’s father owned a 50-acre farm. He commented

> Normally one would assume that a girl coming from such a home would be suitable for some of the special homes [i.e. mother and baby homes], but I do not think that the father is much use and the social and family background - apart from the mental stature of the girl - does not indicate that the case is one for such an institution.

10.17 He proposed that she be transferred to the county home, despite a clear policy from government at this time to remove unmarried mothers from county homes. There are similar examples of prejudicial judgements relating to women being repatriated from England during the 1940s and 1950s. The CPRSI determined that one woman was not suitable for a special home because she was ‘incapable of thinking for herself’, and suffered from ‘nervous tensions’, so she was sent to the county home in Killarney. A young woman, who it was claimed wanted to be admitted to Castlepollard but was described as a ‘mental defective’, was sent to

\(^{19}\) Department of Health, RM/ARC/0/489984

\(^{20}\) Department of Health, INACT/INA/0/476463.
her county home in 1952. Another woman, who was described as ‘handicapped’, was admitted to the county home in Athy.\textsuperscript{21}

10.18 Some women refused to go to their local county home because of fears that their pregnancy would become known to neighbours or family. By the 1940s a number of councils were making arrangements for women to be admitted in a different county. A married woman, who was separated from her husband and pregnant, was admitted to the Kilkenny county home in Thomastown rather than her local county home in Cashel. Another woman, who refused to go to the county home in Roscommon because she claimed that she had relatives working there, agreed to go to the Leitrim county home in Manorhamilton. She was eventually admitted to the Longford county home because Roscommon did not have a reciprocal arrangement with Leitrim. In another case, a Department of Health inspector tried to arrange that a woman who was chargeable to Louth would be admitted to another county home because she refused to enter any of the district hospitals in the county. This type of arrangement appears to have been initiated by the public assistance authorities in Donegal and Sligo; both counties had refused for many years to send women to special mother and baby homes. But in 1952 when the Department of Health queried why this arrangement was not being observed, an official in Sligo county council reported that all the unmarried mothers in the county home refused to go to Donegal because they wanted to stay close to family and friends. When one young woman, who was in an advanced state of pregnancy (her first child), was asked if she would go to another institution ‘she became hysterical’, and refused to leave the Sligo county home.\textsuperscript{22}

A number of women expressed a wish to be admitted to a county home rather than the special mother and baby homes. One woman asked for a transfer to her local county home - in Newcastle West - because she was unhappy in Castlepollard. In 1952 Miss Litster reported that first-time mothers were still being admitted to the county home in Killarney. It was claimed that some were unwilling to go to Bessborough because of ‘fear of a lengthy period of detention or hope that, if they are in the County Home their relatives may take them and their babies home in a short time’.\textsuperscript{23} On another occasion she commented that ‘there is a good deal to be said for admission to this [Wicklow] County Home’; babies were boarded out earlier than in the special

\textsuperscript{21} Unless otherwise indicated all these cases, and those cited later in this chapter come from the repatriate files and files of women who approached the Department of Health seeking assistance. Details of these files are given in Part 5: Archives

\textsuperscript{23} Department of Health, INACT/INA/0/447861.
homes, so the mothers were not detained for as long, and there were classes in domestic economy.\textsuperscript{24}

10.19 There was a wide variation in the length of time that mothers spent in county homes. Some remained for many years, but others left within a few days’ of giving birth. Over 40% of women in the Donegal county home in Stranorlar were resident for less than 50 days in every decade (see Chapter 29A). A report by the DLGPH dating from the late 1940s noted that ‘It is difficult to make any calculation as to the number of such [long-stay] cases. The attitude of parents towards the return of their daughter in such circumstances is not predictable, and while a large number may return home in one year from one institution, none may be permitted to do so in the following year’. It estimated that roughly 300 of the 1,000 children who survived infancy were taken home by their mothers - though it was unclear what arrangements were then made for their care. ‘A number remain with their mothers in the County Homes and at a suitable age find their way to Industrial Schools generally through the good offices of the district inspector of the NSPCC’. This was usually done through a private arrangement between the child’s mother and the NSPCC inspector and was not disclosed to the county home.\textsuperscript{25}

**Physical conditions and diet**

10.20 In 1949 the government established an inter-departmental committee to report to the Minister for Health on the reconstruction and replacement of the county homes. This report suggests that not much had changed since the Commission on the Relief of the Sick and Destitute Poor had reported more than 20 years earlier. Although 5,208 of the 8,585 ‘inmates’ nationwide were over 65 years or younger adults who were described as ‘chronic sick’, the remaining one-third included ‘other adults’: ‘mental defectives’, blind, deaf mutes, casuals and 450 unmarried mothers and 829 children.

10.21 This committee repeated the recommendation made in 1927 by the Commission on the Relief of the Sick and Destitute Poor that county homes should be reserved for the aged and the chronic sick and should ‘cease to be institutions housing a variety of persons for whom specialised accommodation is obviously more desirable’. The committee members recommended that unmarried mothers should be removed to special homes; additional special homes should be provided by

\textsuperscript{24} Department of Health, INACT/INA/0/430895.

\textsuperscript{25} Department of Health, RM/ARC/0/489778.
groups of counties and placed under the control of ‘appropriate organisations specialising in the care of unmarried mothers and their children’. All children should be removed from county homes. The committee described boarding out as a ‘reasonably satisfactory method of dealing with this problem’, and recommended that it should be extended. Children for whom foster homes could not be found should be placed in industrial schools. Additional special homes should be established to accommodate children who were below the normal age for boarding out and for ‘unmarried mothers for such time as it was found necessary for them to remain with their children and be maintained by the local authority’.26 The committee made no reference to adoption.

10.22 During the 1950s the Department of Health kept up a sustained effort to have unmarried mothers and children removed from county homes. They monitored the statistical returns on numbers in county homes; department inspectors recorded personal details of the children and mothers in the county homes and there were frequent follow-up letters from the department, asking whether any action had been taken to remove named children (aged over two years) from a county home. It is important to recognise that county homes provided emergency accommodation for needy women and children. During the 1950s occupants included children whose parent(s) were being treated for tuberculosis in sanatoria; children and mothers with a parent(s) or spouse in a mental hospital, deserted wives and homeless families (Some of the women and children in the Tuam Children’s Home had similar profiles). A 1953 inspection of the Kildare county home in Athy noted that ‘This County Home generally has a fleeting population of families admitted because of eviction, unemployment, illness of one or both parents or some other cause of break in family life’.27

10.23 Unmarried mothers continued to give birth in county homes during the 1950s. A Department of Health file dated 1952 lists maternity beds reserved for unmarried mothers in most county homes. Medical care was provided by the medical officer attached to the county home, though some counties were no longer delivering women in the county home - all Sligo women gave birth in the county hospital, likewise in Tipperary South, and Limerick. In Meath women gave birth in Trim

26 Department of Health, White paper on the reconstruction of county homes and improved care of the aged and other classes at present in county homes (Dublin, 1951).
27 Department of Health, INACT/INA/0/448082.
maternity hospital which was in the grounds of the county home. Many women who gave birth in county homes left shortly after the birth. A report on the Wexford county home in 1951 noted that women were entering the home at a very late stage in pregnancy, sometimes after giving birth, and they were exiting the home at an earlier stage; ‘many discharged mothers return with baby to their employment. No means of knowing type of care. At least the baby is in the mother’s care’. Most single mothers in county homes were described as domestic servants or were working in the parental home. The inspector suggested that higher wages and better job prospects (an increasing number of young women were refusing to take jobs as domestic servants in Ireland) accounted for the late admissions and early discharges.

10.24 In 1952 the Department of Health issued instructions that ‘If unmarried mothers are confined in county or district hospitals each mother and child should be discharged to the appropriate special homes at the end of the puerperium, approximately 30 days after delivery’. Despite this instruction, single women continued to give birth in county homes until the early 1960s. There are references to children who were born in the Monaghan county home in Castleblaney in 1961, though on each occasion the mother and child left shortly after the birth. There were seven mothers - six single, one married - in the Limerick county home in Newcastle West in 1962. When the department challenged Miss Reidy, the inspector, to explain why the women had not been sent to special homes she reported that the special homes would be reluctant to accept most of the unmarried mothers who resort to county homes; many of these cases would have a bad moral influence on the usual ‘inmates’ of the special homes and she saw no alternative to accommodation being provided as required for such cases in county homes.

10.25 The department was not convinced by these arguments, because other local authorities were no longer admitting unmarried mothers to county homes. There was one unmarried mother in the Carlow county home in October 1963. On 31 December 1963 unmarried mothers were found in only two county homes - Cashel (Tipperary South) and Midleton (Cork). The Department of Health noted that

32 Department of Health, INACT/INA/0/449398.
33 Department of Health, INACT/INA/0/425267
anything approaching a “colony” of unmarried mothers in a county home is for all practical purposes now a thing of the past. They conceded that ‘It is unlikely, however, that admissions of unmarried mothers to county homes will cease entirely. Women far advanced in pregnancy or with some special reason of their own for not going to the special homes will occasionally look for and be granted accommodation in a county home’.34

10.26 The reduction in the number of unmarried mothers giving birth in county homes was partly due to an expansion in the number of maternity beds in provincial Ireland. In the 1950s a number of county hospitals reserved specific numbers of beds for unmarried mothers, but that was not standard practice. Some county homes had provided maternity care for married as well as single women but that gradually ceased. In the early 1950s the Wicklow county home in Rathdrum appears to have been used by dispensary doctors as a ‘dumping ground’ for difficult maternity cases; complex paediatric cases were also sent to the county home without any prior notification - this practice reflected inadequate hospital facilities within the county and difficulties in having Wicklow cases admitted to Dublin hospitals. The maternity unit at the Wicklow county home closed in 1955 because the county medical officer was not satisfied with the quality of medical care.35 Midwifery ceased in the Donegal county home in 1960.

**Conditions in the Homes**

10.27 All county homes were located in former workhouses. During the course of their investigations, the Commission on the Relief of the Sick and Destitute Poor, which reported in 1927, visited every county home. The majority were in very poor condition. Whether this reflects a lack of investment prior to 1920 or the fact that many of these institutions had been occupied by military forces - British forces, the Irish Free State army and the anti-treaty IRA - is not clear - but their poor condition is not in question. They concluded that the county homes were ‘not fit and proper places’ to accommodate their residents. They set out some basic essentials - ‘good water supply and sanitary and bathing accommodation; well-ventilated wards, good beds, sufficient dormitory accommodation, good kitchen and laundry arrangements and possibly, above all a sympathetic and maternal administration’. They described the sanitary and bathing facilities, and the kitchen, laundry and day rooms in some homes as ‘extraordinarily bad’. The wards needed improvement.
The county home in Cavan presented ‘a cheerless appearance and everywhere looked gloomy and cold’. The accommodation provided for unmarried mothers and their children was ‘only moderately good’. The West Cork county home in Clonakilty was ‘one of the most primitive institutions in the country’; it was ‘doubtful if it has been improved in any way since it was built. The walls are unplastered, the water supply is poor and the kitchen is not good. The sanitary accommodation is very bad’. This home contained 23 unmarried mothers and there were 55 children in the nursery. Some of the children, despite being of school age, were getting no schooling. There were 38 unmarried mothers in the Kilkenny county home in Thomastown; only eight were ‘first offenders’. The water supply was ‘bad’, bathing and sanitary accommodation was ‘very bad’, and the standard of comfort ‘from a home point of view poor, little effort being made to brighten the lives of the aged and infirm or to reform those who, through moral weakness, were obliged to seek shelter there’. The accommodation in the attached maternity department was ‘insufficient’ - and the inadequate water and sanitary services presumably included the maternity unit.

10.28 Thomastown had 41 children under three years, and 17 aged over three - these 58 children slept in 23 cots (see Chapter 30). In the case of the Laois county home the Commission on the Relief of the Sick and Destitute Poor commented that it did not appear that ‘any great effort had been made to justify the change in name from Workhouse to Home’; the accommodation in the attached maternity unit was ‘not good’. The Leitrim county home at Manorhamilton had a low standard of comfort: ‘the walls of the wards are not plastered; there is no bathing accommodation, and except for a flush closet in each of the yards, no sanitary accommodation. Except on the ground floor there is no method of heating any of the wards. The kitchen is poor and the laundry primitive’. The adjoining county hospital, which had a maternity unit attached, appears to have been better. The Longford county home ‘has not yet advanced much beyond the poor standard of workhouse comfort’ and the accommodation in the maternity department was ‘not good’. The Meath county home in Trim was described as ‘a gloomy depressing institution, indifferently managed…in no way changed, [from its days as a workhouse] except for the worse’. Pregnant women were sent to await confinement in a maternity hospital on a separate site. Some male and female ‘inmates’ in the Roscommon county home were sleeping two to a bed.
The seven school-going boys in the Tipperary South county home in Cashel attended an outside school, but they mixed with the male ‘inmates’ in the county home - which the 1927 Commission described as ‘unsuitable’. Although the Cashel town water supply ‘comes practically to the building’ it was not connected to the county home, and bathing conditions were ‘totally insufficient’. Female children were housed in a shed at the back of the home. There was a maternity ward - which presumably lacked proper water and sanitation. The water supply at the Donegal county home was ‘bad’; there were no flush toilets in ‘the body of the home and the contrivances in the yards are very bad and rather revolting’. Elderly women, ‘lunatics’, ‘imbeciles’ and unmarried women were all herded together. The home was fully occupied and occasionally overcrowded. Accommodation for unmarried mothers and their children in the Westmeath home was ‘bad - the whole place wanting in comfort’; there was an attached maternity hospital. Accommodation in the Wexford county home at Enniscorthy was described as ‘ample, but rough’.

In Carlow, Cavan, Cork North and South, Kildare, Kilkenny, Louis, Leitrim, Longford, Meath, Offaly, Tipperary South, Westmeath, Wexford and Wicklow there was some form of maternity unit attached to the county home. While some counties such as Westmeath admitted only unmarried mothers, others delivered the babies of both single and married women. It is not clear whether a qualified midwife or a doctor was in attendance. The Limerick county home at Newcastle West appears to have been among the best in the country. Considerable money had been spent; sanitary arrangements were described as ‘good’, there was a storage tank for water, ‘a good kitchen, laundry, and engine house’, presumably for heating the home. The former workhouse at Castleblayney, Co Monaghan, was being reconstructed and the commission expressed the belief that it would be ‘suitable’ when work was complete. The Offaly county home was located in the former Tullamore workhouse. While the premises had been improved and the commission described the management as ‘good and sympathetic’, sanitary and bathing arrangements ‘should be improved’. The commission was not prepared to blame the local authorities for the poor condition of the homes, but it did state that ‘a continuance of the present conditions would be a serious blot on the Schemes
adopted for the purpose of improving and humanising the administration of public assistance'.

10.31 There is no evidence of significant improvements to most county homes until the 1950s. Under the Public Hospitals Act 1933, the sections of county homes which were used as an infirmary were eligible to receive funding from the Hospitals Trust, but the only such institution that was funded was St Kevin’s Hospital in Dublin which was on the same grounds as the Dublin Union. By contrast there was significant capital investment from the Hospitals Trust in the mother and baby homes run by the Congregation of the Sacred Hearts.

10.32 Waterford is one of the few county homes for which inspection reports survive for the 1930s. In February 1933 indoor lavatories and bath accommodation was ‘lacking throughout the institution’. Nine wards had no ceilings - i.e. the rafters were exposed. Dust continually fell down, as did water when the floors in upstairs wards were being washed. The ‘inmates’ were segregated. Able-bodied women, who were almost exclusively unmarried mothers, had no dining room, or day room; the only space available to them for eating or any form of relaxation was their sleeping quarters. By 1934 there were hopes that the water supply to the home would soon improve. There is no indication that Waterford was atypical. Some improvements were carried out during the 1930s; many county homes were connected to mains water supplies and mains electricity, and other minor works were carried out. The white paper on the reconstruction and improvement of county homes quoted the report of an inter-departmental committee established in 1949, which concluded that

while the buildings are sound and spacious, they are lacking in comfort and amenities. In general, the day rooms and dining rooms are cheerless and badly furnished. They are frequently unceiled and have unplastered walls. These factors combined with unsatisfactory lighting and rough bare floors render the atmosphere depressing.

There is considerable variation in the standard of the kitchens and cooking facilities. In some Homes the standard is very good, in others is it so low that the food, while originally of good quality, is unappetising when served.

36 Commission on the Relief of the Sick and Destitute Poor including the Insane Poor, Report (1927), Summary of principal conclusions and recommendations 4, 5, 6, and 7, p. 124.
38 Department of Health INACT/INA/D 475469
The wards are large and commonly have unplastered walls, no ceilings, rough floors, poor beds and bedding, very few chairs or lockers and no dressing tables or mirrors. A number of the wards still have the original central valley or depression which served as a gangway when the inmates slept on straw spread on the raised portion of the floor at either side.

The narrow, steep stone stairways, which elderly and ailing people find difficulty in using, still survive in many Homes. In a number of Homes, however, efforts have been made to improve the staircases by covering them with wood. No County Home has a lift. Windows are generally too small and often have the original workhouse diamond panes and in general they are ineffective either for the provision of ventilation or light.

Sanitary and bathing facilities are insufficient and are generally rather crude. Baths are the ordinary deep reclining type into and out of which helpless patients must be lifted, often with great difficulty. Supplies of running water, especially running hot water, are frequently insufficient. Sluice rooms are few. Central heating is a rarity and the standard of heating resulting from the single open fire in a large ward or room is usually quite inadequate. Quite often, too, the fires smoke, thus adding to the prevailing gloom...

The accommodation provided for unmarried mothers and children is, in general, equally unsatisfactory and in particular the committee reported that the environment of a County Home is most unsuitable for children. The nurseries are rough, poorly furnished and lacking in elementary playing facilities. In some County Homes proper segregation of children and adults is not possible.\(^\text{39}\)

10.33 Inspection reports confirm the account given above. The county home in Castleblaney was reported in 1926 to be undergoing major improvements. It is unclear whether they were carried out. In 1948 the floor in the day nursery which was used as a dining room for mothers and babies, was ‘rotting in many places’; the open fire place was broken; plaster was peeling from the walls and one corner was very damp. The floor in the mothers’ dormitory was also rotting and there were large holes along the skirting board and a rat trap under one bed. The nearby bath had not been useable for some months ‘as the water cannot get away’; the water supply to the WC was described as ‘all right, but the manhole

\(^{39}\) Department of Health, White paper on the reconstruction of county homes and improved care of the aged and other classes at present in county homes (Dublin, 1951), pp 9-10.
outside is constantly getting choked’ as it was when Miss Litster visited. In 1952 the nursery in the North Cork county home was described as ‘The usual long room on the ground floor opening directly off the yard. Conditions are primitive. No water is laid on. Hot water is brought from the laundry for bathing of babies. There is one WC in the yard. It is also used by the epileptic women. It is not as clean as it might be’. In 1949 the nursery in Enniscorthy contained 16 small and seven larger cots. The cots were described as in good condition, equipped with hair mattresses, but the blankets were worn, old and discoloured from use and washing. There was ‘a stock of good new Foxford blankets’ - but it is unclear whether they were being used. The nursery also contained five adult beds - two were occupied by mothers who slept there and attended to the children during the night; the others were occupied by ‘casual’ women: one bed had recently been occupied by a woman who had been brought in drunk by the Gardaí at 10pm.

10.34 Most nurseries were heated by an open fire - with a fire-guard (though there is at least one report where there was no fireguard); the open fire was used to heat milk for children’s bottles in several homes. Facilities for washing and feeding the infants varied. In Rathdrum (Wicklow) in 1952 there was a wash-room, which was described as ‘dark’, plus a large sink with hot and cold water but no WC or bath. The Laois county home in Mountmellick had a bathroom beside the nursery, that was unused because it only had a cold water supply; babies were bathed in small baths beside the fire. Bath water was heated on the open fire. Given that there were children in the room, and this fire was also used to heat the children’s milk, there must have been a considerable risk of accidents. Such arrangements raise serious questions about the cleaning of infants’ feeding bottles. The only WC was outside in the yard, and it was adult-sized; children used chamber pots.

10.35 In 1948 the nursery in the Waterford county home was also used as a dining room for mothers and children; it was heated by an open fire. Food was brought from a kitchen ‘some distance away’. ‘A door opening from the nursery directly outside is badly fitting and rain and wind sweep in under the door’. There was no bathroom or indoor sanitary accommodation. When a Department of Health inspector visited

some months later, workmen were carrying out repairs that would address these complaints. However the cooking facilities for 260 people were still inadequate; the inspector recommended that a large cooker - Aga or Esse - should be installed without delay.\textsuperscript{46}

10.36 In the Limerick county home, as elsewhere, breastfed infants slept in the mothers’ dormitory, other infants slept in the nursery - a room that was roughly 40 feet by 16 with 26 cots; those against the wall were close together with no space between them. A Department of Health inspector estimated that where a nursery was used day and night, ‘50 square feet may be regarded reasonably as minimum floor space per cot’ - the space available was just under half that figure. An adjoining bathroom contained six small baby baths; water was heated in an old-fashioned boiler and then ladled into the baths. There were four outdoor WCs. The older children had access to a day room but the children did not appear to have any toys - except a toy horse on wheels ‘from its appearance, [it] does not seem to have suffered by use’. The children were minded by a paid attendant - an elderly woman who was described as ‘no doubt kind to them’ but ‘much too old to enter into play and organised games’. The older children slept in a separate dormitory. The mothers’ dormitory contained 27 beds but only six were occupied at the time of this inspection. The walls were ‘rough surfaced, painted green below and distempered in pink above’. There were two WCs and a wash basin off this dormitory but no mention of baths.\textsuperscript{47}

10.37 The first substantial investment in county homes commenced in the early 1950s when money was specifically allotted in the capital budget for this purpose. Between 1950 and 1952 the main passages in the Mountmellick home were laid with terrazzo flooring; the kitchen was provided with ‘excellent cooking facilities; the dining room furnished with covered tables seating four to six adults with good solid chairs; a boiler in the kitchen supplying hot water to the men’s bathroom’. The department’s inspector described this as ‘entirely laudable’, before going on to note that ‘The contrast with primitive conditions in the quarters allotted to mothers and children is pointed’.\textsuperscript{48} Several inspections report that nurseries were recently painted, dormitories ceiled and walls plastered. In Wexford the children’s dormitory was a ‘large bright airy room, 18 beds, clean and comfortable’. There

\textsuperscript{46}Department of Health, INACT/INA/0/475557.
\textsuperscript{47}Department of Health, INACT/INA/0/430462.
\textsuperscript{48}Department of Health, MHS/INA-0/490058.
was a bathroom off this dormitory with hot water. In 1952 the mothers’ dormitory in the Wicklow county home contained 15 beds; good sheets and blankets, flock mattresses - which were seen as a major improvement on straw and similar mattresses. Each mother was provided with a locker - this seems to have been a recent improvement - and was uncommon in county homes at this time. There was a WC and bathroom off the ‘old women’s ward’, which was presumably shared with the old women; and another WC and bathroom on the ground floor, plus five wash basins ‘situated in the passage opening directly from outside, and an outdoors flush WC.\(^49\) A 1949 inspection which described identical sanitary facilities said that the hot water supply was ‘ample’ and ‘there is no restriction on baths’.\(^50\) Capital expenditure on county homes was reduced as part of the curbs on public spending resulting from an economic recession in 1956.\(^51\) In 1959 an official in the Department of Health commented that ‘the greatest single need in any county home over four or five months of the year, having regard to the type of people accommodated is adequate heating’. This report described ‘a circle of inmates huddled together round a fire’.\(^52\)

10.38 The investment in county homes was designed to create appropriate accommodation for the ‘elderly’ and ‘infirm’. Unmarried mothers were not a priority. Inspectors’ reports indicate that most unmarried mothers had no privacy or personal space. There is no indication that beds in mothers’ dormitories were screened by curtains; in several instances there would not have been sufficient space between the beds. Many homes did not even provide women with a locker to store personal belongings. The lockers in the Kildare county home in Athy in 1952 had been made in the home - they were ‘simply tables with a small drawer, closed by a wooden catch, sufficient to hold small personal belongings’.\(^53\) Mothers in the county home in Killarney had to store personal belongings in a suitcase which was kept in a cloakroom. Miss Litster noted that there did not appear to be sufficient room in the dormitory for lockers or chairs.\(^54\) In the Laois county home a four-bedded room contained chairs and a press, plus five cots where children, including one five-year-old boy slept. The two women who slept in the larger

children’s dormitory, which contained ten cots, each had a chair and a locker. Providing five wash-hand basins in a passage ‘opening directly from outside’ indicates a complete disregard for the women’s privacy or dignity. Improvements continued throughout the decade. Donegal county home installed central heating in 1962, though by that time there were almost no unmarried mothers and few children in the home.

10.39 In the years following World War II efforts were made to provide play spaces or leisure activities for the children in county homes. In Enniscorthy in 1949, 20 toddlers and children used a ‘shelter’ in the playground which was heated by a stove. They came there in the morning and meals were served to them, seated on long benches. In Wicklow a recreation room with wireless, table, piano and comfortable chairs was available to the mothers after the babies’ bedtime, until their own bedtime at 8.30 pm. The dining room was being ceiled. Miss Litster commented that ‘an attempt is being made in the County Home to provide some comfort and amenities for mothers’.

Diet

10.40 The diet of county homes, like the workhouse diet pre-1922, was carefully regulated and overseen by central authorities. In 1924 the diet in the Donegal county home for female patients, unmarried mothers and children consisted of

- Breakfast, 8.00 am: 6 oz bread, 1 oz margarine, 1 pint tea
- Dinner, 1.00 pm: 4 oz beef or mutton, 2 lbs potatoes, vegetables
- Evening Tea, 3.00 pm: 4 oz bread, 0.5 pint tea, 0.5 oz margarine
- Supper, 1 pint porridge, 1 pint milk

10.41 The Minister for Local Government and Public Health deemed this diet to be excessive and administrators were ordered to bring it into line with other county homes. The local board of health and public assistance resisted this instruction for two years, but eventually complied. We have no record of the reduced dietary scale. No further diet sheets survive until the mid-late 1940s. The inspectors appear to have been more interested in what the children ate, rather than their mothers’ diet. By the late 1940s the Department of Health employed a resident

dietician, who advised on these matters, and inspection reports contain references to children receiving various vitamin supplements, such as cod liver oil, Abidec (vitamin drops), Parish’s Food (an iron supplement) and Virol (malt extract). The introduction of these supplements reflected greater awareness of dietary needs and key vitamins, which was reflected in the reports of the National Nutrition Survey. In 1947/48 Miss Litster reported that

Diets vary considerably. On the whole children are sufficiently nourished in County Homes. There is however, no variety in diet. In some Homes eggs are never given; fruit may be obtained by mothers and given to children but forms no part of regular diet. Tomatoes, prunes, lettuce are unheard of. Milk puddings are given occasionally in some Homes when cereals are available, in others not at all. Diet generally consists of porridge, bread and milk, mashed potatoes and butter or soup. Older children are probably given scraps from their mothers’ plates and so add a haphazard variety to their diet.

In 1947 children in the Carlow county home aged from six months to three years were allocated 12 oz of bread and one quart (2 pints) of milk daily, ‘No butter, eggs, meat or fruit appear on the dietary scale’; nursing mothers were given a child’s allocation of milk but nothing extra. The medical officer had suggested that the diet should be improved. On the day of Miss Litster’s inspection in 1951 the children’s dinner consisted of peas, potatoes mashed with butter and soup made with meat and vegetables. She noted that a daily egg and minced vegetables had recently been added to their diets. In one Louth district hospital in 1949, breakfast was served ‘about 10.30’, on the day of the inspection. It consisted of bread and milk or porridge and milk. The inspector was uncertain whether the late breakfast was due to a late delivery of milk or a late mass. The children might get an egg on a ‘special day’. Dinner at 1.30 pm consisted of mashed potatoes with gravy or soup poured over. Sometimes they were given butter or eggs mixed through the potatoes; older children received ‘a little meat’. Babies commencing a solid diet were given a milk pudding consisting of cornflour or sago. Milk pudding was not usually included in the older children’s diet, and there was no fruit. Tea at 4 pm consisted of milky tea, bread, butter and jam; supper at 7 pm was porridge

60 Department of Health, 475469
62 Department of Health, INACT/INA/0/474129.
63 Department of Health, INACT/INA/O/425267
and milk - with unlimited supplies of milk. Bottle-fed infants were fed at four-hourly intervals.  

10.43 Diet sheets for the Waterford county home in 1951 showed that able-bodied women received 6 oz of bread, \( \frac{3}{4} \) oz of butter and a pint of tea every day. Working ‘inmates’ also got either an egg or 8 oz of porridge for breakfast, and two eggs, 6 oz jam or 4 oz of cheese, or liver or 6 oz of fish at their evening meal. Another report suggested that the only means of cooking liver was on an open fire. Dinners consisted of 1.5 lbs of potatoes and \( \frac{1}{2} \) lb of vegetables daily plus 6 oz of bacon, beef or a pint of stew, in which case no separate potatoes or vegetables were served. Friday’s dinner seemed very austere, consisting of eggs, bread and butter. Breastfeeding mothers and children were given milk mid-morning, and breastfeeding mothers were allocated two pints of milk a day.  

10.44 In 1952 the children in the Limerick county home had breakfast at 8 am, consisting of porridge and milk, one egg daily, generally soft boiled plus bread, butter and tea. Dinner at 12.30 pm consisted of potato and 2 oz minced meat; vegetables in season, milk to drink. Soup was not generally given. Tea, at 4.30 pm, was bread and a milk ‘goody’ or bread, butter and milk or tea. They were given daily doses of cod liver oil, and Virol and Parish’s Food when required; orange juice for infants; oranges were sometimes given to the older children.  

10.45 The diet in county homes up to and during the Emergency was almost certainly deficient in key nutrients, but the post-war improvements and the introduction of dietary supplements probably ensured that the diet, though boring, was adequate. It probably compared well with the diets of larger families of small farmers/labourers and unskilled workers in cities and towns.  

**Work carried out by unmarried mothers in county homes**  

10.46 Requiring able-bodied ‘inmates’ to work without pay was a core principle behind the 19\textsuperscript{th} century workhouses - hence the name - and this principle survived into the 20\textsuperscript{th} century. A man who worked in an English workhouse from 1924, when asked about unmarried mothers, recalled that

---

64 National Archives of Ireland, HLTH/A20/47  
65 Department of Health INACT/INA/O 475469  
66 Department of Health, INACT/INA/0/449398
The ladies came...into the workhouse and did domestic work, cleaning up and washing and they did that until such time as the baby was due and then they were moved into another section to have the baby. Whilst they were with the baby and providing they were feeding the baby they stayed there looking after the babies in the nursery. They came back again, if they had nowhere to go, back into the workhouse to do ordinary domestic work.67

10.47 In Ireland, many of the pre-independence workhouse regulations continued after independence, and they were often incorporated into revised legislation, so able-bodied ‘inmates’ of county homes - a category that included unmarried mothers - were required to work. Section 25 of the Public Assistance Act 1939 stated that

A public assistance authority may, as a condition of the granting of general assistance to a person, require such person, either before or after or during receipt of such general assistance, to perform such work as such authority shall consider suitable to that sex, age, strength and capacity of such person and shall direct such person so to perform.

10.48 There appears to have been no effort to conceal the extent of unpaid work carried out by unmarried mothers in county homes. A representative of the Mayo board of health told the Commission on Relief of the Sick and Destitute Poor that, while he agreed in principle that first-time unmarried mothers should be sent to special mother and baby homes,

I think the financial conditions of the County do not permit. I do not agree with the suggestion that all unmarried mothers should be removed to a Central or Provincial Home except as regards second offenders. The reason for my forming this opinion is, there is not very much difference for the moment, I cannot see any advantage having this class under a religious order in a Central Home when they can be left in charge of a religious order in the ordinary County Home doing useful work. Their removal would mean the employment of several extra wardsmaids which would be very difficult to procure. If it were possible to employ them it would be at great extra expense to the Ratepayers.68

68 Oireachtas Library, Commission on the relief of the sick and destitute poor, including the insane poor, minutes of evidence, twenty-fourth day, 20 Jan. 1926.
10.49 The record of an inspection of the Waterford county home in the early 1930s noted under the heading of rehabilitation that unmarried mothers received ‘lectures from nuns’.  

10.50 Although the 1927 commission recommended that first-time unmarried mothers should be removed from county homes, they qualified that recommendation:  
There is in each County Home a good deal of work, such as is done by wardsmaids, that would afford useful employment for some of the women who would be received into the special institutions. We would see no objection to such women as the Matron considers suitable being transferred to the County Home for the purpose of assisting in the work of cleaning, etc.

10.51 The organisation, financing and running of a county home was determined by the local authority and funding came from local taxes. The value of the unpaid labour carried out by unmarried mothers remained a key consideration in the decisions made by local authorities on sending women to special mother and baby homes or keeping them in the county home. In 1931 Tipperary South board of health and public assistance estimated that the weekly cost of a mother and baby in the county home was 6s each, which was roughly half the cost of maintaining them in a mother and baby home. The significantly lower cost reflects the inferior conditions in a county home plus the value of the unpaid work performed by the mothers.

10.52 Draft material prepared in 1940 for the Annual Report of the DLGPH noted that ‘In general laundry work, scrubbing and polishing of floors, kitchen work, wardsmaid work etc. is done by the mothers who are inmates of the institution. Whether adequate time is permitted to mothers for attention to their infants or proper supervision received over cleanliness and comfort of cradles, cots or nurseries or over preparation of foods for bottle-fed infants varies considerably with the institution. Conditions for mothers and babies in some of our County Homes are bad’.

While the women in mother and baby homes also carried out unpaid work, it is important to distinguish between the respective workloads. In July 1925 there were 287 residents in the Donegal county home, including 33 infants under three years, 21 older children and 39 unmarried mothers. The infants and children needed care and attention, as did the 194 other adults - many of them elderly and infirm, or with special physical and mental needs. The 39 unmarried mothers were responsible for caring for 194 adults and 54 children, and for the cooking and cleaning in the county home. Much of that work was physically difficult, and often unpleasant. Facilities were primitive, with no hot water on tap and inadequate/non-existent toilets, bathing and laundry facilities. Comparable duties in a mother and baby home were shared between a much larger cohort of women, and their work did not include providing personal care or doing the laundry for elderly, infirm, or/and handicapped adults. The homes run by the Congregation of the Sacred Hearts were reconstructed in the 1920s and 1930s to cater for their new function as mother and baby homes and they had much superior heating, cooking, laundry and sanitary facilities, plus proper floors (this is not to say that conditions were ideal). While some women in special mother and baby homes may have taken part in farming, market gardening and saving turf, no mother and baby home inflicted a workload on the mothers comparable to that in county homes.

Evidence about the mothers' work in county homes is scanty and often incidental. It can be assumed that in the 1920s all the unskilled work was done by the able-bodied 'inmates'; outdoor work was carried out by able-bodied men. Although the county homes were subject to regular departmental inspections, almost none of these reports survive before the 1950s. In November 1950, Miss Litster reported on her inspection of the Wexford county home in Enniscorthy that 'The mothers do most of the domestic work in the institution. They are not as a rule employed in the kitchen. A large part of the work allotted to them is in the laundry, where conditions are not good'. There were no paid domestic staff in Mountmellick during an inspection in February 1952 - the mothers carried out all the laundry and domestic work. When the county home in Athy was inspected in September 1952 Miss Litster reported that

The mothers do the household work. There appears to be three or four women, not all unmarried mothers, working daily in the laundry under the

supervision of an older woman. None are paid workers. The washing for the whole institution is done here. Many begin work about 10 a.m., have a break at about 11.30 and have tea, dinner 1 to 2 o’clock generally. They finish about 5.30 pm or may wash babies’ napkins later than that. There is no washing machine. The provision of a washing machine would lessen their labour. The matron complains of the difficulty of getting good work from the mothers. What surprises me is that, in the conditions in which they have to work, they do not rebel. It is not a question of each mother washing her own children’s clothing. Clothing for all children must be washed, sheets and often blankets from all dormitories, wards and cots: this daily unpaid and without holidays.

Other mothers work as ward attendants, nursery attendants and one looks after the nurses.

There are in the Home women admitted as unmarried mothers whose children have been boarded-out. They are employed according to their capacity but not paid. It would be an incentive to work and a deterrent to their leaving if they could be given some remuneration for their work. Article 38 of Gen. Regulations state definitely that no inmate shall receive any remuneration for work. Elsewhere this is got over by a technical discharge as inmate and readmission as paid staff.77

10.55 There is evidence that the Kildare local authority objected to this report, though their letter is not on the file. A handwritten note by an official in the Department of Health dismissed most of their response as ‘entirely irrelevant’ and went on to note that ‘The Inspector did not criticise the facilities provided in the Hospital, but the conditions in which the unmarried mothers live there, with particular reference to long hours and unpaid labour. The matter has been studiously avoided in the letter’.78 The most damning evidence of the draconian work regime in Athy is given in Miss Litster’s observations of one nine-week-old infant:

Appears healthy, clean and well cared for. She was however, lying in her cradle with a half emptied bottle of milk beside her. I suggested to her mother in the presence of Matron and the nurses that she should be lap-fed and not put into her cradle until she had finished the feed. The excuse she gave was that she would never get her work done if she had to spend so much time feeding the baby. This is not an isolated case by any means. It is mentioned

77 Department of Health, INACT/INA/0/448082.
78 Department of Health, INACT/INA/0/448082.
as being significant in the relative importance of the welfare of infants and the
domestic work of the institution even in the view of the mothers.[italics added
in pen]79

10.56 By contrast she described the Wicklow county home in Rathdrum, ‘as one of the
few homes where unmarried mothers were treated like human beings’. In 1952
there were ten paid employees, ‘in addition to the mothers’. Mothers whose
children had been boarded out were expected to remain in the home, carrying out
unpaid work, for two years after giving birth - this also appears to have been
common practice in other county homes. Wicklow babies were generally boarded
out at the age of nine months. In the late 1940s classes were organised in this
county home on three days of the week, given by domestic economy
instructresses, who taught cookery and needlework. The classes were designed
to give mothers skills that would help them to find work when they were discharged
- this was at a time when domestic or institutional service was the largest source of
paid employment for Irish women. Miss Litster noted that the classes had not
resumed in 1952. She was told that they could not encourage enough mothers to
enrol, but her account suggests another explanation:

It is possible that the inevitable disruption of routine in the Home by the
holding of these classes has led to discouragement of the girls from
attendance. Also, the labour of girls attending the classes is necessarily
withdrawn from work in the institution for about 3 hours a day for three days
weekly. It is merely of course a surmise on my part that failure to recommend
classes may not be altogether the fault of the girls’.80

10.57 While the regulations specified that the ‘inmates’ should work without pay, a
number of local authorities appear to have circumvented that rule. The paid staff
of the county home and hospital in Cork city included a number of unmarried
mothers whose children had been boarded out. When the South Cork board of
public assistance decided that these mothers should be asked to contribute
towards their children’s upkeep the matron objected: ‘They have but 15/- a week
and rations and a claim of the nature suggested would leave them with little more
than 9/- a week for which they are unwilling to work’. She described them as ‘very
good girls’ who carried out ‘important duties’.81 The proposal to deduct payments

79 Department of Health, INACT/INA/0/448082.
80 Department of Health, INACT/INA/0/430895.
81 South Cork, Board of Health and Public Assistance, minutes, 28 Feb. 1938, 28 March 1938.
was dropped. In this, as in other aspects of health and welfare at this time, practices varied between counties. County Meath operated a punitive regime. If an unmarried mother, whose child(ren) had been boarded out, determined to leave the county home, her child(ren) were removed from their foster home and presented to her, making her responsible for the upkeep. Some mothers placed their children at nurse.\textsuperscript{82} The practice was similar in Wexford.

10.58 When the \textit{Health Bill 1952} (which became the \textit{Health Act 1953} - see Chapter 1) was going through the committee stage in Dáil Éireann, Deputy Noël Browne (a former Minister for Health) moved an amendment, which was accepted by Minister for Health James Ryan, to delete a subsection that retained a requirement from the \textit{Public Assistance Act 1939} that those in receipt of general assistance should carry out unpaid work. During the course of the debate, Deputy Jack McQuillan argued that by allowing that subsection to be included in the legislation ‘we are condoning a system of slave labour. Whether that is to last for a long or a short period, we cannot say’. He argued that ‘if unmarried mothers have to work in these institutions and are asked to work they should be paid for it’. Ironically most of the contributors to the Dáil debate on this topic referred to ‘he’, rather than ‘she’.\textsuperscript{83} Deputy Kyne (Labour) noted that whereas casual men were no longer required to break stones before getting their breakfast, unmarried mothers were still ‘kept in and made wash filthy linen and made do the most menial tasks…we put them to carry out some of the most menial tasks, made to do unnecessary work sometimes, just maybe as a lesson to them not to come in again’. Dr ffrench-O’Carroll TD stated that unmarried mothers were ‘maintained in an institution and, as part of the return for the maintenance and treatment which they got, were obliged to give certain domestic services for a period of a year or two years, apparently without any remuneration’. The minister tried to play down the type of work demanded of women in the county homes. He claimed that they were only asked to do work which was suitable for their age, sex, strength and capacity. He suggested that local authorities were now employing people

\begin{itemize}
  \item from outside…in the laundries, in the cook-house, in the kitchen, where they had not got them some years ago. . . .
  \item Up to some years ago-maybe up to recently, in some cases - they had the unmarried mothers to do a lot of that work, laundry work and kitchen work.
\end{itemize}

\textsuperscript{82} Department of Health, RM/ARC/0/489697. This was in the 1940s.
\textsuperscript{83} Pressure to end unpaid work came from trade unions who objected to male ‘inmates’ of the Dublin Union carrying out unpaid work.
That has disappeared from some institutions and even where it is left they are not doing as much of that type of work as they were doing before.

10.59 Deputy McQuillan countered that by permitting local authorities to make these women work without payment ‘we are giving an example to private institutions to make things even worse for the girls in these institutions because they can point to the example set by local authorities and say that the power has been given by this house’. He referred to institutions ‘where unmarried mothers from the day they go in until they die are not allowed out’, which is an obvious reference to the Magdalen laundries.\(^4\)

10.60 The inspection reports on county homes are incomplete, and not all give information about work practices and staffing, so it is not possible to determine when the practice of requiring mothers in county homes to carry out unpaid work ended. In September 1953 however, a letter was sent to the secretary of Kerry county council on behalf of the Minister of Health, stating that ‘he is seriously concerned to learn that unmarried mothers who should be accommodated in special homes are being retained in the County Home on the grounds that their removal would necessitate the employment of additional attendants…In the Minister’s view it is inexcusable that girls, who as stated in your letter could have been sent to any of the three Special Homes should be kept in the County Home’.\(^5\) A memorandum dating from the early 1960s claimed that ‘The Health Act, 1953, repealed, inter alia, the provisions of the Public Assistance Act, 1939, which related to the giving of institutional assistance. No inmate of a county home therefore can now be required to work’. In 1962 however unmarried mothers were still carrying out work without pay in the Limerick county home in Newcastle West.\(^6\)

**Children**

10.61 An undated memorandum by Miss Litster, which was probably written in 1947/48 stated that

The care given to children in County Homes varies considerably. It is customary to find that all the domestic work, laundry etc. is carried out by the labour, unpaid except by maintenance, of the mothers.

---

\(^4\) Dáil Éireann, 14 July 1953
\(^5\) Department of Health, INACT/INA/0/447861.
\(^6\) Department of Health, INACT/INA/0/449398; INACT/INA/0/464099.
Under the supervision of an enlightened and liberally-minded Matron, mothers are encouraged in breast-feeding and given ample time for nursing and care of their infants. The case may be far otherwise where the Matron is a stern disciplinarian, more concerned with the efficient running of the institution than with the case of infants.

10.62 The regime presented serious health risks for infants who were not breastfed. County homes did not have refrigerators until at least the 1950s. In 1947/48 milk was commonly stored ‘in airless cupboards in nurseries used days and night, or in vessels left uncovered on tables or window-sills. The cleaning of feeding-bottles, preparation of feeds etc. is usually done by the mothers. Milk is generally heated on an open fire’. An inspection of the Waterford county home in 1951 reported that ‘the milk food for the children were mixed in a not too clean mug and given from unboiled bottles’.

10.63 Babies slept with their mothers in most county homes, either in the same bed or in cots that were brought to the mothers’ dormitory at night. Boys of school-going age generally slept in the men’s ward - a practice that carried potential risks for the children, apart from the fact that it gave no recognition to children’s needs. A report on Roscommon county home in November 1943 noted that there were 23 children in the home; eight were suitable for boarding out. The nursery was overcrowded and three children had to be accommodated elsewhere - two brothers, aged six and three, slept in the female ‘mental ward’ and one seven-year-old boy slept in the men’s ward. Two children were described as ‘mentally defective’ and ‘a deaf mute’. The county home in Kildare had a separate nursery in 1952, but this had disappeared by 1954 and the 24 children - whose ages ranged up to their early teens - were scattered throughout various dormitories. In the Laois county home in Mountmellick, five-year-old boys were sleeping in the men’s dormitory and girls of that age slept on the women’s side. Miss Litster expressed concerns about the sleeping arrangements for the boys:

> There are doubtless good and kindly old men on the male side. There are doubtless also the degenerates and the sub-normal. Much of the language and behaviour heard and witnessed by an impressionable child cannot be worthy of his imitation. Is it to be wondered at that the language used by

87 Department of Health, INACT/INA/0/474129.
88 Department of Health, INACT/INA/0/475469
89 Department of Health, RM/ARC/0/489727.
90 Department of Health, INACT/INA/0/448082.
children boarded out directly from County Homes is often such as to horrify country folk not for the most part unaccustomed to bad language?  

10.64 One might suggest that Miss Litster should have been more concerned about other aspects of these sleeping arrangements, and less concerned about the possibility that the children might learn ‘bad language’. In Mayo most mothers and children who sought public assistance were sent to Tuam, but a small number of children who were awaiting medical treatment, transfer to Tuam or boarding out, were in the county home. As there was no nursery the children slept in the adult wards, mainly sharing a dormitory with infirm and elderly women.

10.65 A mother could not leave the county home without her child. There was no law preventing a mother from leaving, provided that she took her child. The poor law regulation stipulating that ‘every woman shall be liable to maintain such of her children, whether legitimate or illegitimate, as are for the time being under the age of sixteen years’ was restated in the Public Assistance Act 1939. (It remains the law that parents are liable to maintain their children.) The Commission on the Relief of the Sick and Destitute Poor noted that in Kerry it was the practice to refuse to discharge unmarried mothers with their children for a period of three years, despite the fact that the local authority lacked the statutory power to enforce this ‘at present’.

10.66 The children in county homes included those who were born there; children admitted with their mother shortly after birth; children transferred from another institution; and children who had been living either with their parent(s) or were nursed out/boarded out and ended up in the county home for various reasons. The county home was the catch-all place for women and children who had nowhere to go. There were children of married couples, those with serious medical needs, children whose parent(s) were sick, in prison or had abandoned them; children who were being cared for by a grandparent, aunt or other family member who had died or become incapacitated and could no longer cope and children who were returned or rejected by a foster parent.

91 Department of Health, MHS/INA/0/490058.
92 Department of Health, INACT/INA/0/451522.
93 Commission on the Relief of the Sick and Destitute Poor including the Destitute Poor, Report (1927), para. 125.
10.67 In Cork, it appears to have been standard practice to transfer children from Bessborough to the county home prior to boarding out, and this also happened in Kilkenny and in other counties. A review, carried out in 1937 by the South Cork board of public assistance, of children placed at nurse by the Catholic Women’s Aid Society showed that many had been placed with foster mothers whose sole source of income was public assistance. The Catholic Women’s Aid Society paid these foster mothers for the upkeep of children for three or four years (this money had been given to the Catholic Women’s Aid Society by the child’s mother or a family member), after which time payments ceased and the foster parent was expected to ‘adopt’ the child. Many foster mothers could not afford to maintain these children, so they sent them to the county home. The Cork health authority issued instructions to the Catholic Women’s Aid Society that children should not be placed with foster mothers whose sole source of income was home assistance and the fee paid for maintaining the child.94

10.68 The county home was often the revolving door for children of unmarried mothers. Children who were rejected by a foster parent or had to be removed from a foster home for some reason were taken to the county home, sometimes as a short-term arrangement pending their transfer to an industrial school or another foster home, but some children remained in the county home for long periods. There are records of children who were long-term residents in county homes attending a local national school.

10.69 In 1946 Miss Litster noted that public assistance authorities were reluctant to admit children who were not accompanied by their mothers - and might refuse to do so. ‘There does not appear to be any legal authority for refusal to admit infants unaccompanied by their mothers, provided they are destitute’. She described the public assistance authorities’ reluctance as understandable. In few of the County Homes is there any provision for care of motherless infants and the PAA find it more difficult to procure suitable foster homes for infants than for older children. If infants were to be admitted to County Homes in any great numbers unaccompanied by their mothers, a properly equipped and staffed nursery would require to be provided in each institution. The care of infants as well as the general work of County Homes is as a result carried out by the mothers who are maintained there. They are

94 South Cork, Board of Health and Public Assistance, minutes, 26 July 1937, 17 Sept. 1937.
for the most part unwilling to give attention to any child other than their own, and the motherless child is liable to neglect.\textsuperscript{95}

10.70 In 1952 seven of 17 children in the Wicklow county home were without their mothers; in Killarney seven of the 19 children aged from one to five were without their mothers. An inspection report from 1952 noted that 20 of the 34 children in the Kildare county home ‘are members of families admitted because of failure to procure accommodation or other temporary cessation of home life. This is such a frequent occurrence in the Home that it is regarded as part of the pattern of normal population’. The 1953 inspection commented on the presence of five siblings, whose ages ranged from two to 11 years. Their mother was being treated for TB in a sanatorium; their father visited them occasionally. Miss Litster suggested that it should be possible to give the family financial support to hire a housekeeper under the TB scheme, which would enable the children to remain in their home.\textsuperscript{96}

10.71 Another family of four children were in the Kildare county home in 1952; they had been evicted from their home when their father deserted his family. They were still in the county home in 1954, when the older children were 14 and 12 years old; a third child was being treated for suspected TB in a sanatorium. Despite repeated pressure from the Department of Health and promises by the local authority to find them a house, the family was still in the county home in 1955. By 1958, as a result of sustained pressure from the department the number of children in the Kildare county home had fallen to eight; six were the children of single mothers, the remaining two had serious medical problems.

10.72 There were 37 children in the Limerick county home in 1952, whose ages ranged from three months to six years; the two children aged over four years were blind and suffering from intellectual disabilities. There were 24 mothers with children in the home (several had two children in the home); three expectant women; and 17 women without children, who had originally been admitted as unmarried mothers but who were retained as unpaid workers and whose children were either boarded out or in institutions. Approximately 40\% of the children in the nursery were breastfed.\textsuperscript{97}

\textsuperscript{95} Department of Health, CCL/INA/0/478958.
\textsuperscript{96} Department of Health, INACT/INA/0/448082.
\textsuperscript{97} Department of Health, INACT/INA/0/449398.
10.73 Little information is available about the extent of contact between mothers and their children in county homes once they were no longer babies. Mothers in the North Cork county home were described as not over-worked. They are given occasional domestic work but have ample time to devote to the care of their children. The children are kept clean and comfortable, but they are quite obviously receiving no training, nor is there any attempt at training the mothers in mothercraft. It requires patience to teach a child to eat from a spoon and to drink from a cup.

10.74 Miss Litster described the fact that children in this home were still using a bottle up to three years of age as ‘laziness’. She reported that in Donegal mothers of babies not breast-fed and of older children sleep in the main body of the County Home and work there. They are allowed no freedom of access to their children. On their ‘day off’ Sundays they may visit their children and if the children are ill they are allowed special visits. It is stated that more frequent visits cause disruption of routine, quarrelling and a general upsetting of the children. There is under this system no fostering of affection for and interest in their children. On the other hand, if we have nothing to offer the mother eventually but complete separation from her child, it is perhaps kinder to avoid the growth of affection. Nevertheless we may have to consider whether or not the loss of maternal care may have some share in the mounting death rate.

10.75 The age range of children in county homes varied widely. Some counties made serious efforts to place children with foster families at a relatively early age. In 1951/2 the youngest Wicklow child boarded out was 14 months old. The inspector noted that in the past children were placed in foster home when they were under a year, but it was becoming more difficult to find foster parents who were willing to take very young children, though the local authority made great efforts to do so. But in North Cork in the same year, Miss Litster reported that ‘children of suitable age are generally committed to industrial schools from the institution. The Matron informs me that she may send for the N.S.P.C.C. inspector who interviews the mother and makes the necessary arrangements for committal’.

10.76 Although the number of children in county homes declined during the 1950s, they proved to be a more permanent presence than the mothers. Following the introduction of the Adoption Act 1952, most long-stay children in county homes had some physical or intellectual disability, which meant that they were regarded as unsuitable for adoption or fostering. In some cases the mothers refused to agree to adoption or boarding out, though many of those children who were not placed for adoption ended up in industrial schools. Some children who spent long periods in a county home had quite minor problems. A report on the Killarney county home in 1952 identified one five-year-old boy who was ‘a bed-wetter and for that reason unsuited at present to boarding out, unless the foster-mother were warned about the habit’. Foster parents often returned children if they were suffering from any medical complaint. In Laois one five-year old was reported to be back in the home because he was suffering from a prolapse of the rectum - which was successfully treated.

10.77 However many of the children had severe physical or intellectual disabilities. When Margaret Reidy inspected the unmarried mothers and children in the Tipperary North county home in 1958, she found three bedfast children in the nursery, two invalids - a spina bifida and a hydrocephalic - and an apparently normal healthy baby. The infant was feeding itself from a bottle which was propped on the pillow and there was evidence that the two invalid children (who because of their disability were lying on their backs) had fed themselves also as partially empty feeding-bottles were on the floor beside their cots. The two invalids were lying on bare mackintoshes and it appeared to me that quite a time had elapsed from when they were given care last. The door was closed and the children were unsupervised. The other children were in a Dayroom which looked equally unkempt and neglected, a ‘bad’ low-grade (female) mental defective was eating bread which was being shared by the toddlers from the floor which was far from clean and which had been ‘abused’ by the toddlers. Altogether, it was a very distressing sight.

103 Department of Health, MHS/INA/0/490058.
10.78 The matron, who was out visiting the dentist, ‘pointed out that the care of invalid children and low-grade defectives was very time-absorbing, that there were fewer unmarried mothers now in institutions than in the past to assist’. 104

10.79 In 1953 one woman wrote to the Minister for Health complaining that mothers whose children were boarded out were required to remain in the Wexford county home, as unpaid workers, sometimes until their child was 15 years old. If a mother insisted on leaving the county home her child(ren) were removed from foster homes and the mother was made responsible for their maintenance. When Miss Litster checked with the Wexford authorities she was informed that this rule still applied though

Matron has assured me on several occasions that although she must leave mothers under the impression that it will be enforced, she will not in fact remove children from their foster homes if their mothers leave the County Home. It is thought to be in their interests to subject them to the discipline of the institution as long as possible.

10.80 Miss Litster reported that a few years previously several women, whose children were boarded out, had left the county home without permission, but no attempt was made to enforce their return ‘and it is difficult to see how return could have been enforced’. Mothers, if permitted to leave to take up employment, were asked to contribute to the support of their children - but ‘no hard and fast rule as to amount can be made’. A memorandum in the department noted that the local authorities justified this rule on the grounds that ‘if the mothers are relieved of their responsibilities, and discharged, they will fall into similar trouble again, and that discharge in such circumstances only encourages immorality’. The officials determined that the matter ‘calls for delicate handling…any official reply…might have the effect of fomenting trouble with other inmates in a similar position and create an embarrassing situation both for the local authority and the Department’. It was agreed that Miss Litster would meet the matron ‘with a view to relaxation of the rather rigid attitude of the local authority’. 105

10.81 In Wicklow, mothers whose children were boarded out were ‘expected to remain in the home until two years have elapsed from the date of confinement’, working without pay. In 1943 Miss Litster reported that if a mother left the Meath county

104 Department of Health, INACT/INA/0/471871.
105 Department of Health, INACT/INA/0/476463.
home any children that had been boarded out were ‘handed to her’; believed that Meath was the only county to follow ‘this short-sighted policy’. In 1950 the Department of Health, noted that one child who had been in a ‘very satisfactory foster home’ was returned to her mother in such circumstances; the mother subsequently returned to the county home to give birth to another child and the whereabouts of her older child was unknown. A local official claimed that Meath was planning to pay mothers working in the county home for their labour, using this money to meet the cost of boarding out. The minutes of the South Cork board public assistance record several instances of mothers ‘escaping’ from the county home - generally during mass. Although the Gardaí were asked to apprehend them, and in at least one case were aware of the address in Cork city where a mother was staying, there is no evidence that they were returned to the county home.

Conclusions

10.82 County homes continued to accommodate single mothers and children until the 1960s, despite frequent statements by the DLGPH that they should be removed from the county home. This happened for a combination of reasons: for many years they were the only places that admitted single mothers on a second or subsequent pregnancy, and a woman could bring her older children to the county home during her confinement; the homes were the last-resort refuge for mothers and children. Local authorities acquiesced, indeed probably connived at the retention of single mothers, because they valued their unpaid work. The conditions in Ireland’s county homes were primitive, lacking in privacy and dignity, and they were utterly unsuitable for children. Until the 1950s the mothers in most of the homes (perhaps all) were required to carry out physically-demanding, unpleasant chores in primitive conditions. The type of work that was required of unmarried mothers in county homes was far in excess of the work that was expected of women in mother and baby homes, and until the 1950s, and in some cases the 1960s, the living conditions for both mothers and children in the county homes remained largely unchanged from the pre-independence workhouse.

10.83 There was also an unstated segregation between mothers and children in county homes, and those who were maintained by local authorities in mother and baby homes. Women from more deprived backgrounds, those deemed to have physical

106 Department of Health RM/ARC/O/ 489391; NATARCH/ARC/O/408587
or intellectual needs, and children with special needs were much more likely to be found in county homes.

10.84 Generations of single mothers in county homes, institutions which were owned and run by local authorities, carried out onerous and often degrading unpaid labour, and some were effectively held hostage in these homes, threatened with having to take on responsibility for maintaining their child(ren) if they attempted to leave. This is yet another instance of a gulf between the regulations laid down by central government, and their implementation by the local authorities. County homes also provided emergency accommodation for women and children in need - a role that was later undertaken by women’s refuges.
Chapter 11: Boarded out Children

Introduction

‘It would need a very considerable amount of supervision to be able to follow the movements from birth of all children maintained apart from their parents’.¹

11.1 The purpose of this chapter is to provide some insights into the lives of many children who were born to unmarried mothers before the introduction of legal adoption. The reforms of the health and welfare services outlined by the First Dáil and by the government of the Irish Free State included a strong commitment to place children who could not be raised by their mothers in foster homes, not in institutions (see Chapter 1). An editorial in the *Nenagh Guardian* titled ‘Workhouse Reform’, which appeared in an edition dated 25 December 1920, was enthusiastic about the advantages:

What a change for the better, what a contrast to the poorhouses! Cast iron rules, bare whitewashed walls, the high enclosures, the absence of the little comforts, the general feeling of being subjected to commands, and the degradation of the whole system! What a priceless boon to the children to take them from the horrors and contaminations of poorhouses! The blighting and corrupt influences of such institutions on children cannot be gainsaid. You need but look at the children to note how in everything they are handicapped. Clad in ridiculous and humiliating dress, ill-fitting, baggy and uncomfortable, with boots to match, they shuffle along, poor stunted children feeling no doubt the difference in dress and appearance to those other more fortunate children they may meet on their too few outings. They come too early in contact with evil. The natural healthy appetite of children, which in homes can be satisfied every time it manifests itself, is here restricted by rules and official time tables. The dietary, according to official scheme, lacks the little comforts all children crave and to a greater or less extent receive everywhere but in the poorhouse. No toys, no petting, nothing of love or affection, and who can wonder at the result? In no place, no slum, can a child be worse than in a poorhouse. In the former there is a better chance of receiving some benefit. In the poorhouse the food may be more regular and in other matters perhaps somethings may be better, yet in its after effects the workhouse influence is the most harmful. It is intended that every child who

¹ Department of Health, RM/ARC/0/489773
can be boarded out will be boarded out and as early as possible. It is anticipated that there will be little difficulty in this and in exercising through charitable and patriotic societies, rather than officialdom, of a wise and kind supervision. The question of the unmarried mothers who habitually frequent poorhouses is a difficult one, which under the proposed scheme will be dealt with properly.

**Policy and practice**

11.2 Despite the commitment of the Department of Local Government and Public Health (DLGPH) and later the Department of Health to boarding out children, many children remained in county homes (as the workhouses had been renamed), orphanages, industrial schools and other institutions, and some of the descriptions of the workhouse children - dressed in clothing that distinguished them from other children, lacking love and affection - could be applied to children who were boarded out by the local authorities or voluntary organisations. There is evidence of foster children who were grossly neglected; some were required to carry out work or caring duties that were inappropriate to their age, and some experienced appalling living and sleeping arrangements. However there is also evidence that some foster mothers were deeply attached to their foster children and tried to protect them from exploitation. When considering the histories of children raised by foster families it is important to remember that there are no comparable descriptions of the lives of children who were raised in their birth family during these years. Many Irish children who lived with their family were kept from school to carry out farm tasks or caring duties; children carried out heavy chores before or after school; some were abused by a family member; many went to school in bare feet, without adequate outer clothing or a proper lunch and they would have slept in conditions that were not dissimilar to some foster children.

11.3 A number of children experienced several forms of care - in foster homes and in institutions. A woman, or more commonly her family, who had some financial means could leave a mother and baby home with her child shortly after giving birth, and place her child with a foster parent, ‘at nurse’. Women who lacked such means had to remain in the institution until the local authority arranged to take responsibility for her child, which was generally around the age of two years and sometimes later. Some children were placed at nurse by their mother or her family shortly after birth. When the payment to the nurse mother ran out, the nurse mother might send the child to the county home. From there a child might be then
boarded out by the local authority. Children who were born in county homes might remain there for several years - some attended local national schools. Many children who were initially placed ‘at nurse’ were later committed to an industrial school, often with the assistance of the NSPCC, when payments to the nurse mother ceased. Boarded-out children who were returned to the county home, because their foster parent was no longer willing or able to keep them, were also sent to industrial schools. A number of local authorities kept children in county homes for several years after their birth and then sent them to an industrial school, despite the fact that this contravened government policy. The conditions in industrial schools have already been investigated by the Commission to Inquire into Child Abuse (the Ryan Commission) so they are not examined here, though we know very little about the junior industrial schools where a majority of younger children were placed.

11.4 The Department of Health provided this Commission with a considerable volume of records about boarded-out children and children at nurse. These files document the lives of many children who were born in the institutions that have been investigated by the Commission. Most of these files are records of inspections carried out by the female inspectors in the DLGPH and later the Department of Health. They give details of the living conditions of foster children; their education and health, and there are occasional comments about the children’s appearance and personality. The records are not comprehensive and the level of detail varies.

11.5 Until the unmarried mother’s allowance was introduced in 1973 few single mothers could afford to raise a child without the support of her family or the child’s father. Legal adoption was introduced in 1953, though children were being sent to the USA for adoption from the late 1940s, and an indeterminate number of children were ‘adopted’ informally in Ireland, Britain and Northern Ireland. Some families were willing to support the mother and her child, but it was more common for grandparents, an aunt or another close relative to assume the role of parent. Similar arrangements were quite common when children in a two-parent family lost one or both parents or one parent was ill. There were also many instances where a childless aunt or uncle might take one child from a large family into their home, in order to ease pressures on that family, and make the child their heir, less
frequently their heiress.\textsuperscript{2} But most children of unmarried mothers did not grow up within their family circle.

**Children who left mother and baby homes**

11.6 The institutional records of the mother and baby homes investigated by this Commission show the exit pathway for many of the children. The Commission has been able to compare the recorded exit pathway with other records - usually local authority records - to find out what subsequently happened to the child. In many cases, children who are recorded in institutional records as going with their mother to her family home show up in the boarded out records of the local authority. It appears that the mother did leave the home with the child but then placed the child for boarding out, or ‘at nurse’. The majority of children who left Bessborough alive in the 1930s and 1940s were placed in foster homes. The comparison between the initial destination and long-term placements suggests that being placed at nurse or boarded out was not always the long-term outcome. Many children were later adopted, either formally or informally, by their foster family. While these figures are incomplete, they suggest that few Bessborough children ended up in institutions. The proportion of Pelletstown children who were transferred to an institution was much greater; the institutional records show that in the 1940s almost half of the children who left Pelletstown were transferred to another institution (which included hospitals); for the 1950s the figure was 33% (see Pelletstown statistical appendix).

**Governance and regulation**

11.7 There were two distinct categories of foster children and they were governed by different legislation - children at nurse and children who were boarded out.

**Children at Nurse**

11.8 Children who were placed in a foster home by a private person or by a charitable organisation were described as being ‘at nurse’. The maintenance cost was paid by their mother or by a member of her family, directly to the foster mother, or to a charitable organisation such as St Patrick’s Guild, or the Nursery Rescue and Protestant Children’s Aid Society.\textsuperscript{3} These organisations assumed responsibility for finding a foster mother, making regular payments, and, in theory, monitoring the

\textsuperscript{3} For information about the Protestant Nursery Society see Chapter 23.
child’s welfare. Some infants were placed for a fixed sum of money, which was generally seen as encouraging foster mothers to neglect the child (for example, see Chapter 13 where concern was frequently expressed about the evils of ‘adoption’ for a lump sum). Foster mothers recruited by a charitable organisation received a weekly payment for a fixed number of years, as evidenced in the records of the Cork Catholic Women’s Aid Society. When the payments ceased, after three or four years, foster parent(s) were expected to ‘adopt’ the child, though many could not afford to keep these children without continuing financial assistance. Private individuals who placed children at nurse - many were the proprietors of private nursing homes - were often accused of ‘baby-farming’. An unmarried mother or her family might pay a fixed sum to a woman who promised to find a foster home for the infant. This woman would retain perhaps half of the money as her fee, and pay the residual to the actual foster mother.\(^4\)

11.9 The *Children Act 1908* set regulations that applied to any person taking on the ‘nursing or maintenance’, ‘for reward’, of a child under seven years. A woman who agreed to maintain a child at nurse for reward was required to notify the local authority within 48 hours of accepting the child, and to notify the local authority within 48 hours if a nurse child died or was removed from their home. If there were children at nurse in a locality, the local authority was required to appoint infant life protection visitors who would inspect the children and the foster homes. A local authority could permit a ‘philanthropic society’ such as St Patrick’s Guild to exercise the powers of the infant life protection visitor; in such cases the voluntary society had to submit regular reports to the local authority. A number of recognised charitable agencies that placed children at nurse, such as the Catholic Protection and Rescue Society or the Nursery Rescue and Protestant Children Aid Society were eligible for financial support under the Maternity and Child Welfare scheme, amounting to half the approved cost of maintaining these children up to the age of five years.

11.10 The *Children Act 1934* strengthened the powers of local authorities and they were extended to apply to children up to nine years. The 1934 Act required that any home taking a child for reward should be inspected and approved by the local authority before a child was placed there. Under the act any ‘illegitimate’ child placed with a family was deemed to have been placed for reward. The act

\(^4\) See Chapter 6, for information on the McAlpine maternity home.
prohibited advertisements relating to children at nurse (by would-be foster parents or somebody seeking to place a child) unless it gave a name and address. The act also gave the Minister for Local Government and Public Health authority to set regulations and oversee the compliance of local authorities.

**Children who were boarded out**

11.11 Children who were placed in foster care by local authorities were described as being ‘boarded out’. The boarding out of children by local authorities was initiated under the nineteenth-century poor law (see Chapter 1). Initially under the poor law regulations a boarding-out allowance was paid only for children who were under five years. This was later extended to ten years, by which time it was assumed that the child had become ‘so thoroughly affiliated and capable of making itself useful’ that he/she would not be returned to the workhouse; in 1898 the age-limit was extended to 15.\(^5\) After independence in 1922 payments continued until the age of 15, or until a foster-child had left full-time schooling.

11.12 As part of the reform of the poor law system, the *County Boards of Health (Assistance) Order 1924*, set out the responsibilities of Boards of Health/Public Assistance with respect to boarded-out children. This did not involve any major change to the previous arrangements. In summary, the order provided that:

- A board of health could not board or place out at nurse any child, other than an orphan or deserted child, without the consent of the Minister.
- The limit of age up to which a child could be boarded out or placed out at nurse was 15.
- The foster parent had to be of the same religion as the child.
- A child could not to be boarded out or placed at nurse in a house in which there was not a woman of full age with experience in the management of children.
- The boards were required to satisfy themselves as to the healthy situation of the proposed home, the sleeping accommodation, the water, the food and milk supply, and the convenience to a public school.
- The number of children who could be boarded out with one foster parent could not exceed two, unless they were children of the same parents.

\(^5\) Royal Commission on the Poor Laws and Relief of Distress, Report on Ireland, paragraph 285; Department of Health, RM/INA/0/505478.
Boarding out was prohibited in homes in which children were boarded out by persons other than the board of health; with persons who kept farm animals in the dwelling-house or an accumulation of filth or manure in dangerous proximity to the house; or with a person residing in a house or premises licensed for the sale of intoxicating liquor by retail.

Children could not be boarded out in towns or villages without the consent of the minister.

11.13 The regulations provided that boarded out children would be inspected by officers or committees of the board or officers of the minister. They also covered matters such as monitoring the attendance of the children at school, and divine worship; medical attendance in case of illness, and generally for their care and clothing.

11.14 As stated, these regulations were similar to those introduced by the Irish Local Government Board - the prohibition on boarding out in cities and towns was introduced in 1902. In 1947, inspector Miss Alice Litster claimed that the regulations relating to boarded-out children were ‘practically identical’ to those that were introduced in 1902. Responsibility for boarded-out children was placed with assistance officers; they were also responsible for outdoor assistance, approving admission to a county home, or a mother and baby home and other institutions (see Chapter 1). The assistance officers were responsible for selecting foster homes; placing children with a foster parent; carrying out monthly visits to inspect the home and the child and pay for the child’s maintenance. If a child died they were responsible for arranging the funeral. Foster parents were required to sign a contract with the board of health.

11.15 The Public Assistance Act 1939 consolidated and updated laws relating to the relief of the poor by local authorities but did not significantly change the rules about boarding out of children (see Chapter 1). Section 27 stated that children remained the responsibility of their parent(s); ‘illegitimate’ children remained the responsibility of their mother. Section 44 set out the circumstances under which a public assistance authority would assume the rights of parents. These provisions only applied to children, whose parent(s) were dead, or a child who was deserted by her/his parent(s). If an ‘illegitimate’ child was deserted by his/her mother, she could reclaim her child from the public assistance authority at any time. Sections

---

6 Department of Health, RM/INA/0/505374.
7 Department of Health, ed006406/INACT/INACT/0/443909.
44-46 provided that the vesting of parental rights in a public assistance authority did not relieve a parent of the responsibility to maintain their child; section 48 stated that ‘A public assistance authority may provide…for the assistance in any one of the following ways (whether in or outside their public assistance district) of a legitimate child…or of an illegitimate child in respect of which the rights and powers of its mother are vested in such authority, that is to say, by placing such child out at nurse, or by boarding it out, or by sending it to a certified school, or where such child is not less than fourteen years of age, by placing it out at service, or by placing it in any suitable trade, calling or business’, and paying either an apprenticeship fee or contributing towards their maintenance during their apprenticeship.

11.16 Section 48 (4) provided that the minister could make regulations in relation to placing by a public assistance authority of children out at nurse: fixing the minimum and maximum ages at which they could be placed; prescribing the form of contract with the person taking care of the child; providing for supervision and visiting on behalf of the minister of these children and generally securing the welfare of children placed at nurse and fixing the age - no less than 14 - at which children might be apprenticed or placed in employment; fixing conditions under which they could be placed; prescribing the form of contract; providing for supervision and visiting on behalf of the minister or the local authority.

11.17 The Health Act 1953 gave greater latitude to local authorities to board out children. Section 55 (3) provided that a health authority could, with the approval of the minister, assist any person eligible for general assistance within the meaning of the Public Assistance Act 1939 by doing, with the consent of such person and in accordance with regulations, any of the following things in respect of any child for whom such person was liable under the Public Assistance Act 1939, to maintain, that is to say boarding the child out, or sending him to a school. The prohibition on placing boarded-out children in cities and towns was removed, though it appears that the local authority officers who were responsible for placing children in foster homes were slow to look for foster homes in towns. In 1957 the Department of Health sent local authorities a reminder of this change. The Boarding out of Children Regulations 1954 required the foster parents and the health authority to

---

8 Department of Health, ed006406/INACT/INACT/0/443909.
sign a contract, and it imposed tighter regulations on the selection of foster parents and inspection of foster children.

11.18 The 1906 Vice-Regal Inquiry into the Irish Poor Law, the Dáil Éireann Department of Local Government, and the Commission on the Relief of the Sick and Destitute Poor which reported in 1927, all expressed a belief that boarding out was the best means of caring for children who could not be raised by their family, and they encouraged local authorities to take children out of institutions and place them with foster families. There was some ambiguity in the early 1920s about whether children of unmarried mothers qualified for boarding out. The pre-1922 poor law regulations stipulated that only orphaned and abandoned children could be boarded out by a local authority, so local authorities frequently sought the permission of the Minister for Local Government and Public Health to board out children of single mothers. However Alice Litster claimed that the reform of Irish poor relief after independence abolished previous restrictions on outdoor relief so boarding out was no longer restricted to orphans and deserted children. Before 1922 Irish poor law authorities had been slow to place children in foster homes. Virginia Crossman noted that ‘Despite official acknowledgement of the benefits of boarding out, the majority of poor law children in England and Ireland remained in some form of institutional care. In Scotland the majority of children were boarded out’. This reluctance persisted after independence.

11.19 A circular letter issued by the DLGPH to local authorities in 1924 stated that:

i) It is believed that the successful upbringing of the children would best be achieved by having the children individually cared for in the families of the respectable poor. The requirements of home life supply the means of cultivating natural affections, self-reliance and the perception of the duties of every-day life which are invaluable towards the development of the children into normally minded adults. In the home life under the boarding-out system strong ties of affection spring up between the child and the members of the family with whom it lives. Where the homes of foster parents are suitable in rural localities the children are reared in healthy surroundings and have opportunities of acquiring training and experience

---

9 Department of Health, RM/INA/0/505374.
10 Virginia Crossman, ‘Cribbed, contained, and confined? The care of children under the Irish Poor Law, 1850-1900’ in Éire-Ireland, xlv, 1&2 (Spring/Summer 2009), p. 39.
suitable to them in after life. It is not unfitting that they might for the most part become absorbed in the agricultural industry.\textsuperscript{11}

11.20 The annual reports of the department reiterated the benefits of boarding out:

- The care of children in foster homes is a much cheaper form of maintenance than in institutions; but the advantages of boarding out do not rest on its comparative cost alone although cost is an important consideration…Suitable homes can always be found, there is no lack of them.

- The best of all homes is a country home occupied by parents with children of their own of more or less the same age as the foster child, but excellent homes are also given by childless couples.

11.21 The reports noted cases where couples willed their home and land to a foster child. They urged that children should be boarded out at an early age:

indeed the younger the age the better the prospects of success. For in this way the child is more quickly absorbed into the family. It then becomes more easy to regard its foster parents with filial regard, and becomes itself more easily the object of parental love.

Children should always be boarded-out in country homes, and except for very compelling reasons never in towns or large villages. Good food, good milk, fresh air, are easily obtainable in country homes; temptation to evil-doing is less strong, and a superior class of foster parents can be there obtained than can generally be obtained in towns or large villages…The child brought up in this system has the advantage of a home upbringing. The world is seen as it really is, with its ups and downs, its joys and sorrows. The atmosphere of the foster-home is the atmosphere of real life.\textsuperscript{12}

11.22 Some foster homes lived up to this ideal, but many failed to do so, and the argument that boarding out offered the best outcome for children who could not be raised by their birth mothers was not uncontested. The Commission on the Relief of the Sick and Destitute Poor heard testimony from a number of witnesses who were highly critical of boarding out:

Speaking from an experience that extends over a long number of years, I can say that with regard to the people who apply to take out these children in 99

\textsuperscript{11} DLGPH, First report, 1922-25.
\textsuperscript{12} DLGPH, Annual report, 1927-28.
cases out of 100 they are of the very poorest. No one else applies to take out children, and that being so the applications which these people make for children to board out with them are rarely refused. They take out the children who are not sent to school or properly fed. As regards the clothes supplied by the Board of Guardians for these boarded out children, it is not an unusual thing to see the clothes divided up amongst the members of the family of the foster parents. The great complaint I have to make in the case of these boarded out children is that they are not sent to school or to the catechism classes. They hardly get any religious instruction at all, and that to us Catholics is most objectionable.  

Another witness, who was from Wicklow, claimed that ‘A man said to me one time “it is just as easy for me to keep that baby as to keep a little pig”. He looked upon the thing in a commercial light’. A member of Rathdown Board of Guardians believed that orphanages offered much better prospects for training children. The manager of Artane industrial school, who was the secretary of the association of industrial schools, was highly critical of boarding out, and the Bon Secours Sisters who ran the Tuam home were insistent that Tuam children should not be boarded out until the age of six or seven (See Chapter 15). Some members of local authorities believed that placing children in an institution, under the care of a religious order, provided a better future for them than boarding out. In the 1920s Pelletstown kept some children up to the age of four; in later years many Pelletstown children were transferred to St Philomena’s Home (see Chapter 13). Some children remained in institutions because the mothers wished them to remain where they could visit, and the mothers hoped to take their child home at some future date.

**Numbers involved in boarding out**

The DLGPH, and later the Department of Health, maintained pressure on local authorities to remove children from institutions such as county homes and industrial schools and place them with foster families. In 1924/5 there were 1,907

children boarded out; by 1936 this had risen modestly to 2,304. Most of the increase was concentrated in counties where few children were boarded out in the 1920s; for example the numbers in Galway increased from 45 to 151; Kerry from 44 to 128. The county statistics indicate that the commitment by a local authority to promote boarding out was critical: how otherwise can the discrepancy between 151 children boarded out in Galway and 53 in nearby Mayo or 29 in Roscommon be explained? Despite many complaints during the war years that payments to foster parents were not keeping pace with inflation, the numbers remained stable, though this was at a time when the number of ‘illegitimate’ births was rising. There were 2,330 children boarded out in 1943, and 2,351 in 1945.  

It can be assumed that statistics for boarded-out children are accurate, because these children were maintained by the local authority. The statistics for children at nurse are much less reliable. A DLGPH memorandum in 1943 estimated that 2,300 children were boarded out by local authorities and an additional 2,500 children were placed at nurse by charitable agencies or by individuals. Not all of these children were ‘illegitimate’; some were orphans or children whose mother suffered from a long-term illness; some were foundlings. The registers kept by the local authorities did not record the child’s status, but it would appear that the great majority were the children of unmarried mothers. A Department of Health memorandum in 1954 noted that according to Miss Murray, an inspector of boarded-out children, 75% were the children of women in county homes or special homes (the term used by the department for mother and baby homes).  

Local authorities came under renewed pressure in the early 1950s to increase the numbers of children boarded out. This is evident in a 1950 letter to South Tipperary county council from the Department of Health asking whether they had secured more foster homes following recent advertisements, and querying their practice of committing children to industrial schools. The council was asked to supply ‘a precise and detailed statement’ regarding the procedures they used to commit children, the grounds for committal, and who initiated it. The letter continued:

It appears to the Minister that in the minds of people who were not familiar with the details of the legislation committal to a Certified School suggests an

17 Figures for the number of children boarded out, or at nurse, were published annually in the reports of the DLGPH until 1945, but not in later years.
18 Department of Health, ed006406/INACT/INACT/0/443909.
added stigma on children who are already socially handicapped and for that reason committal proceedings are objectionable. As regards the relative merits of boarding-out and institutional accommodation, it is noted that the County Manager has discussed the matter with ecclesiastical authorities and that he has doubts as to the advantages of boarding-out, but, the reasons for his doubts are not mentioned in your letter.

11.27 This letter cited article 20 of the Public Assistance (General Regulations) Order 1942,¹⁹ which stipulated that a public assistance authority could not send a child to a certified school unless the authority was satisfied that the child could not be suitably boarded out. It noted that ‘the responsibility of the PAA administering the legislation does not, therefore, extend to deciding between the relative merits of the different methods of assisting children deprived of a normal home life…it is surprising that consideration of “saving the rates” in such a small measure should influence a Public Assistance Authority to choose a course disadvantageous to the children in its care’. The argument that placement in a certified school would save money was ‘without foundation’ because from April 1948, the Department of Health would meet the full cost of any increase in health spending over the 1947-48 figures until expenditure had doubled.²⁰

11.28 This letter referred to the attitude of the ecclesiastical authorities. In a memorandum on foster care probably written around 1949, Miss Litster commented on the attitudes of parish priests. She noted that many had ‘a keen interest in boarded out children’ and some sought to secure children for their parish to maintain the numbers on the school roll, though they only wanted children of school-going age. A number of parish priests objected to foster children, believing that they should all be sent to industrial schools. Miss Litster noted, ‘Generally neither opposition nor assistance is encountered, simply apathy’. However she believed that it was advisable to secure their co-operation in encouraging families to accept boarded-out children. Yet not all parish priests were opposed to boarded-out children.²¹

11.29 Article 4 of the *Boarding out of Children Regulations 1954*\(^\text{22}\) increased the pressure on local authorities to board out children, as opposed to sending them to approved schools. It provided that ‘A health authority shall not send a child to a school approved by the Minister…unless such child cannot be suitably and adequately assisted by being boarded out’, and it extended the age at which children could be boarded out to 16 years. The department monitored the number of children in county homes closely throughout the 1950s, and they repeatedly urged local authorities to place children in foster homes. Despite these pressures to board out children, and repeated strictures against dispatching children to industrial schools, a number of local authorities continued to commit many children to industrial schools without ministerial approval.

11.30 Offaly was regularly noted as having few boarded-out children. The number fell from 40 in 1950, to 24 by 1955, by which time the department’s inspector believed that ‘the scheme is threatened with collapse’. Only three children were boarded out in 1954 and 1955. Despite repeated pleas from the inspector, Offaly failed to advertise for foster parents, leaving it to the assistance officers to identify suitable homes. Having failed to convince Offaly that boarding out was in the best interests of the child, the department inspector suggested that they consider the financial benefits of fostering: it cost substantially less than the cost of keeping a child in an approved school. Nevertheless Offaly persisted in keeping the children of unmarried mothers in the county home for several years, and then transferring them to industrial schools. Girls were generally sent to Lenaboy; boys went to St Joseph’s, Salthill. The department reminded Offaly, in vain, that children should only be sent to institutions when efforts to place them with a foster family had failed. Many of the children who were placed in foster homes in Offaly were removed; the department’s inspectors interpreted this as evidence that foster homes were not chosen with sufficient care.\(^\text{23}\) In 1965 there were 146 children from Laois and Offaly in institutions, ‘the vast majority of whom appear to have been sent automatically’; having spent their early years in the county home or a mother and baby home, these children were then dispatched to industrial schools.\(^\text{24}\)

\(^\text{23}\) Department of Health, INACT/INACT/0/457780.

\(^\text{24}\) Department of Health, RM/INA/0/489849.
11.31 Department of Health inspectors consistently criticised the policy of delaying the boarding out of children from Tuam. In 1957 Alice Litster stated that ‘The trouble with the Children’s Home is persistent. The Sisters are not helpful in getting children boarded out at an early age. It is distressing to see a ‘crocodile’ of children going to school from the Home.’

11.32 She recommended that the Galway health authority should require the Mother Superior to notify them when a child reached the age of three; prospective foster parents should be encouraged to visit Tuam ‘in order to select a child’.25

11.33 The number of children boarded out or at nurse declined during the 1950s, though it is important to emphasise that the figures for children at nurse were incomplete. Between 1948 and 1953, the numbers boarded out by the Dublin health authorities fell by over 50%.26 The introduction of adoption had a major impact but the decline started before adoption was introduced; it probably reflected the fall in the number of ‘illegitimate’ births in the late 1940s. During the 1950s the charitable agencies that had been prominent in placing children at nurse became adoption agencies, and local authorities began to view adoption as the preferred outcome for ‘illegitimate’ children. Many of the early adoptions involved foster parents adopting children who had been in their care for some years.

11.34 A mother had the right to refuse to have her child boarded out. There are documented cases of mothers leaving a county home with her child and then applying, via the NSPCC, for his/her committal to an industrial school. Limerick county council sent 41 children to industrial schools in the years 1953-59; all children except one were committed as a result of an application by their parent.27 The local authority claimed to have identified suitable foster families for all of these children; in all cases the mothers refused to have their children boarded out.28 It seems that these mothers were unwilling to part with their child to another ‘home’ where the child might develop an attachment to another ‘mother’ or ‘family’; they hoped to sustain more of a parental relationship if the child was in an institution. In 1960 several women, whose children were in the Wexford county home, refused to

consent to them being boarded out; they wanted them to be sent to the Good Shepherd Convent in New Ross, where mothers could visit.\textsuperscript{29}

11.35 Mothers could reclaim a boarded out child at any time. In 1969 an inspector described one mother of several ‘illegitimate’ children who were boarded out: ‘when a whim overtakes her, the mother turns up to the foster-home and demands the children back’; she would take them to her cottage but abandon them shortly afterwards. One of these unfortunate children was admitted to an industrial school because of his mother’s erratic behaviour.\textsuperscript{30} In 1946 Alice Litster wrote a memorandum on children boarded out by public assistance authorities. She stated that foster parents who would willingly take an orphan would often refuse to care for the child of an unmarried mother because of fears that the birth mother might appear and cause trouble. Miss Litster reported that ‘one of the fears of a good foster home is that the child’s parent may claim him, as often happens, when he arrives at wage-earning capacity’.\textsuperscript{31} In 1933 a woman whose child had been boarded out in North Tipperary informed the local authority that her daughter was now 15 and ‘she intends putting her to business’.\textsuperscript{32} The papers of the inspector Miss Clandillon record several instances where the birth mother or a member of her family, who had had no contact with the children since infancy, contacted them when they reached their fifteenth birthday and were in a position to become self-supporting and perhaps help to support their mothers or relatives. One grandmother sought to claim a foster child, though her foster mother wished her to continue at school. A teenager who was reclaimed by his mother when he reached working age ran away from his mother and her husband (who was not his father). When the department’s inspector met him three years later, by which time he was in his early twenties, she reported that he was working and living with his mother and her husband, but was extremely unhappy there. This practice of reclaiming children when they reached working age was not unique to Ireland.

**Payments to foster parents**

11.36 The number of children boarded out within a county reflected the socio-economic conditions and the attitude of the local authority. Children were commonly boarded out in the homes of small farmers and rural labourers, so the number of

\textsuperscript{32} Tipperary North, Board of Health and Public Assistance, minutes, 14 July 1933.
households in those categories often determined the presence or absence of foster children. Local authorities could encourage or discourage boarding out by advertising for foster parents, or not doing so, and by the sums that they paid to foster parents. Each local authority set the rate, which had a bearing on the number of foster homes. During World War II (the ‘Emergency’ years) payments to foster parents failed to keep pace with the rising cost of living. In 1943 the department carried out a review of provisions for unmarried mothers and their children. The section headed ‘Boarded-Out’ reported that the inspectors for boarded out children were emphatic that the allowances for maintenance and clothing should be increased in light of the rising cost of living. The department wanted all local authorities to pay 30s a month. Children should be boarded out as young as possible ‘so that they may have the advantages of family life from their earliest years’. They wanted an end to the practice of placing foster children in homes of elderly people and other reforms. In 1947 Galway was the only county to retain ‘the antiquated practice’ of paying less maintenance for children aged nine years and older - which ‘appeared to invite foster families to make the children earn their keep’ by working on a farm or in the home. This practice had been widespread in the 1920s and 1930s; in 1933 Tipperary North Riding paid a weekly maintenance rate of 7s for children aged two to four; 6s for children aged four to ten; and 5s for children aged ten to 15.33 In 1947 the average payment per child nationally was just under 7s, weekly payments to foster parents in Monaghan ranged from 8s 6d to 11s, the highest payment was for infants; Galway paid 5s weekly for children up to the age of ten, and 4s weekly for older children.34

11.37 Payments varied considerably between local authorities. In 1949, for example, Limerick city paid foster parents 8s a week, which Miss Clandillon judged insufficient to give the children an adequate diet. In contrast Co Limerick paid foster parents 14s a week35 - and as most Limerick city children were boarded out in the county, the discrepancy was significant.

11.38 Local authority minutes and managers’ orders indicate that many local authorities tried to extract a contribution towards the cost of boarding out from the child’s mother or the putative father, though there is no evidence as to their success in doing so. The annual report of the DLGPH for 1934-35 indicated that the mother’s

33 Tipperary North Riding, Board of Health and Public Assistance, minutes, 14 Dec. 1933, letter from the Minister for Local Government and Public Health in relation to an inspector’s report.

35 Department of Health 489431
contribution towards the cost of foster care was estimated on the assumption that
she would retain £10 a year for her own needs, with the balance going towards
maintaining her child. These figures assumed that the mother was working in a
service position that provided her with food and lodgings. Some mothers were
detained in county homes for years, working without pay, in return for the local
authority paying the cost of their child’s foster care. In Meath and in Wexford, a
mother who had been working unpaid in the county home and whose child had
been boarded out, was forced to claim her child and maintain her/him if she
decided to leave the county home.36

Galway was among the most assiduous local authorities in trying to extract
payments to cover the cost of maintaining the children of unmarried mothers. In
1943 the county manager sought information from other local authorities as to their
practices. The North Tipperary county manager reported that unmarried mothers,
before leaving Sean Ross, had to provide suitable foster parents for their children
and that was usually done by the woman’s parents, a prospective employer or
some other interested party. He claimed that the mothers paid the foster parents
half the weekly cost of maintenance plus a full clothing allowance; the other half of
the cost of maintenance was paid by way of home assistance through the local
assistance officer. Only in exceptional cases, where the mother was incapable of
looking after herself and her child, was the child boarded out (by the local
authority), and in such cases the mother was usually provided with employment in
a convent or other institution under the control of religious sisters and a
contribution in proportion to her earnings was made direct to the local authority.
The South Cork Board of Public Assistance reported that in cases where an
unmarried mother contributed towards the cost of her child no agreement was
entered into and repayments by the mother were made through the Mother
Superior of Bessborough and credited to the board’s account. The board had no
means of checking the accounts; they accepted the word of the Mother Superior.
They claimed that all payments were voluntary.37 They noted that an unmarried
mother qualified for unemployment assistance amounting to 9s a week in rural
areas so long as her child lived with and was being maintained by her. The
Galway county manager ordered that copies of the above letters should be sent to
Sister Hortense, the Mother Superior in the Tuam home, asking her to get mothers
in Tuam to identify foster parents. He suggested that Tuam should follow the Sean

37 It is not clear to the Commission that the South Cork board’s description is accurate.
Ross model: the mothers would pay half the cost of maintenance and the full cost of clothing their children, and the remainder would be paid by the public assistance authority. He gave instructions that the local unemployment officer should be consulted in regard to the payment of 9s unemployment assistance to unmarried mothers to enable them to contribute to maintaining their children.38 A later communication from Westmeath county council to the Galway county manager stated that unmarried mothers in rural areas did not qualify for unemployment assistance during the summer - from the last Tuesday in June to the last Wednesday in October (when they were expected to find work in agriculture), but mothers could apply for unemployment assistance during the remainder of the year, if they were available for work but could not find work. Unmarried mothers living in urban areas could apply for unemployment assistance throughout the year.39 This correspondence suggests that unmarried mothers were encouraged to apply for unemployment assistance on the assumption that part of that money (which came from central government) would be used to contribute towards the cost of maintaining their child - reducing the cost to the local authority, however few women were awarded unemployment assistance.

The requirement that children could not be boarded out in cities or towns, which applied until 1953, meant that many Dublin city children were placed in other local authority areas. The fact that Dublin retained the pre-1922 poor law unions of Dublin, Rathdown, and Balrothery added to the complexity (see Chapter 1). In the 1940s Mrs McKean, a Commissioner appointed to oversee the Dublin Board of Assistance, increased the number of Dublin children who were boarded out, as opposed to being placed in an institution; many Dublin children were boarded out in Donegal and Wicklow.40 In 1952 there were 248 boarded-out children under the care of the Dublin Board of Assistance; but only 34 children were fostered in the Dublin Public Assistance District; the remaining 214 were outside the area; many were in the Balrothery and Rathdown Districts - to the north and south of the city. Local authorities elsewhere complained about the competition that they faced from Dublin in securing foster homes, so Dublin was forced to agree not to pay higher rates than were paid by the county in question. But as the local assistance officers received additional payments for inspecting Dublin children, whereas inspections

of children placed by their local authority were part of their normal workload, it was alleged that they preferred to place Dublin children in foster homes.\textsuperscript{41} By the late 1940s a succession of county managers - under pressure to increase the number of children who were boarded out - claimed that the placement of Dublin children in their area meant that they were unable to secure foster homes for children under their care, and the department reluctantly conceded that if a county manager objected, Dublin would cease to place children in that county. The chief executive officer of the Dublin board of assistance pointed out that of 36 children recently boarded out from Dublin, only five had mothers who were natives of Dublin. By 1951 11 counties were refusing to accept any children boarded out by the Dublin authorities.\textsuperscript{42}

11.41 By the 1950s children at nurse and boarded-out children were scattered across many parts of Ireland, often in a seemingly random manner. For example in 1960, of the 357 children who were boarded out by the Dublin board of assistance, 171 or approximately half, were in foster homes outside Dublin city and county; 20 were placed in Galway, 32 in Mayo and 23 in Roscommon. An additional 183 Dublin children were in industrial schools or other institutions.

11.42 Alice Litster claimed that there were advantages associated with placing foster children away from their home area, because ‘Women are not anxious to take into their homes children who may have undesirable relatives resident in the neighbourhood or wandering about the county’; they were more willing to foster ‘children about whose history nothing is locally known’.\textsuperscript{43} However there were major logistical problems associated with long-distance foster care. During the 1950s, Donegal households who were fostering Dublin children complained about long delays in getting approval for specialist medical care or glasses, and reimbursement for the cost of medicines. A woman whose foster child had tuberculosis was not given any additional money to cover extra expenses. There were also serious shortcomings among the foster parents. School attendance among Dublin children boarded out in Donegal appears to have been extremely irregular, and warnings and reprimands were generally ignored. Miss Murray noted that ‘The Board of Assistance is at a disadvantage in dealing with foster parents so far removed from the home county, since the removal of a child is a

matter of difficulty and inconvenience. Foster parents are well aware of this situation and take advantage.44

11.43 Despite the firm messages issued by the Department of Health, the decision as to whether children were boarded out, remained in a county home or were dispatched to an industrial school were taken by local authority officials, and the practice varied significantly between counties, as it did before independence. Some local authorities placed children with foster families at an earlier age than others. Wicklow placed children ‘at as early an age as homes can be found for them’; whereas in Galway children were not boarded out until they were at least four to six years old.45 The fact that Donegal had ‘no prejudice against young children’ was cited as one of the reasons why Dublin children were placed in Donegal.46 By contrast, in Kerry it proved ‘impossible’ to place children in foster homes under the age of three or four years, and most prospective foster parents asked for children who were five years or older. In Sligo applications for foster children generally specified that ‘they should be of school-going age and capable of doing occasional messages for the foster parents’.47 The Tuam children’s home insisted on retaining children until the age of five and seven years, which meant that children in Mayo and Galway were boarded out at a later age than elsewhere. In 1953 it was reported that most foster parents in Mayo were only prepared to accept children aged six years and older.48 There appears to have been little reflection on the difficulties that children raised in an institutional setting faced in adjusting to life with a foster family. Foster parents, irrespective of the county or the age at which children were placed, received no support or advice about the difficulties involved in parenting a foster child.

11.44 Children boarded out by local authorities could only be placed in a town or village with the express permission of the minister. This provision ended with the Health Act 1953. This requirement, which pre-dated independence, was not necessarily misguided, because until the 1950s child mortality was significantly higher in cities and towns and the practice of placing foster children in rural areas was not unique to Ireland. In the nineteenth century ‘orphan trains’ carried thousands of children - who were offspring of single mothers or poor families - from the American cities,

placing them with foster families in the countryside. Children born to unmarried mothers in Paris and other large French cities were placed with families in the countryside - partly to redress the falling rural population. Given the low birth-rate in France many of these children inherited farms or other properties of their foster parents.\textsuperscript{49} There was no restriction on placing children at nurse in cities, and many were placed in tenements or small cottages in central Dublin and Cork.

So there were two distinct but overlapping fostering systems in operation: one organised by the local authority, the other organised by individuals or by charitable bodies, and to some extent two discrete concentrations of children - most children at nurse were placed in cities and larger towns (though there were some in the countryside); boarded-out children almost exclusively in country areas.

**Inspection**

The regime for inspecting boarded-out children and children at nurse predated the foundation of the Irish Free State. The *Infant Life Protection Act 1897* required each poor law authority to appoint infant life protection officers to inspect children placed at nurse, and this requirement was restated in the *Children Act 1908*. The 1902 Local Government Board Ireland regulations provided for the appointment by each poor law union of a ladies committee with responsibility for selecting and inspecting foster homes and supervising the welfare of foster children boarded out by the poor law authority. Miss Litster noted that ‘being frequently composed of women belonging to the well-to-do classes’ these ladies often employed former boarded-out children.\textsuperscript{50} Most of these local ladies committees disappeared after 1922, probably because the membership included many women from Anglo-Irish landed families. In 1947 Miss Litster noted that the longest surviving committees were in Wexford and Dublin South, but it would appear that they had disappeared by 1947.\textsuperscript{51}

In 1902 Mrs Dickie was appointed as the first woman inspector of boarded-out children; she was joined some months later by Miss Fitzgerald-Kenny.\textsuperscript{52}

\textsuperscript{49} Jeanne F. Cook, ‘A history of placing-out: the orphan trains’, *Child welfare*, lxxiv, 1 (1995), pp 181-196. Many of these children were Catholic children who were placed with Protestant families; the descriptions of their placement are not dramatically different to a slave auction, except that no money changed hands. On France, see Ivan Jablonka, *Ni Père, ni mère. Histoire des enfants de l’assistance publique (1874-1939)* (Paris, 2006).

\textsuperscript{50} Department of Health, RM/INA/0/505478.

\textsuperscript{51} Department of Health, RM/INA/0/505478.

\textsuperscript{52} Caroline Skehill, *History of the present of child protection and welfare social work in Ireland* (Lewiston, 2004), pp 196-207. gives an account of the early history of boarding out and the role of women inspectors.
According to Miss Litster ‘the first result of the appointment of women inspectors was a storm of protest against inspection of children and homes and especially against inspection carried out at schools’. The system of inspection established under the Irish Local Government Board continued after independence. The work of these pioneering women, and their successors Mrs Crofts, Miss Kennedy-O’Byrne, the redoubtable Alice Litster, Fedelma Clandillon, Mary Murray and Margaret Reidy should be acknowledged; their reports constitute the primary source for this chapter.

In the 1920s the Dublin Union had an extremely active ladies committee that inspected foster homes and made regular reports to the Board of Guardians (see Chapter 13). In the 1940s the DLGPH noted that inspection of Dublin foster children had improved when Commissioners were appointed - probably because one of the Commissioners, Mrs McKean, had extensive experience of working with child welfare groups. Tipperary North considered appointing a ladies committee in the 1930s but it is unclear whether it was ever established. A 1923 report to the Laois Home and Hospitals committee suggests that inspections in that county were conducted by a nurse; she explained that she had given a foster mother ‘every opportunity for improving the place and on this visit I find it worse’. This child was removed to the county home while a more suitable foster home was sought.

The Children Act 1908 required all local authorities where there were children placed at nurse to appoint infant life protection visitors. In 1947 Miss Litster stated that Cork South (which included the city) had appointed a nurse as a dedicated infant life protection visitor. In Wicklow and Louth the role was filled by public health nurses (in addition to other duties); Wicklow had designated two nurses; in Monaghan it was held by the senior assistance officer, ‘who happens to be a woman’; Galway had delegated the function to the NSPCC officer. The remaining local authorities gave the role to assistance officers. Miss Litster suggested, diplomatically, that her objections to assistance officers inspecting foster children was ‘not based on any assumption that they are all lazy, incompetent and not interested in the welfare of the children’; they were ‘for the most part of the wrong sex’. Most assistance officers were men; the small number of women tended to be

---

53 Department of Health, RM/INA/0/505478.
54 Department of Health, NATARCH/ARC/0/527135.
widows of assistance officers. She also objected to the fact that this arrangement meant that fostering was associated with public assistance.56

11.50 Many assistance officers regarded boarding out as a form of supplemental home assistance. Fostering was viewed as meeting the needs of foster parents, rather than the best interests of the child. Many local authorities adopted a careless, even negligent attitude to their responsibilities to inspect children and foster homes. The department’s inspectors frequently criticised local authority inspections and their general oversight of boarded-out children. A report on Clare in 1953, which was broadly positive, noted that the assistance officers lacked the capacity to report on children’s health or inspect girls’ clothing.56 The department’s inspectors criticised the lack of record-keeping, inspections not carried out, reports of late payments to foster parents, where the local assistance officer undoubtedly had the money, but paid parents in arrears. The assistance officers were required to pay monthly visits to foster homes - checking on the child, their school attendance and health, while handing over the monthly fee to the foster parent, and recording details of each visit in an inspection register, but these regulations were widely flouted. There were reports from Galway in 1938 that assistance officers were failing to carry out inspections; foster parents were paid in dispensaries or depots, which meant that the home and the child were not inspected. Some assistance officers left the money to be collected in a local shop, or required the foster parents to call to their office - which might involve a round-trip of ten miles; details of children’s health and school attendance were rarely recorded. A 1946 report on Leitrim noted that

There is every reason to believe that the Assistance Officers’ visits of inspection to the foster homes are extremely irregular. The condition of many of the homes is ample proof that the foster parents do not anticipate visits of inspection. The monthly maintenance allowance is rarely if ever paid in the foster home, the foster parent collects it in the nearest town or calls to the home of the Assistance Officers.57

11.51 The report of an inspection in Monaghan in 1949 commented that requiring foster mothers to collect maintenance grants from the public assistance office ‘must

55 Department of Health, ed006406/INACT/INACT/0/443909.

57 Department of Health, NATARCH/ARC/0/404325.
militate against finding a good type of foster-parent, as women do not care to be obliged to attend with recipients of public assistance’.

11.52 Relations between local officials and the inspectors were occasionally fraught and some local officials resented the fact that female inspectors could review and comment on their work. In 1942, Mary Murray informed John Garvin, secretary of the DLGPH, that she ‘had never had any help or co-operation’ from the county secretary in Meath: ‘he invariably supported the SAO and AOs and always opposed any reforms I wished to make’. Efforts to arrange a meeting with the senior assistance officer before a planned visit were invariably thwarted, and the senior assistance officer tended to be unavailable when she carried out an inspection. This dispute continued for over a decade. In 1954 she was denied access to the files of boarded out children; local officials demanded that she apply to the county manager, providing an advance list of every detail that she might want to check. They told her that ‘there was no reason why all the medical certs or medical reports should be examined…No necessity to carry out a detailed inspection of the records’. When files were eventually supplied to her a member of the local authority staff kept her under observation to make sure that she only examined the portion of the file that they had opened. The Department of Health informed the county manager that the inspector was entitled to have full access to all files. It would appear that they sent another inspector to Meath to carry out later inspections. A 1957 department memorandum that was sent to Miss Litster and Miss Murray stated that ‘It is considered necessary to bring to the attention of inspectors the necessity of eliminating from their reports any statements regarding local conditions or practices which cannot be substantiated if challenged by the local authority concerned’. It noted that one recent inspection report had included information given in confidence to the inspector; such information should not be included in future.

11.53 Tensions between the department’s inspectors and the local authority were not confined to Meath. Louth also resented any outside advice or interference. In 1947 Mary Murray reported that there were only 18 children boarded out in the county, compared with 27 at the time of her last inspection (no date is given and no report survives of this inspection, but it was probably two years previously). Louth

had only placed two children with foster families over the previous two years, whereas they had sent a much larger number to industrial schools, or discharged them with their mothers from the district hospitals. Local officials claimed that they were unable to secure foster homes, but Miss Murray suggested that they had made little effort to do so. They also ended boarding out before children reached their fifteenth birthday (regulations stipulated that foster children remained under local authority care until their sixteenth birthday or had completed their schooling). They also failed to transfer children to vocational schools, hiring them out ‘at absurdly low wages’, or leaving them with the foster family ‘as unpaid domestic and agricultural workers’. Miss Murray’s report prompted a letter to the county manager, which was signed by the parliamentary secretary (junior minister) Liam Cosgrave, expressing his concern at her report and asking for a response. The senior assistance officer in Louth dismissed the report as ‘in the same tone as previous reports by this Inspector with its inaccuracies and destructive and, in places, sarcastic comments, instead of being constructive and symbolical of that co-operation which should exist between this inspector and the officials concerned’. The county manager was less hostile, but he took refuge in the fact that her report was ‘out of date’. The department replied that ‘The Minister takes grave exception to the tone of the report’ from the senior assistance officer. However the department’s criticism appears to have had little impact. Louth continued to retain children in institutions - whether district hospitals or industrial schools. By 1963 there were only ten children boarded out, four in the county, five in Monaghan and one in Kerry; no child had been placed in the county since 1958. Louth was planning to place three children in Cavan. In 1967 the department complained that

the set up in Louth is very unsatisfactory and has shown no improvement over the years; in fact it has deteriorated steadily. From the County Manager down the officials are hostile to the scheme and no effort is made to co-operate with the Dept. or to establish the scheme on a satisfactory basis. The CMO [chief medical officer] knows little of the work, his staff are antagonistic or indifferent and the Public Health nurses confine their interest to spasmodic visits to the foster home.

11.54 In 1951 the Department of Health asked local authorities to provide details of their inspection practices. Limerick City Public Assistance Department (which was

---

61 Department of Health, RM/INF/0/82807
62 Department of Health, INACT/INA/450148
distinct from the county) reported that assistance officers provided monthly reports on children who were boarded out and these reports were laid before the city manager. The matron of the City Home and Hospital (a county home) - who was a religious sister - paid surprise visits to foster homes and reported to the city manager on the children and conditions in the homes. The inspector and public health nurses provided monthly reports on children at nurse. However, the Department of Health inspector provided a much more critical account of Limerick city inspections. She claimed that reports submitted by assistance officers consisted of a printed sheet with entries such as ‘satisfactory’ and similar comments. Inspections were not thorough. In one case where three boys had to be removed from a home following allegations of cruelty, two successive matrons of the City Hospital had reported favourably on this foster home, though they acknowledged that it was overcrowded, because the foster mother’s daughter, husband and two children had returned to live there.

11.55 The Limerick infant life protection visitor was also the senior assistance officer. Miss Clandillon claimed that he had never kept a register and had to be shown one; she was sceptical that he would perform his duties adequately. He informed her that he had removed some names from his list of children at nurse, because they had been ‘adopted’ by the families - i.e. payments for maintenance had ceased. She had to explain that these informal ‘adoptions’ had no legal validity and any children who had been kept for payment should remain on the register until the age of nine, or until legally adopted. Miss Litster had given this official a detailed explanation of the legislation - apparently to no effect.63

11.56 The reforms of health and welfare services in the late 1940s resulted in pressure on local authorities for the appointment of designated, full-time children’s officers with responsibility for boarded-out children; children placed at nurse, and hired-out children. Miss Litster recommended the appointment of trained social workers to this role. She recommended that they keep detailed case notes for each child, including health, progress at school and their intellectual aptitude; they should advise foster parents on the choice of future occupations for these foster children; inspect possible places of employment and provide follow-up support after they left foster care. Their duties should also involve ‘giving advice and guidance to

63 Department of Health, 489431
unmarried mothers’. There is no indication that this proposal received serious consideration and there were insufficient trained social workers in Ireland to fill these jobs. The Limerick county medical officer of health designated public health nurses to carry out these duties. The nurses inspected boarded-out and nursed-out children, but the foster homes continued to be selected by the assistance officers, probably without checking with the nurses, and the assistance officers continued to handle payments to foster parents and clothing allowances. The medical officer would not agree to the public health nurses providing written reports of inspections, ‘his view being that their sole duty consists in satisfying themselves to the physical welfare of the children’.  

In 1950 Seamus Murphy of the Dublin Board of Assistance determined that inspections of boarded-out children carried out on behalf of the Dublin Board should be made by a dedicated children’s officer, who should be a woman. In Carlow, Cavan, Meath and South Cork, public health nurses were responsible for inspections. In Balrothery and Rathdown (both Dublin), and Wicklow, infant life protection officers who were qualified nurses inspected all foster children. In the remaining counties inspections continued to be conducted by the assistance officers. The workload of public health nurses increased significantly with the expansion of health services for mothers and infants under the *Health Act 1953*, routine medical inspections of school children and immunisation programmes; consequently public nurses had little time for inspecting foster children. In 1953 the Joint Committee of Women’s Societies and Social Workers submitted a report to the Minister of Health in relation to boarded out children and children at nurse, and this resulted in a meeting between a deputation from the Joint Committee and officials in the Department of Health. The deputation pressed for the appointment of dedicated children’s officers, who should be trained social scientists, and the introduction of stronger regulations relating to the registration and inspection of children in foster homes. Officials explained that it was the Department of Health’s policy that inspections should be carried out by trained children’s officers, but as the appointments were made by local authorities, ‘the most the Minister could do is urge such an authority to make an appointment’.

The introduction of legal adoption meant that many unmarried mothers were faced with deciding between adoption and foster care (few had the option of raising their child) but there was a ‘lack of cohesion in child-care practices’; the department believed that the appointment of full-time, qualified children’s officers to deal with boarding out, private placement of children and adoption would improve the position. Most local authorities continued to resist this proposal, pleading that they were under pressure to keep rates bills under control - despite the fact that under the Health Services (Financial Provisions) Act 1947 the additional cost in health spending was borne by the Exchequer. Public health nurses objected to proposals that the position of children’s officer would be open to candidates who were not qualified nurses. Galway appointed a children’s officer in 1958, but a department inspector noted that ‘the results of the appointment are disappointing, and that it has in no way fulfilled its expectations’. Reports and records were described as ‘generally unsatisfactory’; inspection reports showed ‘little if any improvement on those carried out by the Assistance Officers’. Many local authorities continued to divide responsibility for foster children between assistance officers and public health nurses. In 1962 the Connacht Tribune reported that the Galway county manager and county councillors had expressed disagreement with the recommendation of the assistant county manager to a Dáil Éireann Select Committee on the Health Services, that all counties should appoint a ‘suitably qualified’ children’s officer. In 1960 Miss Clandillon suggested that Laois and Offaly should appoint a joint children’s officer to take responsibility for the approximately 60 boarded out children in the two counties; in 1965 she reported that responsibility had been transferred to public health nurses, which ‘only resulted in a worsening of the situation’. Wexford, by contrast had a very active and effective children’s officer, who worked hard to identify suitable foster homes, and to prevent children being sent to institutions. However in 1970 only six of the 17 children’s officers were social workers or social science graduates.

Sections 55 and 56 of the Health Act 1953 required each local authority to keep an up-to-date register of boarded-out children, including details of their date and place of birth. The department urged all local authorities to have copies of every child’s birth and baptismal certificates, which would be available to foster parents as

required, under article 17 of the *Boarding Out of Children Regulations*. Many children who were fostered at an early age came to be known by the surname of their foster family and the department inspectors reported cases where a child was not aware that he/she had been fostered. In 1958 Miss Clandillon expressed concerns about one such boy in his early teens who was attending the local vocational school; she feared that this would be a bad age to make this discovery. This boy wished to join a religious order; she wondered whether they would accept him. In another instance where the foster mother was keen to adopt a seven-year-old girl who had lived with her for many years, Miss Clandillon urged the woman to tell the child about her personal history - the girl’s mother’s surname had been used at school. This foster family were finding it difficult to trace the birth mother to secure her consent to the adoption but they eventually succeeded. Local authorities appear to have been extremely lax about birth and baptismal certificates. In 1963 Miss Clandillon complained about the difficulties getting birth and baptismal certificates for children born in the Limerick county home. A baptismal certificate was required when a child was being confirmed.

11.60 Documentation appears to have been even more cursory in the case of children placed at nurse. One 13-year-old girl, who had been placed at nurse when she was 12 days old, was known by the name of her foster family, ‘and has not been informed that she is not a member of the family’. In another case, a foundling received the sacrament of confirmation, but it was then discovered that she had no baptismal certificate, so she was given conditional baptism, and confirmed (again) at a later date. Her foster mother reported that she was ‘very depressed and upset’ as a consequence. One foster mother did not know the child’s mother’s surname and she had no birth or baptismal certificate, so was unable to claim children’s allowance. In 1959 Mary Murray reported that Galway foster children had difficulties in obtaining their birth and baptismal certificates, ‘due to the inadequate records kept by the Children’s Home, Tuam. Personal files, to serve as case histories of the children, have only been opened during the past few years

and many of them are incomplete. Birth certificates were increasingly required when young people were starting work, as evidence that they complied with regulations about minimum age. Miss Murray reported a case in Donegal where a boarded out child got a job in a local hotel and was asked to produce a birth certificate for social insurance purposes. When he and his foster parents could not produce one - they had not been given one by the local authority - he lost his job.

**Foster homes**

Most of the Commission’s knowledge of boarded-out children and children at nurse comes from the reports of the departmental inspectors. Some of their comments are impressionistic and reflect their personal opinion but they indicate that the female inspectors were very concerned about the welfare of the children that they inspected. They tried to speak to the children, apart from their foster family; they often collected them at school and drove them home, using this as an opportunity for private conversation. Their reports indicate that they generally accepted the child’s account of their foster home and treatment at home and in school. By comparison, a study of foster children in Sweden in the mid-twentieth century suggests that social workers only spoke to children in the presence of the foster parents. The inspection notes often recorded the children’s concerns. One boy was told by another older foster child that he would be moved to another home. Children boarded out in Longford in the mid-1950s ‘were obviously apprehensive of being removed and sent to America’, and as a result were nervous and ill at ease and ‘have lost the feeling of security which is so essential’. Foster parents were also uneasy at this development. Their fears were not unreasonable because the Longford county manager had approved a number of American adoptions. The inspectors spoke to the child’s teacher, and they noted cases where the teacher was critical of the foster family or the children. A report on one foster home stated that the ‘children seemed repressed and nervous in contrast with other boarded out children in the area’. One foster mother was described as ‘a quarrel-some type and shouted at the child telling him she would send him away. I had to tell her to stop frightening him’. A 1964 report of a foster home stated that

There appears to be no affection whatever for this boy in this home though he has been there since September 1950. The foster-mother, her son-in law and daughter said he would be of no use to them on the farm as he is very small for his age and is rather frail - asthmatic…it is quite obvious these people are only too anxious to part with […] as soon as possible. The boy has always appeared to be nervous and unhappy in this home and he has certainly got no encouragement here.

He was described as 'backward'; the inspector suggested that he might be admitted to the special school at Lota.85

11.62 Most foster parents were selected by assistance officers. In many instances the decision was made primarily, even exclusively, with the needs/wishes of the foster parent in mind. Children were boarded out to foster mothers who had large numbers of resident children; in such cases the purpose was presumably to increase household income. Women who fostered children placed by a local authority were forbidden from taking children at nurse, but it was common to find both groups in the same house - yet another attempt at maximising household income. A foster mother in Tipperary North who was reprimanded by the assistance officer for doing this threatened to return the boarded-out children to the county home. There are also reports of foster children (both categories) sharing a private house (and occasionally a bedroom) with a lodger, who were another source of income for hard-pressed households.86 In the 1950s Miss Clandillon reported allegations that some Dublin families fostered children in order to qualify for a local authority house;87 the number of children in a household was taken into consideration in determining a family’s place on the housing list. Some children were boarded out by the local authority with a close relative, commonly their grandmother; it is unclear whether this happened from the 1920s; most of the inspection reports referring to such arrangements date from the 1950s or 1960s.

11.63 One inspection report claimed that when two children had to be removed from their foster homes - a girl whose foster mother had died and a boy whose foster parent no longer wished to keep him - the assistance officer was reported to have brought

both children around the neighbourhood in his car until he found new foster homes. The girl was described as in tears throughout the journey.\footnote{Department of Health, INACT/INA/0/442719.}

11.64 Foster mothers included single women, childless widows and elderly women, some living alone, others living with their husband, or an unmarried brother(s). Miss Fitzgerald-Kenney urged that ‘single women who say they want a child “for company”’ should not be approved as foster mothers. She alleged that younger single women tended to turn the foster children into ‘servants attending only upon their personal wants’; childless couples were not accustomed to caring for younger children. She described an inspection visit to one foster home, ‘which the foster-mother (a childless woman) had locked up while she went to visit her sister, residing a little distance away. The foster-child had been left behind tied into a bed and had obviously spent its time crying. ‘Risks of the child injuring itself by going too near the fire, or otherwise, had, of course, to be guarded against, and there was no other course open to the woman. It is difficult however to estimate the terror a child may feel in being thus left alone’.\footnote{DLGPH, Annual Report, 1934-5.} The inspectors repeatedly urged that ‘Children should not be boarded-out in homes where the maintenance allowance is a necessary addition to family budget. In these circumstances the Boarding Out system becomes a form of Outdoor Relief, which naturally it was never intended to be’. One foster mother in Kildare informed an inspector that she intended to send her two foster children, boys aged five and ten, back to the county home. ‘She appeared to have no affection for them whatsoever’. She already had had three others, one taken by family, two sent back to the county home.\footnote{Department of Health, RM/ARC/0/489399.} The fact that a succession of foster children had been placed with this woman suggests that council officials ignored her record of rejecting previous foster children, and gave no consideration to the children’s welfare. One mother of eight children - six living at home - kept two foster children, ‘because her husband’s wages were low’. Miss Clandillon believed that children should not have been placed with this family - the ‘motive for taking the children appears to be purely financial’. However the boys remained in that home, and some years later the family fostered a girl. The inspector’s reports became progressively more positive and the family adopted the girl.\footnote{Department of Health, RM/ARC/0/489244.} Income from a foster child was taken into consideration in determining a widow’s pension (non-contributory); the department inspector pointed out that this money was to be used to support the
child(ren) ‘and was never intended as a source of profit to the foster parents’, so it should not be viewed as a source of income for the foster mother.\textsuperscript{92}

11.65 Foster children were commonly viewed as a source of unpaid labour. In 1931 an inspection in North Tipperary noted that ‘Mrs C admitted that she did not take the boy to foster but as help. This is in reality paying her his maintenance to have her own work done, for which a servant boy should be paid’. The inspector recommended that this boy should be moved ‘to a genuine home with genuine foster parents’ and no children should be placed with that foster mother in the future. A 12-year-old girl in another labourer’s cottage, which was occupied by a widow and her elderly brothers, was very poorly clad. She appeared ‘to be there really as a help for general work with no home attention to her’. She was only in third class at school. The inspector suggested that her lack of progress was because of her work duties. A 12-year-old boy boarded out nearby was ‘here for work. Going to the creamery and anything else that he can do. Appears hardworking and industrious but walks with a stoop such as children acquire from carrying loads of heavy buckets’.\textsuperscript{93} A 14-year-old boy was described as extremely unhappy in a foster home, where he was expected to do a man’s work unpaid.\textsuperscript{94} Another family wanted to foster a child to help on the farm; they would not take a child under nine years and would prefer a 12-year old.\textsuperscript{95} A Donegal foster mother claimed that she got so little money for keeping a boy that her husband had a right to keep him from school to work on the farm whenever he needed help.\textsuperscript{96}

11.66 One report claimed that

the principles which appear to determine the selection of foster homes in Co Mayo give cause for grave concern. There appears to be a complete misunderstanding of the aims of boarding out. The primary requirements of the children for whom foster homes must be provided are affection and stability. Both these vital requirements are frequently missing in Co Mayo. Owing to faulty selection in the first instance many children have to be moved with disastrous results...Owing to a high emigration rate there is a dearth of domestic and agricultural workers in the country and, as a consequence,
boarded-out children have come to be regarded as a substitute for the normal labour supply. When an older child is available for boarding out - usually as a result of removal [from another foster home] - there is a spate of applications from middle class householders which require domestic or agricultural help. Generally speaking this type of home does not extend to the child that affection which is the first requirement for successful boarding-out. There is no question of the child becoming a member of the family or of having that feeling of belonging which is essential for normal development. I found that children who had been placed in this type of home were under no illusion as to the reasons for their being there.

11.67 One girl was boarded out in a hotel which had a ballroom and a bar, and it would appear that her duty was to care for the children of the family; there did not appear to be any domestic staff. This foster mother was described as ‘truculent and difficult’. When a public health nurse attempted to inspect a house where a 14-year-old boy was boarded out, the owner prevented her from examining the boy or inspecting the house. The senior assistance officer refuted the nurse’s report, but the county medical officer supported her account. The county medical officer claimed that ‘The boy appeared to be in fear and was evidently used to slave labour’; he supported the nurse’s recommendation that he be removed from this house. The local authority appealed to the department to determine whether the boy should be removed, but the department demurred. In 1960 Galway county council wrote to the department asking permission to remove a boy from a foster home. They had received ‘numerous complaints’ about the boy’s treatment by his foster mother. His school attendance was poor and the teacher and the local priest confirmed ‘that it was common knowledge that […] was severely beaten’. The priest had also received complaints from visitors who had stayed in this house about the amount of housework that the boy was required to carry out. This house was in the Gaeltacht and it became a ‘boarding house’ during the summer months.

11.68 Many foster children were placed with women who were in their sixties or even seventies. The inspectors repeatedly reminded the local authorities that a foster home was expected to be a permanent home for a child, and ‘anything that

97 Department of Health, INACT/INA/0/451521.
98 Department of Health, INACT/INA/0/442718.
99 Department of Health INACT/INA/0/442718
threatens this permanency should be seriously regarded as impairing the suitability of a foster home’. For that reason children should not be placed with elderly foster mothers, because that generally meant that a foster child would have to be removed to another home; ‘in the normal course of events the woman will either die or become incapable through old age or infirmity.\textsuperscript{100} There are many instances where children had to be removed from foster homes following the death of the foster mother, or when the elderly foster mother showed ‘signs of mental deterioration’.\textsuperscript{101} An inspection carried out in Mayo in 1946 stated that ‘practically all the children boarded out during the past few years have been placed with elderly foster parents - at least two of these were over 70’.\textsuperscript{102} In the early 1960s the foster father in one Clare home was 82.\textsuperscript{103} An 80-year-old Limerick foster mother was responsible for at least two school-going boys. Two girls, boarded out in Monaghan in the 1950s, lived in a home where the man was over 80 and the foster mother ‘admits to being 65 but looks older’.\textsuperscript{104} In 1963 Mary Murray reported on a ten-year-old girl whose foster mother, a widow with no cohabiting relatives, ‘appeared to be in her sixties…a thin and feeble person physically with a decided tremor in her limbs’. Miss Murray believed that this woman was unable to carry out normal housework. The house was extremely clean, but the foster child had an appalling school attendance record. The inspector had commented unfavourably on this foster mother in 1948 - she was described then as ‘incapacitated’, and a child was removed as a result, but this particular girl was placed with her in 1954. This was not a unique case. Another child in Mayo was fostered by a woman who was paralysed from the waist down and in a wheelchair. When this home was inspected the entire family (other than the foster mother) was working in England, as migrant workers, and the foster child aged seven or eight was alone in the house to care for her.\textsuperscript{105} Miss Murray noted that Mayo is an exceptional county in respect of local intrigue connected with the boarded-out children. The general attitude seems to be to regard the advent of a boarded-out child rather from the foster parent’s point of view than from the point of view of the welfare of the child, in other words people are anxious to see boarded-out children coming to a home from the point of view that the

\textsuperscript{100} Department of Health, 489373

\textsuperscript{104} Department of Health, 489320; Department of Health INACT/INA/0/454516.
\textsuperscript{105} Department of Health, INACT/INA/0/451521.
child’s advent will mean some help for the foster parents in the physical sense
and some money also.\textsuperscript{106}

11.69 There were huge variations in the relationship between foster mothers and foster
children. One report noted ‘Bed not too clean’ but the foster mother’s two sons
were ‘very fond of the boy’. The inspector met him on the road, and noted that ‘he
seemed to be very intelligent and well cared for’.\textsuperscript{107} There are several instances
where a foster mother died, and other family members continued fostering the
child, obviously regarding her/him as part of the family. The 1950s was a decade
of high emigration, and a number of foster families, who were emigrating to
England, arranged for their foster child to accompany them, and a family who
moved from Donegal to Tyrone continued to receive maintenance payments for a
foster child.\textsuperscript{108} Some families fostered a succession of children successfully for
two or more decades. By 1952 one Kilkenny couple had cared for three boys, now
adults, and were fostering a fourth; they also took a child from an industrial school
for the holidays. The inspectors’ description was very positive. Another Kilkenny
woman, whose teenage foster daughter gave birth in Sean Ross (she was working
and living away from her foster home when she became pregnant), was willing to
take her and her child into her home.\textsuperscript{109} When a foster child was no longer under
the care of the local authority, it was expected that he/she would retain links with
the foster family. In 1935 the DLGPH wrote to Clare board of health about a 15-
year-old boarded out child, whose foster mother had declined to ‘adopt’ him. The
letter emphasised that it was undesirable to place children with foster parents who
would be either unable or unwilling to ‘adopt’ the child when he/she was 15.\textsuperscript{110}

11.70 A series of reports in the late 1940s from a Munster county, chosen at random,
record ‘two children - well cared for; an older girl, previously fostered there but now
working some distance away was home on holidays at the expense of the foster
mother and apparently considers this her permanent home, while a girl of 21 years,
another foster child still lives there and works in a local factory’. However reports
from the same area in the mid-1950s described a 15-month-old child ‘found sitting
on a stone flour with a sack under him; his only clothes a thin vest which half
covered him’. He was ‘thin and white’, his feet were ‘blue with cold’. The home

\textsuperscript{109}Department of Health, RM/ARC/0/489311.
\textsuperscript{110}Nenagh Guardian, 27 July 1935.
was ‘poverty-stricken’, the foster mother was ‘well-intentioned but hardly able to cope with four foster children’. Another home had three children at nurse who were described as ‘well cared for quite at home’ with the foster mother’s three children. The accommodation was adequate; the children had pet rabbits.111

11.71 Some individuals believed that they had a right to a boarded out child. In the late 1950s one Mayo councillor complained about the ‘gross abuse of the Boarded-Out Children scheme in the mountainy parts of the county’. A ‘brother and sister living in a mountainy area wanted a boarded out child’ but they were refused one by the assistance officer. This councillor contacted senior officials ‘to prove the rights of my case, that this brother and sister were entitled to a boarded out child’.112 A Donegal woman wrote to the Taoiseach, Eamon de Valera, in 1947 asking his assistance in getting a boarded out child from the county home. She already had two foster children, though one child was no longer being supported by the local authority and it refused to grant her a third child.113 There is no indication that either of these appeals was successful.

11.72 Although the Health Act 1953 provided that a foster child should not automatically be removed from a home if there was no resident woman, many local authorities promptly sent a child in such circumstances to the county home or industrial school. There were many instances where the harmony of the foster home, and the relationship between foster mother and child was disrupted when an adult son or daughter moved back into the family home, often with a spouse and children. When fostering arrangements broke down the children were placed in the county home before being sent to an industrial school or another foster home. In 1951 Miss Clandillon reported that in the Cork South area, which included the city, ‘at least 14 boarded-out children have been removed from their foster homes and sent to industrial schools’, over the past 12-18 months.

There is no doubt that the changing of children from one home to another has a very bad effect on their mental and physical well-being and it is not surprising to find adverse comments on their behaviour in some of these cases...If more care were taken at the outset to place the children with suitable foster parents these drastic removals need not occur.

111 Department of Health, RM/ARC/0/489718.
112 Undated press cutting in Department of Health, INACT/INA/0/451521.
11.73 She complained that no time was spent trying to find alternative foster homes for these 14 children; they were sent to industrial schools on the recommendation of the matron of the county home, who was a religious sister, some having spent only one night in the county home. The inspectors pressed local authorities to identify homes that could provide emergency accommodation for foster children who had to be moved.

Living conditions

11.74 The descriptions and standards of foster homes reflect the living standards in a particular county; the worst conditions were undoubtedly found in poorer counties. Many of the reports by the department’s inspectors were very positive about the standards in foster homes. In the early 1940s, the inspector who was responsible for the southern half of Ireland reported ‘a very high standard of cleanliness, tidiness and comfort in the foster homes’; ‘the children were healthy and well cared’. All the foster homes in Wexford were ‘very satisfactory and the boarded-out children well cared and well nourished’. Some homes were described as ‘excellent’. In Carlow the children ‘appear healthy and well cared’; the board of health ‘exercises great care in the selection of foster homes. The manner of inspection is regular and thorough and the medical care of the children excellent’. ‘On the whole’, the homes in Clare were ‘comfortable and good and the children…well-nourished and happy’.

11.75 Until the 1950s boarded out children were placed in rural homes that would have lacked running water, indoor sanitation, and perhaps electricity, but most rural families lived in similar conditions. Many were fostered in homes with inadequate and inappropriate sleeping accommodation, and they were poorly clothed, despite the fact that each child received a twice-yearly clothing allowance, and from 1944 they qualified for a separate footwear allowance that applied to other welfare recipients. The value of the clothing allowance varied between counties and some allowances were manifestly inadequate. In assessing living conditions the inspectors applied their concept of acceptable standards. However many Irish children, who were living with their families, were in overcrowded insanitary homes, went barefoot to school, or in wellington boots. Very few children of rural labourers and small farmers would have had sandals or dedicated summer clothes; their clothing was often scanty and hand-me-down. When reading descriptions of the

114 Department of Health, INACT/INA/0/429427.
115 Department of Health 489391
living conditions of boarded-out children, it is important to remember that there are no similar reports for the children of rural labourers and small farmers. There were many children living with their parents in squalid and overcrowded homes. In 1933, Miss Fitzgerald-Kenney recommended that boys boarded out should have two pairs of boots or shoes; two suits of clothes; three pairs of socks, one pair of braces, a new overcoat every third year, two caps, three collars, one gansey, one comb and a prayer book. For girls she recommended two pairs of boots or shoes, two dresses, three pairs of stockings, one serge over-petticoat; one dark bloomers, two pairs of knickers, two flannel petticoats, three shifts, four pinafores, one heavy outdoor coat, jacket or shawl, and one prayer book. Few children living with their parents in 1930s Ireland would have had a comparable wardrobe. She also reported that several children suffered from tooth decay and should be taught how to brush their teeth; at this time it is probable that many Irish children never brushed their teeth. Some officials were conscious of the danger of imposing standards for boarded-out children that did not apply to the children living in the neighbourhood, who attended the same schools. In 1943 a departmental memorandum commented that

an effort is made to hold an even balance between the very proper zeal of the inspectors for a better administration of the system and the knowledge which the Department’s Officers have as to the standards of life actually prevailing in the ordinary households of the areas concerned. It is difficult to suggest that homes should not be selected at a distance from schools or to be over critical in the matter of footwear, etc. if there is reason to believe that the children of ordinary households in the district incur hardship on account of the distance from the schools or through lack of proper footwear.

11.76 It noted that ‘nearly all the reports indicate that generally the children are found in a satisfactory condition and the foster homes clean and comfortable’. However this final sentence was unduly positive. It certainly did not apply to two boys who were being fostered in Co Monaghan during these years. The smaller boy, who was aged three, could not walk properly. ‘He was dressed in a cotton overall, many sizes too big and two woollen jerseys. He wore no vest and no other clothing was produced for him’. A six-year-old boy was dressed in ‘a torn short and a worn pair of trousers. No other clothing was produced for him’. The younger boy slept in a box, ‘a large one containing a layer of straw and obviously

used for nesting fowl'. The foster mother was described as 'definitely obstructive and obstinately refused any information'.

Although the clothing worn by these Monaghan children was exceptionally bad, a report by the department's inspectors for the year 1944/45 described the clothing for boarded out children in general as ‘far from satisfactory’. Clothing allowances were paid twice a year. The clothing allowances paid by local authorities had failed to compensate for war-time price increases, and many boarded-out children ‘have been very badly clad since the outbreak of the war’ - particularly children boarded out in Longford and Westmeath. Foster parents in Mayo and Galway complained that children boarded out from Tuam arrived with scanty clothing, and they had to wait until the next six-monthly clothing allowance from the local authority before they could buy additional clothes. They also complained about delays in payment by the assistance officers. Similar complaints were made about children boarded out from county homes, and from Castlepollard.

Clothing allowances were sometimes given in the form of vouchers to be exchanged in a particular shop. In many instances the senior assistance officer arranged that all clothing had to be bought in a particular shop, using his authority as a form of patronage. Some local authorities determined what clothing was needed, and then bought in bulk. This often meant that children had a long wait for clothing. One female assistance officer in Donegal insisted on clothing being bought in one shop. She accompanied the foster parents and chose the clothing so that all the foster children were dressed identically - foster parents (and presumably the children) resented her actions.

This was not the only instance where an assistance officer insisted that all boarded-out children should have identical clothing. In Limerick city, foster parents contacted the matron of the City Home and Hospital detailing the clothes that they required, and she sent them clothes, but they were often the wrong size, and Miss Clandillon was concerned that dressing the foster children in clothes that originated in the City Home and Hospital emphasised their links with this local authority home. In 1951 the city manager agreed to give foster parents clothing vouchers,

\[121\] Department of Health 489373
but these could only be exchanged in one department store.\textsuperscript{122} There were reports of staff in drapery stores being extremely rude to boarded out children who came for new clothing. In many cases the foster parent received cash to buy clothes for the child. In 1946 one inspector reported that the change to cash payments, together with an increased allowance, had been beneficial and most of the foster children were better clad than in the past. ‘In the case of girls, however, underwear was scanty and generally in need of repair. Footwear was also much worn’. In Meath shops had to tender to supply clothing to boarded out children; all the clothing had to be of Irish manufacture, and the foster parents were given vouchers that they used to get clothing in a designated shop.\textsuperscript{123} Foster parents had to produce itemised receipts for purchases, but some local officials were lax in checking these, and foster parents often used some of the money to buy clothing for themselves or their families. One foster mother in Offaly in 1945 allowed herself 25s because she had made some small garments for her five-year-old foster child; others bought material but it was unclear whether that would be used to make clothes for the foster children.\textsuperscript{124} An inspector who visited children fostered by Limerick county council in 1944 - i.e. during the Emergency when clothing was scarce - criticised the fact that two children boarded out in one house did not have a warm overcoat. The receipts for clothing vouchers showed that the foster mother had bought knitting wool - but it was unclear whether this had been used for the children.

\textbf{11.80} Instances where a foster parent used the money to buy clothing for herself or her family were all too common. An inspection in Offaly in the early 1950s described how the foster mother had received £13 the previous month to buy clothing for three foster children but the clothes shown would not have cost half that sum, and the children were dressed in worn-out garments. Some foster parents bought the clothes, but did not let the children wear them - one Offaly foster mother was reported as ‘inclined to hoard clothing, particularly undergarments, for inspection purposes while the child is clad in worn out garments’. This was not a unique case and it suggests that foster mothers probably feared visits by a department inspector. Another foster mother was described as ‘addicted to hoarding the children’s clothes and had bought suits which were much too large and could not

\end{enumerate}
\end{footnotesize}
be worn for a considerable time'.

In 1949 the clothes of one girl, who was fostered by a single woman in Meath were described as 'scanty and well-worn' despite the fact that this woman 'appeared to be in more comfortable circumstances than the majority of foster parents'. In another case it was evident that the clothing produced for inspection, a hat and two dresses, had not been bought for the foster child. In 1957 one foster child in Galway had no clothing other than what she was wearing. Inspectors frequently reported that children had very inadequate underwear and no night clothes. In 1960 one foster mother was given a delicate reminder that she should buy night clothes with the next clothing allowance. These are only a tiny sample of cases; misuse of clothing allowances was widespread.

11.81 An inspection in Offaly in March 1951 prompted several complaints about foster children who were barefoot going to school or around the home. Although the children were eligible for free footwear under a public assistance scheme, many foster children were not receiving this. But lack of footwear, inadequate or non-existent underwear would not have been unique to foster children. In 1953 the Department of Health approved the payment of additional clothing allowances by the Dublin board of assistance to cover the cost of First Communion and Confirmation outfits, but they stipulated that this should be a fixed sum per child, not reimbursing foster parents for the cost of an outfit - beginning a practice that survived into the twenty-first century.

11.82 The Commission has found almost no information about food, other than occasional reports that children were under-weight and seemed malnourished, and the all-too-frequent reports of boarded out children bringing dry bread to school as their lunch. One Cork girl brought home most of the free milk that she was given at school - an indication that she did not get milk at home, or she was instructed to bring it home for household use.

Sleeping arrangements

11.83 Sleeping arrangements were a common cause for concern in inspection reports. Children tended to be placed in poorer households, which often had only one or

two bedrooms and few beds. Bedclothes were inadequate, sometimes nonexistent. Reports of homes with no bed clothes were quite common in the 1940s. There is no reason to assume that a lack of bed clothes or many people sharing a bed were unique to boarded out children - such circumstances were all too common in poorer Irish homes, both rural and urban at that time, but some sleeping arrangements raise serious concerns about child protection. The Department of Health was critical of boys and girls, who were not from the same family, being boarded out in a house together. Given that many foster children were placed in small cottages with only two bedrooms, these concerns were valid. The regulation about children of different sexes who were not siblings was relaxed in the 1950s. In 1960 Miss Clandillon noted that one foster mother, who was keen to foster another, older girl, who could bring her existing foster children to and from school ‘would find it difficult to provide adequate bedclothes’. On many occasions the inspectors were shown the best bedroom in the house, and they were convinced that this was not the foster child’s bedroom, though it was impossible to challenge this. One inspector reported that a 13-year-old nurse child shared a double bed with one of the foster mother’s daughters and the bed was in the same room with the foster mother - she described the arrangement as ‘unsuitable’. One Offaly foster mother in 1945/6 reported that the boy she had fostered slept in a particular bedroom, but the child, when questioned, told the inspector that he shared a settle bed in the kitchen with the workman. Another child was fostered in a labourer’s cottage, home to three adults and six children; the entire household slept in two double beds and one single bed. In 1957 one boarded-out child in Wexford was sleeping in an outhouse used to store potatoes. In 1949 one nurse child in Limerick slept in a cot lined with straw. In 1957 a ten-year-old girl in Co Galway slept in what was described as a ‘fixture’ at the end of her foster mother’s bed - instead of a mattress this ‘fixture’ used a seat from a pony trap. There are numerous instances where young children slept in the same bed as the foster mother - often because the home lacked a cot(s) or bed(s) and bedding. In 1960 two foster children (boys) in Co Limerick were sleeping in a very damp caravan beside the house; they were removed to the Limerick City

Miss Clandillon reported cases of nurse children in Dublin in 1941 who were sharing a bedroom and perhaps a bed with a lodger.135

Health

By the 1950s the inspectors were paying increased attention to children’s health - identifying children who were short-sighted, with a squint, skin infections, tooth decay, orthopaedic complaints and other treatable conditions, and demanding that these be addressed. Some foster children had more serious medical problems. The local officials appear to have been lax in documenting foster children’s health. There were frequent complaints from foster parents who were unable to secure the approval of the local health authority for a child needing specialist treatment to travel to Dublin; many foster parents complained that they had not been reimbursed for the cost of medicines, or trips to hospital. The department was highly critical of a case where the assistance officer had failed to inform the health authorities in Galway that a foster child suffered severe epileptic seizures.136 In 1952 Miss Litster commented on an inspection report on children boarded out in Meath which noted that a number of children needed some minor medical treatments: ‘There is little use in having a nurse trained in PH work if she does not take action when children obviously require care.’137 During the 1950s inspectors often commented on children who appeared to have intellectual disabilities and a growing number of children were referred to child assessment clinics.

Conflict

There were repeated disagreements between local officials and the department’s inspectors over the suitability of foster homes. In 1946 Miss Murray reported a labourer’s cottage in Leitrim consisting of two rooms and a kitchen that was home to nine people including the foster child (who was a nephew of the foster mother). She only managed to see one room, ‘where the bed consisted of a bundle of straw covered with a few old coats. There were no blankets or bed clothes of any kind. The child was verminous’. She noted that the assistance officer ‘reports each month that this house is satisfactory, child clean, bedding clean and sufficient etc. If this case is taken as a criterion’, she concluded that ‘his reports are not of much value’. The assistance officer countered with a description of ‘the bed in which the child slept…a bed that was clean and as good as is to be found in the ordinary

country house’. The other room contained, he claimed, ‘a large settle bed in which a bunch of children could be put without danger of falling out. The coverings were laid on the beds. They were dark in colour like army blankets. They were not new neither were they old nor torn.’ When Miss Murray tried to inspect this home on her next visit, all appeared to be in order, but she was aware that the foster mother had been given advance notice of an inspection.

11.87 Some of the worst conditions were in Mayo. In 1944 one boy ‘had no clothes except what he was wearing’; two girls were described as ‘dirty and verminous’. In the case of another boy, the inspector commented that

This is a home in which a child should never have been boarded-out, and has been commented on in all my reports. Though the foster mother appears to be kind to the boy she is evidently in rather poor circumstances and has several young children. The child was not clean in person or in dress, and his school lunch consisted of dry bread.

11.88 Conditions in some Donegal homes were equally bad. In 1950 Miss Murray reported on a home where there were two girls aged seven and nine; the foster mother, a middle-aged single woman was

of a highly nervous and irritable temperament. The foster mother’s attitude was hostile from the start. She refused to allow me to inspect the children’s bedroom and only yielded when I insisted that I must see where the children slept. The bed was filthy. She stated that she had her own room, but the children told me that they slept in the same bed as their foster mother. When I examined their clothes I found that they had insufficient underwear and that one child had no change of undergarments. I had been informed that the children frequently got dry bread and when I questioned them on this point they replied that they ‘used to get dry bread but now they got butter’. I had also been told that the foster mother was very severe with them, but I did not mention this, or any other form of ‘cruelty’ as I was afraid she might retaliate by beating the children again. They appeared to be cowed and afraid and I found it very difficult to get any information from them. That was in sharp contrast to the friendly carefree attitude of the other boarded-out children in the district.

---

138 Department of Health, NATARCH/ARC/0/404325.
139 Department of Health, NATARCH/ARC/0/404307.
She noted that ‘there appeared to be no affection between her and the children’ and recommended that they be removed to another home. This foster mother sent a solicitor’s letter to the Dublin board of assistance, which had placed the children with her, demanding that Miss Murray be severely reprimanded for her report, and denying its truth. By the late 1950s however the quality of foster homes was improving, and there are many references to the family moving into a new house, close to their former home, or references to houses being repaired or extended.

There are few references to corporal punishment, yet it must be assumed that many foster children, perhaps the majority, were beaten - how violently cannot be established. The paucity of references is partly a reflection of the fact that evidence of beatings would not have been readily apparent during the course of a visit by an inspector, plus the fact that corporal punishment was common in most Irish households at this time. In 1952 an inspector reported that she ‘heard child crying as I came up to the cottage. Foster mother beating her over her knee’. The four-year old was being punished for having a ‘tiny cut’ on her finger. She informed the foster mother that the child would be removed; the foster mother ‘asked for a chance because she needed the money’. The assistance officer and local public health nurse wanted to leave the child with this foster mother but the inspector insisted that she be removed. She noted that an older boy ran away from this home to his grandfather because he was badly treated. In 1955 a teenage girl refused to return from school to her foster home, and asked to stay in the convent attached to her school; she alleged that her foster mother had chastised her. The inspector noted that she wished to enter the convent.

In 1947 an inspector reported that a young man had been convicted two years earlier and sent to prison for a criminal assault on a girl who was boarded out in Donegal, but the assistance officer, recorded only a ‘bald statement’ to that effect and did not carry out any further inquiries. When a Cork foster child was seen with a black eye, and the foster parent and child gave contradictory statements, he was removed to the county home. In 1960 Miss Clandillon threatened to report another teacher who struck a boarded-out child on the face, causing severe

bleeding. In the early 1960s an inspector recommended that a child being fostered in Kilkenny should be moved because she was being beaten. One foster child in Cork was so unhappy that she went to the local convent and asked them to take her in. She was wearing a dress given to her by a neighbour. Arrangements were made to move her to another foster home and plans were put in place for her to attend secondary school. She was not the only child who ran away from a foster home.

Foster children: the teenage years

When foster children reached the age of 15 or 16 it was expected that they would be ‘adopted’ by their foster parent; alternatively they might be hired out by a local authority as farm labourers or general servants. In the 1920s and 1930s it was not uncommon for poorer families to place their children at hire with farmers, but the practice appears to have died out in the 1940s though the evidence is scant. The number of boarded out children who were hired out by local authorities peaked during the Emergency, when there was a strong demand for agricultural workers to assist with compulsory tillage and wartime turf cutting and harvesting. In 1936, 89 children who had been boarded out and remained under the care of the local authority were hired out. In 1945 there were 105 children hired out in the northern half of the country; the greatest number, 44, were in Galway; the only other counties in double figures were Donegal with 11, and Mayo with ten. In 1946 Mary Murray recommended that the hiring out by local authorities of boarded-out children should cease, but it continued. Some children were hired out before their fifteenth birthday, which was contrary to the law. In the 1930s an inspector suggested that children should not be hired out in places distant from their foster parents: ‘The ties that bind to the former foster-home are weakened and grave moral risks may be incurred in that way’. Children were advertised for hire in local newspapers. When a foster child was about to reach ‘hiring out age’, the Galway county manager directed that an ‘advertisement be issued for an employer’ if the foster parent was not willing to employ her. An inspection in Co Meath in the 1940s claimed that there was a misunderstanding about the objectives behind the hiring out scheme. It was designed

149 Department of Health 489373
for the sole benefit of the children, and aims at preventing their exploitation, by ensuring that they are adequately remunerated for their work. It is not the intention of the Department that children should be removed against their will from their foster homes or separated from foster-parents to whom they are attached. On the contrary, every effort should be made to enable the children to remain in or near their foster-homes by procuring work for them in the neighbourhood or at a convenient distance.

11.93 The inspector reported that ‘Distressing scenes were witnessed during the past year when a girl of 16 was removed against her will from her foster-home to be hired out at a distance’. Hiring-out contracts only lasted for one year, and they should only be renewed ‘if the child is satisfied’ and was receiving a fair wage. Some employers regarded the hiring of formerly boarded out children as a means of paying less than the going rate. During the Emergency, Galway approved the hiring out of children at rates as low as £4 a year; the inspector described this sum as ‘miserably inadequate’ and only justifiable if they received a substantial increase in the second year, or if that low rate meant that they continued to live in their foster home. The normal starting wage at this time was £6. Although agricultural wages rose during the Emergency, most hired-out children remained at their starting rate. In 1946 one inspector recommended that hiring out by local authorities should be discontinued because it was being abused. In 1949 the department was not satisfied that placing Meath foster children in service was in their best interests. Their wages remained lower than the general rate, and these former foster children were not aware that they were free to leave their employer when they were 16. An inspector reported that a 19-year-old boy thought he was still under local authority control. He did not know what wage he was paid.

11.94 The regulations stated that the hired-out child should be kept and clothed by her/his employer and their wages should be deposited in a post office savings account in their name. These rules were occasionally ignored. In 1946 seven boys and girls were hired out in Offaly; their annual pay was £9 for the first year; £11 for a second year, and £13 for a third year. Although their wages were lodged regularly in a savings account, these accounts were in the joint names of the employer and the teenager, which was ‘contrary to the practices in other counties’.

153 Department of Health 490807
154 Department of Health, RM/ARC/0/489697.
The inspector advised that a hired-out child should be free to leave his employer at the year’s end; if that happened the assistance officer should collect the post office book and hand it to the new employer. The post office book only became the exclusive property of the hired-out child when she/he reached 18 years. It is obvious that this system was open to abuse. In one case in Clare the inspector discovered that the employer/former foster parent had not placed any money in the child’s Post Office book; furthermore the employer was quite explicit that when this boy reached the age of sixteen he was not in a position to pay him the statutory wage rate specified by the Agricultural Wages Act. The inspector pointed out that when he reached his sixteenth birthday this boy was free to take any job that he wished and could not be bound by an agreement reached between the local authority and his employer. She reported that she had failed to find any employer who was willing to pay former boarded-out children the wage rates determined by the Agricultural Wages Act. She suggested that the local authority should be less well-disposed to applications to hire former foster children for agricultural work.\textsuperscript{155}

Several local authorities removed children from their foster home before the age of 14 (the end of mandatory school attendance) and placed them in a convent - such as the Limerick House of Mercy - where they were given domestic training, before being hired out as domestic servants. Miss Clandillon reported that the local authority - who had statutory responsibility until the foster child’s fifteenth birthday - had no involvement with this convent, and did not pay for their maintenance. ‘Therefore, it was explained to me by the Sister in Charge that nobody is allowed to visit the house’. She complained that no academic subjects were taught in this ‘school’; some of the girls placed there had not sat for their Primary Certificate, an examination sat by children at the end of their primary schooling (it ceased in 1967). She considered it ‘unwise and unjust’ that they were denied that opportunity. She urged that foster children should not be hired out at a distance from their foster home ‘as this is liable to break the very valuable ties between the child and the foster parent which are of especial importance in their adolescent years’. One former foster child who was on holidays in Co Limerick with her foster family had been placed as a servant in Co Louth, where she received 2s 6d a week pocket money; an additional 7s 6d a week was placed in a post office account. The Limerick city manager contested these allegations and he provided some further evidence as to the age of these girls, though it emerged that several

\textsuperscript{155} Department of Health 489850
had been placed in employment before their fifteenth birthday which was contrary to the law. It also transpired that he lacked the authority to place these girls in the Limerick House of Mercy, as it was not certified under the *Public Assistance Act 1939*. In 1949 two foster children in Limerick were working at a rate of 10s a week in the City Home and Hospital (the county home for the city of Limerick). Another who had spent some time in the Limerick House of Mercy was sent to a private home as a domestic servant; eight months after being sent there she had received no payment. The matron of Limerick City Home and Hospital appears to have retained some oversight role, keeping the savings book for one of these girls.  

11.96 In 1954 Mary Murray visited a laundry that was run by the Sisters of Mercy in Navan, where Longford county council was maintaining a 15 year-old girl who had formerly been boarded out. She reported that ‘conditions in this institution are unchanged. A public laundry is attached to it where all the girls (with the exception of one in the kitchen) are employed full time. *In theory* [underlined in the original] they are supposed to be moved from one duty to another but in practice this is not done’. This particular girl had been working in the laundry for approximately three months. ‘I had a talk with the girl herself and asked her if she would like to be transferred to another school. She said the work was hard and trying but that she was used to the place and would not welcome the prospect of starting off again somewhere else’. Miss Murray had previously recommended that this girl should be sent to a domestic economy school when she reached the age of 15, but she had been sent to this laundry that was run by the Sisters of Mercy. The department officials acknowledged that in this institution ‘the “training” means little more than working in a public laundry for no wages’. They had inspected this laundry five years earlier, and in 1949 the department had refused to approve a proposal to send two boarded-out girls in Kildare to this laundry. On this occasion they agreed that this teenager could remain in the laundry for a year because she seemed willing to remain, and Longford claimed that they were unable to find her a place in two domestic economy schools, however the department emphasised ‘that work in a public laundry is considered unsuitable - children should not be sent there in future’.  

This was not an isolated incident. In the 1950s girls in foster homes in Kildare were being sent to St Joseph’s Training School Kilkenny, before their fifteenth birthday, to work in the laundry. The Sister in charge told the inspector that they were not paid, ‘but that they are given pocket money

---

156 Department of Health 489431
157 Department of Health, INACT/INA/0/449929.
sometimes’. The work was allegedly designed to train them for domestic service, but the department’s inspector doubted whether the conditions and equipment ‘would approximate in any way to those found in the average household’. She suggested that ‘each girl’s case be judged on its merits’. If the foster parents wished the girl to attend a secondary or technical school ‘it would be of far greater benefit for the girls if they were left in their foster homes as members of a normal family. The value of a permanent home background in the years of adolescence cannot be over-estimated’. One of the girls was being fostered by her grandmother who was keen that her granddaughter should be sent to the local Mercy Convent (presumably as a domestic worker) when she was 16.\(^{158}\) The authorities in Kilkenny wished to send a girl to Stanhope Street Convent in 1958 for ‘training in domestic knowledge’ but Miss Clandillon noted that the institution was not registered under the *Health Act 1953* and had a public laundry attached. She recommended that she should attend the local vocational school.\(^{159}\) By moving these young people before the age of 15, the local authority (and these schools/laundries) were avoiding the requirement to pay these young people; they were also in breach of the regulations.

11.97 A 1951 inspector’s report expressed ‘some uneasiness’ about the practice where foster parents in Galway had to commit to paying their former foster child £15 a year plus clothing and lodging when she/he reached the age of 15. If they were unable to do so the child would be advertised as available for hire. She conceded that this provision was designed to prevent children being exploited - i.e. retained as unpaid labour. However many ‘otherwise estimable foster parents’ could not afford this arrangement, and in such cases the child was ‘removed from what is in fact his home and the only parents he has ever known’.\(^{160}\) In response the Galway county manager issued a directive that children should not be hired out until they were 16 years, ‘and that children so boarded-out be sent to a continuation school at 14 or 15 years of age’. The department’s inspector noted that 30 children in the counties that she inspected had been placed in employment during the past year, but none was under 16 years, except in Galway, where ‘many children were still placed for very inadequate wages when they reached the age of 16…and given to understand that they cannot change their place of employment nor ask for higher wages until they reach the age of 18’. The department’s inspectors were

\(^{159}\) Department of Health, RM/ARC/0/489311.

\(^{160}\) Department of Health INACT/INA/0/442719
determined that these young people should be made aware of their rights: former boarded-out children going into employment should have it explained ‘in the presence of their foster parents’ that at the age of 16 they were ‘free to choose their employment and state their wage demands without interference. Wages should be exclusive of clothing…If they wish to remain on in their foster parent’s home without payment of wages no obstacle should be placed in their path but the decision is entirely one for the children themselves’.

11.98 In 1960 one woman wrote to Miss Clandillon about her former foster son, who had been hired out by the local authority as a farm labourer. She claimed that he was ‘badly treated’; he was milking six cows every day, cleaning out from 16 cows and four calves; giving them hay and delivering milk in town twice a day to 40 people - all for the promise of 10s a week which had not yet been paid. She had rescued him from his employer - who was a woman; ‘the door was slammed [sic] in my face’; his employer had refused to permit him to return to his foster home, and she kept all his clothes, and later refused to give them to the local sergeant. She told Miss Clandillon that it has cost her £6 to rescue her foster son. Miss Clandillon once arrived at a foster home ‘to find a car drawn up outside and a teenage girl being escorted to it’. The foster parents explained that the girl was being removed ‘against their wishes to work as a domestic, at an extremely low wage, for relatives of a local official who had a family of small children’. She arranged for her to be returned to her foster home. Some children of small farmers/agricultural labourers probably suffered similar exploitation, but they had a parent(s) who might come to their assistance.

School attendance

11.99 The question of school attendance crops up in many inspection reports and they are revealing about attitudes towards foster children. Foster homes were often chosen by the assistance officers, with a view to keeping up the number of children on a school roll. Mary Murray reported that in Donegal a teacher had on occasion canvassed households ‘in order to have them take in boarded-out children with a view to keeping up the average of his school’. One woman living near Ballinasloe informed the department that the local assistance officer had removed a child from foster parents and placed her with a family in another area in order to

‘make up the average for his wife’, who was a teacher in the local national school. These were not isolated cases. The first half of the twentieth century was a time of falling population, with high emigration and a very low marriage rate; the numbers of school-age children were falling in many school districts, and schools were at risk of closing or losing a teacher. In 1939 Miss Litster reported that

There is a decided tendency in Co. Galway to board-out children in certain districts on account of a falling school average without due regard for the suitability of the home or the welfare of the child. School averages are not the concern of the Homes and Home Assistance Committee and no child should be sacrificed in order to raise or maintain them. Foster parents should not be compelled to send children who are under school age, long distances in winter to maintain the average in the school.

11.100 She noted that foster parents were ‘ignorant of the law and have no weapon to combat the pressure upon them’. Miss Litster claimed that parish priests often asked for foster children to be placed in their district to maintain school enrolment, but ‘in such cases, they invariably want children already of school-going age’.

11.101 Local authorities were required to provide foster children with school books, pens, pencils and other requisites, but there is evidence that this did not always happen, and some children were humiliated at school by teachers because they lacked school requisites - but this also happened to children from poor families. A boarded out child in Cork was not allowed by his foster parent to join his classmates on a school educational tour; the inspector arranged in future the health authority should be informed about upcoming school trips and would pay the cost.

11.102 Foster parents were required to report absences from school to the local authority; the local officials who were responsible for boarded out children were required to monitor school attendance, though many failed to do this. Children were frequently kept from school to help with farm work or domestic work. When Miss Clandillon called to one midland house in December 1960 to inspect a child, she found her at home from school picking potatoes, with ‘some of the foster mother’s twelve

168 Department of Health, 489373
children'. When she checked with the school she discovered that this 13-year-old girl had only been at school for three days since September and had missed six weeks of school in the previous spring. When an inspector visited a foster home in Clare in the early 1950s she discovered that the boy was off school helping at a threshing, though many rural children would have done likewise. In 1956 one 15-year-old boy was absent from school and working on the farm; his foster mother objected to the fact that he was still at school. A 13-year old was also absent from school and working on the farm; a ten-year old was on the bog. Another boy’s foster parents were on holidays; he was left in the care of their shop assistant. A foster child in Donegal was marked as present on the school roll when the inspector called, but she was absent, ‘having been allowed to return home in the forenoon at the request of her foster parent’.

One of the most positive features of government policy relating to boarded out children was the commitment to maintaining them in full-time education. A 1944/45 report on boarded-out children stated that in the northern half of Ireland:

- Sligo was the one bright spot in educational matters…
- There is a tradition in this county that talented boarded-out children should get every opportunity to continue their education beyond the primary stage and become independent. The present Co. Manager has very laudably adopted this policy and a number of the children are now attending continuation and technical schools. Some of the older children have secured good positions as a result of this enlightened policy.

More than a decade before the introduction of free second-level education, and at a time when compulsory schooling ended at the age of 14, the Health Act 1953 contained a provision removing the upper age limit for supporting boarded out children if they were in full-time education. The department’s inspectors tried to persuade foster parents and local authorities to keep children in school; children who were faring well in national school were encouraged to compete for scholarships that would enable them to attend a secondary school; the department inspectors demanded that local authorities supply them with bicycles to enable them to travel to a nearby vocational or secondary school. The local authority was expected to pay any school fees and cover the cost of books. Inspectors advised

foster parents about future careers and discussed these with teenage foster children. At this point the practice of boarding out children in rural areas became a disadvantage. An inspection report on foster homes in Waterford recommended that more children should be placed in foster homes in the towns, where the children would have the benefit of modern amenities in the home and opportunities for post-primary education.\textsuperscript{173}

11.105 This commitment to post-primary education was often thwarted by foster parents, local officials, and occasionally by a national teacher. Some assistance officers failed to provide bicycles; one foster child in Donegal had to walk five miles each way to vocational school on an exposed mountain road.\textsuperscript{174} A 1947 report on children in Galway noted that the number ‘accorded the benefit of vocational education is negligible’; many boarded out children over the age of 14 remained in national schools, in order to keep up the numbers on the school rolls. In 1949 Miss Clandillon complained that girls who had been in foster care were automatically sent to service positions. She suggested that ‘there are undoubtedly some children who have shown intelligence and ability’, who should be given a chance of extending their schooling. She could only discover one case in Limerick of a foster child (a boy) who had been sent to the local technical school.\textsuperscript{175}

11.106 Mary Murray reported that foster parents and national school teachers in Donegal were reluctant to encourage the transfer of children to vocational schools when they reached the age of 14 years. This means that intelligent children frequently waste the years between 14 and 16 at a national school. The reluctance of foster parents is due to a belief that the children will be less useful to them if they were attending a vocational school; and the attitude of teachers is probably determined by the school average.

11.107 One foster mother was not in favour of an ‘intelligent’ boy going to the vocational school, ‘as he was so useful to her on the farm’. Two girls described as ‘above-average’ were ‘wasting their time’ still in a national school two years after passing the primary certificate which was generally regarded as a terminal examination for primary schools because, yet again, the foster mother did not want them to attend

\textsuperscript{173} Department of Health INACT-INA-O 475224
\textsuperscript{174} Department of Health 489373
\textsuperscript{175} Department of Health 489431
a vocational school. The inspector also noted that foster parents in one district complained that boarded-out children were treated very harshly by the local teacher ‘and this was confirmed by the children themselves. The situation is not even hinted at in Assistance Officer […]’s reports although foster parents stated they had brought the matter to her notice on several occasions’. Two years later in 1956 she reported that matters had come to a head when two boys refused to attend that particular school and the assistance officer had sided with the teacher. She also reported about the case of one 14-year-old boy, by far the biggest boy at the National School. The teacher however has not recommended him for a vocational school, as a punishment for being disobedient during the year! The boy denies this and says that the teacher has always been ‘down on him’ which I believe is correct. Even if the teacher’s accusation were true it is not a valid reason for depriving this boy of vocational education.\(^1\)

However in 1956 the headmaster of a vocational school urged the local authority to permit one boarded-out girl who was attending his school to continue her education.\(^2\)

11.108 Miss Clandillon wanted all children to transfer automatically to a vocational school when they reached their fourteenth birthday, unless there was a ‘well authenticated reason’ for not doing so. In the 1950s one or two years of post-primary schooling enhanced a young person’s career options significantly; they could train as a nurse in England, secure an apprenticeship leading to skilled employment with state agencies, such as Bord na Mona or the ESB, and secure scholarships to CERT - the training agency for hotels, restaurants and tourism. By the early 1960s foster children were attending residential summer Irish courses; several had secured scholarships enabling them to become boarders in convenant secondary schools or diocesan colleges; a number of teenage boys were awarded scholarships enabling them to attend a residential course in an agricultural college, which would qualify them for a variety of jobs. The inspectors encouraged families to be ambitious for their foster children, and pressed local authorities to provide the money to enable them to attend summer Irish courses. This broadly positive story must be qualified; records also show delays in remunerating foster parents for school books or bus fares to school and other shortcomings. Westmeath county council was paying the cost of boarding school for one boy; other local authorities gave financial support to

\(^1\) [Department of Health 489373]

\(^2\) [Department of Health, INACT/INA/0/434202]
boys who entered seminaries - one in England. However Westmeath had sent some teenage foster children to a rehabilitation centre where they worked in gardening/horticulture, despite the absence of evidence that they had special needs. The department’s inspector determined that they should not be in this institution.\textsuperscript{178}

11.109 In 1965, of the 728 boys and 542 girls boarded out by local authorities, 224 were attending vocational schools, 69 attended secondary schools, two were at university; 13 attended other educational institutions, such as an art college or agricultural college.\textsuperscript{179} These statistics predate the introduction of free second-level schooling, school transport (1967), and grants for attending third-level institutions (1968). There were increasing reports from the department’s inspectors of foster children who were sitting their intermediate certificate, taking jobs in the factories that were opening in many provincial towns; some joined the army and a number of girls who had been boarded out trained as children’s nurses in Temple Hill, where they would have looked after children who were being placed for adoption. One of the last reports compiled by Miss Clandillon concerns a foster child who was attending a course in one of the new regional technical colleges; he failed his exams and was in danger of being excluded from the college; she interceded with the college authorities on his behalf.\textsuperscript{180}

11.110 Local authorities were not always sympathetic to the inspectors’ ambition to keep foster children in school. Some boys and girls – often those deemed to be smart - were removed from school by the local authority and placed as servants or farm labourers. In 1967 Miss Clandillon reported that

A teenage girl attending vocational school was prevented from sitting for the Group Certificate [a terminal examination for students at a vocational school] and was placed as a maid, through the efforts of one of her teachers, with this lady’s nephew and his wife who had eleven children.

11.111 Miss Clandillon removed her from this home, but the girl failed to complete her vocational schooling. She also reported a case where another girl, who had not completed her education, was being sent as a domestic servant ‘for an influential family in the county who had applied to the health authority for a maid!’ She

succeeded in keeping this particular girl at school, but another foster child was removed from school and sent to work for this family. Although the second girl left and returned to her foster mother ‘her education had lapsed’. The family where she was working as a domestic servant had suggested that she attend night classes.\textsuperscript{181}

**Children at Nurse**

11.112 In March 1945 there were 2,494 nursed-out children, and 2,351 children boarded out by local authorities. There are many similarities between the stories of children at nurse and boarded out children and there are some important differences. While both were subject to inspection and oversight by local authorities the monitoring of children at nurse was less thorough and it ceased at the age of nine. Many women who took children at nurse failed to register with the public assistance authority. They denied that they were receiving a financial payment for a child who was living in their home, in order to avoid inspection and registration. The *Children Act* 1934 sought to address this by presuming that any ‘illegitimate’ child who was placed with someone who was not a close family member had been placed ‘for reward’. The DLGPH inspectors frequently remarked on the small number of children at nurse who were registered in a particular county; they invariably assumed that the reported figure in such cases was an underestimate. In 1931 Miss Fitzgerald-Kenney asked Tipperary North Board of Health and Public Assistance whether the *Children Act* 1908 was enforced in their district, because the most recent returns did not record any nursed-out children. They informed her that the Act was not enforced.\textsuperscript{182} Tipperary North was not the only negligent local authority, and the position appears to have deteriorated in later years. In 1941 South Cork board of public assistance contacted the department to express their concerns about the failure to register children at nurse. They commented that ‘Persons who agree to accept such children from Bessboro or from the Catholic Women’s Aid Society are often of a class that it is very difficult to bring home their responsibilities to’.\textsuperscript{183} In 1939 the department noted that the number of children at nurse registered in Cork South (which included the city) had risen from 80 to 378 following the appointment of an infant life protection visitor whose sole job was carrying out inspections under the *Children Acts* i.e. children at nurse.\textsuperscript{184}

11.113 In 1943 the DLGPH were clear that the provisions of the *Children Act 1934* were widely evaded. They noted that ‘illegal traffic in children in Dublin has been detected by the more vigilant [sic] attitude adopted since the Commissioners were appointed’ and public examples have been made of some persons connected with it who were prosecuted in the Courts’.\(^{185}\) Two years later, Mary Murray, who was responsible for the northern half of the country, noted that

With the exception of Co Dublin the Children’s Acts are very indifferently administered in my area. Local authorities take their obligations in this connection lightly, and make little or no effort to ensure that the provisions of the Acts are put into operation. Advertising is haphazard and irregular, and usually lapses altogether in the interval between annual inspections. Prosecutions are extremely rare, and the fines imposed, usually 1/-are more of an encouragement than a prevention. In no county apart from Dublin, is 48 hours prior notice insisted on, and this means that many unsuitable homes must be tolerated.\(^{186}\)

11.114 She described the register of children at nurse in Westmeath as ‘a masterpiece of confusion’, despite the fact that she had taken time several years earlier to compile an up-to-date register of names.\(^{187}\) There were only four nurse children registered in Offaly in 1945; the inspector concluded that the Act was not being observed in that county. Galway county council claimed that they had no children at nurse. In 1949 there were only four children on the register in Limerick city although a further 13 had been identified. Miss Clandillon reported ‘an extraordinary lack of interest in the welfare of nurse children in Limerick City’. Part of the difficulty there and indeed elsewhere was that ‘there are a number of charitable ladies who help in placing children at nurse usually in the most unsuitable homes and with a disregard for the registration’.\(^{188}\) Five children at nurse died in Co Limerick over the years 1948-51. In two cases there was no death certificate - the department’s inspector had previously recommended removing a child from one of these homes. One of the dead children had been placed at nurse for a lump sum of £100. Several of the children’s names remained on the register; nobody had informed the authorities that they had died and their deaths were not investigated. Nurse

children also died in Co Limerick in 1946 and 1947 and their deaths were not registered.\textsuperscript{189}

11.115 Many children at nurse were fostered in cities, whereas this was prohibited in the case of boarded out children until the 1950s. The women who took children at nurse were among the poorest in Irish society: widows, mothers of large families, perhaps with an invalid, tubercular, alcoholic or chronically-unemployed husband; single women whose sole means of support was home assistance. There were few opportunities for women in Irish cities and towns to earn an income, other than as a live-in domestic servant, a laundry woman or cleaner, so many women viewed nurse children as an essential source of income. In 1947 Miss Litster, in a lecture given to social science students, wrote that

\begin{quote}
The manner in which foster mothers are found by private persons is haphazard in the extreme. The person placing the child is generally its mother, although frequently persons who conduct a maternity home may undertake to find a foster home or to secure adoption for a child born in the maternity home.

Often enough, the mother has been known to carry the child from door to door, enquiring for a foster mother.
\end{quote}

11.116 She described a case in Cashel that ended up in court, where a foster mother who was registered to take three nurse children was found to have 11 in her home. ‘Five of the smaller babies from infancy to 4 years old were neglected and emaciated. This woman stated in Court that she had been pestered by women coming to her house at night begging her to take their babies.’\textsuperscript{190}

11.117 Although the homes where children were placed by charitable organisations were in theory vetted by these charities, there is no evidence that they were superior to private placements. The financial or personal needs of the foster mother appear to have ranked much higher, in decisions about placing a child, than the capacity of the foster parent to provide appropriate care and attention. The suitability of either the home or the person to care for a child was not necessarily a consideration.

11.118 Many unmarried mothers found it difficult to find the money to place their child at nurse. This is evident in the story of one woman who was in her thirties, who

\textsuperscript{189} Department of Health, RM/ARC/0/489717.  
\textsuperscript{190} Department of Health, ed006406/INACT/INACT/0/443909.
cared for an elderly blind aunt and uncle in rural Ireland. She became pregnant having been raped during the Irish Civil War. When she was several months pregnant she borrowed money, and stole from her aunt to go to Dublin, without any clear plan as to what to do. She eventually went to St Patrick’s Guild in Abbey Street, where Miss Cruice advised her to return home until the baby was due. The baby was born in Holles Street. When he was nine days old the mother brought him to St Patrick’s Guild. It would appear that Miss Cruice had not explained (or perhaps the mother had failed to grasp the fact) that she would have to pay 25s a month to place her child at nurse with St Patrick’s Guild. For £20 Miss Cruice would ‘take the Baby completely off my hands’. She managed to keep up payments for nine months, often by taking the money from her aunt and uncle’s pensions. In despair she wrote to the Archbishop of Dublin, Doctor Byrne, asking for his assistance, and threatening that otherwise she should ‘have to ask some Protestant charity to take it [her son]’. Having checked her story by writing to the Franciscan Friar in whom she had confided, the archbishop sent her a cheque for £20.191

11.119 Foster mothers taking children at nurse were in a more precarious financial position than women who fostered children that were placed by the local authority. Children boarded out by local authorities were supported until they reached the age of 16, and sometimes longer; the foster parents received regular payments. Payments for children at nurse generally ceased by the age of five or six years, if not earlier, and many nurse children were placed for a fixed sum. For this reason nurse children were probably at greater risk of being sent to an industrial school or another institution.

11.120 Mothers who made private arrangements to pay a weekly sum to the foster mother frequently ceased making payments after one or two years. Most foster parents were poor, and incapable of maintaining a child without some outside assistance so, when payments ceased, nurse children frequently ended up in a county home or an industrial school. In 1925 seven children nursed out by St Patrick’s Guild were admitted to the Dublin Union; the foster parents complained that they could not afford to maintain the child for the £5 ‘adoption’ fee that they were given.192 The Cork board of public assistance received applications from families who had

192 Dublin Union, minutes, 1 July 1925.
previously been paid to keep a nurse child, asking for payment from the public assistance authority to keep the child under its boarding out scheme. They sent instructions to the Cork Catholic Women’s Aid Society that children were not to be placed in households where the only income came from home assistance, because these foster parent(s) could not support a child once payments had ceased.

11.121 Children were placed at nurse in city-centre tenements in Cork, Limerick and Dublin, where households were grossly overcrowded; the only access to running water was often a tap in the yard, sanitary facilities were non-existent and the rear yard was often heavily littered and soiled. In February 1925 the clerk of the Dublin Union notified officers of several rescue societies that no children were to be placed in Corporation Buildings, Corporation Street, Gloucester Street (Upper & Lower), Gloucester Place (Upper & Lower), Railway Street, Waterford Street, or Foley Street because these streets had been condemned as unsuitable. This was the notorious ‘Monto’ prostitution area. Some weeks later the Dublin Union approved a list of women who were banned from taking any children at nurse in future; in at least one case the children had been placed by St Joseph’s Guild of Rescue.193

11.122 Many of these nurse children were neglected, even abused. An inquest on the death of one such child in 1921 returned a verdict of natural causes, although the doctor noted that his body had several bruises.194 The minutes of the Board of Guardians noted the outcome of a court of inquiry into the sudden death of a nurse child in a cottage in Glasnevin, which found that the cottage was ‘not suitable for “child farming” except on a more limited scale if at all’. At the next meeting the ladies committee reported that as the court had restricted this household to keeping two nurse children, two of the four children should be removed. This meeting also approved the prosecution of a woman in Dorset Street for failing to notify the Union that she was keeping two children at nurse. In 1922 the committee reported on the prosecution and conviction of a woman in Little Denmark Street for having five children who were not registered; she was fined £10 and ordered not to take any nurse children in future. The committee also reported that a woman who placed children at nurse had advised foster mothers to have the foster children baptised with her surname in order to avoid having to register them. The Dublin

193 Dublin Union, minutes, 26 Aug. 1925.
194 Dublin Union, minutes, 7 Sept. 1921.
Union warned that they would take action against this woman if they became aware of this happening in future.195 In 1923 the ladies committee determined that no children should be placed in future with a particular woman because several children had died while in her care. They also investigated the case of another nurse child aged five months, who was admitted to the Dublin Union in a neglected condition; they gave instructions that the child should not be returned to that home.196 Some of these children had been placed by Catholic priests. The ladies committee wrote to a priest at the Pro-Cathedral urging him not to place any children in future with a particular woman. Despite being banned from taking children for reward, she had recently been found with another child at nurse. The committee also followed up on instances where children placed by St Patrick’s Guild had not been registered with the local authority. This had some effect; in 1923 Miss Cruice informed them that she had been instructed by the DLGPH to register all children placed at nurse and was seeking forms to do this.

11.123 Miss Litster pressed for the Dublin board of guardians to be supplied with lists of all children placed by voluntary societies, but there was no legal power to require a voluntary society to provide this information. Responsibility for registering a child at nurse rested with the foster mother, not with the individual or the society that placed the child. There were occasional disputes between Miss Cruice of St Patrick’s Guild and the ladies committee over children being removed from foster homes. In one case Miss Cruice and her nurse were adamant that a particular woman provided good care, the committee pointed out that two children had recently died in this woman’s care; her house was ‘anything but clean’ and they regarded her as unsuitable to care for children. On another occasion Miss Cruice was censured for placing a child with a woman who lived in an underground kitchen with no natural light. The clerk of the Union was instructed to write to the Sisters of Charity Convent, Gardiner Street, stating that in future they were not to place children at nurse in any home until the Dublin Commissioner gave sanction that the home was suitable. A religious sister had recently placed a child with a woman in a cottage near the convent; this child died in St Ultan’s Hospital a few hours after admission.197 Another woman was prohibited from taking nurse children because several children had died while in her care. In 1924, the secretary of St John’s Ambulance wrote to the Union stating that a widow with no

means of support was caring for a nurse child; the ladies committee was concerned that the child was not properly treated.\textsuperscript{198}

11.124 Many children were placed at nurse for a single payment. Such arrangements were widely condemned, on the basis that it was in a nurse mother’s interests not to keep the child alive; if the baby died she could take another child. But the practice was not illegal. There is no indication that consideration was ever given to banning this practice, and it continued until the 1950s. In 1947 Mary Murray noted that of the 25 children at nurse, registered in Westmeath, ‘more than half are in Athlone, and practically all are “lump sum” adoption cases, the majority from Manor House’ (Castlepollard); many were fostered by the wives of army privates and corporals. The foster mother received a sum ranging from £50 to £70 for each child.\textsuperscript{199} In 1949, while carrying out an inspection in Co Roscommon, Miss Murray found that a named NSPCC inspector had placed four children at nurse ‘in consideration of lump sums ranging from £40 to £75’. The foster parents of one of these children - a girl, who was later deemed to be ‘mentally defective’ - sent her to the county home when she was 18 months old.\textsuperscript{200} In 1951 a child was placed at nurse in Offaly for a lump sum of £100, in a home that contained a family of seven children.\textsuperscript{201} A Limerick woman who had taken a child in 1946 for a sum of £100 was told by the religious sister, who had presumably placed him with her that she would have to return the money, when he was admitted to hospital. He had been with her for almost two years and he appears to have suffered from a serious medical condition.\textsuperscript{202}

11.125 Mary Murray reported on one case in Westmeath, where the foster mother had received a lump sum of £100 for taking a child. ‘When it was spent she neglected the child knowing that the local authority would be obliged to remove him, and she would be relieved of all further responsibility.’\textsuperscript{203} Several nurse children in Co Limerick were removed at an early stage and sent to industrial schools. The inspector reported that one woman had already sent two children to industrial schools and ‘She told me in the boy’s hearing she was thinking of sending […]’. She apparently uses this threat frequently.\textsuperscript{204}

11.126 Some children were placed at nurse in homes where they had a poor prospect of surviving. In 1949 a father removed his daughter and her two-week old child from the county home in Killarney where she had given birth. The matron reported that he refused to give any information as to what would happen to the child. The infant was placed in ‘a wretched home’ in the town, and was readmitted to the county home 12 days later, and died the following day. The coroner determined that the infant had died of neglect.\(^{205}\) In 1951 an inspection was carried out of the Dunscombe home, a private nursing home in Cork city run by an elderly woman and her daughter. It contained four ‘illegitimate’ babies, without their mothers, three had been born to private patients in Bessborough, the fourth was born in this nursing home. The mothers had brought their infants to the Dunscombe home on the day that they left Bessborough. All three children were neglected, with scalded buttocks. The fourth child, aged two and a half years, was described ‘a pale, gentle, listless little girl who has no playmates and gets no fresh air’. The inspection gave details of a further four children, who had been in this home but were not placed at nurse or ‘adopted’. Five babies born in Bessborough had died in Dunscombe Home, two of marasmus. In one case no cause of death was registered. The proprietor’s mother, who carried out most of the work, was described as showing no interest in the children. The local authority had not been notified that these children were in the nursing home, contrary to the terms of the Children Acts, and the owner had denied keeping infants without their mothers. All of these babies, including those who died, were examined by Dr Sutton in Bessborough and certified as fit before they left. In this instance all barring one of the Bessborough babies who died were the children of private patients (see Chapter 18).

11.127 The department had few sanctions against this negligent nursing home; the offence of not registering the children was only a misdemeanour. When the proprietor’s daughter agreed to comply with the law in future the Cork city manager agreed not to institute proceedings.\(^{206}\) There was a similar outcome in another private nursing home in Dublin, which was also run by a mother and daughter. This home survived despite a number of convictions.\(^{207}\) It proved difficult to monitor the treatment of children at nurse: the Catholic Bishop of Cork refused to

give the authorities details of babies born to private patients, and the Kerry county home had no authority to know where the father who removed his daughter and her infant planned to place the child. Some women who took children at nurse claimed that they were not being paid, which, if true, would exempt them from the requirement to register under the *Children Acts*.

11.128 Nurse children were often moved from house to house, without informing the local authority, in defiance of the law. An inspection in Roscommon noted that ‘A number of unmarried mothers leave the County Home each year taking their children with them. It is probable that some of these children are subsequently placed at nurse but none of the children registered so far come from this source’. One nurse child, who was born in Bessborough, and placed at nurse in Limerick shortly after birth by the Cork Catholic Women’s Aid Society, was not on the register. Evasion of the regulations was all too easy - and it often happened with the connivance of the local authorities. In 1946 Mary Murray reported that a nurse child had died in Mayo. She had previously condemned this home and recommended that the child should be removed, but nothing happened; ‘the AO had not visited the home for almost a year prior to my inspection’.

11.129 Inspectors removed some nurse children from homes that were obviously unsuitable, only to find that there were new nurse children in these homes on their next visit! In 1949 one home in Limerick city with three nurse children (not all registered) consisted of a kitchen, two small bedrooms and an attic; it was home to 11 people. One nurse child shared a bed with a nurse child who suffered from TB of the abdomen, and these boys shared a small attic room with a married daughter of the foster mother and her two young children. Another child was placed in a condemned house with a couple aged 65 and 75 respectively and shared their bed. Miss Clandillon reported ‘evidence of lack of hygienic habits in the spittle on the floor’. The child had lived there for six years, but had never been inspected. Another nurse child in Co Limerick, who was visited in 1944 was ‘in a dirty condition and covered with sores, and appeared to be undernourished’. The house also contained, contrary to regulations, two boarded-out children who were ‘badly clad and dirty’.

11.130 In 1941 Miss Litster drafted a note for DLGPH Secretary John Garvin setting out the position with respect to children at nurse:

The general procedure with regard to the placing at nurse of infants born to private patients in the Sacred Heart Home, Bessboro is that either (a) the Cork Catholic Women’s Aid Society agrees to take over the child on payment of a lump sum of £70 in advance by the mother, relative, putative father or other interested party or (b) the Bessboro Community finds a foster mother and either pays over a lump sum or makes periodic payment. In either case the foster mother is required finally to ‘adopt’ the child. As there is no machinery for legalised adoption, the obligation of the mother to maintain her child is not removed by any document which the foster-mother might sign.212

11.131 Charitable societies appear to have operated a lax regime when placing children at nurse or for informal ‘adoption’. The inspectors noted that:

Some of the Boarding-out Societies in Dublin make a practice of sending children for ‘adoption’ to various parts of the country. They make no enquiries of the local authority beforehand as to the economic circumstances of the applicants, the only reference necessary being one from the Parish Priest. This procedure is extremely unsatisfactory as many of the foster parents are in very poor circumstances and are occasionally in receipt of Home Assistance. Local authorities very naturally resent the action of these Societies, but they do not appear to have any redress, as the Societies contend that no fee or reward has been paid or promised to the foster parent, and that therefore the children are not subject to registration or liable to inspection.213

11.132 Bethany Home (see Chapter 22) placed children at nurse on the basis of a reference from a local clergyman. Some charitable societies employed inspectors; others did not. Inspecting children placed at a distance would have proved expensive and was probably often not done. Protestant children were placed at nurse in Monaghan, Wicklow, Tipperary and Carlow in areas with numbers of Protestant small farmers who were willing to take foster children. Mrs Keating, proprietor of St Rita’s Nursing Home in Ranelagh, was reported to be placing children in Wicklow in unsuitable homes. In the 1940s children were placed in Roscommon by St Patrick’s Guild, and by Manor House, Castlepollard. The

212 Department of Health, CCP/IMP/0/45492.
213 Department of Health 489391
majority of nurse children registered in Donegal in 1947 were placed by St Patrick’s Guild; others were placed by the CPRSI, the Rotunda Girls’ Aid Society, Mater Dei Hostel Belfast, and Nazareth House. It is difficult to determine how these foster homes were selected; many were unsuitable. Some of the descriptions are grim - abusive foster mothers, overcrowded homes and acute poverty. In 1947 one Donegal nurse child ‘appeared to have rickets’. Arguably the worst description of a child at nurse was that of a boy, in Mayo in 1946, who had been placed by the Rotunda Girls’ Aid Society. The inspector described the home as ‘easily the most wretched that I have ever visited. There is only one room in use, which appears to be shared with the farm animals, no furniture except a bed, and the whole structure in wretched repair’. The foster parent ‘stated that he had applied for some assistance and had been refused’. The inspector ‘had no opportunity of examining the boy who disappeared when he saw a stranger approaching the home’. The assistance officer dismissed this report. He claimed that when he visited ‘there were no signs of cattle being kept therein’; the boy slept in the kitchen with the male foster parent; the man’s wife slept in an adjoining room (though Miss Murray described only one room). The outcome of this inspection did not necessarily improve the boy’s welfare; the priest in charge of the Rotunda Girls’ Aid Society proposed to move the boy to ‘a suitable school’, presumably an industrial school.

11.133 The CPRSI was the largest agency placing children at nurse. In the half year ending December 1943 it maintained 399 children; 200 of the children were eligible for grants under the Maternity and Child Welfare scheme. Some were the children of married women, who were ill, widowed or otherwise incapable of caring for their child, perhaps for a temporary period. Miss Litster was highly critical of the fact that placing children at nurse was ‘frequently a stepping stone to committal to an industrial school’. Young children were removed ‘from the only home and parents he has ever known’ and ‘the nurse mother los[ing] a child to which she has probably become attached’. Government subsidies to charitable societies in receipt of money under the Maternity and Child Welfare scheme ceased when a nurse child reached the age of five years and the societies generally ceased to make any payment to the foster home. Unless the foster parent(s) agreed to ‘adopt’ the child - they were usually offered a modest lump sum if they did so - the

216 Department of Health, RM/ARC/0/489773
217 Department of Health RM/ARC/O/489773
children were brought before the court for committal to an industrial school. Patrick Touher was placed at nurse in Sandyford - which was then a rural area - by St Brigid’s orphanage in Eccles Street; his mother had died and his father had vanished; the parents appear to have been married. His account suggests that he was happy in his foster home, attending the local school and playing with pals who were also foster children. He described the older daughter in his foster home as ‘just like a loving big sister to me’. In 1950 when he was seven he was taken to a nearby courthouse, where it was determined that he should be sent to Artane industrial school. As there was no industrial school for Protestant children, children placed at nurse through Protestant charities such as the Irish Church Missions and the Protestant Nursery and Rescue Society were sent to Protestant orphanages such as Emmanuel Home, Marfield House, the Cottage Home Dun Laoghaire and the Children’s Fold. The Department of Health emphasised that ‘These are charitably maintained and although there may be doubt as to legality of inspection in view of the words “for reward” in the Act, they have submitted to inspection under the Children’s Acts and the homes have been found to be generally well run’. St. Brigid’s Nursery and the Sacred Heart Home Drumcondra - two Catholic institutions, were unwilling to submit to inspection, and Emmanuel Home won a legal case to prevent inspection.

11.134 In 1943 the CPRSI agreed to continue to maintain children, whom it had placed at nurse, beyond their fifth birthday. It seems likely that the society absorbed the additional cost. In 1948 the director of the Kirwan House - the official name was the Female Orphan House - wrote to Dr Noel Browne, Minister for Health, complaining that the charity was finding it increasingly difficult to cover its costs. This was a time of high inflation, and while they received a government grant for children up to the age of five under the Maternity and Child Welfare scheme, they received no support for children over that age, and they asked that this should be reconsidered. Almost a year later Fr Barrett, director of the CPRSI, wrote a similar letter on behalf of several Catholic voluntary societies - in addition to the CPRSI he listed the Rotunda Girls’ Aid Society; Holles Street Girls’ Aid Society, and St Patrick’s Guild, requesting that the government subsidy be extended to cover children at nurse up to the age of 16 - i.e. making them comparable with boarded out children. He asked ‘what is supposed to happen when a child turns five years old. Does the

219 There is further information about these organisations in Chapters 22 and 23.

State envisage they should be transferred from the foster home to an industrial school?’ He argued that it was ‘not in the best interests of such children to send them to institutions or have them committed to Industrial Schools’. He claimed that the societies only took that decision ‘with great reluctance and only as a last resort’. They tried to persuade foster families to ‘adopt’ children before their fifth birthday, but that was not always possible - some children were unsuitable ‘for one reason or another’; some were ‘somewhat backward with an intelligence quotient below average; others are unsuitable for adoption because of bad parental history or because they are delicate or the mother will not give her consent’. These references to ‘adoption’ are several years before the introduction of legal adoption. Fr Barrett claimed that parents rarely contributed towards the support of a child aged over five. The Department of Health official who reviewed this application conceded that restricting government grants to children under five years was a purely arbitrary decision, but he then took refuge in the demarcation lines between government departments. He claimed that contributing towards the cost of maintaining children at nurse should be a matter for the Department of Social Welfare. The Department of Health’s reply to Fr Barrett complimented the societies on their work but emphasised that ‘it is difficult to maintain that they should be regarded as ministering to the health of their charges rather than to their social and moral welfare’. There is no indication that any consideration was given to extending the state subsidy to enable charitable societies to support children at nurse until they reached the age of 16; the failure to do so resulted in many children at nurse being sent to industrial schools.

The register of children at nurse kept by the Dublin board of assistance recorded the names of 816 children in September 1951. Many had been placed by the CPRSI and other well-known charities. They were concentrated in areas with local authority housing: Ringsend, Mountpleasant Buildings, Cork Street, Oliver Bond House, York Street, Dorset Street and Sean McDermott Street. A growing number of children at nurse were living in the newer local authority housing in Crumlin, Ballyfermot, Cabra and Finglas. There were a total of 16 foster children on Galtymore Road Drimnagh in 1951; nearby roads had similar large concentrations of children at nurse. The living conditions for nurse children and for working-class households improved significantly in the late 1940s and 1950s, with the

222 National Archives Ireland, HLTH/A/128/429
223 Department of Health, RM/INA/0/489392.
provision of modern local authority houses, which had running water, toilets and (in a majority of cases) bathrooms, and a greater number of bedrooms.

11.136 With the introduction of legal adoption in the 1950s, boarding out increasingly became a short-term arrangement, prior to adoption. However in 1960 an inspector reported that there were only 12 boarded out children on the register in Limerick city but 55 nurse children. She suggested that these numbers meant that the local authority was shirking its responsibilities. ‘The wide difference between these figures reflects little credit on those responsible for the care of deprived children in this area up to the present, indicating as it does that most unmarried mothers are left to make what arrangement they can for their children’. Many mothers disappeared having left children with foster mothers, who received no further money. She noted that ‘It is to the credit of the foster mothers that few have requested the removal of children to industrial schools’. In one case where a mother was working in the laundry of the Limerick City Home and paying for her child at nurse, Miss Clandillon recommended that he be boarded out, relieving her of the cost.224

Adoption (see chapter 32 for more complete discussion)

11.137 Adoption brought about major changes with respect to boarding out and children at nurse. Charities that had previously placed children at nurse were now concentrating on adoption. Adoption also had a major impact on boarding out by local authorities. Couples wishing to adopt a child often saw fostering as a first step. The inspection reports describe many cases of couples who wished to adopt their foster child, and successfully doing so. In 1956 an inspector, visiting Donegal, reported that ‘a large percentage of the placings [of children at nurse] have been de facto adoptions, which were legalised when the Act came into force’.225 The high proportion of boarded out children or children at nurse who were formally adopted indicates that many foster children were cherished by their foster family and this evidence qualifies some of the bleaker material presented in this chapter. However an inspector noted that parents who had taken children at nurse from Castlepollard and now wished to legally adopt the child faced difficulties because the child had been placed through intermediaries and the adoptive parents did not know the name of the child’s mother or how to contact her.226 The

224 Department of Health, RM/ARC/O/489717
225 Department of Health, INACT/A/O/434322
226 Department of Health, INACT/INA/O/476180
transition from boarding out to adoption presented difficulties for some foster parents. Couples who had fostered a child for many years were threatened with the loss of the maintenance payments if they adopted their foster child. Section 55 (9) of the Health Act 1953 permitted local authorities to continue to pay the fostering allowances in such cases, but many foster parents were not aware of that possibility until the department’s inspectors informed them, and the payment was made at the discretion of the local authority. It also presented some difficulties - should that house and the child continue to be subject to inspection despite having been adopted? Former foster parents who had adopted a child resented the continuing inspections, which did not apply to other adoptive parents. In 1968 the parents of 247 former foster children who had been adopted were in receipt of boarding out allowances. The age restrictions in the Adoption Act 1952 also presented difficulties; children could not be adopted after the age of seven - which effectively meant that it was almost impossible for foster parents to adopt children who had been in Tuam (because they were boarded out at a late age). The requirement that adoptive parents should be within a certain age bracket also presented difficulties. There were cases when it proved impossible to comply with both regulations - the adoptive mother only becoming old enough to adopt when the child was already aged over seven, and other cases where the foster parents were too old to adopt.

11.138 Adoption appears to have been welcomed by the local authorities; it relieved them of the cost of boarding out, and responsibility for inspection. When the Department of Health carried out a review of services under the Children Acts and the Health Act 1953 in the late 1960s, an inspector of boarded-out children commented that

In very many cases health authorities favour legal adoption as the best solution to the placement of children. No guidelines have been given to health authorities as to when the mother should be advised to place her child for adoption or when the child should be boarded out...As far as health authorities are concerned adoption would, in general be the most satisfactory course (if regard is not had to the over-riding needs of the parents and the child), as it obviates the need for continuous supervision of the child and with the termination in many cases of the boarded-out allowance or cost of institutional maintenance, is a financial saving to the authority.

---

227 Department of Health, CCL/INA/O/523143
11.139 This memorandum reported that, following a recent inspection of the Dublin Health Authority scheme, the inspector reported that ‘undue pressure is being brought’ to bear on mothers to place their children for adoption; many mothers were not aware of alternatives. 228

11.140 In 1969, a total of 1,005 children were boarded out by local authorities, compared with 1,861 in 1959. In 1971 responsibility for health and welfare services passed from the local authorities to the regional health boards. By then the children of unmarried mothers no longer constituted the majority of these children.

Conclusions

11.141 The Commission has had limited access to the voices of foster children or children placed at nurse; what is known of their circumstances in the early or mid-twentieth century comes mainly from the reports of the inspectors of boarded-out children. There are very few insights into the emotional and psychological problems that these children faced; the prejudice shown towards them by class-mates, teachers, priests or the affection or lack of affection displayed by foster parents. The only evidence of concern for their emotional circumstances comes from the inspectors of boarded out children - their preference for placing children in a family as young as possible; their belief that boarding out should be a permanent arrangement and their comments about the emotional cost when children were moved from one foster home to another. There is also very limited information available about the feelings of foster parents. Some foster children were occasionally violent, engaged in petty theft, and proved difficult to parent. Most foster parents had no support or advice from childcare professionals.

11.142 In contrast to the detailed statistics that the Commission has compiled on the women and children in mother and baby homes, the evidence relating to boarded out children and children at nurse is scant. Not all of these children were ‘illegitimate’; many were not born in mother and baby homes or county homes; it is impossible to disentangle those that specifically come within the remit of this Commission, however there is no reason to believe that the circumstances which they experienced, when boarded out or placed at nurse, differed from what is described here.

228 Department of Health, CCL/INA/O/S23143
11.143 Until the 1970s few of the children born to Irish unmarried mothers were raised by their mother or her family. The outcomes for these children included boarding out, being placed at nurse, or long-term care in an institution. By the late 1950s a majority were being placed for adoption. The Department of Health and its predecessor (the Department of Local Government and Public Health) consistently advocated the benefits of boarding out over institutional care, but they presented no evidence to support this assertion, and some of the experiences of children both at nurse or boarded out, especially in earlier years, were appalling. Although the care and oversight of children at nurse and boarded out children was tightly regulated by the DLGPH, later the Department of Health, these regulations were often poorly enforced by local authorities. Practice and attitudes varied between counties. Many local authorities failed to implement the requirements with regard to inspection, or ensuring that homes taking children at nurse were registered, and there was a serious lack of professional expertise in childcare. The fate of an individual child was at the mercy of her/his mother’s financial means, and the views of local authorities and local officials - an assistance officer, a county manager or the matron in a county home. They determined which children should be boarded out and in what family; which children should remain in a county home, and which children should be dispatched to an industrial school or another institution. Some of these decisions were undoubtedly arbitrary, made with little consideration for the best interests of the child.

11.144 This discordance between national and local government is only one aspect of a piecemeal approach. In Britain, the 1946 Curtis report resulted in all aspects of care for children who were not living with their family being placed under a single government ministry. At around this time Miss Litster recommended that the Children Acts should be revised to bring the guardianship of all children under the care of public authorities under a single government department and a single Act. That did not happen. In Ireland the industrial schools remained under the Department of Education, and there is little evidence of any co-ordination between that department and the Department of Health with respect to the care for these children. It is significant that the 1970 Kennedy report on the Reformatory and Industrial School system does not mention boarding out children. The women inspectors attached to the Department of Health displayed a consistent and

230 Department of Health, RM/ARC/0/489773.
admirable commitment to improving the welfare of foster children, but they had a limited impact on practice and policy. A comprehensive account of the outcomes for the children of unmarried mothers, who were not raised by their family, would require the integration of the histories of children in industrial schools (especially those sent at an early age to junior industrial schools); of boarded out children, of those placed at nurse, and those who were adopted.

Witness Statements

11.145 A small number of former residents of mother and baby homes, who gave evidence to the Commission, spoke about being boarded out by the local authority, or placed at nurse. Those who were boarded out by the local authorities were former residents of Tuam; those who were placed at nurse were former residents of Bethany and Denny House. Their statements support evidence in the reports by the department inspectors about the varying quality of foster care. They are of especial value when they describe their treatment at school, within the community and more subtle aspects of their treatment by a foster family. Several witnesses were placed in more than one foster home. Two witnesses were happy and well-cared for in their foster homes: ‘I was fortunate where I was reared’. One man who was placed in more than one foster home spoke warmly of a foster mother, but he was less positive about that woman’s husband. A man who was placed at nurse by the Protestant Nursery Society suggested that in one foster home the woman was cruel to him, whereas her husband appears to have been kinder. One man who was boarded out by the local authority with an elderly woman and her 50-year-old bachelor son ‘had a horrendous life there’ - he suffered physical abuse. However another former Tuam child was ‘well looked-after’ by a couple in their thirties who were unable to have children and wanted a family. Several witnesses described being required to carry out very heavy farm chores, before and after going to school, which left them with little time for homework and a poor attendance record: ‘our school work collapsed and we never recovered’. One man frequently left school early by agreement to carry out farm chores, having been marked present on the school roll. However another was moved to a different foster home because of his many absences from school. One man described himself, and another foster child, as ‘free child labour on the farm’. By contrast one man said that his foster parents ‘didn’t want a slave or a workman or anything like that’.
11.146 The witnesses cited some telling examples of discrimination. Two reported that they were never permitted to serve mass - which was something of a rite of passage for many school boys when they had made their first communion. One was forbidden by his foster family to visit neighbouring houses, though he claimed that the neighbours were ‘nice’. A man who was placed at nurse, with a Protestant family in Leinster, was sent to the local Catholic school with another foster child, despite the fact that they were being raised as Protestants and the children of that family had attended a Protestant school. He claimed that this family was ‘too socially embarrassed’ to send them to the Protestant school, though it should be noted that they would have had to be driven to and from that school. He said that he and other foster children were last in line when Christmas presents were given to local children, and they only received colouring pens, drawing paper and some sweets. In one foster home this man ate breakfast with the family, but he ate all the other meals, including Christmas dinner, separately in a ‘back kitchen’. One man described himself as ‘an outcast’. Several witnesses mention ill-treatment at school; left out of sports; physically abused ‘mainly by the other children’; ‘children picked on you all the time…the dreaded “B’ word”; taunted that their mother and father had not wanted them. When one man, who had been boarded out, was placed at hire on a large dairy farm where the work was long and hard, he suffered abuse from the farmer’s sons: they kicked him, they ‘ganged up on me’ and accused him of breaking objects that one or more of the family had damaged.
Chapter 12: Unmarried mothers and their children in the late Twentieth century: from the 1960s to 1998

12.1 The things they say

‘What did I do to deserve such a daughter’
‘It’s a fate worse than death’
‘If we had heard that you had cancer it would have been easier to accept’
‘Why didn’t you go to England?’
‘Of course your [sic] not going to keep the child’
‘Every child needs two parents’
‘You are thinking of yourself not of the child’
‘Your child will hate you when it’s eighteen’
‘Of course you never think of the family’
‘What about your poor mother’
‘Your child will be a bastard’
‘What about the neighbours’
‘Couldn’t you have it adopted?’
‘Have it adopted and you can come home’
‘But you’ll never get married if you keep the child’.¹

12.2 This chapter focuses on the years from the mid/late 1960s until the end of the 20th century. This was a time of major change in Irish society. Ireland ceased to be a country of late marriage, large families and a high rate of permanent celibacy. The 1973 Report of the Commission on the Status of Women recommended significant reforms relating to women’s work, legal status and welfare entitlements. In the 1970s the prohibition on married women working in the public service ended and women were given legal protection against being dismissed from their job because of their pregnancy.² Women in insurable employment became entitled to maternity leave in 1981.³ There was a sharp rise in the number of ‘illegitimate’ births and in the numbers of children being raised by single mothers. In 1973 unmarried mothers who decided to keep their children became eligible for social welfare payments. The number of adoptions, which was the outcome for most ‘illegitimate’ children born in the mid-late 1960s, fell steadily. In 1975, the number of adoptions

¹ Department of Health, RM/ARC/0/489397. No source or date is given for this document, but other material in this file relates to the late 1960s.
² Employment Equality Act 1977
was 57.4% of the number of ‘illegitimate’ births; in 1976 this fell to 43.4%; by 1980 the figure was 29.9%; in 1990 it was 8.5%. By the end of the 20th century almost no Irish babies were adopted outside their immediate family. Pregnant Irish women continued to travel to Britain, but from the 1970s, they were seeking abortions. Despite these changes, a substantial number of women continued to be admitted to mother and baby homes throughout the 1970s. In 1980, a total of 552 babies were born to women who were in mother and baby homes, which was higher than the 498 in 1950 or the 456 in 1960. The numbers only fall significantly in the 1980s, when mother and baby homes closed, down-sized or were replaced by flatlets and hostels, and these services tended to cater for women with particular needs.

12.3 Despite the absence of divorce until the late 1990s, Irish family structures underwent changes that were broadly similar to other western countries. A growing number of children were born outside marriage and were living in a single-parent family, most commonly with their mother; many children were living in households with a resident male who was not their father, and/or with siblings who had different fathers.

12.4 Hostility towards unmarried mothers waned; however the attitudes of parents, family and the community continued to impact on the decisions made by single mothers. By the 1970s the Catholic church was adopting a much more sympathetic attitude. This change was partly and perhaps primarily prompted by concerns over the high numbers of single Irish women having abortions in England where abortion laws were relaxed in 1967. Single mothers were no longer absent from the narrative; they wrote to the newspapers and they were interviewed by journalists. An Irish unmarried mother had greater choices and some financial resources to assist her in keeping her child. Social attitudes had mellowed, but many single mothers continued to experience poverty and personal difficulties that demanded new forms of support.

Unmarried mothers in literature and the media

12.5 “The maturity of any society can be gauged from its list of taboo subjects. One of these for many societies even today is ‘illegitimacy’. It is not something that is openly discussed, certainly not in Ireland.”

---

12.6 There are very few references to unmarried mothers in Irish media before the 1960s, and they are generally found in reports of local authority meetings, church sermons, court cases and fictional writings. (see Chapter 9). Irish society did not comment much in public about unmarried mothers or what happened to them or their children, though private commentary and condemnation may have been widespread. It is only in the 1960s, with the emergence of advice/problem pages in Sunday newspapers and women’s magazines and the development of investigative journalism, that more personal stories emerge. The 1960s constitute a watershed in terms of public information and public discussion about extra-marital pregnancy. Until that time unmarried mothers’ voices were almost completely absent, but they began to emerge in letters to advice columns, and occasionally in press articles. The growing number of articles may not have been accidental. Thane and Evans note that during the 1960s the British National Council for the Unmarried Mother and her Child ‘built up its media contacts including “with a group of reliable journalists”’. They list a series of newspapers and periodicals that were targeted; it includes the *Irish Times*.\(^5\)

12.7 Adoption was one of the first topics to bring unmarried motherhood into mainstream Irish media. A growing interest in Irish emigrants to England and their difficulties also focussed attention on unmarried mothers. PFIs had featured in regular communications between British and Irish churches, and officials from the 1930s onwards, but these communications were not generally known to the public. During the 1960s the Catholic Hierarchy held annual Easter conferences on emigration and the proceedings were reported in the newspapers. PFIs featured frequently in conference papers and discussion. Any investigation of the reasons why pregnant Irish women travelled to Britain raised questions about Irish attitudes towards pre-marital pregnancies, and conditions in mother and baby homes.\(^6\) In 1969, Reverend Vincent Buckley, director of missions to emigrants, claimed that ‘Many suffered from a persecution complex which they believed would be manifested by being read by the priests from the altar’, and ‘by being ostracised by parents and friends’.\(^7\) These emigrant conferences were one aspect of a growing interest by the Catholic church in contemporary social problems. The publication in 1966 of Tuairim’s pamphlet *Some of our children*, which investigated the number of Irish children in institutional care, and the increased publicity given to conditions

---

\(^6\) Daly, *The Slow Failure*, pp 296-305.

\(^7\) *Cork Examiner*, 11 April 1969.
in institutions such as Artane Industrial School, prompted questions about the identity of these children, and why they were in long-stay institutions. The Tuairim pamphlet was written by a group of Irish university graduates who were living and working in Britain.\(^8\) A new generation of Irish-published women's magazines provided an outlet for articles on topics relating to women and sexuality. Magazines and national newspapers published letters from women seeking advice on a range of personal matters, including extra-marital pregnancy. The letters and the responses of ‘agony aunts’ exposed readers to the reality of pregnancy outside marriage and the difficult choices faced by unmarried mothers.

**No Birthright**

12.8 In 1964 the *Irish Times* published seven articles by Michael Viney on the topic of unmarried mothers; the articles were subsequently published as a short book under the title *No Birthright. A study of the Irish unmarried mother and her child.* Viney opened with the story of Clare, who went to England on discovering that she was pregnant - the outcome of rape by her boyfriend, who was a foreign doctor. Clare kept her child, despite pressure from social workers in the London hospital to place him for adoption. She did not tell her parents about their grandson until he was several months old. They refused to permit her to bring her child home. Her mother was concerned about what the neighbours might think - ‘The neighbours had always ruled her view of things’. She said that they would have to move house if Clare was seen with her baby. Her father urged her to have her son adopted. Clare’s story highlighted parental attitudes. Viney also reported the case of a woman who wrote to a Catholic priest in London asking him to tell her daughter, who was a single mother, not to set foot in Ireland - ‘she has disgraced her family and her country’. English social workers reported that Irish girls were terrified of their parents knowing about their pregnancy - most went to England to keep it secret. A social worker in a London Catholic agency commented on the ‘fear’ of Irish pregnant women: their expectations of moral censure. Viney cited stories of Irish emigrant couples who, rather than face parental censure over a pre-nuptial conception, placed their child for adoption. Fr Munn of the Southwark Rescue Society suggested that greater publicity about pregnancies among single women might reduce the fear of scandal, and fears of damaging a family’s reputation.

---

12.9 These articles provided information about provisions for unmarried mothers, the role of social workers in Dublin maternity hospitals and the repatriation of ‘pregnant from Ireland’ (PFIs). The article on mother and baby homes said that the women were ‘protected by a benevolent conspiracy of unexpected thoroughness and ingenuity’; the Sisters helped women who did not wish family or friends to know of their pregnancy to keep it a secret. Viney suggested that the homes had an ‘unfavourable, out-of-date image…of a forbiddingly austere institution in which the unmarried mother is likely to be shut away for two years or more, doing useless work in the laundry at the bidding of censorious nuns’. Women fled to England, determined ‘not to be shut away for two-and-a-half years’; refusing to have their child ‘put out to slave labour on a farm’. He suggested that this was ‘an out-of-date impression’; the position had changed since the introduction of adoption and washing machines. The Mother Superior of one unnamed home claimed that ‘moral censure…is no part of our work. We’re here to help not lecture’. He described the accommodation as ‘furnished simply’ but ‘by no means Spartan’. The overall impression was of ‘a fairly good-class boarding school for girls’, and indeed the routine of early rising, morning mass, ending with time in the evening spent watching television, dancing or listening to the radio is similar to a boarding-school time-table at that time. Mothers whose children were placed for adoption might leave within eight weeks of giving birth, though a mother who ‘opts’ for an American adoption might have to remain for up to 15 months. Viney asked whether these mothers resented the ‘good fortune’ of mothers whose babies were taken by the CPRSI enabling them to leave at a much earlier date. He claimed that some mothers ‘do seem perfectly happy to stay in the sheltered, unexacting environment of the home for a year or more’; some might be ‘reluctant to return to the everyday stresses of life outside’, but he queried whether the boarding-school regime was appropriate for women who would be resuming ‘adult life’. He also commented, indirectly, on the absence of advice/counselling services asking ‘is guidance in spiritual terms alone sufficient to help them face up to life again?’

12.10 The final two articles dealt with adoption. He stated that the children of Irish unmarried mothers had a ‘four to one chance’ of being adopted. The fear of ‘what people will say’ was the most important factor deterring women from bringing their baby home. Working-class Dubliners were most likely to keep their babies and to tell their parents that they were pregnant. In the closing paragraph of the series he noted that
The legal machinery of good child care already exists in Ireland; it is in the implementation and practice of it that there are failures and omissions…public attitudes - not the law - are primarily responsible for a lot of unnecessary suffering…even from a non-religious, humanist point of view, the production of an ‘accidental child’ outside the security of marriage is socially irresponsible. But there is a world of difference between condoning conception outside marriage and treating the unmarried mother and her child in an un-Christian, inhumane way.

12.11 He again quoted the phrase ‘what will the neighbours say’, as ‘an expression of taboo… Many cruel things are being done in its name’.

An Triail

12.12 An Triail, or in English, On Trial, was a play by Máire Ní Ghráda, that was written as a court trial. It concerned a young, rather naïve woman from the west of Ireland who became pregnant by a local schoolteacher. She fled to Dublin, gave birth in a tenement and killed the baby. The summary of the play in the Field Day Women’s Writing, states that ‘secrecy, hypocrisy, prejudice and negligence are the real cause of the crimes’. An Triail was first produced in Irish in 1964, at the Dublin Theatre Festival; it ran for four weeks in Dublin’s Damer Theatre, before travelling around the country. President de Valera attended a production at the Cork Opera House. It returned to the Damer for a further run, and was produced on television in February 1965 attracting further plaudits. An English-language version opened in Dublin’s Eblana Theatre later that year. In those days, most Irish households could only receive one television channel, so the Sunday night broadcast would have reached a large audience. A review of the English language version in the Irish Independent, Ireland’s best-selling daily newspaper, noted that

In its terribly real reflection of individual attitudes, the play is undoubtedly the most eloquent indictment of society’s collective and unchristian cruelty towards the unmarried mother that has come out of this country. In its quiet and unsentimental compassion, it is also the most moving portrayal of a betrayed girl’s personal tragedy.10
12.13 The *Irish Times* review of the original production carried the headline

*An Triail* is Viney stressed on stage, crystallised into a searing drama that challenges every aspect of the nation’s treatment of this social problem.

…The ultimate stigma: the Irish mother reared in our version of the competition with the Joneses, backgrounded as it is by a religious outlook smug with righteousness and the betrayal by the invincible and ungetatable man; the system of secret domicile (pungent with the threat of blackmail information to the parents) - all this is challenged as well as the adoption system in which all the drab history is quietly smothered…the girl in *An Triail* is in every hostel-citadel in the country where fallen women do penance for the babies they must lose to the comfortable (if barren) and where hypocrisy hides its head.11

12.14 A speech by the widowed mother of the young woman captures some of key themes in this play:

Mother: But don’t blame me for what happened. God knows I worked hard to give her a good Christian upbringing. It was the will of the Lord to leave me a lone widow, with my man dying on me three months before my youngest child was born. I've had to work and to save and to make sacrifices to bring up and to educate my family, with not a living soul to lift a hand or a foot to help. My head bent and my back bent from dawn till dark, working and slaving and sacrificing myself. And what have I for it in the heel of the hunt? What had I but to be disgraced in the eyes of the world. I can’t lift my head, but the neighbours mocking me and whispering about me behind their hands, and tittering at me as I show my face at church or at chapel, at fair or at market among them.

Counsel for the defence: The neighbours would appear to be your predominant concern.

Mother: I have to live my life in their midst.

Counsel for the defence: Would it be true to say that your harshness drove her from home? Would it be true to say that you attempted to get rid of the unwanted child?

Mother: It's neither a sin nor a crime to get rid of an unholy thing that was accursed at its making by both God and men…(she bursts into noisy tears).

She deceived me. She deceived me wilfully and wickedly…

---

Adoption and Agony Aunts

12.15 The rising number of adoptions received extensive coverage in national and local media. Adoption was generally presented in a positive light, though a 1947 comment by an unnamed ‘special correspondent’ that adoption was ‘Not nearly as simple as it looks’; that there was a need for ‘a full examination of all the circumstances’,\(^\text{12}\) suggests a more critical attitude. The annual reports of the Adoption Board were summarised in national and local newspapers. Local newspapers reported on meetings of the Adoption Board in their area, which appears to have been designed to raise awareness of adoption and encourage couples to consider adopting a child.\(^\text{13}\) In 1966, for example, the *Limerick Leader* claimed that there was an apparent lack of interest in adoption in Limerick compared with Cork. The article suggested that those interested should contact the Limerick Catholic adoption society. ‘Once an adoption order is made, the child legally belongs to his new parents and no further enquiries are made by the Board’. This particular article appears to have been effective; when the Adoption Board came to Limerick 12 months later, it reported a 60% increase in the number of adoption orders - a total of 23.\(^\text{14}\)

12.16 Although most coverage was positive, some columnists presented questionable statements. In 1959 Fr Lucius McClean, a regular columnist in the *Sunday Independent*, headed his column, ‘Is it wise to adopt?’. He was responding to a letter from a couple who were considering adopting a specific baby who would soon be born to an unmarried mother; this adoption was being facilitated by a priest. Fr McClean claimed that many people were ‘ready enough to take an orphaned child but would be afraid to take an illegitimate child’ - fearing that the parents ‘might have been wicked or wayward people’ and the child might have inherited tendencies ‘that would present problems later’. He advised this couple to review medical advice to see whether there was any prospect of them having a child; if not they should adopt this child, because the priest who was acting as intermediary knew the birth mother and they could be assured that ‘despite the fall…she is a good girl and that her child will be more than just physically sound’.\(^\text{15}\) Fr James Good of St Anne’s Adoption Society took serious issue with this article. In a private letter to Fr McClean he said that ‘no reputable adoption worker would commit herself to arrange the adoption of an unborn infant’; the priest mentioned in

---

\(^{12}\) *Connacht Tribune*, 29 Nov. 1947.

this article ‘presumes far too much and far too often’; he failed to understand that a woman might have second thoughts about adoption following the birth of her child. He criticised the suggestion that would-be adoptive parents should bypass registered adoption societies in favour of private arrangements. Monsignor Barrett, director of the CPRSI, not commonly an ally of Fr Good, shared his concerns; he informed him that Fr McClean had agreed to write an article correcting some of his statements, when he returned from America.\(^\text{16}\) Private adoption placements were not illegal in Ireland until the late 1990s but such practices facilitated illegal registrations of births. The family background of adopted children was a major cause of concern to would-be adopters at this time; another article recommended that adoptive parents should not seek information, lest it cause them undue worry and stress. Several articles discussed the possibility that a mother might change her mind and reclaim her child from adoptive parents; the journalists’ sympathies appear to be very much with the adopting parents.

12.17 During the 1960s the problem pages of Irish women’s magazines and Sunday newspapers emerged as a source of advice/information. Several correspondents claimed that they became pregnant not knowing the full ‘facts of life’. A 17-year-old who was raised by adoptive parents, apparently happily, wanted to contact her birth mother, but Angela McNamara dissuaded her ‘don’t let your curiosity drive you needlessly hurting her now’.\(^\text{17}\) A correspondent who had just discovered that she was adopted and was disturbed at learning this and wanted to learn about her parentage was advised that

Your adoptive parents are truly generous and loving people. You are their much wanted child. Please don’t hurt them and be proud of them as they are of you. If questions occur outside, say quite naturally that you are adopted and that information about the circumstances of adoption are not given. This is wise, because when parents give up a child for adoption the situation is thoroughly investigated at the time and what is best for the child is done. So do rest content that the best was done for you.\(^\text{18}\)

12.18 Columnist Joan O’Brien told a woman who had been adopted that it was perfectly natural that she was interested in learning about her mother. But she advised that it might prove difficult to trace her mother, and ‘meeting her might not be

\(^{16}\) Cork Diocesan Archives, St Anne’s Adoption Society, Box 23.
wonderful. She may have married and had a family, and not want to be faced with evidence of a past mistake. Or she may have had a difficult life and be different from the kind of person you hope she is. A long article in *Woman’s Way* described the case of a couple whose final adoption order was delayed for several hours when the birth mother arrived in the court, though she ultimately agreed to sign the adoption order.

12.19 McNamara advised a pregnant single woman who was under pressure from her parents to marry the father of her child and no longer felt that she loved him, to reconsider her attitude, because ‘John was standing by you in your trouble…In marriage you can start anew, and give your child its due - a father, a mother and family life’. Her column in the *Sunday Press* frequently featured letters from young women who were pregnant, and an occasional letter from the father of the ‘illegitimate’ child, seeking information about facilities for unmarried mothers. She generally referred them to the CPRSI; an inquirer from Cork was referred to the local health authority. These queries in a public medium were new; they confirmed the views of English social workers that Irish women were not aware of what services existed and more information should be provided.

12.20 Many articles relating to unmarried motherhood concentrated on PFI (Pregnant from Ireland) cases. In 1968 Michael Keating described pregnant women who travelled to Britain as ‘fugitives from a society they believe to be cold and without understanding and they are fleeing from Ireland’s most dangerous weapons - the whispered insinuation and the glance through curtained windows’. This and other articles were part of a wider campaign for government assistance to provide welfare supports for emigrants; single mothers comprised a significant component of the emigrants who needed assistance. Keating suggested that

The average Irish unmarried mother’s ideas of conditions in this country’s mother and baby homes are based on out of date rumours and idle gossip. In a recent press article Dorene Reihill mentioned some existing impressions such as ‘these places are like jails…the girls are made to work in the fields up

---

19 *Woman’s View* – formerly *Model Housekeeping*, Dec. 1966. It is not clear from this article whether this referred to a court case or a hearing of the adoption board.
24 The Commission has failed to identify this article.
to the time they go into labour’, or ‘the nuns allow the babies to die at birth because there is nobody to look after them’. These ideas are commonplace.

12.21 The Mother Superior of Bessborough described such descriptions as ‘one of the major problems curtailing the spread of our work’. She claimed that many people were not aware of the existence of Irish mother and baby homes. ‘For those who have heard of them the image is of young girls almost locked in dungeons or being denounced hourly by the staff for their sins’. However Keating concluded that ‘There is rarely some smoke without fire’. He quoted a London-based social worker who ‘was disturbed that two girls whom her society had repatriated, returned again to England with alarming stories of conditions in the mother and baby home to which they were sent in Ireland’.25

12.22 *Sunday Independent* columnist Brenda Maguire asked:

> how do we treat the child born out of wedlock? …The child born of an illegitimate pregnancy has done no wrong. Yet we treat him as a second class citizen. Why innocent babies should suffer the stigma of ‘illegitimacy’ because of the sins of their parents, is a question that merits deep and serious thinking. Surely, there are no “illegitimate” babies only “illegitimate” parents?

12.23 Maguire’s article focused on adoption; she described the positive experiences of a childless couple who had adopted a child. This prompted responses from a number of unmarried mothers. One mother criticises Maguire for describing these babies as ‘children whose birth is more an embarrassment than a joy’.26 In a follow-up column Maguire acknowledged that few would regard adoption as the ideal solution. ‘There is something wrong with a society where this is the accepted practice’; it must have ‘a traumatic effect on a child to be told one day that he is adopted’. She claimed, incorrectly, that mother and baby homes were run in the main on voluntary contributions and she praised the Sisters who ‘do a wonderful and sympathetic job and undertake work that the remainder of society (including the parents, friends and colleagues of the unmarried mother) turn their back on, or refuse responsibility for’. She dismissed complaints from unmarried mothers at having to do housework before and after the birth, pointing out that many pregnant mothers with families ‘cook, wash and polish right up to the birth of the baby and

---

within a few days after the birth they are back in harness again’. Maguire concluded by noting that

We all have something to learn from these letters, because whether or not we face up to it, we are all involved...girls become unmarried mothers through weakness, some lack in their upbringing, immaturity, ignorance or sheer misfortune. The climate of opinion might with profit change, so that unmarried mothers and their children are not asked to pay for what is only one of the many mistakes we all make. But self-pity, whatever the reason, and however great the cause, solves nothing at all.

12.24 The *Sunday Independent* published two letters from unmarried mothers to accompany this article. One was from a Protestant woman who had raised her child - now 14 years old. She secured an affiliation order against the father, but only received 12s 6d a week, which was later increased to £1. The second, from a Catholic woman whose child was adopted, was headed ‘Call them Baby Factories, Markets’. She asked whether a tolerant society ‘forces the unmarried mother to seek “Rescue and Protection” in an institution?’ She described a regime of waking up at 6.45 am (6.30 on Sundays and 5.45 after the baby was born). After mass, breakfast, ‘a plentiful supply of white bread’; after breakfast, allotted work in laundry, kitchen or convent; ‘The only therapy the girls get is the recitation of the aspiration “O Mary by thy pure and immaculate conception, obtain for me purity of body and sanctity of soul” innumerable times each day’. She claimed that most women in the home ‘were paid for by the Adoption Board of their county’. These letters appear to be the first occasion when the unmediated voices of single mothers are reported in an Irish national newspaper. A *Seven Days* programme, ‘All Our children’, broadcast in November 1968 included comments by unmarried mothers on their situation, but these were voiced by an actress. One reviewer of this programme claimed that it was

a terrible indictment of our approach to the girl who ‘gets into trouble’. Our ‘solution’ is callous, cruel and quite simple. The girl vanishes either to England or behind the walls of an anonymous ‘home for Unmarried Mothers’. Tongues wag and heads nod knowingly. The unmarried father goes completely free...And as one girl in the programme put it ‘In Ireland it’s a sin you pay for all your life.’

---

27 *Sunday Independent*, 16 March 1969; the Adoption Board had no role in mother and baby homes; most women were paid for by their local health authority.
The *Irish Times* featured two articles by Cork-based journalist Mary Leland later that year that were prompted by a forthcoming report by the Cork Health Authority about facilities for unmarried mothers in the county. Leland featured the story of a 23-year-old woman who became pregnant as the result of a casual sexual encounter. She continued at work until the final month of her pregnancy, when she was admitted to a mother and baby home that was almost certainly Bessborough. Her employer was willing to pay for her maintenance in a maternity hospital or nursing home of her choice. Leland claimed that this young mother was shocked to discover the large number of women in the home. ‘It was the first indication she had that there were many others in her situation’. She claimed that ‘the girls were nice to each other…but she liked only three of the nuns’ - those who were most closely involved with her during labour and delivery. She was not given any antenatal instruction about what to expect during labour;\(^{29}\) she was cared for by a Sister who was a qualified midwife and two ‘inmates’, and she was given drugs to relieve the labour pains. ‘The midwife told her what to expect at each stage, the girls brought her tea and sympathy’. The midwife, assisted by a nurse, delivered the baby. Leland noted that there was not sufficient staff to care for the babies and the mothers, so each mother fed, washed and cared for her own baby until the baby was adopted. The young mother was stunned when her baby was taken away - ‘I knew she was being taken to a foster home…but I hadn’t expected it so soon…I thought my heart was broken’.\(^{30}\) A second article described a visit to Bessborough. Leland noted that ‘The Reverend Mother is well aware that Bessborough has an unfortunate - she didn’t say unpleasant - reputation. But, as she points out, the girls themselves can hardly publish how nice the place is, as in doing so they would reveal their familiarity with it’. Leland acknowledged that many women ‘still feel that it is a prison, where their sentence may be of years’. The Mother Superior was concerned that this reputation prevented unmarried mothers from going to Bessborough ‘until they are frantic with fear and see it as a place to hide’. Leland described how women were assigned a ‘house name’, and addresses were set up where post could be sent if the woman wanted to conceal the fact that she was in Bessborough. She corroborated statements made in her previous article, i.e. that the women were not given any information about the labour or birth until they were actually in the labour unit. She spoke to one woman, ‘a tall graceful girl of 24’, who only learned what facilities were available to her from Angela McNamara’s newspaper column. She had planned on going to England

\(^{29}\) That would have been the norm for all first-time mothers at this time.

until she learned of the CPRSI. Her boyfriend had refused to accept that he was the father. ‘Her family know nothing of it all; she writes long letters describing non-existent activities. She prefers it that way. Still she has been under terrific mental strain, the high point of which will come shortly, as her baby will soon be adopted’. This mother had bought clothes to dress the baby prior to her going away, ‘She dreads it - “it’s like death. I can’t describe it”’. She would have kept the baby ‘if she had had any help at all’.

12.26 Leland noted that the mothers that she met were not bitter, ‘they would like to see some social acceptance of the unmarried mother and her child…for them it seems as if society is something from which they are now safely removed’. The Mother Superior would also like to see ‘a willingness on the part of parents to accept the girl and her child but feels that this will not come for a long time’. She commented on the fact that the fathers of these babies were free whereas the mothers were ‘trapped’.31

12.27 Leland’s articles prompted several letters in response; one was from the proud adoptive father of three children. A woman took issue with her comment that ‘the stringent cleanliness of the whole place indicates the somewhat unpalatable fact that much of the housework is done by the girls themselves’. She pointed out that most married women did all the housework until they gave birth, and often looked after several children as well. One letter came from a single mother who had been in Bessborough and kept her child. Her description of the home as ‘a baby factory and a baby market’ suggests that she had read the letter in the Sunday Independent which was discussed earlier. She described Leland’s articles as ‘sensitively and very well written’; they had made her see Bessborough in a ‘more objective and less horrific light’. When she was there, she was ‘on the border of mental breakdown’. She suggested that Leland had failed to confront the question of adoption; ‘judging from the remarks of the girls, the pro-adoption brain washing campaign is as effective as ever’. She described adoption as ‘akin to capital punishment - it involved the taking of a life’.32 Leland contacted the Mother Superior before replying to these letters. The Mother Superior confirmed that all women underwent a Wassermann test, but Leland pointed out that the test was obligatory for all pregnant women in England and in the Dublin maternity hospitals,

though not in Cork. The Mother Superior claimed that most work in the laundry consisted of folding nappies.\textsuperscript{33}

12.28 Newspapers and magazines published several articles about mothers who had kept their babies. Angela McNamara while condemning pre-marital sex was supportive of families who assisted a daughter to raise her child within the wider family. In 1969 she featured a letter from the mother of a pregnant, single 19-year old, who wrote about the ‘shock and hurt’, the fact that ‘there would be talk around here if our girl brought the baby home’. She and her husband sought advice as to what they should do. McNamara encouraged them to bring mother and baby home. ‘Whenever it is possible for the baby to remain with its mother and become part of the family, this is the most ideal solution’. McNamara cautioned that the entire family should be prepared for comments in the neighbourhood, ‘each member of the family must be prepared for these, and must be able to support your move in having the child home’, but if they remained calm, ‘the gossip will die down, and in fact people will admire you’.\textsuperscript{34} A woman who had apparently written to Angela McNamara when she was pregnant, intending to place her child for adoption, had changed her mind and was now asking for information about day nurseries where she could place her child during working hours.\textsuperscript{35} Joan O’Brien published a letter from a single woman with her own home, who had gone through her pregnancy alone ‘because my relatives were all against me’. She brought her baby home from hospital but he later died. O’Brien commended her for her courage in living ‘as an unmarried mother to be in the place where you always lived’, and she referred to the probability that a single mother and her child might be ‘the object of unkind comment in the neighbourhood’.\textsuperscript{36}

12.29 Journalist Ella Shanahan described the pregnant unmarried Irish ‘girl’ as ‘one of the loneliest people in any community anywhere in the world’. She claimed that the ‘awful stigma’ attaching to unmarried mothers was ‘a peculiarly Irish phenomenon’; she compared it to the inhumane attitude shown towards young girls raped by soldiers during the war in Bangladesh. At a time when she was most in need of assistance and sympathy the unmarried mother ‘finds herself bereft of parents, former friends and neighbours, and dogged by financial and material worries’. She claimed that attitudes were changing

\textsuperscript{33} Irish Times, 20 Aug. 1969.
\textsuperscript{34} Sunday Press, 6 April 1969.
\textsuperscript{35} Woman’s Way, 23 Oct. 1970.
\textsuperscript{36} Woman’s View, 10 Jan. 1967.
Being unmarried and pregnant no longer means that a girl must incur the wrath of her family and the sly and vicious talk of neighbours. It no longer means that she must enter into an unworkable marriage, doomed from the start or that she must take the first boat to England. Girls who find themselves in this unfortunate position can now have their babies quietly and confidentially at home in Ireland, and return to their homes and jobs within a short time, and no-one save a social worker and one or two other strangers need ever know.

12.30 She emphasised that services for unmarried mothers had improved, but Shanahan presumed that the baby would be adopted.

Social Research, Policy, Changing Attitudes and Provisions

12.31 The late 1960s was marked by a rise in pre-marital and extra-marital sex throughout the western world. The three books cited below all have chapters with ‘sexual revolution’ in their titles. The sexual revolution is generally associated with the availability of the contraceptive pill, though the evidence from the United States, Britain and Australia suggests that the relationship between the two was complex. Hera Cook, writing about Britain, comments that: ‘The pace of change in the second half of the 1960s was astonishing. By the late 1960s, many of those who wanted a new sexual morality felt able to talk openly about wanting sex before (and a different approach after marriage)’. She notes that ‘From 1965 to 1969, there was a transformation of sexual mores. This happened as a result of supplying contraception to women publicly and solely for the purpose of sexual pleasure, indeed explicitly to prevent reproduction’. In Australia a growing number of unmarried couples were living together by the early 1970s and public disapproval of such arrangements was declining. In the United States there was increasing sexual activity among single women, though the early adopters of the pill were overwhelmingly married women. In Ireland access to contraception was prohibited under the Criminal Law Amendment Act 1935, though the contraceptive pill became available in 1963/4 as a means of regulating a woman’s menstrual cycle. Despite the prohibition on contraception, a family planning clinic opened in Dublin in 1969; by the early 1970s condoms were being imported and distributed in

39 Frank Bongiorno, The sex lives of Australians, A history, (Collingwood, Victoria, 2012), chapter 8, Sexual revolution’, pp 222-58
40 Elaine Tyler May, America + the pill, (New York, 2010), pp 71-91.
Ireland by mail order. In 1974 the Irish Family Planning Association clinic at Synge Street reported that 43% of their clients were unmarried and 53% were under twenty-four years. A survey by Emer Philbin Bowman of the women attending this clinic suggested that while three out of five single women were planning to marry in the near future, two out of five had no such plans. While the proportion of single women who were sexually active was rising, it was lower than in Britain or the United States, and the age of first intercourse was higher. She concluded that Ireland was experiencing - albeit more slowly - the changes in sexual behaviour found elsewhere, and lack of access to contraception was not a deterrent. Most of these women were well-educated and from middle-class backgrounds, and all but 6% were sexually experienced, and indeed they had been sexually active for an average of 2.2 years before coming to the clinic. By 1975 almost half of the clients attending this family planning clinic were single women, but opinion polls showed that 20% of respondents and only 21% of young married women were in favour of contraceptives being available to single people. Between 1968 and 1979 the number of ‘illegitimate’ births in Ireland more than doubled from 1,558 to 3,331. The Health (Family Planning Act) 1979 made it legal to supply contraceptives ‘for the purpose, bona fide, of family planning’, which was generally assumed to limit access to married couples, though that was not explicitly stated. Access to contraception did not become widely-available in Ireland until the enactment of the Health (Family Planning), (Amendment) Act 1985.  

12.32 The late 1960s brought changes with respect to unmarried mothers and their children. Forty mother and baby homes in Britain closed in the late 1960s (English homes tended to be much smaller than those in Ireland). The numbers of babies being adopted in Britain peaked in the mid-1960s, so trends in Ireland were not out of line, though the proportion of Irish women in mother and baby homes and the proportion of ‘illegitimate’ children who were adopted were much higher in Ireland. In 1973 Britain’s National Council for the Unmarried Mother and her Child (NCUMC) changed its name to the National Council for One-Parent Families, and expanded its remit to include all single-parent families such as separated or divorced women and men. These changes were in response to pressure from public opinion and parents who contacted them. It was also consistent with the British government’s appointment of a committee to investigate the problems

---

41 Irish Independent 8 April 1974
facing one-parent families - the Finer Committee was appointed in 1969; it reported in 1975. This practice of seeing unmarried mothers and their children as part of a wider community of one-parent families became a common feature in the policy and practice of social work in many western European countries though unmarried mothers ‘continued to be the most seriously disadvantaged lone parents’. In Ireland unmarried mothers continued to be seen as a distinct category until almost the end of the century. By the late 1960s, 90% of ‘illegitimate’ children born in Ireland were placed for adoption; the next highest rate in Europe was 35% (the country is not stated, it would appear to have been either Britain or Sweden). In Denmark, 93% of unmarried mothers kept their babies and fewer than 7% were adopted. However Ireland was changing. Fr Gabriel Colleran, chaplain of the CPRSI, claimed that 60% of the women who contacted the CPRSI in 1969 had informed their parents, and they were supportive, but 40% of parents were either unaware of their daughter’s pregnancy or unsupportive. The birth rate to unmarried women was rising, as was the number who gave birth outside mother and baby homes.

12.33 There was a 50% increase in the number of unmarried mothers giving birth in Holles Street between 1966 and 1971; almost a quarter of the mothers (24%) were 18 years or younger. In 1969, 27.8% of Irish unmarried mothers gave birth in the three Dublin maternity hospitals. When interviewed by officials in the Department of Health, the chief social worker in the Rotunda said that unmarried women who gave birth in the Rotunda ‘were encouraged to wear wedding rings, receive male visitors if possible during husbands’ visiting time, and generally to give the impression toward mates that they are married…..A disturbing feature in 1970 was the development of co-habitation’.

12.34 A profile by Dr Declan Meagher of 400 consecutive unmarried mothers who gave birth in Holles Street highlighted the increased medical hazards of ‘illegitimate births’. The health of a new-born baby was strongly linked to maternal health and the quality of ante-natal care. Most women who became pregnant while

---

49 Department of Health INACT/INA/ 0/448171
unmarried, married before giving birth. Over 50% of the unmarried mothers who gave birth in Holles Street had received no ante-natal care until the final month of their pregnancy; 17% first received care when in labour. Many complications of pregnancy, including some serious complications, were significantly higher among the 400 unmarried mothers than the hospital average. Hypoxia - interference with oxygen supply to the baby, which put infants at risk of death or brain damage - affected 20% of the unmarried mothers. The incidence of anaemia - a reflection of social disadvantage, and a failure to be prescribed iron tablets, which was standard practice in the hospital’s ante-natal clinics - was twice as common among unmarried mothers. These additional risks reflected the financial and social stress of a pregnancy outside marriage. A failure to attend ante-natal clinics meant that blood pressure and the development of the foetus could not be monitored. Doctors often lacked accurate information on gestation date, which meant that it was more difficult to identify infants at risk from failure to grow in utero. The greater risks were not unique to Ireland. In Finland in the 1980s, despite a high incidence of cohabitation and social tolerance of pregnancy outside marriage, there was a 45% difference in the rate of ‘small for gestational age’, a 17.5% difference in the rate of preterm birth and a 26% difference in the incidence of babies weighing less than 2.5kg, approximately 5 lbs. at birth.

Seventy per cent of the unmarried mothers in the Holles Street study held service jobs, 20% were unemployed and the remainder were still at school. Many came from disadvantaged families; some were the children of single mothers. Single mothers from more privileged family backgrounds probably gave birth in private nursing homes. Dr Meagher claimed that there was ‘an over-representation of girls who have themselves been illegitimate and who have grown up in the emotionally sterile, unisexual atmosphere of an institution and who are thrown at an early age into a world of whose complexities and subtleties they have learned little’; he described these women as ‘clearly vulnerable, emotionally, intellectually and otherwise’. He suggested that the inadequate medical care received by unmarried mothers reflected their sense of shame, which made them reluctant to attend ante-natal clinics. As long as Irish society condemned unmarried mothers it made it more difficult for them to seek medical care. Impressionistic evidence suggested that many of their infants failed to thrive; they had a higher incidence of infection

---

and remained physically backward until placed for adoption. Children who failed to thrive were not placed for adoption; they were retained in institutions, which meant that they continued to fail to thrive. He claimed that there was discrimination against adopting children who were handicapped. Unmarried mothers also had a poor standard of post-partum care; many failed to return to the hospital for a check-up. He recommended that the government should pay a special maternity grant to single mothers at an earlier stage in pregnancy to encourage them to enrol for ante-natal care.  

12.36 The *Reformatory and Industrial Schools Systems Report 1970* (commonly known as the Kennedy Report) noted that a high proportion of children in industrial schools were the children of unmarried mothers. ‘Traditionally a stigma attached to the unmarried mother at various levels - family, neighbourhood, official - which made it extremely difficult for her to keep her child. Financial and housing difficulties added to the problem’. The report suggested that there was a trend ‘towards a softening of this attitude in recent years. The unmarried mother now meets with more sympathy and understanding than was once the case and everything possible should be done to encourage this trend’. The ‘first prerequisite’, was ‘sympathetic advice and help’ from the welfare authorities and voluntary organisations.  

The object should be to help the mother to keep her child if at all possible.  
The alternatives available should be explained and sufficient time given to enable her to consider the problem fully.  
Adequate benefits should be available to enable unmarried mothers to keep their child. Support should include housing, providing day nurseries and other facilities to enable her to work, if she wished…  
A sympathetic and helpful approach to all problems is essential and any hint of discrimination on the part of authorities, organisations or individuals must be rigorously avoided. Social workers should be on hand to provide mothers with advice and support.  

12.37 Ireland was extremely late in developing a cohort of professionally-educated social workers, because many of the institutions and agencies that cared for deprived children, adults with special needs and unmarried mothers were run by voluntary organisations, whose staff commonly lacked professional training. The censuses

---

52 *The unmarried mother in the Irish community*, p. 35.  
in 1961 and 1966 list ‘social welfare worker’ as an occupation, but most of those included under that heading were probably home assistance officers and senior home assistance officers. The first census to list ‘social worker’ as an occupation was 1971; there were 831 social workers - 476 men and 355 women.\textsuperscript{54} The Irish Association of Social Workers was established that year.\textsuperscript{55} In the 1981 census the numbers had more than quadrupled to 3,680 and a majority - 2,004 - were women.

12.38 The Dublin maternity hospitals had employed almoners/social workers for many years. During the 1960s there is evidence of greater interaction by these social workers with unmarried mothers. In the year 1966/67 a social worker was appointed to Pelletstown (see Chapter 13). Kilkenny and Limerick established social service councils - partnerships between the Catholic church, voluntary organisations and the local health authorities. The 1969 report of the Limerick social service council noted that

Since 1965 a professional casework service was available to multi-problem families throughout the city, and during 1967 was intensified in St John’s Parish. Voluntary workers were recruited, assessed and trained. They worked in St John’s Parish under the direction of the social welfare workers, especially to help the mothers of underprivileged families...Casefiles were opened and classified under the following headlines: Itinerants, men of non-fixed-abode, adoption, unemployed and its consequences, marital problems, alcoholism, mental and physical handicap, childcare, housing and unmarried mothers.

12.39 This service was funded by the Catholic diocese of Limerick; its bishop, Jeremiah Newman, had both an interest and expertise in applied sociology.\textsuperscript{56} The \textit{Health Act 1970} created regional health boards in place of county-based services, which facilitated the appointment of specialist child-care professionals and social workers. By 1971 the Eastern Health Board, which covered Dublin and surrounding area, employed three children’s officers (who were mainly nurses) and

\textsuperscript{54} It is unlikely that these were all professionally qualified social workers. The first social worker in the statutory health services was employed by the Dublin Health Authority in 1966; by 1971, its successor, the Eastern Health Board, had 11 ‘social workers’ but they were not all professionally qualified. The first professional qualification for social workers in Ireland was introduced in 1968; see \textit{Report into the Catholic Archdiocese of Dublin} 2009, page 108.
\textsuperscript{55} Caroline Skehill, \textit{History of the present of child protection and welfare social work in Ireland} (Lampeter, 2004), p. 103.
\textsuperscript{56} \textit{Limerick Leader}, 29 Nov.1969
several social workers (as noted above, not all were professionally qualified); one social worker was based permanently in Pelletstown.57

12.40 In 1972 Fr Colleran, who had succeeded Fr Barrett as director of the CPRSI, contacted the Department of Health to inquire about the arrangements with regional health boards for dealing with unmarried mothers, and the need to ensure confidentiality. His request was prompted by the experiences of two women who had been admitted to Pelletstown. One, a native of Leitrim, had contacted the CPRSI the previous autumn, ‘in a very upset state’. She was determined that no family member should learn of her pregnancy. The CPRSI arranged that she would be admitted to Pelletstown and they would arrange for her baby’s adoption. Some days before her baby was to be placed, an official from the North Western Health Board rang the CPRSI and informed them that he had arranged adoptive parents for the Leitrim woman’s baby. He also phoned the mother in Pelletstown - she was shocked by the call, as they were acquainted, and he wished to place her baby with a Leitrim couple. This man made a similar intervention in another Leitrim pregnancy. In the latter case the woman was told that the health board would pay for her maintenance only if they placed her baby for adoption. The CEO of the North Western Health Board explained that the particular official was intervening in matters ‘outside his bailiwick’; this man believed that ‘anything anybody could do in regard to adoption he could do better’. The CEO promised that this would not recur. In response to a query from the Department of Health to all the health boards, prompted by these events, the CEO of the Western Health Board explained that a code number was used for each mother when paying bills in mother and baby homes. Enquiries were limited to determining that the mother lived within the Western Health Board area; individual files were under lock and key. Another health board explained that they automatically acquiesced in any requests from CPRSI to sanction admission to a home, without seeking the woman’s name.58 In the 1970s the Mother Superior in Bessborough claimed that the greater concern for confidentiality created difficulties in billing health boards and some health boards had refused to pay for a patient.59

12.41 From the early 1970s social workers attached to the regional health boards assumed a greater responsibility for unmarried mothers in their area. They

57 Sunday Independent, 10 Jan. 1971

informed women about their social welfare entitlements and options; arranged their admission to a mother and baby homes if that was the woman’s wish; visited her while she was in the home, and they outlined future arrangements for mother and baby. Evidence given to the Commission relating to Pelletstown and Dunboyne confirmed that social workers attached to the regional health boards paid regular visits to women in mother and baby homes, who were supported by that particular health board. Visits were also made by social workers attached to charitable organisations such as the CPRSI. These regular visits by social workers changed the culture of mother and baby homes.\textsuperscript{60} Women who were undecided as to their future and that of their child had access to a professional social worker, who might suggest alternatives to those presented by the Sisters in the home. Health board social workers co-operated with voluntary agencies, which were beginning to employ professional social workers. In 1973 there were four agencies in the Cork-Kerry region working with unmarried mothers, all employed trained social workers. Two were voluntary agencies; two were run by the Southern Health Board. One of their goals was to dissuade women from travelling to England.\textsuperscript{61} In 1973 the Southern Health Board published a brochure, written by social workers, listing the services for unmarried mothers in that area; this ready access to information reflected a major cultural change from past secrecy.

\textit{12.42} In 1967 Mary Frances Creegan, author of a master’s thesis on unmarried mothers in Pelletstown, suggested that ‘illegitimacy’ and unmarried motherhood constituted ‘a source of strain in the society as a whole’. The only solution was ‘to work to change the attitude of society… If the mother decides to keep the child while remaining unmarried she may be faced with years of struggle and difficulty in an attempt to bring up a child without the support of a husband or family’. She noted that in Britain there was a trend from institutional to community care for unmarried mothers but in Ireland ‘as yet’ no alternative existed ‘for mothers who cannot remain at home…but efforts are being made’. She was referring to a family placement service established by the Irish Dominican priest and UCD political philosopher Fergal O’Connor that was later known as Ally. Creegan highlighted two issues: the need to change social attitudes so that pregnant single women and unmarried mothers could live in the community, ideally without feeling a need to conceal their status, and providing pregnant single women with an alternative to a mother and baby home. The 1968 report of the Rotunda Hospital stated that the

\textsuperscript{60} Based on evidence given by the Good Shepherd Sisters and by social worker.

Rotunda was using Fr O'Connor’s scheme. The social worker also noted that an increasing number of single mothers were keeping their babies - ‘(almost all want to)’. Those who did not have family support faced major difficulties - the greatest being lack of suitable housing, the inadequate level of home assistance and the low maximum payment that could be secured from putative fathers. Twenty of the 98 unmarried pregnant women who attended the Coombe in 1968 married the father of their child, either before or after the birth.

In 1971 the Irish magazine This Week carried a cover story about ‘illegitimate’ pregnancies. It suggested that women who entered Pelletstown ‘encounter, successively, professional compassion, adequate care for self and infant a minimum three-month period of protection from Society’s stigma and finally a bruising emotional encounter with the harsh realities of unmarried parenthood in Ireland’. This article suggested that before the birth of their child ‘local authority and Department function effectively even kindly’. Women had a range of options, but these options ‘taper off following the birth, forcing mothers into adoption’.

Kilkenny Conference

The article in This Week was almost certainly prompted by a major conference in Kilkenny on ‘Community Services for the unmarried parent’: the first conference on this topic in Ireland. The event was organised by Kilkenny Social Services, a consortium of voluntary social services in the city and county, initiated by the Catholic Bishop of Ossory, Peter Birch. An undated document in the files of the Department of Health, which was probably written in 1972/3, states that a group of people interested in unmarried mothers had begun to meet in the Dominican Priory in Dominick Street approximately six or seven years earlier (presumably with the support and involvement of UCD lecturer and a member of the community, Fergal O’Connor) and they came up with the idea of establishing an Irish National Council for the Unmarried Mother and her Child. The Kilkenny conference was designed as part of that process. Newspaper articles suggest that the conference was instigated by Fergal O’Connor and others who were keen to develop alternatives to mother and baby homes and adoption. They invited Margaret Bramall of the

64 This Week, 12 Feb. 1971.
65 Department of Health HPO/INA/O/425641 425641
NCUMC to speak in Dublin in the summer of 1970.66 Many of those involved were professionally-trained social workers.

12.45 The agenda for the Kilkenny conference was largely based on the Council of Europe’s resolution on Social Protection of Unmarried Mothers and their Children, which was published in May 1970.67 It set out a series of recommendations with respect to medical and social care, employment and housing facilities. Among other things, member states were asked to stimulate a greater comprehension in society of the problems faced by unmarried mothers and their children and to bring about ‘the use of non-discriminatory terminology with regard to the mother and children in question’. The non-discriminatory language is evident in the title of the Kilkenny conference - ‘unmarried parents’; however the report of the conference proceedings used ‘unmarried mother’ in the title.

12.46 The Council of Europe’s resolution expanded on paragraph 17 of the European Social Charter (which had been agreed in 1961) which set out the rights of mothers and children to appropriate social and economic protection irrespective of marital status and family relations.68 The underlying premise was that the health, satisfactory upbringing and the future of every child was dependent on the capacity of a mother to provide her child with ‘a welcoming home and…the social and psychological situation created by society’. The Council of Europe’s resolution highlighted the importance of appropriate social and medical care during pregnancy to reduce the high rates of stillbirth and infant mortality. It was opposed to segregating unmarried mothers and children, suggesting that social workers should not deal exclusively with them. It set out recommendations that member states should adopt: providing comprehensive information about the medical and social services available to unmarried mothers; health care and social and psychological supports during and after pregnancy; supporting a mother in retaining her job and facilitating access to vocational training following the birth of her child; temporary housing during pregnancy; assistance in finding suitable housing for mother and child, plus day nurseries and other facilities; a guarantee that single mothers and children had access to the same benefits as other families; assistance in establishing paternity and securing maintenance from the father of her child. Psychiatrist Dermot Walsh, who edited the proceedings of the Kilkenny

conference, noted that the Council of Europe document ‘hardly mentions adoption’.  

12.47 The Kilkenny conference was attended by 161 women and men from all the major state and voluntary organisations involved with unmarried mothers and their children. No unmarried mother was present. A pencilled note by Miss Clandillon recorded that 43 attendees came from health authorities, six from government departments, two from the Dublin Corporation housing and welfare unit. The remainder were attached to social service and welfare agencies operated by the Catholic and Protestant churches; social workers attached to hospitals or working in the community; representatives of mother and baby homes, adoption societies, and agencies working with children, marriage counselling and related services. More than a quarter of those present - 42 - were religious Sisters; evidence of their greater freedom post-Vatican II.

12.48 The opening session was chaired by Dr McAdoo, Church of Ireland Bishop of Ossory, Ferns and Leighlin; the second session was chaired by Dr Birch, the Catholic Bishop of Ossory. The opening speech, by Minister for Health and Tánaiste Erskine Childers, adopted a conservative tone. He began by suggesting that ‘the unchristian attitude often encountered towards the unmarried mother…stemmed from the traditionally high regard for the sanctity of marriage’. He warned ‘against the danger of double-thinking by expecting Irish communities to have the highest regard for the sanctity of marriage, and, on the other hand, to accept without qualms procreation outside of marriage’. Parents and neighbours should display ‘a Christian response’ to unmarried mothers. He praised the ‘excellent work’ of mother and baby homes, suggesting that in addition to medical care appropriate for a normal birth they provided ‘a range of social services including counselling for the girls and placement of the babies’. He described medical services for unmarried mothers as adequate but acknowledged that social services should be improved. There was also a need to provide advice and information to prospective unmarried mothers, and it was vital that those providing information and advice should respect the need for confidentiality. There was ‘an obligation to give the mother a real choice’ between keeping the baby or placing it with foster parents or for adoption. He asked whether the special difficulties facing mother and child and the lack of financial or social support justified the existing

---

69 The unmarried mother in the Irish community, p. 11.
tendency to favour adoption. However he did not indicate any plans to provide mothers with financial support to enable them to keep the baby.  

12.49 One of the most important speeches was given by Margaret Bramall of the NCUMC. She described the experiences of unmarried mothers in Britain and in Scandinavia; she claimed that Scandinavia offered the best support for unmarried parents. Bramhall expressed the opinion that the high proportion of single mothers who agreed to adoption reflected ‘the punitive attitude of society’, although the number placed for adoption in Britain was falling. She claimed that most single women in the UK who became pregnant continued to feel ‘fear, guilt and shame, and suffer deeply because of the grief they feel their families will undergo’; ‘we still have not attained the situation where one can honestly say that any mother who wishes to do so can bring up her child rather than have him adopted’. She highlighted the importance of social attitudes to an unmarried mother - ‘unless society is accepting of her and willing to treat her as an ordinary citizen worthy of dignity and tolerance, the very services that are needed will never be provided because if state or local authorities are to make provision for a minority group there needs to be a firm public opinion’.

12.50 Minister Childers made several references to the importance of confidentiality, whereas Bramhall was determined to puncture the ‘aura of secrecy’. She echoed the Council of Europe’s resolution which advised against segregating unmarried mothers because, ‘it isolates and diminishes the status of the mother and makes it less likely that society will accept her’. Segregating services for unmarried mothers prevented agencies from comparing married and unmarried women and consequently they had too high expectations of single mothers. She noted that single mothers were expected to behave in a different manner to other mothers - ‘in some countries it is almost accepted as normal that they should part from their children for adoption, even though this can be a tragic bereavement from which they may never recover’. The churches continued to provide services for unmarried mothers in Britain; Bramall suggested that there might be disadvantages in concentrating these services in religious organisations, especially as ‘the problem is related to the moral attitudes of society to religious organisations in a country where lay statutory workers are the general rule’. She told the conference that it was important to foster independence among single mothers; if the mothers

---

70 Department of Health INACT/INA/0/448171
and children were hidden away ‘we shall never get society to accept them or to appreciate their problems’. She welcomed the proposal in the Council of Europe’s resolution that the state should guarantee a regular maintenance payment to all one-parent families. The senior assistance officer of the Dublin Health Authority supported Bramall’s suggestion that public services for single mothers should form part of wider services for widows, deserted wives and families.71

12.51 During the course of his address to the conference, Fr Colleran, chaplain to the CPRSI, criticised the family placement service operated by Fr Fergal O’Connor. He suggested that it might fail to protect the secrecy of pregnant women and the women might receive unprofessional advice from a host family. He even suggested that some marriages might be threatened because the husband could become emotionally involved with their house guest.72 This aspect of his speech was criticised in the media.73 The conference discussed the merits of small family group homes, ‘in preference to the large impersonal institution which had been only too common a feature of services in the past’. The Mother Superior in Bessborough spoke of seeing large impersonal homes in the United States, a description that may also be applied to Bessborough though she did not say this. She claimed that it was unrealistic to condemn mother and baby homes when no alternative existed and Irish society remained hostile to unmarried mothers.74

12.52 Several speakers indicated their remorse and the need to improve on past treatment of unmarried mothers. Bishop Birch suggested that Irish society had lacked the social and moral responsibility to ensure that unmarried mothers and children were brought up in suitable environments. He claimed that the children of unmarried mothers, lacking affection, became unmarried mothers.75 The conference heard from Dr Declan Meagher (whose paper was summarised above), and from psychiatrist Dr Dermot Walsh, who highlighted the fact that mental health care was an important part of medical care for unmarried mothers. Many single women who became pregnant required specialist psychiatric treatment. They suffered from depression; ‘a period of intense rejection, rejection of above all herself and very often of the father of the child, and perhaps rejection of the baby’.

74 The unmarried mother in the Irish community, pp. 7, 28.
75 The unmarried mother in the Irish community, pp 9-10.
Unmarried mothers were, ‘inevitably’ at greater risk of psychological disturbance than the general population. Dr Walsh suggested that in mother and baby homes, where large numbers of pregnant girls and young infants live together under the same roof, a great deal of emotional damage and trauma can be effected, as the tensions which each girl at this particular time holds within herself tend to overflow onto the others and in doing so to build up large resonating waves of disturbance and turbulence.

He highlighted the damage to the children of unmarried mothers resulting from institutional care, and the importance of early adoption to prevent the damage from the ‘mass environment’ of mother and baby homes.\(^{76}\)

12.53 The report of the conference, which was edited by Dr Walsh, stated that ‘the conference expressed the opinion that it was a fundamental human right that a mother should be given all assistance to keep her child’; the state had a responsibility to ensure that she had the social and financial support that would enable her to do so. The senior assistance officer of the Dublin Health Authority suggested that a single mother and her child constituted a family, one that required greater support than a two-parent family.\(^{77}\) The concept of civil rights - which was extensively deployed at the time in relation to Northern Ireland - also cropped up. Dr Walsh noted that Irish society provided ‘absolutely no assistance’ to enable the unmarried mother to exercise her fundamental human right - that of keeping her child; deserted and unsupported wives, widows and prisoners’ wives were also treated as second-class citizens.

One single deficiency emerged more indelibly than another. It was that we in Ireland offer little real alternative to adoption and that in doing so we violate the basic human right enshrined in the Council of Europe document that the mother has a right to retain her child and that that right must be supported and fostered by the provision of services to make it possible.\(^{78}\)

12.54 The report of the conference highlighted the need to stimulate:

modern mass communication media…to make public opinion aware of the problems of unmarried mothers and their children and to seek to obtain a greater comprehension of those problems by society, with a view to doing

away with prejudice against them and to securing their acceptance on an equal footing with other families’.  

12.55 The conference attracted extensive media coverage including a number of supportive editorials. The Irish Independent, echoing the 1916 Proclamation, noted that ‘the State has a duty to cherish all its children equally and while insisting on the marital family as the basic unit in society it was not entitled to ignore the unmarried mother and her child’.  

12.56 One of the underlying motivations for the Kilkenny conference was to establish an Irish equivalent to the NCUMC; a single organisation with representation from all parties involved in providing for single mothers and their children. The idea was proposed by the prescient Alice Litster in the 1940s; (see chapter 5) it featured among the demands made by the Irish Women’s Liberation Movement (IWLM) in their manifesto Chains or Change. The IWLM claimed that ‘The unmarried mother who keeps her child does not officially exist as a class as far as this State is concerned. It is time she was recognised’. They called for a central organisation to ‘help and rehabilitate the unmarried mother’, and advise her on practical and financial matters, ‘encourage her to keep her child if she so wishes’; assist her in finding housing, employment and crèches and engage in a programme of public education to improve public attitudes towards unmarried mothers.  

Bramall alluded to this proposal in her speech, as did Minister Childers, who said that he would welcome such an organisation and gave a commitment of Department of Health assistance.

12.57 The proposed Irish national council for unmarried mothers would be lay-controlled, and non-denominational. It would act as a publicity/referral agency; press for statutory provision to enable mothers to keep their child, including financial support and housing, and conduct research into single motherhood. The conference failed to reach a decision on establishing a national organisation, perhaps because Bishop Birch and the Bishop of Kerry, Eamonn Casey, expressed reservations.  

Both men were influential; Bishop Birch was the founder of Kilkenny Social Services, and Bishop Casey had worked closely with single mothers in London. Bishop Birch suggested that if a national council was established, it was important
that shy unmarried mothers from rural areas were not excluded; he believed that they would be more inclined to seek assistance from someone known to them. Yet evidence presented elsewhere in the Commission’s report, and in this chapter, suggests that many women sought assistance far from their home to protect their privacy. Bishop Birch feared that the proposed council would be ‘another, cold impersonal efficient Dublin group dictating to the whole country’. Bishop Casey was dubious about the proposal, and his views carried some weight, given that he had been a member of NCUMC while in Britain. He believed that unmarried mothers should be looked after as part of wider provisions for families in need, rather than being segregated.83

12.58 The Archbishop of Dublin, Dr McQuaid, opposed the formation of a non-denominational organisation under lay leadership. Fr Barrett, the long-time director of the Dublin archdiocese’s Catholic Social Service Conference and the CPRSI, alleged that, although the Kilkenny conference ‘purported’ to examine the Council of Europe’s recommendations, the main agenda item was a proposal to establish an Irish variant of the NCUMC. He described the conference as ‘non-denominational’; there were many Protestants in attendance; ‘at least two of the main speakers were agnostic’. One panel contained no member of a Catholic voluntary society. The proposal for a national council was ‘conceived by people who, though well-meaning, certainly lack adequate experience and would appear to have ultimate objectives differing substantially from those of the Catholic agencies’; the Archbishop of Dublin was not consulted before the conference. Fr Barrett rejected claims that a publicity/referral agency was needed; the CPRSI, doctors, priests and ‘women’s journals’ provided adequate information. Working with unmarried mothers demanded ‘the highest degree of prudence and confidentiality…over-publicity could very well damage the work by robbing it at the onset of the quiet, controlled and discreet manner in which the good and balanced worker tries to carry it out’. This put him in direct conflict with those who believed that publicising unmarried motherhood would help to remove stigma and prejudice.

12.59 Fr Barrett expressed fears that the role of publicising services for unmarried mothers would be ‘handed over to or taken over by a non-denominational body that could not be controlled by the Church and would scarcely show sensitiveness towards our attitudes’. This agency would ‘exercise a very powerful influence on

the activities of all voluntary agencies in this field, by simply not using those of which it did not approve’. A lay, non-denominational organisation would have ‘serious implications for the spiritual and moral welfare of our Catholic unmarried mothers’. It would have no interest in their ‘spiritual rehabilitation’; there was no guarantee that Catholic social workers would be made responsible for Catholic mothers. He claimed that the proposal revealed an utter lack of understanding of the nature of the unmarried mother’s problems. Neglect of her religious duties - Mass, the Sacraments and prayer - is very often the cause of her fall. Repair of that neglect contributes very much towards her rehabilitation.

12.60 He echoed Fr Colleran’s opposition to family placements because they might discourage women from entering mother and baby homes. He queried the proposal that single mothers should be provided with an allowance and housing to enable them to raise their children. If the number of mothers who were keeping their child was increasing (and he had no statistics on the subject), he believed that this reflected greater willingness by parents to accept their daughter and her child into the family home, though he conceded that the numbers who did so remained small. He acknowledged that some women came under parental pressure to place their baby for adoption. Parents justified their refusal to permit their daughter to return home with her infant by referring to the ‘family reputation, their daughter’s future, the interests of their other children’. He believed that most mothers readily consented to their child’s adoption at six months; most of those who withdrew consent were marrying the child’s father. Providing an unmarried mother with the necessary support to enable her to raise her child was ‘not a panacea’. Few women wanted to live independently with their child. An unmarried mother and her child would be unable to survive on an allowance equivalent to that given to widows and deserted wives; giving them a higher allowance would raise an outcry, as would allocating public housing to single mothers given the long waiting lists for local authority housing. He claimed that ‘any experienced social worker will agree that these cases are exceptionally difficult to support through to ultimate success’. Fr Barrett expressed the opinion that unmarried mothers were ‘in some instances at least, unstable, perhaps even in need of psychiatric care’; their children showed ‘signs of deprivation’ by pre-school age. A mother’s right to her child ‘derives from her duties to her child’; if she was unable to provide ‘a normal upbringing’ the child should be adopted.
12.61 Fr Barrett further claimed that the CPRSI had been providing financial assistance to unmarried mothers who were raising their children for some years - supplementing their wages or home assistance, but these arrangements were not successful. Mother and child missed the support of a father/husband, and ‘whether she started with a high-minded sense of duty…or a more emotional and natural, but often in effect selfish, reluctance to part with her child’ in time the mother found herself unable to cope. There is no indication as to the number of mothers who were assisted by the CPRSI to keep their children. Its annual report for 1969 does not contain a heading for such expenditure, unless it is included in ‘Grants to Foster Mothers and Others’ - totalling £517 - which was a tiny fraction of the CPRSI annual expenditure of £21,409.

12.62 Fr Barrett’s memorandum was circulated to all bishops and to the Central Council of Catholic Adoption Societies. It is evident that he was using this organisation as a means of thwarting the formation of the proposed non-denominational national council. In January 1971 Fr O’Mahony (now in charge of St Anne’s Adoption Society) reported to Bishop Lucey of Cork on a recent meeting ‘where it became obvious to me and to a considerable number of non-Dublin delegates’ that Monsignor Barrett was using the council ‘to preserve the national status’ of the CPRSI ‘and knock a group different to him in Dublin’. This Week claimed that he had ‘capture[d]’ the Central Council of Catholic Adoption Societies - whose role was to co-ordinate the work of all Catholic adoption societies, and they noted that Archbishop McQuaid was reluctant to see it controlled by another bishop.

12.63 Irish Press journalist T P O’Mahony reported on these efforts to block the proposed national council for unmarried mothers. An editorial in the same issue commented that ‘Even a cursory acquaintance with the situation here in Ireland would suffice to show that in attitude toward and provision for unmarried mothers we have an awful long way to go’. There was ‘no room for smugness or complacency…new thinking and new approaches are vital, especially at a time when it is being increasingly recognised that many unmarried mothers accept adoption only because of society’s punitive attitude towards them’. Fergal O’Connor emphasised that the

Kilkenny conference had been organised by a group of professional social workers, several of them working with unmarried mothers, and whose goal was to expand and supplement existing services and promote greater co-operation between the agencies. Fr Barrett’s assertion that they had no experience of working with unmarried mothers was incorrect. He rejected Fr Barrett’s suggestion that non-Catholic social workers were not concerned about the spiritual welfare of Catholic clients.\(^{90}\) Fr James Good, the Cork theologian and former director of St Anne’s Adoption Society, continued to press the case for establishing an agency that would help single mothers to examine their options ‘as rationally and as deliberately as the circumstances allow’. In its absence he suggested that ‘we will continue to have these girls making decisions on inadequate or inaccurate knowledge, we will have them pressurised into decisions which they will regret as soon as they are made.’\(^{91}\)

State supports for the single mother and her child

By 1971 the position for mothers who were determined to raise their child was somewhat better than in the 1930s. A growing number were in insured employment, which entitled them to maternity benefit for six weeks before and six weeks after the birth of their child. A mother with social insurance could apply for unemployment benefit;\(^{92}\) mothers who had exhausted this benefit or did not qualify could claim home assistance, a discretionary payment disbursed by local authorities to persons with inadequate means to survive (see Chapter 1). The proportion of the population in receipt of home assistance varied widely between counties, as did the criteria for eligibility. As it was funded by the rates, counties with a high rateable valuation - areas with larger farms and fertile soil - had greater rateable income. In 1966 the national average of recipients was 5.2 per 1,000; it was 14.3 in Kilkenny, 13.3 in Tipperary South, but only 6.38 in Tipperary North.\(^{93}\)

There are no statistics as to the number of unmarried mothers in receipt of home assistance for themselves and their child. In 1937 there were 1,046 ‘illegitimate’ children receiving home assistance; whether these children were being raised by their mother or another family member is unclear. In 1937, 3,939 able-bodied women were receiving home assistance; the numbers who were unmarried

\(^{90}\) Irish Times, 26 Jan. 1971.
\(^{91}\) Irish Press, 16 Feb. 1971.
\(^{92}\) Availability for employment was a condition for getting this payment. Very often, mothers with small children (whether unmarried or married) were not regarded as meeting this criterion because of their childcare responsibilities. The same criterion meant that most mothers did not qualify for the means tested unemployment assistance.
Occasional pieces of information relating to boarded-out children suggest that in some cases a grandmother or grandparents received home assistance to enable them to care for their daughter’s child. These statistics were not published in the 1960s so it is impossible to determine how many unmarried mothers were in receipt of home assistance.

Seamus Ó Cinnéide, whose 1970 book remains the only substantial study of home assistance, cited an undated memorandum that was supplied by the Assistance Officers and Senior Assistance Officers Association listing their duties. They included ‘assisting unmarried mothers with the many problems arising from their condition; making contact with their parents or with doctors; arranging adoptions and maternity hospital accommodation or facilities in homes for unmarried mothers; helping to arrange for the rehabilitation of these girls’. It does not refer to assessing their eligibility for home assistance. Ó Cinnéide sent a questionnaire to all the public assistance authorities asking what weekly rate they would pay to various home assistance recipients. The numbers of assistance authorities replying and weekly payments were as follows (the amounts are in shillings, there were 20 shillings to a pound).

This suggests that all local authorities paid home assistance at varying rates to unmarried mothers. One county manager emphasised that payments were discretionary; similar cases did not necessarily get similar rates. There is some evidence that by 1970 home assistance was seen by the Department of Health as a means of providing financial support to unmarried mothers who wished to raise their child. A long file on the topic of children in care, at a time when responsibility for unmarried mothers, foster children, and all aspects of children in care was being transferred to the new regional health boards, includes the suggestion that

---

home assistance ‘should be recommended (if the Legal Advisor agrees) as an adjunct to boarding out and an alternative to placing children in institutions’. A draft Circular no. 70 titled *Children in Care*, which was being drafted in 1970 to be sent to the health authorities, included a section on unmarried mothers, which contains the phrase ‘Should she decide to retain her child she should be assisted in doing so in every way open to the Health Authority’, though it does not mention home assistance. This circular marks the first apparent acknowledgement by the Department of Health that unmarried mothers should be assisted to keep their child.

12.67 In 1967, 5% of those receiving home assistance in Dublin city were married women who were not supported by their husbands; the majority of these were deserted wives, in the remaining cases the husband was in prison. Assistance officers generally referred cases of deserted wives with children to the ISPCC. Home assistance records did not include a separate classification for unmarried mothers with children. Ó Cinnéide interviewed only one unmarried mother for his study. This woman was atypical: she had six children ranging in age from 20 to two. In 1971 *This Week* suggested that the Dublin Health Authority tried to ensure that a mother had £5 a week after paying her rent, and home assistance was calculated accordingly. The article concluded that any single mother who wished to keep her child ‘faced a major economic struggle’. Until March 1972 the maximum sum awarded under an affiliation order was £1 a week, regardless of the wealth or income of the father. From that date a district court could award a maximum of £5 a week, and there was no limit to the award made by the High Court, but few unmarried mothers applied for maintenance orders against the father of their child, and an even smaller proportion secured long-term support.

12.68 In November 1972, two years after the Kilkenny conference, journalist Mary Maher reported that provisions for unmarried mothers had not changed; women who decided to keep their child had no entitlement to financial assistance or accommodation. Services continued to be provided on a sectarian basis. She reported that a group of women was meeting in Dublin with a view to founding an

organisation for single mothers.\textsuperscript{100} A report on the Church of Ireland Social Service confirmed the continuing importance of denominationally-based services. A social worker attached to the Department of Health noted that in 1971 over half of the cases coming to the attention of the Church of Ireland Social Service related to ‘illegitimacy’, and ‘the demands for help from unmarried parents continues to increase’. She had discussed the implications of the expansion in local social services (through the regional health boards) with the director and senior social worker of the Church of Ireland Social Service. They all agreed that in light of the volume of work associated with ‘illegitimacy’, ‘and bearing in mind traditional attitudes in rural Ireland to this problem’ the need for the Church of Ireland Social Service was unlikely to diminish in the near future. She recommended that they should receive a grant from the Department of Health.\textsuperscript{101}

**Unmarried Mothers’ Allowance**

12.69 In February 1972 the *Irish Times* published three articles about unmarried mothers. One was titled ‘The problem now approaches major proportions’. Journalist Frank Kilfeather warned that action was necessary before the problem became ‘insurmountable’. A growing number of women were keeping their child, and support services should be developed that would enable this choice. ‘With the more liberal attitude on the unmarried mother, the homes seem to be losing their importance as places of refuge’; a growing number of women were continuing at work until the final weeks of their pregnancy. There was increasing emphasis ‘on the elimination of the stifling and suffocating secrecy and the abolition of the old-fashioned stigma and disgrace attached to having a child out of wedlock’.\textsuperscript{102}

12.70 Ireland became a member of the European Economic Community in January 1973. Membership was expected to result in a significant expansion in the value and range of social welfare payments, because the cost of agricultural subsidies, which was substantial, would now be borne by the EEC’s Common Agricultural Policy. A general election in February 1973 brought 16 years of Fianna Fáil governments to an end and a Fine Gael/Labour coalition took office. On the eve of the election the *Irish Times* submitted a series of questions about women’s rights to the main political parties. One question asked what they planned to do to help an unmarried mother who wished to keep her child. Fianna Fáil cited a response to a

parliamentary question in November 1972 when the Minister for Social Welfare stated that mothers were entitled to children’s allowances, and any unmarried mother in need could apply for home assistance. The answer indicated that unmarried mothers were being considered as part of a programme to reform social assistance services, including home assistance. Labour gave a commitment to implement changes in social welfare that would enable an unmarried mother to keep her child. Fine Gael does not appear to have replied. In May 1973 Brendan Corish, Labour leader, Tánaiste and Minister of Health and Social Welfare gave a commitment to improve state assistance for the unmarried mother and her child in the forthcoming social welfare bill. An unmarried mothers’ allowance - similar to the 1970 deserted wife’s allowance - was introduced. This allowance was means-tested. A deserted wife’s benefit - which was non means-tested, and paid to deserted wives who had paid social insurance - was also introduced in 1973.

The introduction of an unmarried mothers’ allowance was met with silence in Dáil Éireann - the minister was the only person to mention it. That silence extended to the local and most national newspapers; the only references found following a word search of the Irish newspapers database (which includes many local newspapers and the main national newspapers other than The Irish Times and the Sunday Press) were a small number of government advertisements setting out changes in social welfare regulations. The family placement agency Ally, that was founded by Fergal O’Connor, reported that approximately 5% of the women placed with host families were keeping their child, and they estimated that a higher proportion of mothers that they had met, but who were not in family placements, had kept their baby. An article in the Irish Independent claimed that in Northern Ireland two-thirds of single mothers, mainly working-class mothers, kept their babies. In 1974 women who returned from Britain with their infant became eligible for unmarried mothers’ allowance; initially they could only claim the allowance if they had been resident in Ireland for two years. The introduction of a means-tested unmarried mothers’ allowance meant that single women had no incentive to seek an affiliation order against the father of their child, because any

payment would automatically result in a reduction in the unmarried mother’s allowance.\footnote{107} The number of claimants rose steadily from an initially small base.\footnote{108}

12.72 The introduction of the unmarried mother’s allowance is generally assumed to have transformed the options for unmarried mothers and their children, but that transformation was not instantaneous. The silence in the Oireachtas suggests that TDs were uncertain how to respond; it does not indicate strong support for mothers who wished to keep their children. They continued to face censure from family members and neighbours, and practical difficulties, especially the inadequacy of the allowance, and difficulties in securing housing. By the 1980s the rising number of claimants was attracting some hostile commentary. Journalist Helen Shaw noted that

Because women are trying to support themselves and their babies on the Unmarried Mother’s Allowance they are often judged by the public as social

\footnote{107} James O’ Reilly, ‘Illegitimacy and the law’, p. 27.  
\footnote{108} Taken from Anthony McCashin, Lone parents in the Republic of Ireland. Enumeration, description and implications for social security (Dublin, 1993), Appendix 9.
welfare parasites. Much is made of the alleged abuses within the system. Of mothers living in Corporation flats, claiming the allowance for several children, while living with the father of the children. Nobody is denying that such abuses do happen, but are they the overall reality? A social worker suggested that such abuses were ‘minimal but they are used by the public to cover-up the real problem, because they can’t face up to the situation and imagine what it’s actually like trying to support yourself and a child on £47 a week. If you are living in rented accommodation, half your allowance is gone on rent before you’ve even bought food. The truth is that people living on the allowance are on the poverty line’.

12.73 Shaw noted that no distinction was made between women who were living at home with their parents and those who were living separately, though the latter had much greater expenses. From 1977, women in rented accommodated could apply for a rent supplement from the Community Welfare Officers in the regional health board under the Supplementary Welfare Allowance scheme (see Chapter 1) but it took some time for this supplement to be widely available. If women earned more than a tiny sum their means-tested supplement was reduced, which meant that were caught in a long-term poverty trap; added to this was the cost of nursery care.\footnote{Sunday Press, 8 Feb. 1983.} The statistics given above for the number of qualifying mothers and children refute the claim that many mothers were claiming the allowance for several children. However some conservatively-minded politicians argued that these payments constituted discrimination against married people.\footnote{Sunday Press, 2 Feb. 1986.} A former single mother who had married was very critical of the social welfare system, particularly the supplementary welfare allowance scheme, which she described as ‘degrading and had much of the “poor law” mentality about it’. Other mothers complained about the attitude of social welfare officials: especially their ‘humiliating’ efforts to check whether mothers were cohabiting.\footnote{Sunday Independent, 7 July 1985.}

New Support Services, family placements and voluntary organisations

12.74 Dr Dermot Walsh described family placement schemes as ‘the first real evidence of community concern for this particular problem’. He suggested that there was ‘an untapped reservoir of social concern’ that could be developed.\footnote{The unmarried mother in the Irish community, p. 45.} Ally and the proposed national council were ideas that emerged from informal meetings held in
the Dominican Priory. Initially the family placement service was an ad hoc voluntary activity. Fergal O’Connor contacted friends in England in the mid-1960s asking them to shelter a pregnant single woman, and that prompted him to set up a similar scheme in Ireland. The Church of Ireland Social Services had operated a family placement scheme for some years, and one of the speakers at the Kilkenny conference had hosted pregnant women under that scheme. She explained that all host families were screened by a social worker. It was important not to make the woman feel that she was the recipient of charity. She suggested that the placement gave the woman security and shelter; the host family should help to increase her self-respect. The family should not ask questions or proffer advice, and they should have access to a social worker, if needed. If the woman had a continuing relationship with the father of her child, the host family must enable him to visit and grant them some privacy. She advised that the reaction of neighbours to their hosting a pregnant woman reflected ‘the social attitudes and prejudices of the community at large’; close questioning by neighbours must be deflected. It was important to visit the young mother in hospital after the birth; on occasion her husband had posed as the father of the new-born child. Post-natal arrangements - such as whether the mother would return to the family, with or without her baby should be agreed before the birth. The report of the Kilkenny conference emphasised that family placement could not ‘go it alone’; it should be carried out by a sponsoring agency, with professional help to hand.

12.75 Ally was constituted as a formal agency in 1971. It recruited a full-time social worker, though it remained heavily reliant on voluntary workers. Host families received no financial payment but women were expected to help with child-care and perhaps some light housework. In the 12 months 1971-72 the Ally caseload comprised 402 women; 239 were placed with private families. By 1973 over 500 families and individuals had volunteered to assist Ally, and it was placing an average of 16 women each month; at any time an estimated 40-60 women were living with host families, the majority in Dublin. Ally opened a second office that year, in the south city, in premises provided by the Eastern Health Board.

12.76 In 1973 Fergal O’Connor wrote to the Department of Health requesting financial support for three projects: a hostel for homeless girls, Ally, and the proposed

113 Department of Health, HPO/INA/0/425641
114 Irish Independent, 2 April 1973.
116 One Family, administrative records.
national council for unmarried mothers. He explained that by placing pregnant single women with families, Ally was reducing the costs incurred by the health boards. Approximately one-quarter of the women who contacted Ally went to a mother and baby home. He wished to employ a second qualified social worker and he suggested that Ally should receive a fixed sum of £10-£20 for each woman placed with a family. The department refused to support this proposal, but suggested that he might secure funding from the health boards and they would favour such an arrangement. The department agreed to pay heating, light and phone bills for Ally’s Dorset St office.

12.77 The department further informed Fergal O’Connor that the objections raised in 1971 to the proposed national council for unmarried mothers no longer existed, but they required a more complete description of the proposed council and its activities. They emphasised that ‘it must be acceptable to all religious belief [sic] in the country and also be capable of providing a service which is acceptable to the organisations already active’. This indicates that, despite the change of government, an innate deference to the wishes of the Catholic hierarchy survived. The possibility of establishing a national council rumbled on throughout the 1970s. In 1975 the Irish Independent reported that many of those working with single mothers remained concerned about the ‘inadequate services and the disjointed manner in which the services operate, and for that reason they were still trying to set up a national council’. Single mothers continued to travel to England because they were not aware of the services available in Ireland.

12.78 By 1979 only 10% of Ally clients were willing to enter a mother and baby home and the women were younger. In 1977, 70% were aged between 19-25 years; by 1979 70% were in the age-group 18-21. Ally assisted 624 pregnant women in 1984, but from that time the numbers plummeted. Ally closed in 1989, evidence of changing attitudes. Pregnant single women were increasingly staying at home and at work.

Federation of Services for the Unmarried Parent and Child

12.79 In 1974 the group of social workers who were campaigning to establish a national council for unmarried mothers published a directory of services available in Ireland.
in conjunction with the Medico-Social Research Board, of which Dr Walsh was a member. They continued to highlight the need for an organisation to co-ordinate these services.\textsuperscript{121} Women’s Choice noted that until the publication of this directory, unmarried mothers had no means of discovering their entitlements or the services that were available. The directory brought the problems of single mothers ‘more into the open’.\textsuperscript{122}

12.80 The inaugural meeting of the proposed Federation of Services for Single Parents and their Children, which was the title originally proposed, was held in November 1975. The objective was to promote the welfare of single parents and their children and to supply and co-ordinate information on the existing services. The federation was given office space by the Eastern Health Board.\textsuperscript{123} When the Catholic bishops announced plans to establish CURAM (sic) as an agency to assist single mothers, the federation urged the Department of Health to ensure that CURAM would not be permitted to impede or diminish health board support for the federation.\textsuperscript{124} Department officials recommended that the minister should urge health boards to provide financial support for the federation, which was providing an essential, non-denominational service for unmarried mothers and children and for people who encountered these mothers and children ‘sometimes in circumstances of acute desperation’. If CURAM ‘gets off the ground’ it would be acting in consort with the federation but the two organisations might be competing for funding. The official who wrote this memorandum added that, ‘My personal approach is coloured by the impression that many pregnant girls who flee their homes are refugees from clerical wrath as much as from parental distress and the strictures of local society’.\textsuperscript{125} The department awarded a grant to the federation, and it recommended that all the health boards should make a contribution proportionate to their size (CURA is discussed later).

12.81 By 1978 the membership of the Federation of Services for the Unmarried Parent and Child included the Dublin maternity hospitals; Pelletstown and Bessborough; five of the seven health boards; the social services councils in Kilkenny, Limerick and Sligo; many adoption agencies including CPRSI and St Patrick’s Guild and voluntary organisations such as Ally, Cherish and Barnardo’s. The federation was chaired by Dr Dermot Walsh. The theme of their 1978 conference was ‘Finding

parents for children with special needs’; in 1979, it was ‘The unmarried parent - working towards the best decision’. By 1979 the federation was handling a significant number of inquiries from social workers, community welfare officers and GPs. Federation staff had established contacts with health board community care officers, Dublin Corporation housing officers and others who worked with single mothers and children. They produced quarterly information brochures and papers on topics such as adoption and ‘illegitimacy’.

When they met the Department of Health in 1978, the department claimed that the federation was a less significant source of information than anticipated, partly because of the emergence of CURA, and the postponement of the federation’s planned advertising campaign and lack of walk-in offices. However the department acknowledged that it was assuming greater importance as a forum where organisations working with single mothers met and exchanged views, and it facilitated liaison between statutory and non-statutory bodies. The Central Council of Catholic Adoption Agencies was working with the federation. By 1982 there were 40 member organisations. The health boards remained the primary source of funding but the budget remained tight, as did public funding for Cherish. The 1980s was a decade of economic depression, and these services, like other public services, had to contend with budgetary stringency in the Department of Health and the health boards. The federation and some of its members, notably Cherish and Ally, were active in campaigns to abolish the status of ‘illegitimacy’ - see Chapter 32.

**Cherish**

Cherish, an organisation for one-parent families, was founded in October 1972 by two single mothers, Maura O’Dea and Colette O’Neill. It may have been inspired by Gingerbread, a self-help organisation for one-parent families established in England in 1970. By 1973 there were 70 Gingerbread groups in Britain and one in Belfast. Gingerbread provided support, advice and information for one-parent families. They were unwilling to extend their reach into Ireland because the differences in health and welfare services would complicate their operations. Cherish was established by and for single mothers as a mutual-support group and a lobby for better provisions for mothers wishing to keep their child. They advertised their existence in *Woman’s Way* in March 1973. In 1973 Cherish

126 Department of Health, CCP/INA/0/481800: 1987 budgetary pressures on health boards.
128 One Family, administrative records.
became a limited company with Senator Mary Robinson as President. William Duncan, one of the three Commissioners of this Commission and an authority on family law, played a key role ‘in their development and politicisation’.  

12.84 Cherish promoted the acceptance of single pregnant women in Irish society, arguing that this would enable them to make a realistic choice about the future of their child. They demanded the introduction of a lump-sum grant, which would not be means-tested, and a change in the laws to make it easier to secure maintenance payments from the fathers and a higher maximum affiliation payment. They campaigned for changes in the language used when dealing with ‘illegitimacy’ - they preferred the term ‘natural child’; they also campaigned for changes in the law on ‘illegitimacy’ and the legal rights of ‘illegitimate’ children, including inheritance rights.  

12.85 By 1974 they had employed a social worker and made contact with the Departments of Health, Social Welfare and Justice, and the Eastern Health Board. They publicised their existence through health centres, social workers and clergy. The Eastern Health Board determined that Cherish provided ‘acceptable alternative services’ for unmarried mothers and children to those provided by the EHB and they should be awarded a grant of £1,000. By 1975 Cherish was operating from offices in Pembroke Street, employing two social workers and an administrator who took responsibility for fund-raising. They had been given a house that was used to accommodate mothers and children.  

12.86 The EHB cited the large number of Irish single women travelling to England for abortion because of social attitudes as an argument for grant-aiding Cherish. However Cherish based their case for funding and legal reform on the equal rights of all children. Concern about the number of Irish women seeking abortions in England may also have prompted the 1974 statement by the Irish Hierarchy on Family Law Reform, which Cherish claimed ‘goes a long way in supporting our proposals for legal reform’. The gap between income and expenditure in Cherish rose steadily during the mid-1980s. In the years 1988-93 Cherish received £20,000 annually from public resources, which later rose to £25,000; this

132 Department of Health, CCP/INA/0/482353.  
amounted to 40-45% of total expenditure. Cherish received its first grant from the newly-established National Lottery in 1988 (£10,000).\textsuperscript{134} They also secured small grants from the Minister of State for Children.

12.87 From the mid-1970s Cherish became a regular contact point for all who wanted to learn more about single mothers. Their leaflets were in high demand from public libraries, social workers in maternity hospitals, public health nurses and women’s networks. They raised awareness of the realities of life for single mothers. The correspondence and social worker files show the diverse range of queries that they handled. One mother asked whether she should adopt her son. Another, who had falsely registered her child as ‘legitimate’ wanted to change this, so that she could claim unmarried mothers’ allowance. Cherish advised mothers on their entitlements to social welfare, how to apply for equipment and furniture from the home assistance officer (known as community welfare officer from 1977) or apply for unmarried mothers’ allowance. Women were advised that it was important to put a father’s name on the birth certificate, though that could only be done with his consent and would not affect the child’s succession rights. A mother looking for work was advised not to tell her employer about her baby ‘until you have got the job and proved you can do it. Then tell them’. Letters were forwarded to Cherish by the Gay Byrne Radio Show and women’s magazines. They received letters from religious sisters who were seeking assistance for a pregnant woman; one woman mentioned that her personnel manager had advised her to contact them.

12.88 While Cherish helped and encouraged women to keep their children, they also warned mothers of the difficulties that they would face. The mother of a second child, whose parents had adopted her first child, had placed this child for adoption, because her parents were unable to take her/him; she was now reconsidering her plans for adoption. Cherish told her that ‘it is very difficult to keep the baby. First of all you have to find accommodation for yourself and a nursery to place the baby in during the day, then you would have to get a good job to support yourself and the baby’.

12.89 They provided mothers with prams and other essential equipment, as well as advice on securing accommodation and crèche places, both of which were extremely difficult. Seventeen of the 74 callers to the office over four weeks in April-May 1974 were seeking accommodation, 11 were facilitated. Twelve callers

\textsuperscript{134} Department of Health, CCP/INA/0/482591, Statement by Cherish auditors, 1995.
had a ‘general discussion’; three were parents of pregnant daughters. Miss Clandillon, an inspector in the Department of Health, with responsibility for boarded out children and unmarried mothers, commented that the above list showed that Cherish was meeting ‘a great need’; she recommended that the department should pay the £1,000 grant recommended by the EHB. But for some time the Cherish grant question was sent by the EHB to the Department of Health, and by the Department of Health to the EHB; both parties avoided a financial commitment.135

12.90 Cherish operated as part of a network of services for unmarried mothers. In 1975 a list of 61 ‘specific referrals’ - presumably where Cherish made contact on behalf of a client - included 12 to Ally; 12 to mother and baby homes; 11 to legal services; five to adoption agencies; six to day-care providers; five to the National Rehabilitation Board. Ally referred 22 clients to Cherish; hospitals referred 22, health boards 19; adoption agencies 15, mother and baby homes 15, family members 28; family planning clinics six, clergy one.136

12.91 In 1977 one woman who had sought advice from Cherish wrote later and said that she had gone to Pelletstown: ‘I found it very nice and they were most helpful to me when I needed their support’. She planned to keep her baby and was contacting Cherish seeking a cot and the address of her nearest branch. When Cherish contacted one woman from a provincial town telling her that they had arranged for her to be admitted to Pelletstown she replied:

I am very glad to hear the good news. I will be glad to go to St Patrick’s Home and to stay there until the baby is born. I will be very glad of the company even though I hope I won’t have to stay that long...please let me know as I want to tell my parents I am going to the Civil Service.

12.92 A woman who went to Dunboyne wrote that she had been there for two weeks and ‘likes it very much’; another woman in Dunboyne said that it ‘really is nice and the nuns are very understanding’, however a third complained that there were too many rules and regulations, ‘it is like boarding school’. Another client referred to mother and baby homes as ‘those dreadful places’. Women who sought information about abortion were referred to Open Door Counselling. A woman who was placing her child for adoption wanted to talk to somebody about ‘what to

135 Department of Health CCP/INA/0/482353
136 Department of Health CCP/INA/0/482353
expect within myself after the adoption’. She had sought advice from St Patrick’s Guild ‘but they just keep telling me to leave it all in God’s hands’.

12.93 The growing number of professional social workers who were working with unmarried mothers removed many of the religious/ideological barriers that had existed in the past to such cross-agency referrals. Journalist Mary Kenny suggested that Cherish had been enormously effective as a pressure group; its influence had resulted in an increase in affiliation rates, in the unmarried mothers’ allowance, and a fall in the adoption rate from 94% to 50%, though other factors - national and international - were also driving these trends.

12.94 The financial difficulties that single mothers faced were a recurrent theme in the Cherish files of the 1970s and 1980s. The cost of child care and accommodation made it difficult for them to return to work. Cherish received pleas for support from mothers who were in debt, from mothers who wanted money to buy Christmas presents for their children and mothers who had borrowed money (perhaps from a money lender) and were unable to repay it. Many women commented on how unfair it was that the father of their child had a well-paid job and lived in some comfort, whereas they were living in penury. One woman acknowledged that she did not love the father of her child but would marry him ‘in order to secure a name for herself and the baby’. A Cherish worker described one putative father as ‘supportive’; he intended to marry his girlfriend ‘but not because of baby’. Cherish referred one woman, who was planning to marry, to a marriage counsellor because the social worker believed that she wanted ‘the false security of a wedding ring’. In 1983 one 17-year-old, who wished to marry her boyfriend ‘as soon as possible’, was refused permission by her local priest and was trying to get approval from the bishop. Yet several women were determined not to marry. One woman, who had married the father of her child while pregnant, was seeking advice about ‘getting out’ of the marriage.

12.95 Housing was the most pressing need among the mothers who contacted Cherish. One woman who was living in a flat in Dublin had to leave when it became obvious that she was pregnant. Many single mothers were living in squalid, damp accommodation; several were in squats. Cherish informed one mother who was looking for accommodation that it was difficult ‘as landlords are prejudiced against children’. At that time there was no legislation to prevent such discrimination. One

---

137 *Sunday Independent*, 7 Nov. 1976.
pregnant woman was fearful that her landlord would throw her out because he had already done that to another pregnant tenant. A letter from Cherish to Dublin Corporation housing section reported that one woman who had been evicted from her flat had suffered ‘continual harassment because of her child’.

12.96 By 1976 Cherish was accommodating six one-parent families in flatlets at Newlands’ Cross - most remained for short periods until long-term housing was secured. Some years later they ran a shared house for mothers and their children in Dundrum. They helped mothers with babies to find private accommodation. When Cherish met the Minister for Health and Social Welfare in 1977 they highlighted the need to increase the rent supplement when calculating welfare payments, given the high rents in Dublin. In 1980 housing was the primary concern of 53% of first-time callers. Almost half of those seeking housing were living with their parents. A follow-up study of 130 callers showed that only 12% were now living with relatives; 24% were in privately-rented accommodation, 22% with voluntary organisations, 8% in Dublin Corporation housing, 7% in Regina Coeli, 6% cohabiting; 14% had secured live-in employment.

12.97 In 1978 the Federation of Services for Unmarried Parents and their Children sent a questionnaire on housing to member agencies. The 18 agencies that replied reported that 184 clients had sought assistance with housing over a four-week period. The majority were pregnant women; 63% were leaving the family home; 24% were leaving privately-rented accommodation. The federation commented on the low instance of forward planning by mothers. Most agencies helping with housing were in Dublin, but more than half of their clients came from outside Dublin - so the pattern of pregnant single women coming to Dublin, which was identified in the 1920s, continued. The federation concluded that there was ‘a high incidence of housing breakdown’, when a single woman became pregnant. Regina Coeli continued to house significant numbers of mothers and children, though the quality of accommodation was poor - some viewed it as a means of fast-tracking access to local authority housing.

12.98 In 1980 a Cherish social worker commented that many women were so desperate to find accommodation that they were often forced to take ‘anything they can get no matter how bad or expensive’. Most local authorities gave priority to married

couples with children and they took the number of children into consideration when allocating houses, so a single mother with one child ranked far below a two-parent family with four or more children. The social worker described Dublin Corporation as ‘probably the most enlightened authority in the country. On their books a single mother and child are given the same number of points as a married couple with a child, which means that there is no discrimination towards the single parent’. A number of local authorities had adopted a similar policy, but the practice was not uniform. She claimed that for a mother and child to live with her parents was successful in only a small percentage of cases:

There are obviously some caring and enlightened parents, but many others, while allowing the girl and her child a roof over their heads, are anything but understanding and tolerant. There is often bad feeling if the girl goes out in the evening, so because of this and because of a guilt feeling, many single mothers never really have a life of their own. Others become far too dependent on the family support and are afraid to venture out on their own, despite the fact that often this is the best solution. Relationships can become very strained and problems that may appear petty to outsiders can loom very large in the family life.

She claimed that many arrangements where mother and baby lived with a family exploited the woman, because the family was only looking for cheap labour.\textsuperscript{140}

12.99 In 1975, over 20\% of applicants on the Dublin Corporation housing list, 30\% in Co Dublin and 20\% in Cork city were one-parent families (deserted and separated wives and single mothers). By the 1980s there is evidence of some advances in meeting their housing needs. Dublin Corporation regarded women who were in Pelletstown and who otherwise qualified for housing (for example, had been resident in Dublin) as ‘homeless’ which gave them priority on the list.\textsuperscript{141} Applications from two-parent families with children were falling. The birth rate in two-parent families had fallen; there was renewed emigration and local authority housing lists were much shorter than in the past. Gingerbread – A UK single-parent support group – formed a co-operative housing group with a view to building houses for one-parent families in Ireland and in the early 1980s the National Association of Building Co-Operatives contacted Cherish suggesting that they become involved in co-operative housing schemes.\textsuperscript{142}

12.100 Several schemes, supported by the health boards, had emerged that provided short-term housing for single mothers and their infants, often with social workers on site to provide advice and assistance. Miss Carr’s Home, a long-established charity for Protestant children, opened eight flatlets in Northbrook Road with a nursery attached, where mothers could stay for up to one year. Mothers were usually referred by social workers in the Eastern Health Board, Ally, Cherish and other organisations (see Chapter 25). Denny House, Belmont flatlets and Miss Carr’s Northbrook Road flatlets also accommodated mothers and children when they left a maternity hospital.

12.101 When Cherish met the Minister of State for Women’s Affairs and Family Law, Nuala Fennell, in 1983 they complained that single mothers were often offered accommodation ‘in particularly disadvantaged areas of Dublin often very far from their families’. However both parties agreed that it was virtually impossible for single mothers to get local authority housing outside Dublin, which meant that mothers tended to move to the city. They noted that there was a need for greater co-ordination between the Department of Health (which supported programmes for single parents) and the Department of the Environment. When Cherish met the Minister of State for Women’s Affairs and Family Law, Nuala Fennell, in 1983 they complained that single mothers were often offered accommodation ‘in particularly disadvantaged areas of Dublin often very far from their families’. However both parties agreed that it was virtually impossible for single mothers to get local authority housing outside Dublin, which meant that mothers tended to move to the city. They noted that there was a need for greater co-ordination between the Department of Health (which supported programmes for single parents) and the Department of the Environment.\footnote{Department of Health, CCP/INA/0/482591.} Singled Out, a pamphlet published by Cherish in 1983, claimed that homelessness was a constant threat for single mothers. It recommended changes in local authority housing policy: more units for smaller families and the abolition of restrictive residency requirements (i.e. that a person must have lived in the locality for some time before they were eligible to apply for local authority housing).\footnote{Singled Out, p. 17} It acknowledged that Dublin Corporation made efforts to house unmarried mothers, but they often ended up in ‘what have been termed the Corporation’s transit camps, areas of Corporation housing which gradually become filled with “problem” cases’, such as Ballymun.\footnote{Sunday Press, 8 Feb. 1983.}

Mother and baby homes in a changing environment

12.102 In 1970, 43% of the 1,708 ‘illegitimate’ births were to mothers in the major mother and baby homes. By 1980 the number of births had more than doubled to 3,691 but less than 15% were associated with mother and baby homes. By 1990 when the number of births had risen to 8,766, only 2% were to women in mother and baby homes. A significant number of women continued to be admitted to mother
and baby homes in the mid-1970s though they were a declining proportion of unmarried mothers. In the 1980s there was a substantial fall in the occupancy of mother and baby homes and they increasingly cared for specific categories of unmarried mothers: students, or women with special needs, addiction issues or difficult family circumstances. The denominational divisions that were deeply embedded in Irish mother and baby services disappeared, and the surviving homes, supervised flatlets and other facilities were accessed by women regardless of religion.

12.103 In the early 1970s there were four mother and baby homes: Bessorough, Pelletstown, Dunboyne and Denny House, which was still known as the Magdalen Asylum and exclusively for Protestant women. The 1970s was the first time that mother and baby homes were subjected to public criticism, some of it from former residents. This happened, paradoxically at a time when conditions were improving - but arguably not sufficiently fast to meet changing demands and perceptions. In 1973 the *Sunday Independent* reported claims by a former Bessborough mother that the food was inadequate, medical care was minimal and there was a lack of recreational facilities. The chair of the Southern Health Board described these allegations as ‘grossly unfair’, but we have no evidence that he visited the home and spoke with the women. The sister in charge claimed that they were totally without foundation. In addition to breakfast, the diet included a full lunch and a tea consisting of a fry or cold meats or salads. The women had tea and biscuits, bread and butter or cake at 10am, 3.30pm and 9pm. There was a plentiful supply of fruit when in season from the community’s orchards. A gynaecologist called every morning, and they had the services of two ‘top paediatricians’ and a GP. One sister described communication between the girls and the staff as ‘frank and open and above all sympathetic’. The editor of the *Sunday Independent* claimed that they had received a number of letters from former Bessborough residents, including one signed by five women, praising the ‘kindness, love, care and attention’ which ‘they would never be able to forget’; other former inmates also rejected the allegations. Several witnesses who were in Bessborough around that time and who gave sworn testimony to the Commission described the food as adequate; some suggested that it was similar to boarding-school fare, and there is independent evidence from contemporary inspections that Bessborough had recreation rooms and a television, so the assertions of this woman, who apparently

---

146 The Commission has failed to identify this story.
spent only five days in Bessborough (perhaps in the maternity hospital, where there wouldn’t have been any recreation facilities), are open to question. What is significant is that she chose to speak out - that would not have happened in earlier times.

12.104 In 1974 Dr Dermot Walsh highlighted four priorities in services for unmarried mothers: smaller mother and baby homes; group homes for mothers and children; housing requirements in general; crèches, nursery facilities operated by trained child-care workers, and adequate social work providing guidance, advice and support for single mothers - including the organisation of mutual self-help support for unmarried mothers and their children. Dr Walsh’s criticism of large mother and baby homes was not new, but it was now given a more scientific edge, given his concerns for the psychological well-being of pregnant single women. In 1971 a department inspector complained that mothers in Bessborough had no privacy. By 1974 the dormitories had been replaced by individual cubicles, and there were improvements to bathrooms and other facilities. Pelletstown, another old institution, underwent similar improvements. In 1974, apparently for the first time, the department’s inspector spoke to eight women individually about their experience in Bessborough. (It is unclear how they were selected). She reported that ‘all spoke highly of conditions in general and in particular expressed much appreciation of the work of the community: their understanding of their problems and efforts to iron out difficulties’. In the case of four of these women, neither parent was aware of her pregnancy; the mother of two women was aware, so presumably were both parents of the remaining two women. The women expressed minor criticisms - lack of bath cleaning materials and under-heated dormitories - but the inspector pointed out that there was a nationwide shortage of fuel oil, and economies were necessary; the infant nurseries were adequately heated. The heating shortage was not specific to a mother and baby home. In 1982 Woman’s Way quoted a woman who had given birth in Bessborough: ‘everybody was fantastic…I felt very secure…They did not want me to keep the baby, but as soon as he was born he became important to me and it didn’t seem right to put him up for adoption. He was my responsibility’.

149 Department of Health INACT/INA/0/463707
12.105 The average length of stay fell sharply during the 1960s, though most women remained until their infant was placed for adoption. By the 1970s mothers were no longer required to remain until their infant left the home. In 1975 the Mother Superior explained that ‘For the past year or two the scene has changed very fast’. Because abortion was now available in Britain they decided that mothers should be discharged as soon as they were medically fit to leave after the birth - six to 12 days. Babies remained in the home until the mother determined whether she would keep her child or place the baby for adoption; by 1981 babies stayed for four-five weeks on average.\textsuperscript{151} In 1983 the average length of stay for women in Pelletstown was just under nine weeks.\textsuperscript{152}

12.106 If a woman planned to keep her child, Bessborough would keep the infant until she had arranged accommodation. Most women entered a home only during the final weeks of pregnancy or the immediate post-partum days, so they were no longer carrying out any significant work. Bessborough had to recruit nursery nurses to care for the infants, at a time when wages/salaries were rising sharply, as were non-pay costs. The Mother Superior conceded that ‘if the girls are to be prevented from going to England for abortion there must be something to offer them’.\textsuperscript{153} Staffing levels were considerably higher than in the past, though she claimed that they were not adequate. In 1975 there were five midwives; two at night and three during the day; one SRN for night or day duty, plus one auxiliary during the day in the maternity hospital. There were eight SRNs in the home, two full-time and one part-time auxiliary, plus paid domestic staff in the kitchen and laundry in addition to the Sisters. The number of women joining religious orders had fallen significantly and many were leaving religious life, so Bessborough was increasingly dependent on lay staff - which further increased the costs because the Sisters did not receive a salary, in contrast to Pelletstown where they were local authority employees. When the Department of Health inspector visited Bessborough in 1978 the weather was warm and sunny. She reported that ‘From what I could observe the “girls” took full advantage and spent most of the day sun-bathing. They give little, if any assistance in routine work. The staff are hard at it full-time’; she believed that staff numbers were not adequate for the work involved.\textsuperscript{154}

\textsuperscript{154} Department of Health, CCL/INA/0/488268.
12.107 Large mother and baby homes were increasingly uneconomic because of falling occupancy. Short stays meant that a home could be full one week, and almost empty two weeks later. Rising costs, coupled with falling occupancy (and double-digit inflation) meant that capitation grants were rising steadily, yet finances showed little improvement. The Sisters were pressing to be paid salaries; the Mother Superior claimed that Bessborough was being subsidised by the congregation. A department inspector noted that the order was performing a vital role, and unless steps were taken to provide them with adequate salaries the home might close, adding ‘this would create unsurmountable difficulties for the Heath Boards in finding care and accommodation for young unmarried mothers’.  

12.108 In 1978 a social worker in Cherish sent a note about current needs of single mothers to the chair of the Magdalen Asylum/Denny House. Greater tolerance on the part of families meant that more women remained at home during pregnancy; others opted for family placements. The improved social welfare provisions meant that mothers had some choice about future arrangements for their child, but this had resulted in ‘new areas of need’ such as day nursery places and housing for mothers and children, temporary accommodation immediately after the birth and long-term housing. She suggested that the Magdalen Asylum could provide temporary accommodation for mothers and infants immediately after the birth; many mothers had to place their infants in residential care because they had nowhere to go, which disrupted the bonding between mother and infant. They could also provide emergency accommodation for mothers and babies from the country who often arrived at the Cherish offices with nowhere to live. She also suggested that they should consider extending their facilities to woman of all Christian denominations; its mission since the eighteenth century was confined to Protestant women.

12.109 Miss Clandillon visited this home in 1979 to discuss possible changes, and the trustees appear to have kept the department informed of their plans. The Magdalen Asylum changed its name to Denny House, honouring Lady Arabella Denny, their eighteenth-century founder, and amended its charter to enable them to admit unmarried mothers without religious restriction, and, in certain circumstances, married women who were separated from their husband, deserted

155 Department of Health, INACT/INA/0/538770.

wives, and pregnant widows. The numbers rose significantly following these changes. By the early 1980s women were being admitted to Denny House in the final weeks of pregnancy. They gave birth in a Dublin maternity hospital - presumably the hospital of their choice, because returns show no consistent pattern. They returned with the baby and remained for approximately three months. Social workers in the Dublin maternity hospital referred mothers who needed time and space to determine their future arrangements or needing support in developing parenting skills. Other women spent their time in Denny House resolving their relationship with their parents or the father of their child (see Chapter 23). During this time mothers were expected to decide whether to keep the baby and make arrangements for their future. They were required to take responsibility for their baby while in the home - as part of the process of making them aware of the demands of motherhood. When Denny House staff met Augusta McCabe, the department’s social work adviser, they cited several instances where young women, who had planned to keep their baby, changed their mind ‘when faced with the reality of caring for the small baby’, and contrary cases where women who had planned on adoption also changed their minds. By 1982 Denny House which only accommodated ten women at any time, had a waiting list.

12.110 Miss Carr’s Children’s Home, a long-established charity for Protestant children, was increasingly providing accommodation for the children of separated parents and single mothers; some children were maintained by local health authorities. Miss Carr’s aimed to keep mother and children together and would occasionally permit the mother to live in the home with her child(ren). In 1972 they bought a house adjoining the children’s home that they planned to turn into flats for deserted wives/unmarried mothers and their children and they applied to the EHB for a grant to cover part of the cost. The concept of a health authority giving financial support to a voluntary organisation that provided housing for deserted wives or unmarried mothers and their children was a ‘new development’, though the EHB had been provided with some flats by Inter-Aid, which they used as supervised accommodation for unmarried mothers who were keeping their child. The Department of Health was broadly supportive of these initiatives, noting that they

were in line with the Council of Europe resolution and accommodation would be available on a 'non-denominational basis'.

12.111 The Eastern Health Board held an Open Day in Pelletstown in 1981 to introduce social workers and others working with unmarried mothers to the new matron and to discuss new social work arrangements. It would have been unimaginable even ten years earlier to hold such an Open Day. Pelletstown, which was described as ‘an old rambling building’ and a ‘fire risk’, had capacity for 100 women, but there were only 37 residents. At this time Pelletstown was primarily used to accommodate children with special needs. The EHB considered demolishing the large building and replacing it with flatlets designed to accommodate mothers and babies. In 1982 the Federation of Services for Unmarried Parents and Children announced that a study of mother and baby homes was underway in the EHB region to determine the views of social workers as to the benefits and shortcomings of the homes. They noted that ‘the response from the social workers was poor’.

12.112 A handwritten page dated January 1979 in a Department of Health file noted that at a recent meeting of the Federation of Services for Unmarried Parents and their Children ‘reservations were expressed at the level of obstetrical care’ provided in mother and baby homes. The maternity unit at Pelletstown closed in 1980. Doctors had wished to close it for some time, but some members of the EHB believed that it enabled women to keep their pregnancy a secret; the doctors were concerned about the quality of care and potential risks to mother and baby. In 1981 the senior health officer at the Department of Health expressed concerns about ‘the high level of risk’ in Bessborough births. He described five stillbirths and two infant deaths in a total of 307 births as ‘very high’. He questioned whether the service was adequate and whether the women received adequate antenatal care. By 1981 approximately two-thirds of women admitted to Bessborough were giving birth there. The Department was investigating the desirability of ending deliveries in Bessborough. The matter was referred to the SHB; they reported that the peri-natal mortality among Bessborough infants - whether they

were delivered in the home or in St Finbarr’s Hospital - was double the national average. The director of community care had investigated the stillbirths and concluded that little could have been done; two neonatal deaths were due to gross deformity, one of these infants was extremely premature. The SHB acknowledged that ‘the position of this unit in the overall obstetrical service’ should be considered.  

No decision was taken. In 1985 a senior SHB official raised questions about obstetrical care in Bessborough. A handwritten note on a Department of Health file claimed that a nun/midwife had contacted the Board privately about discontinuing deliveries. The Department commented that

For the unmarried girls who reside in ‘mother and baby homes’ and their babies, pregnancy and delivery carry a much higher than average degree of risk and this is particularly so during the perinatal period…To continue to carry out deliveries of this high risk group in a non-consultant staffed unit, funded by a health board, would appear to be contrary to the Department's clear policy on deliveries.

12.113 The general hospitals division wished to discontinue births in Bessborough ‘in the light of the overwhelming medical opinion and evidence re non-consultant staffed units’. Shortly after this report the Southern Health Board confirmed that Bessborough had agreed to discontinue deliveries.  

12.114 By 1983 the facilities provided for unmarried mothers and their babies in Bessborough, Dunboyne, Pelletstown, Denny House and Miss Carr’s were costing £1.5m in public funds. Bessborough was the only home that provided maternity care. An official in the Department of Health commented that ‘Actually, the homes have a social function only, serving as a refuge for unmarried mothers and their children and providing them with counselling and accommodation during the later months of pregnancy and for a short time after delivery’. In the final years many of the women in Pelletstown and Dunboyne were referred by CURA.  

By the mid-1980s the occupancy rate at Pelletstown at certain times was only 10%.  

12.115 In 1983 a social worker wrote a report of her experiences with women who were admitted to Pelletstown. She had been under the impression that women would only be admitted following conversations with a social worker, and that the social

169 Department of Health, CCL/INA/0/488258.  
170 Pelletstown Discovery E 11
worker would retain contact with the woman while she was in Pelletstown. Having interviewed all the women when they arrived in Pelletstown her overall impression is of minimal contact and a marked resistance on the part of the women to maintain the contact or travel outside the Home for office interviews. The young woman hiding from family and community often fears meeting a friend or neighbour…Patterns of institutionalisation with its apathy and dependency can be observed within a week of admission…The women often view contact with Social Worker as upsetting and will avoid such contact denying the need to plan for the expected child.

12.116 Only 40 of the 177 women came from the Eastern Health Board area, which indicated that ‘a flight to the city’ continued. Many woman had made hasty decisions on discovering that they were pregnant, abandoning jobs at a time of high unemployment, without being aware of their entitlements to maternity leave; dropping out of school or college ‘in a similar, hasty unplanned way’. Some women needed education on the ‘biological facts of life’; she claimed that there was ‘a marked level of ignorance amongst the women who did not avail of ante-natal classes at hospital’. She noted that ‘Moral dilemmas and legal requirements do, however, emerge in assessing how some handicapped girls will parent their child either in the short or long term. There is not in my opinion sufficient recognition of the fact that some mothers require long term semi-sheltered accommodation if the child is to receive adequate care and protection’. Pelletstown had lots of vacant space, so anybody who applied was admitted, but ‘Obviously a smaller unit will have to select criteria’.171

12.117 In 1985 the Eastern Health Board purchased a house on Eglinton Road, as the successor to Pelletstown. They asked the Sisters who had been running Pelletstown to take charge. Eglinton House accommodated a maximum of 13 women and 10 babies; all the women were referred by social workers. The focus was on enabling mothers and children to move to independent living arrangements. Mothers often moved into flatlets in nearby Belmont Avenue (see Chapter 14).

12.118 A 1986 Department of Health file that reviewed current and future provisions for unmarried mothers and their children commented that

171 Pelletstown Discovery E 11
It is not known how the girls managed in the homes before and after pregnancy but there is a conventional wisdom that they had to perform ‘penitential work’, e.g. laundering and other domestic work. Presumably this was, in part at least, an act of atonement for the grave wrong they had perpetrated against the pristine society of saints and scholars.

12.119 Minister of Health, Barry Desmond, agreed that officials should examine the possibility of closing St Clare’s children’s home in Stamullen, Temple Hill Children’s Hospital, the Nazareth home at Fahan (Donegal) and Bessborough. When the department contacted the North Eastern and Southern Health Boards to discuss this proposal, their ‘response was less than ecstatic’ despite the fact that closing Bessborough would release £500,000 for child care and family services within the Southern Health Board; closing Stamullen give the North Eastern Health Board £120,000 for similar purposes. The department emphasised that this was not a cost-saving exercise; the savings would be used to develop child and family services in the community, including support services for single-parent families. The Southern Health Board official told the department that the Sacred Hearts congregation had raised the question of Bessborough’s future with the board, and they had indicated a wish to continue working with children. At this time Bessborough accommodated 18 pregnant women, nine mothers with babies and five babies without their mothers. It was staffed by ten nurses - six Sisters, four lay - ten domestics and two non-nursing Sisters. The SHB official said it was ‘basically operating as a small acute hospital with sick patients’, which was a strange description, especially as it no longer provided maternity care. The Southern Health Board indicated that it would use the resources freed by closing Bessborough to hire additional social workers, develop flatlets for single mothers and day-care centres in Cork city, and provide additional resources for fostering and parenting courses for mothers. Closing Bessborough would take time; it would take time to identify alternative activities for the congregation and the premises.172

In the early 1980s Bessborough introduced AnCo173 training courses for the women. The Southern Health Board was concerned that some women were staying for unduly long periods presumably to attend these courses.174 Some mothers were helped to move into flats in Cork with their babies.

172 Department of Health, CCL/INA/0/488268.
173 The State training agency; later called FÁS.
174 Department of Health, CCL/INA/0/488268.
12.120 While Bessborough and Pelletstown had very low occupancy rates, in 1981 the occupancy rate in Dunboyne was ‘very high’ and it remained high in the early and mid-1980s. Dunboyne continued to offer the best facilities, and the smaller scale made it less daunting for mothers. A doctor who visited it during the 1980s described it as ‘chintzy’. There were a total of 29 beds in single rooms, cubicles and bedrooms for two, three and four women (the latter had a bathroom attached). There was a TV room, a smoke room, a record room and two parlours for visitors. Staffing for the approximately 30 young women consisted of five religious - one midwife, one children’s nurse, one social worker, one administrator, one receptionist; two cooks, one domestic worker, a gardener and eight part-time teachers. By 1989 roughly half of the Dunboyne residents were aged from 14 to 18. Most of these teenagers spent their time studying for school examinations, and they often arrived relatively early in pregnancy; older women arrived later in pregnancy. In addition to classes for younger women, some of the women carried out light work for external companies - assembling the contents of board games, and sorting papers for large meetings, for which they were paid a piece-rate; and there were lectures on diet and personal care. In 1989, at a meeting between the Department of Health and the North-Eastern Health Board, the latter expressed the view that Dunboyne and its service were outdated, but any proposal to close the home should come from the Sisters. The Sisters were examining the possibility of replacing it with two smaller homes - one catering for students and women under 18 years and a second for other women. These homes should be in a city, close to a maternity hospital. The department recommended that Dunboyne should remain in operation as a ‘stop gap measure’, until alternative arrangements were agreed. The official noted a ‘need to move quickly on this before it becomes a political issue’.

12.121 Dunboyne began the process of closing in late 1990. CURA and Bishop O’Mahony claimed that the health boards were not aware of the full demand for mother and baby homes, because many women preferred to seek support from church-based services. When the department met the bishop and CURA, they claimed that there was a continuing need for a place such Dunboyne. They also claimed that the Good Shepherd Sisters came under pressure from the North Eastern Health Board to close Dunboyne, whereas the health board claimed that the Sisters had initiated the discussion. When the Department contacted the health boards about the impact of closing Dunboyne, they indicated that it had not presented any difficulties. All but one of the senior social workers reported that
there was little demand for Dunboyne. Women who wished to leave their home area when pregnant were accommodated with CURA families; the Midland Health Board planned to recruit ‘host families’ for women who would previously have been sent to Dunboyne. The South Eastern Health Board highlighted the problem of pregnant teenagers dropping out of secondary school, suggesting that further research was needed on that topic. The Eastern Health Board reported that the numbers admitted to Denny House had increased, and suggested that this might be due to the closure of Dunboyne. It was reported that CURA in Limerick were developing a hostel to fill the gap created by closing Dunboyne. Denny House closed in 1994. Bessborough, the first mother and baby home to open in the Irish Free State, was the last to close - in 1999.

**Changing Attitudes?**

12.122 In 1972 the sociologist and Catholic priest Micheál MacGréil, published a detailed report on Irish attitudes on a variety of social issues. He reported that only 3% of respondents agreed that ‘the unmarried mother should pay for her sin’. There was strong agreement that ‘children born out of wedlock should be treated the same as those born in marriage’. These findings would appear to suggest that prejudice against single mothers and their children had disappeared. However there is evidence that, while attitudes were changing, the transformation was less radical than MacGréil suggests. In 1971 June Levine wrote about Northern Ireland civil rights activist and MP Bernadette Devlin, who was a single mother. She described Devlin as ‘a liberated woman’. Levine contrasted Bernadette Devlin with an unmarried friend who had kept her baby and was struggling, unable to cope; she was not trained to earn a living, and was ‘hurt but not angered by the fact that the father of the child is as free as a bird, while she is so tied that she barely manages to get to mass’. Journalist Ginnie Kineally suggested that

In the final analysis, though, even a hundred helping agencies will not be enough so long as parents continue to throw out their pregnant daughters, so long as the men responsible for women’s pregnancies insist on abortion. But as long as people thoughtlessly make uncharitable and censorious remarks about unmarried mothers these parents and these boyfriends will continue to behave this way, out of fear of ‘what people will say’. So it could be said that

---

175 Department of Health, FIN2/EST/0/543210.
a great many of us in Ireland are responsible, indirectly, for the evil of abortion. It’s not a pleasant thought.\textsuperscript{178}

12.123 In 1976 journalist Mary Kenny suggested that having a child outside marriage was the worst tragedy that could happen to an Irish family. She quoted a young single mother who claimed that “It’s not just your own life you’re supposed to have ruined…You’ve ruined your sisters’ marriage prospects and your brothers’ chance of promotion. Sometimes, young brothers can’t even be told, for fear of strong reactions. And by young brothers I mean lads of 25”. Kenny quoted from her interviews with Cherish clients: women who panicked and fled their home town, and often quit their job on discovering they were pregnant. ‘But the panic is for the old reason - fear of the family’s reaction, of society in small towns and also of forced adoption’.\textsuperscript{179}

The Catholic Church

12.124 By the mid-1970s growing numbers of single Irish women were travelling to England for abortion, and the proportion of extra-marital pregnancies ending in abortion was higher than in England. Over 80% of Irish women having abortions in England were single, whereas a majority of English-based women who had abortions were married. In 1981 the ratio of abortions to single births in Ireland was estimated at 70:100, prompting one sociologist to conclude that ‘for those unable or unwilling to assume the role of single parent, abortion is becoming the preferred solution’.\textsuperscript{180} Abortion had a major impact on Catholic church attitudes towards single mothers, though the change was not universal. Independently-minded priests such as Fergal O’Connor and James Good were among the most sympathetic. In 1973 James Good told a seminar on Christianity, held in a West Cork hotel, that he had worked with 1,000 unmarried mothers in the course of his work with adoption and ‘he doubted if they could produce one mortal sin between them all’.\textsuperscript{181} The publication of excerpts from Fr Good’s speech in a Sunday newspaper prompted a vehement letter from the secretary of the Catholic Priests Association who claimed that he was ‘leading the readers of your paper into error, if he thinks for a moment that they should accept his findings on sexual morality, and abandon the teaching of the Church that violations of the virtue of chastity can

be as serious as violation of the virtue of justice’. Much of this attack was directed at Fr Good’s criticism of papal teaching on contraception. The correspondence that followed this altercation showed that opinions were divided though a majority of letter writers were hostile. A Dublin woman asked ‘Why have I read so many indignant letters upbraiding Fr Good for declaring that he found no evil in the 1,000 unmarried mothers with whom he had come in contact? Surely, this is a matter for rejoicing, and reflects credit on Fr Good that he saw only the good in them’. A speech on medical ethics by the Archbishop of Dublin, Dermot Ryan, linked abortion, euthanasia and single mothers. He explained that the Catholic Hierarchy planned to establish a ‘lifeline’ to assist women contemplating abortion. People should not rush to attribute guilt and blame to single mothers; the male partner commonly remained hidden and was slow to assume responsibility for the pregnancy. Unmarried mothers should be treated with compassion, sympathetic understanding and practical assistance, but ‘people must not make the mistake of making compassion the criterion of a particularly tolerant minority’.  

12.125 The primary purpose of CURA, which was launched in 1977, was to reduce the numbers of Irish women travelling to England for abortion. When Bishop Dermot O’Mahony sought financial support from the Department of Health, he mentioned that at a later stage CURA would probably give consideration to other problems - such as the status of ‘illegitimate’ children. The department noted that the only agencies consulted by the hierarchy before establishing CURA were the Catholic adoption agencies; furthermore CURA had no advisory committee. They expressed concern at being asked to provide funding (roughly three-quarters of total costs) for an organisation that was established without prior consultation, whose need was unproven, and might compete with existing organisations. CURA’s request for £17,000 in 1977-8 was substantially greater than the combined grants given to the Federation of Services for Unmarried Parents and their Children, Cherish and Ally. The Minister of Health was also coming under pressure from Lifeline, a British anti-abortion organisation, to support their activities - but officials advised against doing this. Shortly after CURA was launched, the Bishop of Derry, Dr Edward Daly, suggested that Irish attitudes towards unmarried mothers were responsible for the many Irish women who sought abortions in

---

185 Department of Health, CCP/INA/0/482259
In 1978 Fr Colleran, formerly of the CPRSI, now a regional organiser for CURA, announced that CURA planned to provide hostels where mothers could stay with their babies when they left hospital. The Belmont Flatlets (see chapter 14) opened in 1980). CURA hoped to accommodate up to 70 women and children in the Dublin area; they also planned to establish day nurseries and a programme where families would provide child-care for an infant while the mother was at work. The Commission has not seen evidence that hostels or day nurseries were opened, other than the Belmont Flatlets. CURA would also, with the bishops’ permission, provide a guaranteed and free pregnancy testing service, with results within 24 hours. He reported that CURA had been contacted by up to 1,500 women in its first year; 10% of the women had been contemplating abortion; he claimed that only 20 women went ahead with an abortion.

An undated CURA handbook, which was probably printed in the early 1980s, listed their services as pregnancy testing; information and advice on social welfare entitlements; medical facilities; counselling; abortion; post-abortion counselling; pre-natal accommodation; foster care; adoption; help with keeping babies, including practical help around food, clothing, accommodation etc. The 1984 annual report noted that CURA had handled 7,353 telephone queries during that year. CURA referred pregnant women to Pelletstowns and Dunboyne. By the 1980s fewer women were willing to go to mother and baby homes, so CURA organised family placements. Minutes of a meeting of the Connacht bishops in 1985 record that ‘most of those who come to CURA first will want adoption. As time goes on they will want to keep the baby’. They counselled against women ‘rushing into adoption’, because that decision ‘may contribute to a second pregnancy’. Some mothers wanted their daughter to have an abortion; ‘If the parents do not accept the child the girl should not keep the baby’. They noted that ‘Most of those who keep their baby end up in a mess. They experience great frustration in looking after the baby’. By the 1980s CURA had a team of volunteers and social workers who provided advice and supports to women who kept their babies. In Galway they organised a weekly tea morning for mothers and their children as a mutual support network. CURA also provided some short-term

---

188 Dublin Diocesan Archives, Dermot O’Mahony papers
accommodation in flats and houses for single mothers and their child(ren), and they used their influence to secure local authority housing.  

12.127 Fr Colleran claimed to have seen a change in attitudes towards unmarried mothers:

When I began 13 years ago, very few parents of the unmarried mother wanted to know. Now a large majority are prepared to help the pregnant daughter; most will take her child into the family and accept it as one of theirs. Often university graduates and the like who espouse strong liberal views turn out to be the most conservative. But overall the whole pattern, reflected in every class, is much more tolerant of the single mother.  

12.128 Dr Cahal Daly, Bishop of Ardagh and Clonmacnoise, criticised lingering stereotypes about the treatment of pregnant single women. ‘It is totally untrue that all pregnant girls are rejected by their home, blamed and scorned by caring institutions. But some still believe this. Then visiting social workers tell us that our services for unmarried mothers are better than almost anywhere - but they are not widely known’.  

Fr Michael Cleary and Bishop of Galway, Eamon Casey, both priests who frequently spoke in public about attitudes to unmarried mothers, were later identified as fathers of children born to single mothers. Michael Cleary pleaded for better financial support for single mothers and deserted wives. When Bishop Casey addressed the 1978 AGM of the Federation of Services for Unmarried Parents and their Children he spoke about ‘The Society’s responsibility towards the unmarried parent and child’. He told the audience that ‘children born out of wedlock should be cherished more than ordinary children’; the ideal solution was to keep the child within the family setting. The government was opposed to abortion and it should reflect this opposition by supporting pro-life efforts. He saw no conflict between the work of the federation and CURA.  

**Family, friends and neighbours**

12.129 The letters written to Cherish offer a sobering corrective to any belief that Irish attitudes towards unmarried motherhood had been transformed by the 1970s. A woman who kept her baby reported that she had lost ‘all my so-called friends’ as a consequence; she had also lost her self-confidence. In 1973 the mother of a

193 Department of Health, CCP/INA/0/482259.
seven-year old son, who lived with her three brothers, possibly on a farm, wrote that if they discovered that she was again pregnant ‘they will probably put me out, I guess I would not blame them, once is bad enough’. She was ashamed to visit her doctor. One woman who had phoned Cherish from a provincial town apologised in a follow-up-letter because she might ‘have sounded a bit “short” on the phone, but you understand I did not want to say too much as it is manned by locals at night in particular’. In 1974 many telephone exchanges in provincial Ireland were manual - callers had to be connected by a telephonist who could listen to the call. A woman reported that around the time that she discovered she was pregnant, a young woman in the neighbourhood had a baby outside marriage ‘and my mother said to me “If anything ever happens to you, you can pack your things and go”’, so she had decided not to tell her parents. A farmer’s daughter, who was living at home, concealing her pregnancy and milking a large herd of cows every day with her father, was scared of going to a maternity hospital, lest she meet a neighbour or a member of the nursing staff who knew her. She planned to place her baby in a foster home: ‘the main thing is that no one would know about it as it would kill both of them [parents] apart from that I could never face them again’. Another woman wanted to keep her pregnancy secret because she was afraid that the news might kill her parents as she had been identified as ‘the sensible one in the family’; she felt ‘angry, guilty, embarrassed, ashamed at present’. A woman who described herself as ‘the black sheep of the family’ felt ‘depressed and rejected by everyone’. She had contemplated suicide; planned to keep her baby but was afraid of being rejected by her friends. When one single mother contemplated getting a flat on her own (with her child) her mother said that ‘she would put a red light over the door’.

12.130 A long interview with Cherish workers and Cherish clients in 1976 highlighted the continuing, though declining pressure on mothers to have their child adopted. One mother thought that “The pressure is, I think, lessening a bit now, but it was almost irresistible when I had [her son] eight years ago…Not only my parents but all my contemporaries and all the institutions of Church and State seemed to be pushing for adoption”. If her baby had not been ill after he was born and had to stay in hospital for a year, he almost certainly would have been adopted. This article quoted Maura O’Dea of Cherish who suggested “some girls also want to keep their babies for the wrong reasons…An awful lot of young girls think of their babies as dolls to play with and don’t realise the responsibility of a child”. The mother of a two-year old boy spoke of “the trauma of watching your parents age ten years when you tell them…You have to watch your friends doing their best to talk you
into giving up your child. They’ll tell you, after all, they feel dragged down by what you’re doing”…Sometimes, to be fair, the girls’ own mothers do come around, in the end: sometimes it’s in a compromising kind of way - they will, say come to Dublin to visit their daughter, but not encourage the girl to come back to her home town; or they will allow the girl a discreet visit, but ask her not to accompany them to the same Sunday Mass. Often the most unexpected parents turn out to be the most solid’. 194

12.131 One woman who wrote to Cherish in 1978 explained that her parents were very supportive but ‘at present I would prefer if at all possible I could leave [her home town]’. A 19-year-old from rural Ireland stated clearly ‘I want to get away as soon as possible, immediately. I don’t want anyone to know’; she was unwilling to go to a mother and baby home, and wanted a family placement. Another described Killarney, her home town, as ‘like a second Coronation Street’ - presumably implying that gossip was rife. A woman reported that her mother told all the neighbours about her wonderful grandchild, adding ‘They all think she’s loopy for boasting about the baby instead of hiding her under the kitchen sink’. A mother who went home with her baby had a less happy experience, her parents gave her money to ‘leave the country, as they are badly affected by the talk and do not want me around’. A single mother, whose parents were minding her daughter when she went to work, commented that

I think that the worst part of it all for my mother was facing the neighbours. That’s when I felt really bad about it. She would go out to the shops or something and come back white and quiet because of something someone had said - or what hadn’t been said more often, because the usual reaction was ‘Oh I see’ and then a long silence.

12.132 A woman living in provincial Ireland, whose daughter planned to keep her child sought advice as to what she should do: ‘you can imagine what this place is like…everyone knows everybody’s business and most of them are not very charitable in cases like this’. This woman had offered to keep the baby while her daughter arranged a job,

but that’s when the trouble started. Some of my family and my best friend and my parish priest (who has been most helpful) have advised me that that would be the wrong decision. They say the child would have a bad time when she

starts school - that everyone would know she was illegitimate and would be nasty to her. I was full bent on keeping the little girl as I could not care less about what neighbours or anyone else says but now I am wondering.

12.133 A woman who was pregnant with her second child wrote that ‘the prying and malicious gossip of neighbours is causing me a lot of stress’; she wanted to move to a place where she was ‘less known’ but believed that this would be difficult, as she had been allocated local authority housing. A single mother living with her child in rural Ireland wanted to move to Dublin as she felt that she was ‘stigmatised in the community’. One woman, whose mother had offered to care for her child ‘probably impulsively’, became concerned about the neighbour’s attitudes. The school teacher mother of another woman was insistent that her grandchild should be ‘hidden quite a lot’ because she was ‘aware of what the nuns think…And very aware of her position in the community’.

12.134 One set of parents planned to move house because of their daughter’s pregnancy. A Cork woman who had decided to keep her baby reported that her parents were opposed to her decision and would not permit her to visit with her child, but the Capuchin Friars had assisted her in finding somewhere to live, and her boss and his wife brought her and baby to visit her parents; they relented and wanted mother and baby to come home for summer holidays. A second-time single mother, who had kept her first child, born when she was eighteen years of age, reported that her mother ‘stood by me on both occasions’. Recalling the infancy of her first child in the late 1960s, she recalled that ‘The first three months were hard especially in a small town…with everyone talking and nudging when I went shopping but then I just got to the stage when I ignored them, and pretended I did not care about them’.

12.135 The mother of a five year old girl told Woman’s Way that ‘The children come, [to their home] but their mothers keep their distance’. In 1993 the Sunday Independent quoted a woman whose daughter became pregnant: ‘How would I tell my mother, my friends, my colleagues at work? How would I face anybody? I could not face anybody. I told nobody. We sold our house and moved to a rented house in a new area. I left behind all my very good friends and neighbours.’

---

196 Sunday Independent, 1 Aug. 1993.
Social censure might even extend to a woman who married when pregnant. A letter writer to *Woman’s Way* described how

> The street I live in is full of gossips and when I had to get married last year they’ve never let me forget it. When I take the pram to the shops I hear remarks and one woman has reduced me to tears with the wicked things she says. I love my little boy and I love my husband too. I want to be a good wife and mother, but they make me feel dirty and shameful. Even my mother says she’ll never be able to hold her head up again. Some days I can’t face going out and meeting anyone, so I shop very early or nearly at closing time to avoid people. My husband says I shouldn’t do this, but he doesn’t have to put up with it.  

12.136 In 1980 *Woman’s Way* noted that 50% of single mothers were keeping their babies. They asked

> Does the decrease in babies being offered for adoption coincide with an increase in public understanding? Unfortunately it doesn’t appear so. As one social worker put it, the only reason more girls are having the guts and determination to keep their babies is because there is now excellent support available from various concerned organisations. Thanks to pressure from these groups, unmarried mothers can now get State allowance, tax relief and so on, along with practical help and advice to deal with all the nitty gritty problems that come their way. Public opinion towards the unmarried mother is more tolerant in our larger cities, although far from disappeared, but in many rural areas local censure is still as strongly prejudicial against the single mother as it ever was.

12.137 Cherish reported increasing involvement by the wider family in the lives of single mothers and their children; 46% of parents who were aware of the pregnancy/child were supportive and helpful, 15% were not; 33% did not know the situation, in 6% of cases the main support came from siblings. However a study carried out by Ally of 459 women who contacted them in 1979 concluded that ‘The message that comes over loud and clear is that many of the girls who come to us don’t feel that their relationship with their parents is strong enough even to cope with an extreme problem for their daughter, and it is also apparent that many parents were simply

---

199 Department of Health, CCP/INA/0/489154.
not interested enough to know of their children’s need for help; 46% of parents didn’t know about their daughter’s pregnancy. Whether to tell parents or not remained a regular topic for debate even in the late 1970s.

12.138 In 1981 a 20-year old women who was living in a flat in Dublin with her baby and the father of her child contacted Cherish. Her parents had refused to give her a letter permitting them to marry during her pregnancy, and she hadn’t seen them for several months until they called to her flat, saying that the baby’s father had ‘no legal hold on the baby’; they wanted to place her child with adoptive parents who were known to them. They would come to collect the baby on a specific date. She asked whether they had the power to do so. The case notes on one client, whose religion was recorded as Protestant, stated that ‘her relationship with parents deteriorated, they pressured her to place the baby for adoption. They disapprove of the PF, who is not Protestant and because there is a history of alcoholism in his family’. The parents of a single mother who was a Methodist had ‘very definite views’; they were described as ‘very religious’. The woman’s partner and father of her child was a Catholic, and he wanted the baby to be baptised as a Catholic. Another woman had a row and left the family home because the father of her child was Protestant, and she was Catholic; this couple separated.

12.139 Some mothers came under pressure to marry the father of their child, even though both were teenagers. A social worker with Ally commented that

The immediate thing resorted to is the decency of marriage. This can be totally traumatic. Furthermore, in an Ireland of the 1980s it is horrendous to think of the terrible silence and suffering the girl is being put through because of the social pressures. It is hardly surprising that many girls resort to the abortion trail.

12.140 Peter Prendergast general secretary of Fine Gael and an Ally spokesman commented that

The picture presented in the [Ally] report is but a part of a complex scene which ranges from hastily arranged marriages with little hope of a future stability and happiness to a sordid abortion trail. Unless we face up to these

---

201 At the time, parental consent was required for a person under age 21 to marry.
problems with realism and genuine concern we are storing up massive difficulties which will be much harder to relieve later on.\textsuperscript{203}

12.141 Women continued to face pressures to place their child for adoption. A priest told one Cherish client that ‘she would be selfish to keep the baby’; another woman was considering placing her child for adoption, though she believed that this was the selfish option. One woman explained: ‘I cannot keep the child and do not wish to. I would like to give it up for adoption where someone could give it a good home and love…this situation is pushing me to the edge, if I do not get the child adopted I think I will kill myself. I do not want this child. I am too young, (eighteen), and I do not even like children’. A woman who had contacted CURA claimed that ‘they only talked about adoption’.

12.142 Some mothers changed their minds and reclaimed children from adoptive parents before the final adoption order was signed. One woman reported that her family had rejected her because she had decided to keep the child. The putative father wanted the baby to be adopted and had abandoned her. A later note on this woman’s case file stated that she was ‘talked into’ placing her baby for adoption by her parents; she felt ‘very pressurised into signing the final papers’. A woman who was brought up in care felt that she ‘owes it to the baby to keep him’. But a woman who planned to keep her baby ‘to add meaning to her life’; was contemplating abortion a month later. Cherish social workers reported that some clients were totally unrealistic about the restrictions on their lives if they kept their baby - one young mother asked where was the local dance hall.

**The loneliness of the single mother**

12.143 One theme found in many letters is the loneliness and isolation of single mothers - hence the importance of Cherish. A twenty-nine year old woman explained that she had cut herself off all her friends, and moved into a bedsit, in case they would discover that she was pregnant. This sense of isolation was most pronounced among mothers who were raising their children outside Dublin. One woman asked where was ‘the hang out for the single parent’ in Cork? A sadder letter came from a mother who was living with her parents ‘and I may add with our neighbours’. There were many tensions and friction within the family; ‘personally I have no real friends’. A single mother in Donegal felt ‘isolated’; she went to work, but was too

\textsuperscript{203} *Sunday Independent*, 24 Aug. 1980.
exhausted to organise a social life. She wanted to meet other single mothers. ‘I know of no one in my county who is a single parent. Here the child of an unmarried mother is either adopted (the girl often has absolutely no other choice), or else brought up by the girl’s parents’. One young woman ‘would love to be able to mix with people in the same predicament as myself, as I get depressed looking around at and also hanging around with all my friends’, who were presumably not single mothers. In 1980 a woman who was five months’ pregnant, unemployed and living in a large provincial town, stayed in the house all the time ‘as the stigma of the unmarried mother is terrible around here’. She felt ‘very lonely and alone’.

12.144 Maura O’Dea told an officer of the Limerick Social Service Council that Cherish ran fortnightly group meetings, where mothers discussed their problems and learned from each other’s experience. AMIE, an organisation to assist single mothers in Mayo was started in the late, 1970s; over the first four years 200 women contacted them seeking advice and assistance. They employed a full-time social worker, funded by the Western Health Board and AMIE was supported by volunteers and local branches of Rotary and the Chamber of Commerce. In 1978 they were planning to purchase a house in Castlebar to provide a home for four mothers and their children.\textsuperscript{204} In 1981 a 19-year old single mother was planning to establish a single mothers group in Finglas.\textsuperscript{205} By 1978 there was a single parents group in Ballymun; they set up their own day nursery in 1982; it took them two years to secure premises. A Ballymun single mother of two children commented that “There’s great opposition from the clergy and everyone else to girls having abortions. But the facilities for single mothers who keep their babies is [sic] non-existent. We felt that a nursery where kids would get their meals and be well looked after should be provided. We knew we would be waiting forever for the State to do it, so we did it ourselves”. The Department of Social Welfare gave a grant towards the cost of setting up the nursery, and it was hoped that the Eastern Health Board would provide substantial funding towards running costs.\textsuperscript{206} Single mother groups were also established in Waterford, Galway, Letterkenny and Cork in the mid-1990s.

Discrimination and Prejudice

12.145 In 1983 a social worker, who had counselled many Irish women who decided to have an abortion in England commented ‘Abortion is never the easy way out…Most women we see are too anxious and distressed, fearful most of all of being found out by their families, friends or boyfriends’. This article in the *Sunday Independent* noted that most Irish women having abortions were single ‘and they usually reach the agonised decision not because of medical or financial reasons, but because the social stigma against unmarried mothers is still so strong in Ireland today. Teachers in religious orders schools, student nurses, ban gardaí and women who work in small firms feel they stand to lose their jobs as well ias the respect of their family and friends’. Many women ‘fear their boyfriends would stop seeing them if they found out…Others are afraid wedding plans would be dropped and others still are persuaded by their boyfriends to have the abortion, even though they themselves may want the baby. For single women in their thirties, the decision is hardest of all, as they feel this is their last chance to have a baby’.

12.146 Ally’s annual report in August 1984 was headed ‘Unwed mums: Stigma not gone’. In 1979 Nuala Fennell, politician and journalist related the story of a woman, who was within three months of completing her nursing training, when she became pregnant. The matron ‘told her to pack her case and go home to the country saying that she would telephone her mother’. In 1982 Eileen Flynn, a teacher in a convent secondary school, was dismissed when she became pregnant; she was cohabiting with a married man. In 1984 the Employment Appeals Tribunal upheld the right of the religious order, who ran the school, to dismiss her, because her lifestyle was repugnant to their values. When she appealed this judgment to the High Court, it was upheld. Flynn was the most high-profile of these cases. However Ireland was not quite as exceptional in this respect, as is sometimes thought. In 1974 unmarried teachers who became pregnant were dismissed in Britain; it is unclear when that practice ended. In 1985 Majella Moynihan, a Garda, faced a disciplinary hearing because she had given birth to a baby and was not married, which was contrary to the *Garda Síochána (Discipline) Regulations 1971*: ‘conduct prejudicial to discipline or likely
to bring discredit on the Force’. The father of her child was a colleague. It appears that she was only spared dismissal from the force because of the intervention of the archbishop of Dublin. This case only became known to the public in 2019. Some conservative politicians alleged that women deliberately became pregnant to secure a house. In 1989 a number of callers to the Gay Byrne Radio Show painted exaggerated pictures of unmarried mothers living off the state, but the majority tended towards the view ‘that to be an unmarried mother on Social Welfare is one of the roughest and thankless gigs going, and that anyone who suggests otherwise is either pig-ignorant or just simply bloody-minded’.

12.147 Rape only began to feature in public discourse in the 1980s; the Dublin Rape Crisis Centre was founded in 1979. In 1985 the Sunday Press told the story of the mother of a five-month old baby, who became pregnant as a result of rape. When she tried to tell her mother about the rape and pregnancy she received ‘no sympathy, no understanding’. Her mother’s attitude was ‘She asked for it’. This woman was assisted by the Wellwoman Clinic; they referred her to the Rape Crisis Centre for counselling and to a sympathetic gynaecologist in Holles Street. Following the birth of the baby, her brother urged her to place him for adoption.

12.148 Teenage pregnancies attracted attention, though the trends are complex and much of the media coverage exaggerated the incidence. In 1970 a total of 1,709 ‘illegitimate’ births were registered; 30% were born to mothers under the age of 20. By 1980, when the number of births had more than doubled to 3,723 the proportion of teenage mothers had risen to 38%. In 1990 however 29.25% of the 7,767 births were to teenage mothers, which was fractionally lower than the percentage in 1970. Sunday newspapers occasionally featured scare stories on this topic. ‘Scandal of 13 Year old Mothers’ by Mairtin MacCormaic; ‘Schoolgirls Unmarried Mothers’ by John Feeney; ‘Maths, Macbeth and Bringing up Baby’, Mary Kavanagh. Journalist Frances O’Rourke commented that one theme was ‘how much help is available to single mothers’, yet many pregnant women were still ‘paralysed by fear from looking for that help’. Despite changing attitudes

216 Sunday Independent, 16 April 1989.
unmarried pregnant women continued to be judged harshly. She claimed that there were many schools, ‘perhaps the majority, who won’t let pregnant schoolgirls continue with their classes’. ²¹⁹ In an article titled ‘Sex and Schoolgirls’ Helen Shaw noted that although many schools had to confront the issue of pregnant students neither the Department of Education nor the schools had formulated a policy or even discussed the matter. As the schools were not owned or run by the Department of Education, the department had no power to prevent school managers from expelling pregnant pupils, but ‘neither have they advised the schools against such extreme action or to direct the schools to protect the child’s right to education’. Nuala Fennell, Minister of State for Women’s Affairs, called for maternity protection legislation (legislation preventing pregnant women from being dismissed at work) to be extended to school pupils - but given that Eileen Flynn, a teacher was not protected by that legislation, and neither was Majella Moynihan, the reform needed to extend more widely.

12.149 Most pregnant students had to leave school, which meant that they had to leave home if they wished to continue their education. Many went to Dunboyne. Shaw determined that most convent schools would not welcome the return of a young mother who had decided to keep her baby, and ‘Even the VECs are not prepared to guarantee the child’s right to education without plenty of conditions added’. The principal of a large Dublin VEC indicated that the key issue was the hostility of parents to the presence of a single mother among the pupils. ²²⁰

12.150 The death in 1984 of the 15-year old school girl Anne Lovett, who gave birth to a stillborn baby beside a grotto in Granard ²²¹ prompted widespread emotion, and much commentary. It resulted in a huge number of letters to the Gay Byrne programme - a morning show on RTÉ radio 1 that attracted a large audience. These letters provide evidence about attitudes to unmarried motherhood, and more specifically to teenage pregnancy in the mid-1980s. Some were written by conservative listeners, who used this tragedy to endorse past customs and practice. One anonymous correspondent claimed that such a tragedy would not have happened forty years ago because people would have noticed the pregnancy and spoken to her parents; ‘would it not be better to be a busybody and save a life

²²¹ Inglis, Truth power and lies, pp 124-5.
than to be blind to the needs of others. It could have saved this poor girl and her baby. Another writer complained about ‘church-bashing: the sooner we are back to Christian values and moral teaching the better’; another hoped that the tragedy would ‘scare(s) young people not to be having sex when they’re children’. A Tralee writer blamed the rising rate of illegitimacy on the fact that priests were not preaching ‘as forcefully as previously’; he claimed that such a tragedy would not have happened in the past. Another lamented that those covering the ‘whole tragic affair did not raise the subject of “good old-fashioned morals”’. One correspondent ‘thank[ed] God for the courageous mothers who have the strength to have their children adopted’. Another conservatively-minded writer rejected the criticism of past attitudes towards illegitimacy, arguing that ‘They had a good reason to act the way they did. No contraception to prevent pregnancy or VD. Sexual freedom was out of the question and frowned upon. The millions of children that would inevitably come on stream from this practice would never have a chance of survival’.

12.151 Some writers reflected on their own experiences; their ignorance about sex when they were teenagers. A woman who became pregnant in her early twenties and then married the father of her child, ‘wish[ed] like little Ann Lovett that I was taken to heaven. I have lived in hell since’. A woman who spent five months in a mother and baby home complained that nobody had tried to understand her underlying problems. A single mother, pregnant for the second time, queried the widespread comments that Anne Lovett would have received every assistance if she had asked: ‘no one comes to help, or offered any help’. This woman had lived in her home town since her first child was born but had never been visited by a social worker or the St Vincent de Paul Society: ‘I feel people don’t want to be troubled with the problems of a single mother’.

12.152 Anne Lovett’s death prompted criticism of the Catholic church and its attitudes towards pregnancy outside marriage. Such explicit criticism would appear to have been a relatively new development. A correspondent claimed that those who believed that this tragedy would change attitudes, ‘are only deluding themselves…basic attitudes towards unmarried mothers will remain unchanged. Some people’s attitude will as always be influenced by the teachings of the Catholic Church that getting pregnant outside marriage is still a grave sin, and knowing this, the young people will think twice before asking for help’. A Kilkenny writer described Ann Lovett as ‘a victim of our society and stupid laws. A society
that made her so afraid to ask for help that the only one she felt she could turn to was Our Lady... the doctors and everybody in our so-called Christian society. I believe what happened is a reflection on us all’. Another suggested that ‘the heart of the issue...is the warped primeval teachings of the Catholic church...our attitudes are a reflection of the teachings of the Irish church. They in no small measure must accept the death of this terrified girl and her suffered child - now in some limbo - as another bead of sorrow in that rosary of shame hanging from our country’s lump of ignorance’.

12.153 The tragic death of Ann Lovett and her child, and the story of Joanne Hayes, a single mother from Kerry, which was and is widely referred to as ‘the Kerry babies’, meant that the mid-1980s was a time of unprecedented commentary about unmarried mothers. However it is unclear whether these events brought about a marked change in attitudes. A survey of women aged between 16 and 45, carried out in 1987 indicated that almost 60% believed that it was morally wrong for a woman to have a child outside marriage, however they did not agree with the suggestion that payments to single mothers should be reduced, indeed a majority recommended that they should be increased. In 1992, ten years after the Anne Lovett tragedy, one journalist commented that ‘Her death shocked the nation and prompted us to look at our attitudes and facilities - or lack of them - for women with traumatic pregnancies. As a result of such national heart-searching, some new services were put in place. Everyone hoped that such a tragedy would never happen again’. However in the previous six months the bodies of three new-born babies were found abandoned; one of the mothers was a teenager.

12.154 The 1990s saw a series of high-profile stories about unmarried mothers and children. In 1993 the story of Annie Murphy, a young American woman whose child was fathered by Bishop Eamon Casey became known, resulting in the bishop’s resignation. In 1995 Phyllis Hamilton went public about her relationship with Fr Michael Cleary, and their two children; the first child was placed for adoption, she raised her son Ross while living with Fr Cleary ostensibly as his housekeeper. In 1996 RTÉ broadcast a documentary, Dear Daughter, the story of Christine Buckley, who was the daughter of a Nigerian medical student and a married Irish mother, and her life in Goldenbridge industrial school. Mary Raftery’s
documentary *States of Fear* that aired in 1999 drew attention to the many children who were placed in industrial schools and the reasons for their institutional upbringing. In the same year the government established a Commission to inquire into child abuse in institutions. Not all the children in these institutions were ‘illegitimate’, but many were.

12.155 Another development that focussed attention on unmarried mothers and their children was the growing number of adopted children who were attempting to find their birth mothers; a voluntary contact register was established in 1990. In 1988 St Anne’s Adoption Society reported that a substantial part of their work was ‘not reflected in the word adoption’. The number of adoptions had fallen substantially, but there was a growing number of inquiries from adoptees tracing their parent(s) - 59 in the year 1987-88 compared with 16 the previous year. St Anne’s reported that social workers were increasingly working with families, not simply with the single mother; there was a demand for family therapy, and counselling, including counselling for grandparents ‘especially if the girl’s wishes differ from the child’s grandparents’.

**Extra-marital births**

12.156 One group that are often forgotten in the story of unmarried mothers are the women, married, and perhaps separated or deserted, who gave birth to children that were not their husbands. During the last two years of World War II, one-third of ‘illegitimate’ children born in Birmingham and up to 50% in other areas were extra-marital children of married women. This proved a particularly difficult issue in Ireland. These women were not generally admitted to mother and baby homes. The absence of divorce until the late 1990s prevented couples in stable relationships, where one or both parties had previously married and separated, from marrying. Article 41 of the Irish Constitution pledged ‘to protect the institution of Marriage on which the Family is founded’, and, reflecting this article, the Adoption Act, (1952) did not permit the adoption of ‘legitimate’ children. All children born to married women were deemed to be the child of the woman’s husband and therefore ‘legitimate’ unless the couple went to court to refute this. As the infant was ‘legitimate’, she/he could not be placed for adoption, yet many husbands were unwilling to accept an extra-marital child. In 1978 Fr John O’Mahony, director of St Anne’s Adoption Society wrote a memorandum on the

---

226 Cork Diocesan Archives, St Anne’s Adoption Society, Box 4, annual report 1988 and report 12/11/1987.
registration difficulties of children who were born extra-maritally. He indicated that this was ‘a growing problem’; he estimated that at least 10 per cent of St Anne’s case load related to extra-marital births and the number was rising; he expressed the opinion there were 200-300 extra-marital births every year. He suggested that some women were presenting themselves in a maternity hospital as single and registering the child as the child of a single mother. He believed that there was a real risk that some of these births would not be registered, and no adoption society could accept false registration documents. He recommended that as an alternative to court proceedings, an affidavit from the mother and two independent witnesses, giving the name of the child’s father, should be accepted, permitting the child to be regarded as ‘illegitimate’ and therefore eligible for adoption.228 Adoption in Northern Ireland or Britain was not restricted to ‘illegitimate’ children, and there is evidence that extra-marital children were moved to Northern Ireland for adoption, and this practice was known to the authorities. In 1986 a Department of Health memorandum, relating to the proposed closing of Bessborough and Stamullen, recommended that no action should be taken in relation to the infant nursing home at Fahan, in Donegal: ‘It provides a facility which spares our national blushes in the area of the adoption of legitimate but unwanted children’.229

The Fathers

12.157 The only public references to unmarried fathers before the late 1960s are in relation to affiliation orders. The Kilkenny conference used the wording ‘unmarried parent’, rather than ‘unmarried mother’ - a terminology that reflected changing approaches towards single-parent families internationally around this time and a session at this conference was titled ‘The role of the unmarried father’. At the conference Fr Colleran, of the CPRSI, spoke of the advantages of involving unmarried fathers from an early stage, both in relation to the pregnancy and the future of the child. He claimed that an increasing number of fathers were ‘coming forward’. The consensus of the conference session was that ‘the State should insist on the father fulfilling his material obligations towards the mother and his child’; however it was agreed that ‘the attitudes of the law towards unmarried fathers should not be actively negative’. He had a right to know about the pregnancy, and a right to maintain contact with his child ‘unless it can be shown that such contact is detrimental to the child’.230 This interest in fathers proved

228 Cork Diocesan Archives, St Anne’s Adoption Society, Box 29
229 Department of Health, CCP/INA/0/489126.
230 The unmarried mother in the Irish community, pp 22-5.
short-lived. While the conference used the term ‘single parent’ the publication of the proceedings used the title ‘mother’.

12.158 Putative fathers feature in the earlier chapter that profiles unmarried mothers - but most are anonymous, they commonly disappeared when the woman announced that she was pregnant; sometimes they accompanied her to England having promised marriage and then vanished; others denied paternity, many emigrated. The portrayal in the Cherish records, which mainly comes from the mothers, is generally negative. One woman claimed that the father of her child treated her ‘like she had leprosy’. There are numerous complaints about men evading financial responsibility for their child, enjoying a comfortable life while mother and child lived in poverty. In 1971 a single mother with a six-year old daughter sought advice from a newspaper columnist about what to tell her daughter about her father. She described him as ‘a callous and irresponsible man’ who left her when she became pregnant; other women only discovered that the father of their child was married when they informed him of their pregnancy. In 1974 June Levine claimed that a group of unmarried mothers was setting up a register of single fathers, which would remain confidential; the mothers planned to send newsletters to the men ‘in the hope that some will see the reality of their relationships and agree to take an interest in the well-being of their children’. Cherish advised mothers about a father’s rights with respect to his child, and they supplied guidance on how women should address their child’s queries about their fathers.

12.159 It is important not to exaggerate the number of fathers who wished to be involved with their child. In 1976 a Cherish officer told Mary Kennedy that ‘75% of them [the fathers] are still running’. Some were married - divorce was not available in Ireland until the late 1990s. Many fathers ‘don’t want to know, others aren’t even told’. In 1980 a social worker with Ally claimed that only 47% of single fathers - presumably these statistics related to women who had contacted Ally - were involved in any way in assisting their girlfriends through their pregnancy. Some 53% were not in any way helpful; 23% just didn’t want to know. 30% were not consulted by their girlfriends as they felt it was not worth their while. In most of the

234 Department of Health, 485291 asked Claire
235 *Sunday Independent*, 8 Nov. 1976; Department of Health, CCP/INA/0/482259.
latter cases the relationship was casual and was not sufficiently stable to sustain such pressures.236

12.160 In 1978 the Federation of Services for Unmarried Parents and their Children noted that they had received queries from a number of fathers who wished to be recorded on the birth certificate of their child and the Federation's quarterly bulletin set out how this could be done. By the 1980s an increasing number of men were accompanying their partner to the Cherish office, and reports suggest that some were supportive. One file relates to a man who asks how he could be more supportive to his pregnant girlfriend. He was concerned because she kept changing her mind, and her attitude towards him. His parents had told him that he was foolish to have acknowledged paternity, which prompted him to move out of home. Some men tried to encourage the mother to place the baby for adoption, one woman reported that the father would ‘support her if she opts for termination’, but would not be involved if she kept the baby, ‘because he will not allow this to interfere with his life’. By the 1980s Cherish was receiving more queries from men. One father acknowledged that when his son was born he felt unable to raise the child with his girlfriend; she was unwilling to raise their child as a single parent, so he was reconsidering his position, and came to Cherish to inquire about accommodation. He did not wish his son to be adopted. Another male client wished to discuss the social and legal implications of co-parenting where a couple was not married. Cherish told one mother, in response to a query, that the father of her child had a right to apply to the courts for access or custody, but there had been few such cases and the social worker didn’t believe that any had been successful.

12.161 That changed with the enactment of the Status of Children Act 1987 which abolished the status of ‘illegitimacy’. A press release by the Diocese of Cork and Ross Family Centre in 1989 noted that an increasing number of fathers were aware of the birth of their child and over 50% were supportive of the mother. A growing number of fathers were applying for guardianship and either custody or access to their child. If the father was granted guardianship a mother could not place the child for adoption without his consent.237 In 1990, the Lone Parent’s Allowance replaced the unmarried mother’s allowance (and other means tested payments to lone parents) and became available to male lone parents on the same

237 Cork Diocesan Archives, St Anne’s Adoption Society, Box 4.
basis as female lone parents. In 1996 this became the one-parent family payment; 59,000 women and men, who were parents of 95,000 children received this benefit the following year; only a small minority of recipients were men.\footnote{238}

**From Unmarried Mother to Single Parent: the Changing Irish Family 1970s–2000**

12.162 In 1982 Joe Robins, Assistant Secretary in the Department of Health gave the keynote address at the annual general meeting of the Federation of Services for the Unmarried Parent and their Children. He reflected on the major changes that had taken place over the past decade in relation to single mothers and their children. The number of ‘illegitimate’ births doubled between 1971 and 1980; the number of children legitimated by subsequent marriage rose from 172 to 623 (children whose parents married after their birth). In 1971 adoption orders amounted to 71% of ‘illegitimate’ births; by 1980 they had fallen to 37% of ‘illegitimate’ births. Robins estimated that in 1970, approximately one unmarried mother in five were keeping their babies; by 1980 a majority were opting to raise their child. Unmarried mothers were living in ‘a less hostile society’; attitudes were changing, reflecting the ‘changing values of the modern world’. He highlighted some concerns: the number of mothers who having determined to raise their child, realised after perhaps two years that they were unable to do so; the need for mature social workers to advise single mothers. He described the 6,000 women who were receiving unmarried mothers’ allowance as ‘a large dependent group within our population’.\footnote{239} The annual report of the Rotunda Hospital for 1981 recorded that 505 of the 608 ‘illegitimate’ babies born that year were being kept by their mothers; 20 mothers were undecided, and there were 12 neo-natal deaths. The parents of 14% of these infants were cohabiting - some because one or both were unable to secure a divorce.

12.163 The trends that Robins identified accelerated in the following decade. The 1980s were marked by a sharp fall in fertility rates and a significant increase in the number of births to single mothers. Professor Pat Clancy wrote about ‘the emergence of a rapidly increasing number of “voluntary” one parent families, [which] forces us to re-examine, not just the welfare issues involved, but also the very concept of the family’.\footnote{240} Between 1982 and 1992, the number of single

\footnote{238 Patricia Kennedy (ed.), *Motherhood in Ireland. Creation and context* (Cork, 2004), p. 219.}
\footnote{239 Department of Health, CCP/INA/0/481800.}
\footnote{240 'Demographic change and the Irish family' in *The Changing Family* (Dublin, 1984), p. 29.}
mothers more than doubled. By 1993 one family in ten was a single-parent family; 18% of births were extra-marital and 40% of first births were born to single mothers. Teenage mothers, who were keeping their children were increasingly welcomed and supported by their parents; but Cherish suggested that only 12% remained long-term single mothers. Changes in adoptions reflected changing families. The number of adoptions fell sharply and, in 1986, 28% of adoption orders involved adoption by relatives/family. Most of these involved a child being adopted by his/her mother and the woman’s husband - sometimes he was the child’s father, sometimes not. By 1995 over two-thirds of adoption orders were family adoptions; 90% involved the mother of the child and her husband. Most of the remainder involved the adoption of children born outside Ireland.

In 1978 a survey by the Department of Health of children coming into care, showed that the largest category - 33% were the children of single mothers who were ‘unable to cope'; 40% of these mothers were not in regular contact with a social worker. A follow-up study published in 1981 of 40 children of unmarried mothers who were taken into care revealed that one-third went into care because their mother was ill; 21% because she was unable to cope with the responsibility of single parenthood; 11% because of a lack of emotional response to her child. The remainder gave diverse reasons: unsuitable housing, squatting, rejection by grandparents; secondary causes included homelessness, lack of family support, inability to cope. This study revealed a high recurrence of children going into care which was interpreted as ‘indicating a continuing problem with coping with the child’. A substantial number of the mothers had been living with the father of their child before the birth, but the number fell following the birth. Cohabitation was a bar to getting the unmarried mothers’ allowance. Most of the mothers were in contact with their families, but they received little support from them. The study concluded that ‘the majority of mothers were emotionally and materially isolated in terms of contacts and tangible and useful supportive relationships either from their own families or from the child’s father’. The authors suggested that ‘the study indicates a lack of national or local policy in relation to the place of unmarried mothers and their children in our society’.

244 Finola Kennedy, *Cottage to crèche. Family change in Ireland* (Dublin, 2001), p. 44.
245 Department of Health, CCP/INA/0/481800.
12.165 A more extensive study of 3,724 children taken into care in 1981 revealed that 36% were admitted because their unmarried mother could not cope. Finola Kennedy suggested that this implied that unmarried mothers were not getting sufficient support from the state or the community.246 The 1980s was a tough decade in Ireland, with a high rate of unemployment and pressure on public services. In 1987 the Federation of Services for Unmarried Parents and their Children noted that over the past year unmarried mothers had increasingly become ‘the victims of the begrudging attitude’; however in contrast to the 1960s and 1970s the attitude had an economic rather than a moral base, they suggested that it was a reflection of the fact that there was less money ‘to go around’ because of the recession.247

12.166 By the 1980s unmarried mothers formed one component in the growing number of one-parent families, which also included a large number of separated or divorced wives. Lone parents were at greater risk of poverty and were more reliant on social welfare than two-parent households; unmarried mothers were the cohort of lone parents that were at greatest risk of poverty.248 In 1983 Cherish published Singled Out in response to requests for information about the status and entitlements of single parents and their children. The foreword noted that the booklet raised questions about rights to housing, welfare and equality before the law, which were ‘often perceived as privileges rather than entitlements’. It noted that Article 41 of the Irish Constitution pledged ‘to protect the institution of Marriage on which the Family is founded’, ‘Because of the exclusive nature of marriage other family lifestyles are noticeable and appear threatening to the existing system’. The pamphlet suggested that this did not reflect the reality of contemporary Ireland.249

12.167 In 1993 the Second Commission on the Status of Women highlighted the tenfold rise in births outside marriage and the long-term consequences of younger women having children as single mothers. Their report contains a series of recommendations about education, training and removing barriers that discouraged lone mothers from participating in the labour market.250 The fact that

249 Cherish, Singled Out.
lone mothers were discussed in a chapter headed ‘Women in situations of disadvantage’ indicated that while social attitudes and state supports had changed dramatically over the past forty years, single mothers continued to face many difficulties. Lone mothers now included a substantial number of women who had been married and were now separated. Despite access to state benefits and changes in social attitudes lone mothers who wished to raise their child(ren) remained at high risk of poverty, as they were in the early and mid-twentieth century. In 1995 the government established a Commission on the Family to examine the needs and priorities of families in a rapidly changing social and economic environment. The decision to establish this commission reflected the changes in Irish families; the rise in the number of lone parent families, non-marital births and marital breakdown. The removal of the constitutional ban on divorce in 1995 paved the way for the legalisation of divorce the following year. The final report of the commission, with the title ‘Strengthening Families for Life’ was published in 1998, setting out a range of measures that were designed to support the increasingly diverse families found in Ireland at the end of the twentieth century. The 2002 Census of Population reflected this diversity. Volume 3 Household Composition and Family Units gives 17 different types of household, including ‘lone mother with children (of any age)’, and ‘lone mother with children (of any age) and other persons’. Unmarried mothers were no longer being singled out; they formed part of a growing community of diverse households, though many one-time unmarried mothers and their child(ren) were now counted among the two-parent households (married or cohabiting) with children.
Chapter 13: Dublin Union/Pelletstown/St Patrick’s, Navan Road/Eglinton House

Introduction

13.1 St Patrick’s, Navan Road, Dublin 7, originally known as Pelletstown and subsequent transfer to Eglinton House, Eglinton Rd, Dublin 4 is one of the institutions which the Commission is specifically mandated by its Terms of Reference to investigate. In accordance with its Terms of Reference and the criteria set out there, the Commission chose the Dublin Union as one of the county homes to be investigated. In practice, Pelletstown and the Dublin Union were really one institution with separate premises. Pelletstown was frequently referred to as the ‘Pelletstown Auxiliary’ as it was an auxiliary building to the South Dublin Union. Both sets of premises were owned and financed initially by the Dublin Board of Guardians and subsequently by its successors in title (for example, the Dublin Board of Assistance from 1931, the Dublin Health Authority from 1960-1970 and the Eastern Health Board from 1970 onwards).

13.2 Pelletstown closed in 1985 and a new facility was opened in Eglinton House. This also was a mother and baby home but it was a very different type of facility to Pelletstown. It was owned by the Eastern Health Board.

13.3 A total of 15,382 women and 18,829 children were resident in Pelletstown and Eglinton House between 1920 and 1998.

Origins

13.4 The origins of the Dublin Union and the Pelletstown Auxiliary lie in the poor law - see Chapter 1. The South Dublin Union premises were in James’s Street on the site of what is now St James’s Hospital. The North Dublin Union and the South Dublin Union were amalgamated in 1918 as part of the changes to the poor law and the South Dublin Union premises then became the Dublin Union premises.

---

1 Changes to the Poor Law were made in the period just before and just after 1922. In most counties, the workhouses which were to be retained in use were renamed county homes. The Dublin Union workhouse was never given this name. Like all other former workhouses, it started to be called by a religious name at some stage – St Kevin’s. Locally, it was generally called simply ‘the Union’. There was also a St Kevin’s Hospital on the site; it amalgamated with a number of other Dublin hospitals in the early 1970s and then became known as St James’s Hospital.
13.5 As stated, Pelletstown\(^2\) was owned by the Dublin Board of Guardians and its successors in title. It was run by the Company of Daughters of Charity of St Vincent de Paul.\(^3\) The Sisters and other staff who worked in Pelletstown were local government employees and paid as such. The Daughters of Charity became involved in Pelletstown in 1910; they were already involved in running a number of workhouses in Ireland including the North Dublin Union workhouse in North Brunswick Street.\(^4\) They were brought to Pelletstown at the request of the Board of Guardians and with the approval of the Archbishop of Dublin. A document\(^5\) compiled in Pelletstown in May 1921 states that the house was founded on 26 April 1910. The staff who worked in Pelletstown, including the members of the order, were public employees and were paid accordingly. It was an integral part of the poor law/public assistance system.

13.6 From 1910 to 1919/20, Pelletstown was a National School and orphanage for the South Dublin Union.\(^6\) The Daughters of Charity became involved in Pelletstown in 1910. They were initially asked to provide ‘care instruction and industrial training of the children of the Poor’. They were expected to cater for boys from age 3 to 14 and girls from age 3 to 15; they were then expected to ‘place the children in situations suited to their capacity’. The 1921 document states that there was an agreement between the Daughters of Charity and the Board of Guardians. The guardians/administrators were responsible for all liabilities (including costs of improvements); the Sisters received an annual salary plus vegetables and milk; the document describes the provision as ‘adequate’.

13.7 Some commentators have made the mistake of believing that there were two separate institutions - one called St Patrick’s, Navan Road and one called Pelletstown. This is due to confusion about the name itself and confusion about the name of the religious order that ran the institution. For example, Kilcummins et

---

\(^2\) The Commission has decided to use the name Pelletstown in order to avoid any confusion with the many other institutions such as industrial schools, children’s homes and hospitals which are or were also called St Patrick’s.

\(^3\) They were, and sometimes still are, known as the Sisters of Charity of St Vincent de Paul. As a result they are sometimes confused with the Irish Sisters of Charity (who are also known as the Religious Sisters of Charity). The Commission intends to use ‘Daughters of Charity’ in order to minimise any such confusion but it should be noted that ‘Sisters of Charity’ is used in some of the documents quoted.

\(^4\) This workhouse amalgamated with the South Dublin Union workhouse in 1918 but the Daughters of Charity continued to operate the infirmary in North Brunswick Street until 1929.

\(^5\) Provided to the Commission by the Daughters of Charity; it appears that a similar document was compiled in all houses of the Daughters of Charity.

\(^6\) One woman who entered Pelletstown school in 1912 when she was 10 years old remained in Pelletstown until 1980. She was a ‘legitimate’ child and there is no evidence that she was a mother.
al\textsuperscript{7} when describing the establishment of various mother and baby homes, state ‘The Sisters of Charity of St. Vincent de Paul opened a similar institution on the Navan Road, in Dublin, in 1918…’. The authors state that one of the three special homes provided by the poor law authorities was at Pelletstown in Co Dublin. The special homes were financed by the local authorities but were run by religious orders. Pelletstown is described as having been run by the Daughters of Charity of St Vincent de Paul. Pelletstown and St Patrick’s, Navan Road are, in fact, the same institution. This is repeated by Gwynn Morgan in the Ryan Report\textsuperscript{8} and by O’Sullivan and O’Donnell\textsuperscript{9} who use the term ‘Extern Homes’ to describe those which were established by the local authorities. (The others so described are Tuam and Kilrush; none of these was an extern home; institutions such as Bessborough, Castlepollard, Sean Ross and Dunboyne were extern homes).

13.8 The Daughters of Charity of St Vincent de Paul were (and sometimes still are) also known as the Sisters of Charity of St Vincent de Paul but are now generally described simply as the Daughters of Charity. They were founded in France by St Vincent de Paul and St Louise. They were involved in a number of workhouses (including the North Dublin Union workhouse) and industrial schools in Ireland from the 19\textsuperscript{th} century. They are now mainly involved in providing disability services; for example, they run the St Vincent’s Centre on the Navan Road and the disability services which are provided in St Anne’s, Sean Ross (the Sean Ross mother and baby home was run by the Congregation of the Sacred Hearts of Jesus and Mary - see Chapter 19). They also provide child and family support services and they have a number of primary, secondary and special needs schools.

13.9 In the past, they were distinguishable by the large starched cornette which they wore on their heads. They were described as the ‘big bonnets’ in letters between leaders of the 1916 rebellion.\textsuperscript{10}

13.10 The role of Pelletstown was changed in May 1919. From 1919, Pelletstown was expected to cater for all mothers and infants; motherless children; all healthy children under age 5; and all sick children such as the medical officers considered

would be suitably treated there.\footnote{Correspondence between the Daughters of Charity and Dublin Union.} It was at this point that it began to become a home for mothers and children (but not necessarily confined to unmarried mothers). The care of senior children was transferred to Cabra Auxiliary\footnote{Cabra Auxiliary had housed the North Dublin Union workhouse school. It remained an integral part of the Dublin Union until 1925. In 1925 it was decided to end its workhouse school role and board out the children who were there. However, this did not prove entirely possible because of the number of children with intellectual disabilities who were living there. In 1925, it became a school for children with intellectual disabilities and was renamed St Vincent’s by the Daughters of Charity. While it was no longer an integral part of the Dublin Union, it continued to be inspected and, to some extent, supervised by the Board of Guardians and its successors in title.} (which was part of the North Dublin Union and was also run by the Daughters of Charity).

13.11 Pelletstown was not exclusively a mother and baby home. In later years, while it was mainly a mother and baby home, it continued to house very sick children (including those for whom nothing further could be done in the children’s acute hospitals), abandoned children and children who were considered not suitable for adoption. Sometimes it housed children who were awaiting a place in an industrial school.

Sources

Dublin Union/Pelletstown institutional records

13.12 The originals of the Pelletstown records are held by the Child and Family Agency (TUSLA) and were made available electronically to the Commission. The Daughters of Charity retained paper copies of some of these records and made them available to the Commission. The records are organised into five categories: mothers’ admission cards; children’s admission cards; mothers’ medical charts and related ante-natal and puerperal documents (some include letters of introduction from local doctors, laboratory results, correspondence with maternity hospitals, ultrasounds, consents to operations, correspondence with psychiatric hospitals, especially from the 1960s onward); children’s medical charts (for the early period these are cards often attached to the admission cards; some include laboratory results, detailed medical reports for the duration of the child’s stay, which may span years, IQ testing reports, reports from and correspondence with maternity hospital and/or children’s hospitals, psychological and developmental assessments from the Child Study Centre, correspondence with An Bord Uchtála, correspondence with solicitors); and miscellaneous files, usually social reports, but which may also contain correspondence with the mother, birth certificates, baptism certificates, occasionally tracing files, correspondence with various hospitals,
correspondence between paediatricians in Pelletstown and institutions where they were hoping to place the children from Pelletstown, scrapbooks, photographs, mothers’ consent to adoption forms etc.

**Records of the local health authorities**

13.13 The records of the Dublin Union and the Dublin Board of Guardians/Assistance are held in the National Archives of Ireland and were examined and analysed there by the Commission’s researchers. The Commission has been unable to find any relevant Dublin Health Authority (1960-1970) records. It is clear from other sources that the Dublin Health Authority did carry out regular inspections of Pelletstown but it seems that the records have been destroyed or are lost. The minutes of the meetings of the Eastern Health Board (EHB) are available online. The EHB had visiting committees which visited and reported on the various hospitals and institutions in its area, including Pelletstown. In the early 1970s, the reports of the visiting committees are included in the minutes but, from about 1975, the existence of the reports is noted but the report is not reproduced. Sometimes there is a discussion about the contents of the report. The discovery provided by the Daughters of Charity included some of the visiting committee reports. Apart from these, the Commission has not been able to locate the visiting committee reports that were not included in the EHB minutes.

**Department of Health**

13.14 The Department of Health provided a number of files to the Commission. The main files used for this chapter are:

13 [www.lenus.ie](http://www.lenus.ie)
13.15 The Daughters of Charity provided the Commission with a wide range of documents. The provincial of the order told the Commission that, after Pelletstown was closed in 1985, a Sister and two administrative assistants began copying and typing the information contained in the various registers in order to assist with the large number of tracing inquiries which they were receiving at the time. When Eglinton Road closed, all the original documents were given to the Eastern Health Board (who were the owners). The Daughters of Charity retained copies but did not retain any of the originals; these copies were provided to the Commission. The Daughters of Charity also provided the Commission with a range of documents including personnel files on the Sisters who worked in Pelletstown; documents relating to administration; and documents dealing with vaccine trials which had originally been prepared for the Commission to Inquire into Child Abuse (the Ryan Commission). Documentation about transfers of children to other institutions, particularly St Philomena’s, was also provided. The Commission recognises that the Daughters of Charity adopted a thorough and systematic approach to the provision of documents.

13.16 The following publications provide background information on the Daughters of Charity:

**Published material and unpublished but publicly available material**

13.17 This material is referenced in the text.
Governance

13.18 Pelletstown was a public health authority owned and financed institution. The religious and lay staff who worked in it were public employees. The only difference between the Sisters and other public employees was that the Sisters did not have to go through a public selection process; they were appointed to Pelletstown by their order and the appointments were then approved by the relevant minister: the Minister for Local Government and Public Health until 1947 and the Minister for Health after that.

13.19 The local health authority, that is, the Dublin Board of Guardians and its successors in title, (the Dublin Board of Assistance, the Dublin Health Authority and the Eastern Health Board) was effectively the governing body of the institution. It made the major decisions on spending subject to the approval of the relevant minister. Initially, it seems to have made many of the day to day decisions as well but the Daughters of Charity were very much involved in those decisions and it seems that the Daughters of Charity gradually came to have considerable control over the day to day decisions.

13.20 The Department of Local Government and Public Health (DLGPH) and its successor the Department of Health had little day to day involvement and at times seemed to have been quite badly informed about what was being provided in Pelletstown. They did have a significant involvement in decisions about finance and staffing.

13.21 The local health authority did not generally distinguish the cost of running Pelletstown from all its other expenditure. As a result, very little is known about its finances but such information as is available is included below.
How unmarried mothers entered the Dublin Union / Pelletstown

13.22 The Commission on the Relief of the Sick and Destitute Poor (which was established in 1925 and reported in 1927) heard evidence from a number of witnesses about the system by which unmarried women approached the Dublin Union for assistance. The then chairman of the Dublin Union described how unmarried women simply presented themselves at the Dublin Union institution (in James’s Street) for admission. The standard procedure was for the male porter to meet them at the door. The woman was then brought to the admission ward where a male admission officer interviewed her, asking her a series of questions which appeared on an admission form. This was to allow the officer to get as much details about her circumstances as possible. Usually the unmarried woman was pregnant when she sought admission and was looking to be given shelter both during and after her pregnancy. During this evidence, the chairman of the commission drew attention to concerns that had been raised ‘that the cross examination of that poor girl by the man when she goes to be admitted has been so minute that it rather shocks her or at any rate, gives her a great deal of mental trouble’. The Dublin Union chairman defended the procedure, saying the form contained a series of regulation questions ‘and I do not see anything that is terribly shocking in them’. He further added that it was essential for the Union to get as much detail as possible as it was ‘necessary for our administration’. (This procedure no longer applied when pregnant unmarried women started to be admitted directly to Pelletstown - see below).

13.23 The information gathered by the admission officer was then used to fill in details about each new admission in the Indoor Relief (Admission) Register of the Dublin Union. These registers are now kept in the National Archives of Ireland (NAI). Of relevance to the remit of this report are the 30 volumes, designated BG79/G/158 - BG79/G/186, which cover all admissions into the Dublin Union from November 1921 until August 1938. Each volume covers a six-month period and contains, on average, about 5,000 individual entries.

13.24 The registers record the admission date of every new resident (‘inmate’ is the word used for all residents of the Union). Each was assigned a unique register number.

---

14 Commission on the Relief of the Sick and Destitute Poor, Minutes of Evidence, Fifth Day, Tuesday, 23 June 1925. These minutes are held in the Oireachtas library.
In addition, the names, ages, marital status, address prior to admission, occupation (if any), religion, disability (if any) and the date of subsequent discharge are all recorded in the registers. There is also a column marked ‘observations’. In the case of unmarried women entering the Union, they were marked as ‘unmarried’ under the marital status column. If they were pregnant on admission, this was also clearly marked. Once the child was born, a new admission record for the child was created in the register and the child’s date of birth was used as the admission date in the register. The register number and/or name of the mother was entered alongside the child’s details to identify them as the child of a resident with an existing record in the register. The child was also clearly recorded as ‘illegitimate’. If an unmarried mother came to the Union with a child, the child’s details were recorded directly below that of the mother’s in the register and the child’s register number was usually the next sequential figure to that of the mother. Again, the child was clearly marked as ‘illegitimate’ in the register. Children found abandoned or deserted who were admitted into the Dublin Union were identified as such in the records. The register also records where those children were found and by whom, if that information was available.

Following her interview with the admission officer, the unmarried woman was given a medical examination. If she was pregnant, she was placed in ‘the body of the house’, that is, she was housed within the Dublin Union itself (in James’s Street). When the time came for her to give birth, she was taken to the maternity wing of the hospital within the Dublin Union. Following the birth, the mother and child were moved to Pelletstown. The timing of the move was dependent on the Dublin Union’s doctor certifying the mother and child as fit for removal. Unmarried mothers who entered the Union with their children were always sent directly to Pelletstown after an interview with the admission officer and a medical examination. Likewise, abandoned or deserted children were sent to Pelletstown once they were recorded in the admission register.

Concern was raised by members of the Commission on the Relief of the Sick and Destitute Poor about this system. One member pointed out how objectionable it was to place an unmarried pregnant woman among all the other residents of the Union, ‘where her condition is known, where it is known to everybody what she comes there for, and where, probably, the class she would most likely to associate with are not the most desirable class’. He went on to express the opinion that
association with other ‘inmates’ could further undermine the woman’s morality. In the commission's final report it identified the procedure of retaining pregnant unmarried women within the Dublin Union institution until they had given birth as a defect of the Dublin Union’s system. It recommended instead that Pelletstown should have on its premises a ‘probationary and maternity department’ which would allow pregnant unmarried women to be sent there immediately on their admission to the Union. In this way pregnant unmarried women would only associate with themselves and would be kept apart from the general population contained within the Dublin Union institution.  

13.27 Prior to 1938, no records were kept in Pelletstown of the women residing there. The standard practice when transferring women and children from the Dublin Union to Pelletstown was to regard them as ‘on pass’, by putting their names on the pass book and sending out the relevant admission and discharge docket. These dockets contained only the name, age and religion of the person concerned and were of no assistance when further information on these residents was required.

13.28 From 1935 onwards, the system was changed to follow more closely the recommendations of the Commission on the Relief of the Sick and Destitute Poor’s report. In June 1935, a maternity hospital was opened in Pelletstown to allow unmarried pregnant women to give birth there. A new system of recording the details of women and children in Pelletstown was introduced in 1938 - see below.

### The 1920s

13.29 Information about Pelletstown in the 1920s was garnered mainly from the minutes of the Board of Guardians, the evidence given to the Commission on the Relief of the Sick and Destitute Poor, the report of that commission, the annual Reports of the Department of Local Government and Public Health (DLGPH) and documents provided by the Daughters of Charity.

13.30 The Dublin Union Board of Guardians met approximately once a fortnight. The minutes of these meetings show that issues in relation to unmarried mothers, deserted and abandoned children and Pelletstown facilities were frequently on the
agenda in the 1920s. The minutes of the meetings also include details of inspections of boarded out children.

13.31 The Board of Guardians had 72 elected members. In practice, about 25 members regularly attended the meetings and they carried out most of the work. Initially, the board had a ladies committee drawn from the elected female members. In 1923, the Minister for Local Government and Public Health asked his inspector to conduct an inquiry into the workings and duties of the Board of Guardians. This resulted in the minister concluding that ‘the duties of the Guardians of Dublin Union are not being duly and effectively discharged’. The Board of Guardians was dissolved and its powers and duties were transferred to commissioners. Among other things, this meant that there was no longer a ladies committee. The commissioners usually met weekly and heard reports from the inspectors appointed under the Children Act (see Chapter 1).

13.32 The report of the departmental inspector who had conducted the inquiry had also commented on the issue of child welfare. It stated:

The neglect in dealing with this important aspect of Poor Law just prior to the present administration was, to say the least, painful. To the credit of the Committee dealing with this Branch I am glad to say that serious efforts have been made to grapple with this situation. What has been done, however, serves but to demonstrate what a big task is presented and how very much remains to be done. The evidence shows that an actual system of Baby Farming has been indulged in and this applies principally to the child that is adopted for an immediate monetary consideration. The house where 6 babies died in two weeks is painfully illustrative of this. The unregistered Nursing Home is an equally grave danger and the practice of boarding children by Voluntary Societies in unhealthy and dirty areas should be immediately discontinued. I would suggest that the Voluntary Societies dealing with child welfare, together with those responsible for the management and control of the Union should hold a Conference to see how best the interests of the child may be protected from all the evil influences with which it is already threatened. There would appear to be serious need of legislation under which Nursing Homes, private or otherwise, would be compelled to register before accepting the care of any child. This is an essential step and severe penalties should attach to non-compliance
thervewith. Children are, in some cases, merely got “rid” of, and the methods
used are devised to evade criminal prosecution. This is first perpetrated by
the mother in giving the child to unsuitable foster parents and secondly by the
person who receives a lump sum for its supposed care and maintenance. It is
a reflection on the whole administration and calls for immediate and decisive
remedies.

13.33 While it existed (until 1923), the ladies committee was very involved in activities
which included the inspection of Pelletstown and Cabra. It also was involved in
decisions about the boarding out of children, including the approval and withdrawal
of approval of foster parents, and it made recommendations about the prosecution
of people who had children at nurse without being registered. The ladies
committee reports for each Board of Guardians meeting usually included details of
the children who had been discharged, those who had been boarded out, how
many had been inspected, who should cease to be acceptable for taking boarded
out children and who should be prosecuted for failure to register as having children
at nurse. When the ladies committee ceased to exist, reports on Pelletstown and
Cabra were provided by the resident medical officer/superintendent. The minute
books show that he submitted a weekly report on the Dublin Union and it often
included observations on the general health of residents in Cabra and Pelletstown
and any issues with these two institutions.

13.34 The Board of Guardians\textsuperscript{16} discussed Pelletstown facilities and requirements in
some detail right throughout the 1920s. As a result, the minutes of the meetings
provide some information about the residents in Pelletstown and the conditions
there at that time. The discussions covered a very wide range of issues including
practical maintenance matters and significant policy issues.

13.35 The Commission on the Relief of the Sick and Destitute Poor met from 1925 and
reported in 1927. Its meetings and final report also provide information about
conditions in Pelletstown. The reports of the Department of Local Government and
Public Health (DLGPH) provide some information about occupancy levels and
death rates.

\textsuperscript{16} The term the ‘Board of Guardians’ is used to cover the entire period of the 1920s including when its role was carried out
by the Commissioners.
13.36 On 15 June 1921, the Board of Guardians discussed buying washing tubs for Pelletstown: the finance committee recommended acceptance of an estimate for 22-inch tubs costing 9s 6d each. At the same meeting they agreed a reorganisation of facilities at the Dublin Union, James’s St to include provision for a nursery and crèche for mothers and children pending their being sent to Pelletstown.

13.37 The minutes of the Board of Guardians include information about deserted and abandoned children who were brought to the Union. They were usually baptised and given a name by the priest. In the early 1920s, there were significant numbers of abandoned/deserted children, for example, the minutes record that six abandoned children were taken into the Dublin Union in the period June-September 1921 and, in 1922, 17 were taken in. People who found abandoned children and brought them to the Union were paid for their time if they asked; the payment in the early 1920s was 10s.

13.38 The clerk of works report on the consumption of gas at Cabra and Pelletstown was discussed at the 8 February 1922 meeting of the Board of Guardians. The clerk noted that the consumption of gas at Cabra was 35,000 cubic feet per week, and 25,000 at Pelletstown. He wanted to reduce the consumption and improve the lighting by adopting more modern fittings. ‘If the Board desire, the Gas Company would fit up, free of charge, a few types of these modern economical fittings for demonstration purposes’. It is not known if this happened.

13.39 On 22 February 1922, the board was told that two women and five children were sent to Pelletstown that week.

13.40 A Pelletstown resident asked that she be allowed stay with her two children for a few months. The ladies committee recommended that the board write to the Sister in charge in Pelletstown to ask her to get ‘a signed statement from this woman giving particulars of her place of birth, and that of the children, and her reasons for being here, and any other information she can supply, and any means that she has’.

---

17 Sometimes the surnames they were given related to the street in which they were found, for example, O’Connell; a child found on the North Circular Road was given the surname North. This occasionally resulted in very unusual names and some concern was expressed by members of the board that the allocated names were not sufficiently Irish.
13.41 On 1 March 1922, the board discussed a case of a mother and her twin children who had been sent to the Dublin Union from London and then moved to Pelletstown. The grandmother then took the children out of Pelletstown and had them placed at nurse (see Chapter 1). The ladies committee reported that the children were in a very neglected condition; their poor condition seemed to have been attributable to the arrangements at nurse. The board ordered a report on why the children were discharged and why the mother was still in Pelletstown.

13.42 On 15 March, the ladies committee reported that the matron had submitted samples of infants’ clothing including shirt, binder, heavy flannel petticoat, dress, pinafore and head shawl which the committee considered very comfortable and satisfactory.

13.43 On 22 March 1922, a member of the ladies committee suggested that children were being sent out from Pelletstown ‘almost naked’. The medical officer disputed this and said that children were very rarely discharged from Pelletstown but rather were discharged from James’s Street. The only child who had been discharged directly from Pelletstown had been supplied with an outfit by order of the Board of Guardians and obtained by the same member of the ladies committee. This was discussed again at the 5 April 1922 meeting of the Board of Guardians where it was decided to issue a rebuttal to the papers in which the original report appeared.

13.44 The ladies committee visited Pelletstown and Cabra on 24 March 1922. They found the children ‘particularly bright and clean, general health satisfactory’. They noted that the babies’ skins were clean and healthy and there were no cases of measles. They also noted that the boots of the young children were worn very soft and some had no boots; they recommended that the board would provide the necessary boots. Two dozen cots were required and the Sister in charge had asked that the new wire mattresses be supplied as soon as possible. The Sisters had complained that the quality of buttons supplied for the children’s clothing was of very inferior quality as they caused the clothes to rust.

13.45 On 12 April, the ladies committee recommended the ‘adoption’\(^\text{18}\) by the board of a child resident in Pelletstown. The child’s mother was in the Magdalen Asylum,

\(^\text{18}\) There was no legal adoption at the time but the word was used when a person or, in this case, a public body, accepted responsibility for a child – see Chapter 32.
Lower Gloucester St.\textsuperscript{19} The ladies committee reported: ‘She has been leading an improper life and is an undesirable custodian’.

13.46 On 26 April, the Board of Guardians discussed what happened when a deserted child died in Pelletstown. It was noted that it had been the practice for years to report the deaths of deserted children to the coroner who could decide to hold an inquest. The Pelletstown medical officer complained that he had had to attend a post-mortem examination and give evidence, without being paid a fee, about the death of a deserted child. The bodies of children who died in Pelletstown were taken to the mortuary in James’s Street as there was no mortuary in Pelletstown or Cabra. The master (of the Dublin Union) had now been told that he could not remove the bodies to James’s St, without the coroner’s permission. He noted that the greater number of deserted children lived only for weeks or months after admission. There was another child now dead at Pelletstown; the coroner had accepted the medical officer’s certificate as to the cause of death (acute gastritis) and allowed the removal of the body. As there was no mortuary in Pelletstown, the medical officer asked the board to consider providing one or having abandoned children looked after elsewhere, boarded out or provided for in James’s Street.

13.47 On 3 May 1922, the board was told that there were 64 cases of measles in Cabra.

13.48 Members of the ladies committee visited Pelletstown on 8 June 1922 to consider the issue of having a mortuary built there. They reported to the Board of Guardians meeting of 14 June 1922. They identified a building which was being used by a carpenter as a suitable location. The committee recommended the work should be begun at once as the facility was urgently required. The estimated cost to complete the modifications was £47, which was approved by the committee.

13.49 On 19 July 1922, the request from the superior at Cabra and Pelletstown for ‘extras’ on the feast of St Vincent de Paul, 19 July, was granted as had been done in former years. The master had had to transfer ten children suffering from measles from Pelletstown to Cork Street fever hospital.\textsuperscript{20}

\textsuperscript{19} This was a Magdalen Laundry; Gloucester Street was subsequently renamed Sean McDermott Street.

\textsuperscript{20} The House of Recovery and Fever Hospital, Cork Street was a voluntary hospital: \url{https://rcpi-live-cdn.s3.amazonaws.com/wp-content/uploads/2018/01/Cork-Street-Fever-Hospital-and-Cherry-Orchard-Hospital.pdf}.  

15
13.50 On 26 July 1922, the steward at Pelletstown reported on the production of hay: the three-acre field there had produced 20 tons of hay, the bulk of which had been stored there in the hay shed. He anticipated a good second crop of six tons in about a month from the same field.\textsuperscript{21}

13.51 On 2 August 1922, the clerk of works wrote to the board about the heating of the Pelletstown buildings. He proposed having a separate heating system to heat the western block of the building which housed the mothers and babies. It would be a low pressure hot water system which was safe and reliable and could be looked after by unskilled labour. The heating system and radiators would give a temperature of 12\textdegree{}C in the rooms when the outside temperature was 0\textdegree{}C. The estimated cost for this work for the western block was £1,310.

13.52 On 17 August 1922, it was agreed that the clerk would write to the Archbishop of Dublin about the names given to children found deserted when they were being baptised by Catholic clergy. The board also considered whether it was worth pursuing putative fathers.

13.53 The ladies committee visited Cabra and Pelletstown on 20 October 1922. They reported that the children’s boots in Cabra were very much broken with holes in the soles and generally in very bad repair. In Pelletstown, the committee recommended that a woman be removed as she required ‘watching’. She had tried to get away several times and was not capable of minding her child. It was decided to remove her to the workhouse (James’s Street) and leave the child behind in Pelletstown.

13.54 The ladies committee again drew the attention of the board to a number of women at Pelletstown, whose children were over a year old. They had recommended several times that these women be ‘returned to the House’, that is, to the Union workhouse in James’s Street.

13.55 On 15 November 1922, it was reported that a ‘girl’ in Pelletstown had been very ‘abusive and impertinent’. She had been reported before for her insubordination

\textsuperscript{21} There was an active farm at Pelletstown which seems to have provided milk for the institution but the Commission has very little information about it.
and the ladies committee approved of the master’s action in having her charged for this offence and were of the opinion that all similar cases should also be charged.22

13.56 The ladies committee visited Cabra on 17 November 1922 and found the children very well. However, they again highlighted the poor state of the children’s boots and requested more stock be given as the children cannot have the boots repaired if they do not have a spare pair to wear. ‘The Ladies Committee are of the opinion that a strong effort should be made to have some of the children at Cabra boarded out’.

13.57 On 6 December 1922, the ladies committee complained about the quality of the material sent to Pelletstown to make up the black dresses for ‘girls’ going out.23 The board saw a list of ‘girls and boys’ from Cabra who were classified as workers but who are ‘incapable of being sent out to situation being wanting in intellect or deformed’; they were all aged between 18 and 26. The ladies committee had asked for the list as they wished to know why they were left in Cabra after the age of 15; the committee was satisfied that the reasons given were sufficient explanation for keeping them there.

Attitude of the Dublin Board of Guardians

13.58 The guardians (three females and one male) met the Ministry of Local Government on 2 January 1923 to discuss the proposed scheme to federate the existing rescue societies in Dublin. The guardians’ statement says they had no details of the proposal so were unable to comment. They set out their views on the ‘best method of dealing with the very serious problem of the unmarried mother and her child - as a result of our experience in the Dublin Union’. The following are extracts from their statement:

In any scheme dealing with this question the first consideration should be the welfare, physical and moral, of the mother and of the child. Many of these girls are ignorant and uneducated, some are weakminded, and few of them are up to the normal standard of girls of their class. They need training and education before confinement; the best way to provide this is in an institution run by nuns; they would get training and be less liable to further lapse; it would also benefit the health of the mother and the child.

---

22 It is not entirely clear if this is a reference to internal disciplinary procedures or to a criminal charge but it seems likely to have been a criminal charge.
23 It is not clear if this refers to the mothers or the babies but seems more likely to have been the mothers.
After the birth, the child should be with the mother for at least nine months in order to enable breastfeeding: to remove the child a short time after its birth is positively wicked and could not be too strongly condemned; the girl could get further training and could be involved in the work of the institution; after the nine months, the girl would be in a position to go out and be self-supporting: she will have developed her maternal affection for the child and will not wish to lose sight of it. In the Dublin Union many of these girls contribute to the support of their children and look forward to a time when they will be able to provide a home for them…; the children could be transferred to an orphanage or foundling home and as soon as possible should be boarded out in suitable homes in the country. Many of the children are weakly or suffer from physical defects or are perhaps not up to the normal standard. Institutional treatment for children in large numbers is not desirable.

13.59 The statement reported that in Pelletstown, 472 girls had been admitted since it opened for this purpose in February 1920; 132 had been sent to situations and not one had returned as a ‘second offender’; 120 were still there, some were taken out by the rescue societies, the rest had gone home to their friends. It further stated that the practice of the rescue societies was to place girls in lodgings in the city; ‘this is undesirable as they are placed in squalid slum tenements’. The situation was even worse for the children: ‘Few people realise the extent to which this practice of putting infants out “to nurse” obtains in the city of Dublin’. The guardians had four inspectors whose duties were to visit the children at nurse, inspect them and report on them. There were 1,128 children on the nurse children register on 27 December 1922. In the nine months ending 30 September, the inspectors paid 7,379 visits. Some of the rescue societies had visitors who visited the children in the homes but some did not and they met the foster mothers in offices. The guardians said that their standards were not high because of the difficulty of finding homes and suitable foster mothers but the societies had placed children in homes that the guardians had condemned as being unsuitable. The statement also referred to the practice of ‘adoption’ for a lump sum of money, which was described as a ‘wholly vicious system’. ‘No doubt there are some genuine cases of adoption but the vast majority are cases where the foster mother takes the child for the sake of the money involved…’ ‘Many of these children come to the Dublin Union ill or dying…’
In January 1923, there was a fire in the infants’ schoolroom in Cabra. It was noticed by the night-watchman at 3am. The Sister in charge told the board that the press where the fire started contained loose matches and candles and she reckoned that the fire was started by rats gnawing at the articles. The estimated cost to claim on insurance was £76 10s.

The ladies committee considered applications for overcoats for children who had been boarded out but were no longer on the books; the committee did not grant the applications.

Two members visited Pelletstown to investigate the complaints made by a mother about the condition in which she found her two children when she had visited them the previous week. They saw the two children and found them both clean and healthy and well-cared for, and their heads free from vermin.

The ladies committee visited Cabra and Pelletstown on 19 January 1923. They noted that there were several cases of ‘crippled boys’ in Cabra for whom something could be done. One was a partially paralysed boy who was said to be an ‘imbecile’; however, the committee did not consider him so as he could read and write well. He has been in Cabra for many years, ‘and it is a pitiable sight to see a boy for whom something might be done to improve his condition had he been taken in hands some years ago’.

They also visited the schoolroom where the recent fire had broken out. They noted that the school was infested with rats and it was absolutely necessary that some means should be taken to get rid of them as they were evidently the cause of the fire.

The ladies committee visited Cabra and Pelletstown on 16 February 1923. As a result, a resident was charged before police magistrates for refusing to work as ordered by the matron and for using obscene language. She was sentenced to seven days in prison.

In February 1923, an orphaned child in Pelletstown was being handed to the Catholic Protection and Rescue Society of Ireland (CPRSI) in order to have him ‘adopted’. His mother had died in the Union and the Union had claimed the £106
in savings which she had. It was proposed to give £50 to the CPRSI to arrange the child’s ‘adoption’. In March 1923, the Minister for Local Government and Public Health refused to approve this payment.

13.67 In March, the ladies committee considered a request from the medical officer for a grant to the children’s infirmary for toys for Easter. The committee declined as the children were supplied with toys by outside societies at Christmas and it was not customary to supply toys at Easter.

13.68 The ladies committee visited Pelletstown and Cabra on 16 March 1923. Their report stated that: ‘small sizes sent out are useless…’ The committee ordered the useless boots to be returned to the stores and replacement boots bought. They also complained of the delay in delivering other supplies which they had ordered from the Union stores. On their previous visit, they had ordered that a number of children be sent to the Eye and Ear Hospital to have their eyes examined. Of the nine who attended the hospital, eight were found to be suffering from trachoma24 and there was doubt about the ninth child. Treatment was prescribed and the children were to attend the hospital every week. ‘They are being kept separate from the other children as far as possible, but it is not possible to have absolute isolation’.

13.69 The committee consulted the medical officer about several ‘crippled’ children living in Cabra.25 Most were incurable invalids and nothing could be done to improve their physical condition. The committee recognised that a school like Cabra, which made provision for healthy children only, was not a suitable place for them. There had been a fire in the school a few months earlier. Repairs had not been carried out and the children were without heating for all of the winter.

13.70 The ladies committee visited Cabra and Pelletstown on 20 April 1923. They interviewed ten boys aged around eight years whose names had been sent to the committee as suitable for boarding out. They also recommend that all young children in Cabra be supplied with sandals instead of boots for the summer; it was

---

24 Trachoma is defined by the World Health Organisation as “a disease of the eye caused by infection with the bacterium Chlamydia trachomatis”. It may cause blindness if untreated. [http://www.who.int/news-room/fact-sheets/detail/trachoma](http://www.who.int/news-room/fact-sheets/detail/trachoma)

25 Such children were sometimes sent to what was then called the ‘Cripples Home’, Coole, Co Westmeath; this later became St Joseph’s Orthopaedic Hospital for Children. Initially it catered for boys with physical disabilities and was one of the very few such institutions in existence in the 1920s. It was extended in the 1930s using Hospitals Sweepstake funds and was then available to both boys and girls. It closed in 1981. It was run by the Daughters of Charity.
decided that the master would get estimates for this. They reported that extensive infestation of rats was causing problems.

13.71 In May 1923, the mother of an ‘adopted’ child, aged 3 years and 9 months, died. The child was admitted to the Union; it was agreed that, when the father got employment, he should pay the usual maintenance for the child.

13.72 In June 1923, a boarded out child was charged with larceny and was sent to the Union by the District Court. The committee had sent her to the children’s infirmary pending her re-appearance in the court and it recommend that the court be asked to commit her to High Park Convent, Drumcondra (an industrial school).

13.73 The inspector of schools inspected Cabra in June 1923. He was highly complimentary of the standards in the school; the equipment was up to date and ‘…the general surroundings; the cleanliness, manner and demeanour of the pupils cannot be excelled’. He spoke to the boys and noted that they had pride in the school and looked on the Sisters with great affection. He made some suggestions for classroom improvements and remarked: ‘I cannot conclude without mentioning that the general work done by the good Sisters is beyond all praise. I have never seen better mannered or happier children’.

13.74 In July 1923, the governor of Mountjoy prison wrote to the Union to say that a prisoner who had been sentenced to six months imprisonment for neglecting and abandoning her infant child wanted to go to Pelletstown if released. The board recommended that the woman and child be admitted to Pelletstown.

13.75 The ladies committee continued to express concern about ‘adoption’ for lump sum. In August 1923, three such children died a short time after the ‘adoption’. The lump sum involved was £10 in two cases and £16 in the third. While it was not considered that these children had been neglected as they were delicate from birth, the committee considered that such ‘adoptions’ should be outlawed. They also noted that the law about registration was being evaded by having money provided as a present or for clothes.

---

26 The inspector of schools was concerned only with education facilities and not with residential standards.
27 Children were also nursed out for a weekly or monthly fee rather than a lump sum; in these cases, it seems that the mothers visited the children; the Board of Guardians minutes include the information that one mother was paying £1 4s a month.
On their visit to Cabra and Pelletstown, the ladies committee recorded that the children were on holiday.\footnote{The minutes do not record where they went on holiday but describes it as their ‘annual excursion’.

In October 1923, a child crawled through the window of one of the upper rooms in Pelletstown and fell to the ground. The window had been six inches open. The Sister in charge was unable to find a doctor so she phoned the master and he hired a taxi to bring the child to a doctor. Unfortunately, the child was dead on arrival. An inquest was held. The jury found that the cause of death was purely accidental and there was no blame attached to the officers of the institution. Meantime the clerk of works was seeing to have the windows fixed to open only four inches.

The ladies committee visited Cabra and Pelletstown on 19 October. At Cabra, they interviewed the nine children who had no visitors and considered that they were all suitable for boarding out. They inspected the boys’ paved playground which was in a very bad condition owing to the heavy coal lorries going in and out. They said that there was a great need for a ball alley and it should be put up immediately. The clerk of works was ordered to report on the cost of building one and to have repairs to the playground carried out at once. One hundred and forty seven pairs of boots had been received in October.

The medical officer reported that he had examined 11 children at Cabra and considered that only three were suitable for being boarded out owing to their health. The ladies committee had frequently considered the advisability of having a thorough medical examination of the children at Cabra, at stated intervals, but realised that under the present arrangements it would be impossible to have it carried out. They asked to meet the medical officer to discuss this.

The inspectors of boarded out children were directed to recommend the use of Glaxo milk formula for boarded out children whenever possible and to instruct foster mothers on its preparation. They were to supply the foster mothers with one pound packets of the product at 1s 6d a packet. ‘In this way a check can be kept on the amount of nourishment given an infant. A special monthly report on the results was to be submitted. Later, the inspectors of boarded out children reported that the children who were being fed on Glaxo were doing very well.
13.81 In February 1924, the Minister for Local Government and Public Health approved the appointment of a superintendent of Pelletstown on an annual salary of £90. The superintendent of Cabra Auxiliary was paid the same. In March a temporary superintendent was appointed to Pelletstown at a salary of £76. A temporary midwife (a lay person) was paid 45s a week for night duty in Pelletstown.\footnote{Minister for Local Government and Public Health, Sanction books, 1924.}

13.82 There was a severe outbreak of measles in Pelletstown in 1924. In April and May, the Board of Guardians received weekly reports on the number of deaths from measles and, in many cases, complications such as pneumonia. In one week in April, 19 children died. In May 1924, the doctor reported that the measles epidemic was dying out. The doctor’s report to the Board of Guardians stated that the outbreak started on 27 March 1924. The Sister in charge reported that the total number of cases since the outbreak was 138; 23 children with mothers and 38 without mothers died. There were no new admissions during the period of the outbreak. The doctor’s report said that the high mortality rate was due to three factors:

- The children had very little resistance to any acute illness;
- The virulence of the outbreak was very great;
- Many of the children are already affected with congenital diseases which become painfully evident when they are attacked by the fever.

13.83 The outbreak was apparently caused by a child coming to the institution whose brother already had measles and who developed signs of the disease soon after. Attempts were made at once to prevent the spread of the disease, for example, by isolation. This was, as usual, of no avail as measles is infectious for days before it manifests itself. ‘Every possible care and attention were given to the children by the staff and extra nurses were immediately employed’. Fifteen deaths were due to borne pneumonia and 30 deaths occurred in children suffering from congenital diseases mainly tubercular both abdominal and pulmonary. Three of these children developed meningitis. Five deaths were due to Cancrum Oris. One child suffering from congenital paralysis of both legs died about a fortnight after being attacked ‘from broncho pneumonia’. The youngest child attacked was ten months and the eldest was aged two years and seven months. ‘I would suggest that all children should be kept for a fortnight under observation before they are sent out of the institution. I would also like to have the question of an open air veranda gone
into fully with the object of trying to raise the resistance of these children to disease’.

13.84 The Commission has not been able to find any detailed information about the diet in Pelletstown in the 1920s. In July 1924, there was correspondence between the Dublin Union and the minister about this - the minister stated that he had no objection to the Dublin Union proposals; unfortunately this letter does not say what the proposals were or what diet the children had or would have when the proposals were implemented. In October 1924, the minister agreed proposed expenditure on supplies of apples and bracks for the children at Halloween.

13.85 A report from the Dublin Union in July 1924 found that for the period from 1 April 1923 to 31 March 1924, infant deaths were far higher among children in Pelletstown who did not have their mother present to look after them. It found that out of 216 children admitted, 151 were accompanied by their mothers who nursed them, while the remaining 67 were admitted without any mother to nurse them. Thirty-two of the 151 children nursed by their mothers died in that period while 49 children (including 14 deserted children) died among the 67 that were not nursed.

13.86 In June 1924, the Sister in charge of the Cabra Auxiliary reported that a woman secretly removed one of her two children after a visit to them. The child was dressed in the workhouse uniform. The two children were ‘illegitimate’ and had been there since 1916. The master was instructed to report the condition under which visits were allowed and what supervision was exercised over the children during visiting hours.

13.87 The visiting days in Cabra were the first Sunday of every month between 2 and 5 pm. The Sister in charge of visitors was always present. Because of the ‘unusual circumstances’, the Board of Guardians had allowed this particular mother to visit outside of the usual hours. On the visit in question she had been accidentally left alone with the child while the Sister in charge was looking after the other child. The mother took the child through the grounds at the back of the institution which opened into the Phoenix Park and was inadequately protected.

13.88 In July 1924, a boarded out child who was placed in service was returned to the Union by her employer who found her ‘too difficult to control’. She was sent to
Cabra to be further trained by the nuns who ‘will again place her in service when more fit and steadier in manner’.

13.89 The doctor reported that some of the children in Pelletstown had summer diarrhoea and haemorrhage.

13.90 In November 1924, the doctor’s report stated that there was severe bronchitis with a number of cases of pneumonia amongst children in Pelletstown. A night nurse was requested and sent there for duty.

13.91 In February 1925, the doctor reported that there was ‘nearly always a case of Haemorrhagic dysentery in the house … I am inclined to think that this serious disease may be caused by the want of light in the day room’. The board agreed to notify the DLGPH of the doctor’s concerns.

13.92 In July 1925, the Board of Guardians was concerned about some of the practices of St Patrick’s Guild of Rescue. (St Patrick’s Guild was entirely separate from the Dublin Union and Pelletstown – see Chapters 2 and 27). Seven children who had been nursed out by the guild had been admitted to the Union since 1 April. No payment had been received in respect of them. The nurse mothers with children from the guild had recently been trying to have healthy children admitted to the Union as they pleaded poverty and stated that they could not maintain the children on the small adoption fee, sometimes as small as £5, paid to them by the guild. The attention of the minister was drawn to:

the practice of this society accepting rewards for the care of children and then ridding themselves of all responsibility by dumping the children in the workhouse. We understand that this society is drawing a Government subsidy in respect of this work.

13.93 By the mid-1920s, Pelletstown catered for a large number of unmarried mothers and ‘illegitimate’, abandoned and deserted children. It was reported to the Commission on the Relief of the Sick and Destitute Poor that, on 6 June 1925, there were 107 women present in Pelletstown and that all but three or four were unmarried mothers. In addition, there were 110 male and 91 female children in the institution. In Cabra, there were 31 women along with 28 male and 72 female children. Children were generally kept in Pelletstown until they reached the age of
CHAPTER 13 PELLETSTOWN

four and were then supposed to be boarded-out. Following the birth of her child
and their transfer from the Dublin Union to Pelletstown, the unmarried mother
generally stayed there nursing and looking after her child for a period of twelve
months.

13.94 Of the 201 children in Pelletstown in June 1925, it was reported that about 107
were the babies of the mothers housed there. The remainder were children who
had been found deserted or abandoned and those who had been left behind after
their mothers had left the institution to take up some outside employment arranged
by the Daughters of Charity. Unlike most other mother and baby homes, no
distinction was made in Pelletstown between unmarried mothers who had one,
two, or more 'illegitimate' children.

13.95 In its 1925/26 report, the DLGPH reported that considerable improvements were
being carried out in Pelletstown. The report stated that the average number of
‘inmates’ was 400 - about 120 mothers with children, the reminder being children
without mothers. Although the accommodation was extensive it was entirely
inadequate for the large numbers being sent to it.

   In the day nurseries especially space and light were totally insufficient. Two
large nurseries with verandas are being erected where delicate children can
get all the sunshine available. It is intended in future, if the children are not
claimed by parents or relatives, to keep them in this Institution until they reach
school age, then to board them out with suitable foster parents.

13.96 The Board of Guardians admitted to the Commission on the Relief of the Sick and
Destitute Poor that the percentage of children dying in Pelletstown was ‘very
heavy’ in the twelve months prior to June 1925. In response, members of the
commission pointed out that this was to be expected when such a large number of
infants, of similar age, were being housed together in the one building meaning
there was little protection against the spread of numerous infectious diseases. The
representative of the Board of Guardians said that it was the children being
admitted from the street into Pelletstown, rather than those born to unmarried
mothers in the Dublin Union who were then transferred, that accounted for such a
high mortality rate. He estimated that such children made up 80% of those who
died. In his opinion these children were often in a delicate state of health, suffering
already from the likes of venereal disease and frequently close to death when
admitted. He added they ‘come into the world severely handicapped and are not normal at all’.

13.97 In September, the Board of Guardians and the Daughters of Charity reached agreement about the new arrangements for Cabra. The board agreed to leave the Cabra Auxiliary to the Daughters of Charity for the purpose of carrying on a ‘Home for Mentally Deficient Children and Imbeciles’, at a nominal rent of £5 a year. The board agreed to spend £200 on painting work immediately. The Daughters of Charity agreed to accept up to a maximum of 60 children from the Dublin Union at a rate of £26 a year (10s a week); Dublin Union children above that number and children from other areas would attract a capitation rate of £39 a year (12s 6d a week). The medical officer of the Dublin Union would continue to act as the medical officer to Cabra and would be paid by the board. Cabra ceased to be an integral part of the Dublin Union at this stage although it remained very closely associated and it became a significant exit pathway for Pelletstown. The DLGPH reported that, in January 1924, there were 503 children in the Cabra Auxiliary; of these, 54 were ‘mentally deficient’ and remained with the Daughters of Charity; 149 were boarded out; 103 were sent to situations; 176 were taken by relatives; five died; 10 were sent to industrial schools and four to the Union infirmary.

13.98 The Minister for Local Government and Public Health wrote to each Board of Health and Public Assistance to tell them about the establishment of St Vincent’s, Cabra - described as a home and school for the treatment and instruction of mentally deficient children:

Any adequate personal attention to these afflicted children has been proved to be most difficult in Homes or workhouses, and in many cases their presence has caused much inconvenience and discomfort to other cases. The teaching to be given, more especially in the matter of formation of habits, will largely improve the prospects in life of those children and minimise the extent of their dependence. This will, it is hoped, reduce substantially the contingent liability of public funds for their maintenance throughout life.

13.99 In January 1926, the doctor reported from Pelletstown that, while the general health continued to be satisfactory, there were three cases of bronchitis and one case of jaundice and pneumonia. Eight children had died in the previous week. The board recorded that it took a serious view of the number of deaths and wanted
a detailed report from the doctor. It had come to their attention that babies leaving Pelletstown to be placed at nurse often presented a delicate and even starved appearance.

13.100 In April 1926, the doctor said that he had to ‘again’ complain about the quality of the milk in Pelletstown; on three occasions in the past week it had been stale and sour. In August 1926, it was agreed that the dentist would be notified to give immediate attention to any boarded-out child brought to the infirmary for dental treatment so that the children’s stay in the Union would be as short as possible.

13.101 In 1926, the Commission on the Relief of the Sick and Destitute Poor was told that the full average cost of the children and mothers respectively worked out at about 15s a week at Pelletstown. There is no evidence about how this was calculated.

13.102 In February 1927, the solicitor to the board reported on events in the District Court. During applications to have children sent to industrial schools, it was reported that children were sent out from Pelletstown and subsequently found destitute. The solicitor repudiated this. The District Justice said that, about two months earlier, a boy who was brought before him on a criminal charge stated that he had been six years in Pelletstown and during that time he was working on the farm and was only taught lessons for one week. The Justice further stated that, when tested, the boy could neither read nor write or tell the time. The Justice asked the solicitor to bring this to the notice of the Board of Guardians. The board replied that the Justice had ‘been grossly misinformed’ as

- Pelletstown was for mothers and infants only.
- Cabra Schools had been closed for over one year.
- Cabra Schools when in being were under the National Education Board.

13.103 The Report of the Commission on the Relief of the Sick and Destitute Poor including the Insane Poor was published in 1927. It described Pelletstown as follows:

The school buildings at Pelletstown have already been adapted as a home for unmarried mothers and infant children. It is in charge of the Sisters of Charity of St. Vincent de Paul. In the past year the Commissioners for Dublin Union have effected considerable improvements in the buildings and the whole place is now well suited for the purpose to which it has been allocated, and
appeared to us capably managed. It suffers, however, from the defect that women are not sent there until after the birth of the child, and up to that period are retained in the workhouse. As we have indicated in our previous recommendations (Para. 233) when dealing with the problem of the unmarried mother, we consider a Home of this class should have a probationary and maternity department, a recommendation which applies to the Pelletstown institution.

13.104 In 1928, the Board of Guardians, particularly Mrs Wyse Power, was concerned about the ‘classification’ of unmarried mothers. Mrs Wyse Power had had consultations with the rescue societies and with Mr Frank Duff: ‘The former are most interested in the problem and have offered assistance as far as possible. The latter was not in a position to do anything other than make certain definite and useful suggestions’.

13.105 Mrs Wyse Power proposed that ‘Pelletstown should be devoted entirely to the care of the First Offender and the children’. Second and subsequent ‘offenders’ should be brought to the workhouse and retained there for some time. ‘This would give the advantage of time to develop the best ways and means of providing for them whether by selecting suitable residence for their reception and care or placing them in the charge of a community of nuns’. She said that the nuns attached to St John’s Convent (that is, the Daughters of Charity) were prepared to ‘take over the charge of this class’. She suggested that a portion of the North Dublin Union adjoining the convent and which was then occupied by ‘healthy casuals’ might be converted for this purpose. As an alternative, St John’s could be taken over for ‘first offenders’ with the ‘other classes being retained’ in Pelletstown. In December 1928, the Dublin Union adopted the alternative proposal. The Daughters of Charity were asked to provide three Sisters to manage St John’s which would accommodate 40 to 50 women. ‘This would enable us to give first offenders a chance towards reform, and Mr Frank Duff has promised on behalf of his Society

30 The correspondence in relation to this is inserted into the Board of Guardians minutes of April 1935.
31 Of Regina Coeli – see Chapter 21.
32 St John’s Convent seems to have been owned by the Dublin Union. It was the residence of the Daughters of Charity while they ran the North Dublin Union workhouse in North Brunswick Street. It continued as their residence while they were involved in the infirmary there until 1 January 1929.
to help by getting his workers to keep in touch with the girls when they leave the Institution’.

13.106 It transpired that the Daughters of Charity were not favourably disposed to this proposal. In 1929, they wrote:

We would be adverse to taking over that class of work in St John’s - it does not admit of suitable arrangements for separation between the community and the work. Whether the locality is suitable is questionable also. Wherever the work would be, suitable provision should be made beforehand for the girls, also for accidents which are liable to occur.

The Sisters should have the freedom of management, and of the employment of suitable and necessary staff they would deem necessary to carry out the responsibility of the work. It is a big problem and wants a great deal of consideration on our part - we could never undertake it as proposed.

Another consideration is, we are not sure at present of having the necessary Sisters - it is not by any means every Sister would suit that work and be able for it.

A suitable agreement embodying the necessary control, etc, would also be needed.

13.107 The Daughters of Charity suggested that the Union provide a home elsewhere and give it over to them to operate. This suggestion was unacceptable to the Union because the ‘capital expenditure and commitments in respect of Pelletstown, Cabra, Casuals and Lunatics and Consumptives makes such a suggestion unacceptable’; if the Daughters of Charity were prepared to establish a home with their own funds, the Union would be prepared to enter into an agreement to board out first offenders provided ante-natal care was included.\(^{33}\)

13.108 The possibility of boarding out pregnant unmarried women had also been raised by Mrs Wyse Power. Mr Duff made the point that there would be no possibility of managing this unless ‘...Outdoor Relief was forthcoming, and in fact at a rate above the normal. It is doubtful if less than 15s per week would be accepted by any moderately respectable women to keep them’.

\(^{33}\) Documents provided by the Daughters of Charity
13.109 The DLGPH reported that, at the end of 1928, there were 68 mothers of first born children in Pelletstown and 26 mothers of more than one child. In the late 1920s, there were about 100 mothers resident in Pelletstown at any one time. On leaving, the majority went to ‘situations’ (about 80%) and the rest went to relatives.

13.110 The DLGPH reported on the death rate among children as follows:

**The 1930s**

13.111 The Board of Guardians/Board of Assistance minutes for the 1930s have considerably fewer references to Pelletstown than those in the 1920s. They continue to list the children discharged from the Union (including Pelletstown) and where they went; generally they were boarded out or sent to other institutions. At each meeting, Children Act inspectors gave detailed reports on the children whom they inspected. The ‘State of the House’ report covered all residents of the Union by category including sick children, healthy children and mothers with infant children.

13.112 There were continuing discussions about how Pelletstown should be organised. In November 1930, the Minister for Local Government and Public Health wrote to the clerk of the Dublin Union about this. The minister’s understanding of the proposals was that:

No one would be admitted to the nursery at Pelletstown or the maternity department attached except from the Dublin workhouse;

Classification would be made in the nursery by ‘physical division’;

---

34 The institutional records analysed by the Commission show that average occupancy in the years 1927-29 inclusive was 134 women.
35 The Board of Guardians was replaced by the Board of Assistance in 1931 by the Local Government (Dublin) (Amendment) Act 1931.
36 Other categories included ‘aged and infirm’ and ‘lunatics and idiots’.
‘Troublesome cases’ would be returned to the Dublin workhouse or dealt with under the disciplinary code provided in the workhouse rules; A maternity hospital would be established in the nursery (Pelletstown); trained nurses would be appointed to it by the Dublin Union; The Daughters of Charity would provide a school for the children of the nursery and from the workhouse; the Dublin Union would pay 12s 6d a week for every child transferred to that school; the Daughters of Charity would also admit other children whose parents were temporarily unable to look after them provided they were free from infection.

13.113 In March 1931, the Minister for Local Government and Public Health wrote to the Dublin Union approving the ‘proposals for the reorganisation of the Home for mothers and children at Pelletstown’. The minister went on to say that people from outside the Dublin Union should be paid for by their local authority at a fixed weekly charge. The Union disagreed with this suggestion: ‘We do not think boards of health would pay as girls are not sent here by boards of health but come here and become chargeable to this Union by one or more days of residence and we anticipate refusal of boards of health to pay’. In conveying these decisions to the Director of the Daughters of Charity, Fr O’Connell, (who was a Vincentian priest based in London) the clerk of the Union said that the ‘publication involved would re-act against the recovery of the patients concerned’.

13.114 The DLGPH reported that the average number of women resident in Pelletstown in 1930/31 was 105; again, about four fifths were placed in employment and the rest were returned to relations.

13.115 An elected Board of Assistance was established in 1931 and it had a ladies committee. This was closely involved in decisions about where children in Pelletstown should go. For example, in 1933, the Sister in charge of Pelletstown recommended the transfer of a number of children to St Philomena’s (which had been established by the Daughters of Charity in 1932 to take some of the older children from Pelletstown who were not being boarded out - see Chapter 2) but the ladies committee decided that they should be boarded out.

13.116 The board minutes include details about prosecutions of people for failing to register children at nurse. In one such case, the woman was fined £10. The Judge did not agree with the Dublin Union suggestion that the child in question
should be returned to a nursing home as he did not agree that the place was a
place of safety. Instead, he ordered that the child be taken in to the Dublin Union.

13.117 In February 1933, Children Act inspectors reported that they were unable to trace
the mother of a child who died recently in Dublin Union.

13.118 The ladies committee visited Pelletstown on 7 March 1933 and were told by the
Sister in charge and the medical officer that there were no children fit for
discharge.

13.119 The DLGPH reported that, in 1932/3, the average number of mothers at
Pelletstown was 94; of those who left, 56 were placed in employment, 27 returned
to their relatives and four were sent to homes.

13.120 In August 1934, plans were being made for works to be carried out at Pelletstown.
An architect had had discussions with the medical officer and the Sister in charge
about the plans. Plans were drawn up for the following additional buildings:

- A new children’s room over the existing mothers wing;
- Extension of laundry with new ironing room and linen store;
- New isolation hospital and nurses quarters;
- New baths and lavatories for small children and covered play shed.

13.121 The architect noted that all the plans were not complete but he was of the opinion
that ‘… having regard to the increased accommodation asked for, the sum of
£15,000 originally applied for will be greatly exceeded, probably doubled’.

13.122 The DLGPH reported that the average number of women in Pelletstown in 1933/4
was 92; of those who left, 58 were placed in employment and 33 returned to
relatives. There were 124 women and 440 children there on 31 March 1935; 149
women were admitted during the year and 125 were discharged. Of those, 10 got
married, 50 returned to their parent or relations, and 56 were sent to situations;
297 children were admitted during the year and 156 were discharged.
Proposed change of status

13.123 Attempts were made in the 1930s to change the status of Pelletstown from a directly supported public institution into an institution which would be financed on a capitation basis (like the Sacred Heart homes).

13.124 In February 1935, the Board of Assistance wanted to separate Pelletstown from James's Street maternity hospital. The board members were of the opinion that while the Institutions are combined even the short period of their presence here creates an influence on the patients' minds antagonistic to the promise of moral recovery. Furthermore, as long as Pelletstown is legally a part of the Dublin Union Infirmary even the most well-intentioned persons have no reluctance of instructing girls pregnant or who have babies to apply for admission here with a view to finally being sent out to Pelletstown under the Sisters.

In addition the Sisters feel they are unduly restrained by the usual regulations in dealing with the very complex problem.

13.125 On 17 July 1935, the Dublin Board of Assistance adopted the following proposal:

It would be highly desirable that St. Patrick’s Nursery at Pelletstown would be conducted on the same lines as the Home for Mental Defectives at St. Vincent's, Cabra, i.e., that the Board of Assistance should leave the premises to the Sisters of Charity and that the Board should pay, say a sum of 12/6 per week, or a sum to be arranged, in respect of each mother and each infant. From the Sisters point of view this would give them a free hand in administration unhampered by regulations unsuitable to the very detailed problem in which they are engaged. From the Board of Assistance’ point of view, they will be relieved, to a very great extent at least, of the large numbers coming to James’s Street, with a view to being sent to Pelletstown direct.

13.126 The proposal went on to set out the problems in implementing this. The question arose as to what would happen to the lay staff who were then employed; the permanent staff would have to get ‘abolition allowances’. The Sisters would need an undertaking that the board would allow the return of a mother or child whom they considered unsuitable by ‘reason of conduct or otherwise’.
There was correspondence between the Dublin Union, the DLGPH and the solicitors for the Daughters of Charity about the proposal. The solicitors reported to the director of the Daughters of Charity, Fr O’Connell.

The Dublin Board of Assistance proposed to pay the Daughters of Charity 12s 6d a week for each mother and each child. The director regarded this as a minimum as it was the amount being paid for children attending industrial schools. The Minister for Local Government and Public Health considered it excessive as Bessborough was charging 21s for mother and child.

There were detailed discussions about the financing of the proposed arrangement. The Board of Assistance wanted the rent to be related to the loans which had been taken out to buy the premises; the outstanding charges or loans amounted to about £2,000 a year. There were also discussions about the staff generally and specifically the medical officer, the furniture and even the farm implements.

In September 1935, the director of the Daughters of Charity told the solicitors that they were very much in favour of taking over but they must get a capitation rate of 12s 6d for each person. They did not want a trial period as the superior ‘would feel very harassed by the idea of a scrutiny’. He pointed out that the capitation rate for St Vincent’s, Cabra (where children with disabilities lived - see above) was 15s for each child but they would accept 12s 6d for other work. They had a lease for 25 years on the Cabra premises for which they were paying £280 rent. By October 1935, the Daughters of Charity were agreeable to paying a rent of £190 a year but would not agree the most recent Board of Assistance proposal of a weekly payment of a maximum of 15s for adults, a maximum of 5s for children under seven and a maximum of 7s 6d for children over seven.

Draft leases for the transfer of the lands were drawn up and were ready for signature in March 1936. A draft agreement between the board and the Daughters of Charity was also ready for signing at that time. The intention was that the transfer and agreement would take effect from April 1936.

---

37 Correspondence between the Board of Assistance and the Daughters of Charity provided to the Commission by the Daughters of Charity.
38 These documents are referenced in the minutes of the Board of Assistance but the Commission has not seen the actual documents. All had been submitted to the DLGPH.
13.132 The proposal did not go ahead; the Commission has been unable to establish exactly why but it seems likely that there was no agreement on the capitation rate that would be paid or there was an agreement between the Board of Assistance and the Daughters of Charity but it was not approved by the DLGPH.

13.133 In February 1935, the resident medical superintendent reported to the Board of Assistance on the immunisation of children in Pelletstown. The DLGPH had been inquiring about the matter. The medical superintendent said that the number of children who had been immunised varied because of the varying number of admissions and discharges and also because of the fact that some children might not be regarded as suitable for immunisation on account of their health.

13.134 He reported that there were 423 children in Pelletstown at that point - they ranged from infants up to eight years old. There were a further 21 children in the Pelletstown maternity department and 58 in the infirmary.

13.135 The maternity unit was opened in June 1935. It had two eight bedded wards one ante-natal and one post-natal. In July 1935, the medical superintendent told the Board of Assistance that it was necessary to get 16 beds and 16 cots for Pelletstown.

13.136 He looked for an increase in salary because the amount of medical attention and care required in Pelletstown had increased greatly in recent years and the opening of the maternity hospital involved much more additional work.

13.137 In December 1935, architects provided the estimates of costs for new developments at Pelletstown:

- New isolation hospital - £12,500
- New storey on mothers wing (children’s playroom) - £5,500
- New laundry and ironing room - £6,000
- New sanitary block and children’s shelter - £2,700
- Laundry equipment including electric light and power wiring - £3,000
- Equipment of isolation hospital - £1,000

39 It was an annexe to the existing building and is sometimes referred to as a maternity hospital, a maternity ward or a maternity section.
Approximate total cost - £30,700 (exclusive of architects and engineers fees).

13.138 The DLGPH reported that there were 145 women and 430 children in Pelletstown on 31 March 1936; 246 women were admitted during the year and 223 were discharged. Of those, six got married, 79 returned to their parent or relations, 89 were sent to situations and two to other homes. There were 374 children admitted during the year and 235 discharged.

13.139 As stated, the maternity hospital in Pelletstown had opened in June 1935. In June 1936, the medical officer reported to the Board of Assistance that the hospital had been in operation for a year. He said that work had been started there in a great hurry in June 1935 because of an outbreak of puerperal fever in the hospital at James’s Street. He reported that there had been 139 confinements in the twelve months. One mother died from acute eclampsia and another woman died from pneumonia about a month before she was due to give birth. There were three cases of instrumental delivery and 66 mothers required surgical treatment after delivery. Thirty-three of the male children required to be circumcised and were operated on by the visiting medical officer himself.

13.140 In October 1936, the DLGPH inspector, Miss Alice Litster, reported that she was concerned about the general physical and mental condition of children boarded out from Pelletstown. She said that it was unfair to foster parents to place in their care children suffering from skin disease, addicted to extremely dirty habits or almost bordering on mental defect. She said that every child leaving the institution to be placed at nurse should be medically examined and have a certificate of fitness signed by a medical officer. She had mentioned this to the Sister in charge who had agreed to have this done. She went on to suggest that prospective foster parents might be given some choice about the children they would take especially if it was their intention to ‘adopt’ in the future. The ladies committee noted and approved these suggestions and decided to tell the medical superintendent and the Sister in charge that they would be insisted on in future.  

---

40 This seems to have been used as a euphemism for enuresis (bed wetting) and/or soiling oneself.
41 Miss Litster’s report also expressed concern about formerly boarded out children who were hired out to employers; she was concerned that the foster parents were sometimes insisting that the child’s wages be paid to them rather than to the child. She also addressed issues relating to children who at age 15 had to leave foster care and ended up in institutions and about the implementation of the Children Acts.
In September 1937, the medical superintendent reported that the numbers resident in Pelletstown were as follows:

- 18 September 1934: 526
- 18 September 1935: 630
- 18 September 1936: 573
- 18 September 1937: 669.

He also reported that he had been told by the architect that all documents were ready and advertisements could be issued for tenders for works passed by the board and sanctioned by the department. The isolation hospital had not yet been sanctioned. It was noted that: ‘Even with additional buildings proposed to be erected there would be insufficient physical accommodation for the present numbers, and in Resident Medical Superintendent opinion best results cannot be obtained with such large numbers in the institution’. The medical superintendent had retained an employee at £3 10s a week (plus 7s a week to cover bus fares) to report on each child in the nursery with a view to expediting discharge of as many as possible, for example, by returning to parents, boarding-out or sending to school. The employee would be required for at least two months. Because of this overcrowding, the Board of Assistance decided, in October 1937, that children should be transferred from Pelletstown to St Philomena’s up to the maximum allowable and that this should happen immediately. The board also asked the Minister for Local Government and Public Health to make further provision for the transfer of children from Pelletstown to approved homes as the accommodation in Pelletstown was inadequate.

That same month, the medical superintendent reported that there was a ringworm epidemic at Pelletstown. He had examined 103 residents; 70 were free of ringworm and the remainder had varying degrees of infection. About 150 had not yet been examined.

In December 1937, Miss Litster complained that the Dublin Board of Assistance did not make sufficient use of its power to place children at nurse in rural homes and was more inclined towards putting children in institutional care. Miss Litster pointed out the advantages, including lower costs, of boarding out. She drew particular attention to the health advantages: there were 498 children in Pelletstown on 30 September 1937 and there were 1,502 children registered as
being at nurse; in the year to 30 September 1937, 102 children died in Pelletstown while 39 children at nurse died. She pointed out that six children who had been on the Children Act’s lists during the year were admitted to Pelletstown and died there and she had included these six in the total of those who died at nurse. The number of children boarded out at 30 September 1937 was 160 and there were no deaths among boarded out children in the year to 30 September 1937.

13.145 Miss Litster again pointed out that placing children at nurse or boarding them out was likely to be much more successful if this happened at a very young age. She said that the special institutions for unmarried mothers notified the county Boards of Health and Public Assistance when children were nearing the age of two and if they were healthy, normal and fit for boarding out. Children were maintained in Pelletstown to school going age and did not settle down in their foster homes as rapidly and attach themselves as freely to their foster parents as if placed at nurse at an earlier age. She suggested that the Board of Assistance might require a statement from the superior in Pelletstown at reasonable intervals, say quarterly, showing the ages of children in the institution and stating their health and general fitness for boarding out. The board agreed to this.

13.146 In January 1938, the medical superintendent in Pelletstown reported that he had completed a register of all the woman and children in Pelletstown and at the same time investigated the possibility of decreasing the numbers by discharge, boarding out or sending to appropriate schools. He pointed out that, up to this point, there were no records kept in Pelletstown so ‘... a system of case cards has been started which, properly written up and filed in alphabetical order in a metal cabinet fitted with lock and key, was considered to be more suitable than a book type register’. The writing up of these case cards entailed the examination of approximately one thousand history sheets in the files of the Dublin Union. As described above, it had been the practice when transferring women and children from the Dublin Union to Pelletstown to regard them as ‘on pass’ by putting their names on the pass book and sending out the relevant admission and discharge docket. These dockets contained only the name, age and religion of the person concerned. The case card system allowed for more extensive personal information on mothers and children to be collected by the Sister in charge in Pelletstown; the information included records of admissions, discharges, transfers from and re-admissions to the institution.
13.147 The medical superintendent had investigated the boarding out of as many as possible of the children resident in Pelletstown. He provided the Board of Assistance with a list of those whom he considered suitable: 84 in total. Of the remaining children, there were about 130 under one year and classified as infants; a further 120 were children who had parents or relations or friends interested in them and the rest could not be classed as ‘normal’ and were not suitable for boarding out.

13.148 He did not see any point in preparing a list of the women in Pelletstown. The reverend mother has always shown an admirable discretion in the treatment and ultimate disposal of these women and I am sure, will continue to do so in their very best interests. Though she is daily being approached for domestic servants, cooks and maids, her first thought is to ascertain will the mistress suit the maid - a reversal of the more usual commercial procedure. There are certain women whom she could not conscientiously release to service, and again, the environment of many of the prospective employers is such that she must consider them unsuitable for the women who might be available.

13.149 The medical superintendent addressed the various points made by Miss Litster in her report. He pointed out that the board’s power to place children at nurse in rural homes was entirely dependent on demand and he clearly doubted that there would be much demand. He addressed the comparison of mortality among boarded out children and the children in Pelletstown to which Miss Litster had drawn attention; he regarded the comparison as misleading. He pointed out that, of the 102 deaths which occurred among the children in Pelletstown, 90% were under one year, 9% were between one and two years and 1% over two years. Boarded out children were generally over the age of two and they were carefully selected before being sent out to foster mothers.

The comparison here is hardly fair to the Sisters in Pelletstown. Another point which should not pass unnoted is the fact that in an institution such as Pelletstown the number of physical and mental defectives is, in the nature of things, bound to be high and that these children will never be selected for boarding out. In order to protect prospective foster parents from a very great disappointment long and constant study of every child is made by the Sisters. The fact that there were no deaths among boarded out children was proof of the Sisters’ efforts.
13.150 He further pointed out that, as well as being a home for orphaned children, Pelletstown was also a children’s hospital. ‘All the sick children of the Dublin Area are sent there, all the foundlings, deserted children, and all the children who are discharged from other homes and hospitals find their way to the Union, and thence to Pelletstown’.

13.151 He also pointed out that, while there were 498 children in Pelletstown on 30 September 1937, there had been a total of 1,161 children resident there during the year. He asked the board to expedite the building of the isolation wing and to supply a refrigerator for the storing of serum. He had found the use of serum of great assistance in the last outbreak of measles but he had had to keep it at Cabra.

13.152 The DLGPH reported that there were 151 mothers and 451 children in Pelletstown on 31 March 1938; 238 mothers were admitted during the year and 256 were discharged. Of those, 107 returned to relatives and 77 were sent to situations; 210 children were admitted during the year and 248 discharged.

13.153 The DLGPH reported that there were 166 mothers and 407 children in Pelletstown on 31 March 1939; 289 mothers were admitted during the year and 274 were discharged. Of those, 71 returned to relatives and 86 went to situations. 362 children were admitted during the year and 321 discharged. In April 1939, there were no vacancies in St Philomena’s. It was recommended that a number of girls from Pelletstown be sent to certified schools.

13.154 In June, the Sister in charge of Pelletstown asked that the Pelletstown telephone number be inserted in the telephone directory under St Patrick’s Home, Navan Road, Cabra as people had difficulty finding it and did not think to look for the Pelletstown number under Dublin Union.

13.155 In July, the Board of Assistance was told that 31 children had been boarded out between 1 January and 30 June 1938; 27 were sent to schools and three were ‘adopted’.

13.156 In August 1938, the Sister in charge of Cabra reported that she had been given permission to arrange the immunisation of the residents against diphtheria and
typhoid as they were then prevalent in Dublin. She asked would the Dublin Union bear the cost of this for its residents.

13.157 In November, a medical officer reported that he had visited Pelletstown and saw six cases of scarlet fever (five among children) and one of diphtheria. ‘The infection seems to be pretty widely distributed through the Institution and it is possible that further cases will occur’. He suggested segregating the children with scarlet fever in a separate room and placing them under a separate nursing staff, preferably fever trained. He had the person with diphtheria admitted to Cork St Hospital and suggested that any further cases would also be admitted there. He said it was highly desirable that the children in Pelletstown should be systematically immunised against diphtheria when they reached the age of nine months.

13.158 In January 1939, the visiting doctor asked for the building of an isolation unit to be expedited as, when an epidemic occurred, the numbers likely to be affected were so large that the hospitals dealing with infectious diseases could not cope. He said he was having great difficulty in getting the fever hospitals to take in cases as they were. ‘No hospital will take measles’.

13.159 The Sister in charge of St Philomena’s told the board that they had five boys who were about to reach the upper age limit of 12 years. Three of the boys were in constant touch with their mothers who were not willing to have them sent to foster parents. Two others were not suitable for boarding out because they were delicate and very much below average intelligence. The board decided to send the first three boys to Clonmel.42

13.160 In April 1939, the doctor reported that a child in Pelletstown had measles. He partly immunised the children who had been in contact with this particular child. He informed the board and asked it to pay the costs of the immune globulin (£4 2s 3d). In May, the doctor reported that the measles outbreak had spread: ‘At present it is confined to the Isolation Building and it will possibly spread to other parts of the institution. There is a large room recently built in the institution which is not completed because it has no light, heat or water accommodation’. He complained that he had reported this matter before and, if he had this room available, he would

42 This was an industrial school, St Joseph’s, Ferryhouse, Clonmel. See the Ryan Report: http://www.childabusecommission.ie/rpt/02-03.php
be better able to deal with the outbreak: ‘I would be able to place many children in it and to some extent prevent the overcrowding which is the usual cause of high mortality from this disease’. He asked the board to have this room finished without delay. He also asked the board to have the question of the immunisation of the children against diphtheria dealt with. The board referred this report to the minister for his decision.

13.161 The issue of boarding out of children from Pelletstown was again on the agenda of the Board of Assistance in June/July 1939. The wider issue of the coordination of child care services was also discussed.

13.162 A DLGPH inspector, Miss Murray, gave the Board of Assistance a report on her inspection of the health of the boarded out children in its area. This covered a range of issues about boarding out and it specifically looked at Pelletstown. Her report in this respect echoes Miss Litster’s earlier report. Miss Murray said that she had had many complaints about the methods in operation in Pelletstown when a foster mother called there to select a child; two or three children were brought forward and if the prospective foster mother was not satisfied with any of them, there was no further choice. Miss Murray considered that all eligible children should be brought forward. She said that there was a ‘great tendency to delay’ the boarding out of children until they were aged six, seven, or even older. Some of the assistance officers’ reports (see Chapter 1) show that some children were kept until they were ten or 11. She pointed out the desirability of boarding out at a much earlier age and suggested that children reared in institutions were more likely to ‘contract certain bad habits of which it is almost impossible to cure them afterwards’.

13.163 She argued that a more thorough medical examination of the children from Pelletstown should be carried out before they were boarded out. Each individual child should be examined by the medical officer and certified as fit in every respect for boarding out. ‘Children suffering from defects which might yield to treatment should not be boarded-out until every effort has been made to remedy them. The greatest care should be taken that no mentally defective child is sent to a foster home’.
13.164 The medical officer in Pelletstown replied that no child was sent out who had not been medically examined and no child had been sent out who had any evidence of disease, mentally or physically. He had no recollection of any child from Pelletstown who was at or near the age of ten being boarded out. Children of that age were only occasionally in Pelletstown, for example, if the parents were evicted. He had never seen any evidence of ‘bad habits’ among the children being boarded out; he asked that details of these bad habits be given.

13.165 The Sister in charge in Pelletstown reported that 52 children had been boarded out in the year 1938. She was trying to get the children boarded out at as early an age as possible but prospective foster mothers would only look at children of the age that they require. Some children could not be boarded out because they were ‘maintenance cases’\(^{43}\) or their mothers did not consent to their being boarded out. She acknowledged that two years earlier the boarding out of children was delayed due to an outbreak of ringworm. She confirmed that no child was boarded out without being medically examined and made the point that the complete change of life and the bad conditions of the homes immediately had a bad effect on the child.

13.166 Miss Murray explained that the ‘bad habits’ were acquired by children in all institutions and not just Pelletstown. The chief ‘bad habit’ was bed-wetting.

13.167 Members of the board, acting as a visiting committee, visited Pelletstown in October 1939 and agreed that the Sister in charge would report monthly to the board on the children eligible for boarding out.

13.168 In October 1939, a member of the visiting committee of the Board of Assistance paid tribute to the care and attention paid to the children in Pelletstown ‘resulting in every comfort in excellent surroundings. As a result of this comfort and the surroundings mothers of many of the young children were reluctant to let them go out to foster mothers’. He suggested that a committee meet once a month and have a report on the number of children boarded out in each group. He believed that a great deal might be done if the mothers who were reluctant to let their children out, were impressed with the fact that their children could not always be under the nuns of have such comfort. His recommendation was adopted.\(^{44}\)

\(^{43}\) This presumably refers to children whose mothers/families were paying for their maintenance in Pelletstown.

\(^{44}\) *Evening Herald*, 11 October 1939
13.169 The Sister in charge reported that, on 21 November 1939, there were 146 women, 93 infants (under 12 months), 108 children (aged between three and eight years) and 179 children (aged one to three years) giving a total of 526 resident in Pelletstown. During the month four children were boarded out; six were selected for boarding out and ten children were available.

The 1940s

13.170 In 1940, the *Irish Press* reported on a speech on public health services in Dublin given by Dr WRS Collis, the author of *Marrowbone Lane*, under the auspices of the Dublin Constituencies Council of the Labour Party. He was quoted as saying:

> In Dublin, twice as many babies died under one year of age than died in the country districts and three times as many as in Swedish cities. As for the illegitimate babies - over 300 per 1,000 died before they reached the age of one year, and many more afterwards. The authorities had a place called Pelletstown, where a few devoted Sisters gave their lives looking after hundreds of these children. These children were often weakly and required special attention, but there was no resident medical officer and few trained nurses.\(^{45}\)

13.171 This statement gave rise to a heated debate about the facilities in Pelletstown. All participants were agreed that the Sisters provided a very good service but there was disagreement about the facilities available. While there was a doctor who visited, Dr Collis insisted that there was no resident medical officer. Dr Collis said that the reason so many ‘illegitimate’ children died was because of the people’s attitude towards them. He believed that the children died because of neglect. He said that the majority of deaths from diphtheria could be prevented by inoculation, but this was not available even though there was compulsory inoculation against smallpox, a disease which he said was non-existent in Dublin. Subsequently Labour Party members were invited to visit Pelletstown.\(^{46}\)

13.172 The Dublin Constituencies Council of the Labour Party, when accepting the invitation, said that they shared Dr Collis’s views.\(^{47}\) The medical officer of Pelletstown, Dr GV Ryan, told the Board of Assistance that the views of Dr Collis, as reported in the *Irish Press*, were very misleading. He said the isolation hospital

\(^{47}\) *Irish Press* 25 January 1940
CHAPTER 13 PELLETSTOWN

consisted of two large rooms, one of which contained 15 cots, and the children in it were mostly healthy, awaiting discharge. The other contained children suffering from pulmonary and intestinal trouble, who were kept there because they were infectious. As soon as they were well, they were transferred to other parts of the house, where there were spacious, well ventilated rooms. All these children were seen and examined; their ages, weights and condition were noted by the medical officer as soon as they arrived. If they become ill they were seen and attended to medically. They were under the immediate care of one of the Sisters, who was a trained nurse. The plans for the new isolation hospital, which was nearly completed, were in the hands of the architects for over a year. There was no doubt that the institution, due to economic conditions, was over-crowded, but during the past ten years the Union authorities had done a lot to remedy that state of affairs, and they were continuing to do so far as they were permitted.

13.173 A Labour Party delegation accompanied by Dr Collis visited Pelletstown on 1 February 1940.48 In a statement, the delegation paid tribute to the Sisters in charge and the nursing staff. However, they said that the staff had to carry out their work under conditions which restricted and, to some extent, circumvented their efforts. This was not their fault nor was it entirely the fault of the Dublin Board of Assistance. The outstanding defect was that there was no resident medical superintendent. A consultant children’s specialist should also be available to the institution. They pointed out that the institution was not just a home but was also a hospital and their understanding was that any baby had to be admitted from the Union, legitimate or illegitimate, well or ill. Therefore, it should be staffed as a children’s hospital. A new ward was being added to the institution but was not available for use due to an 18-month delay in providing heat, light and water. Until the new ward was made available, the conditions of acute overcrowding could not be solved. The same extraordinary delay seemed to be taking place with regard to the erection of the new isolation block. The existing facilities for isolation were hopelessly inadequate, and involved the placing of babies with different conditions, some of which may be infectious, in one small ward. Even in some of the occupied parts of the building the heating arrangements appeared to be entirely inadequate. The women members of the delegation were impressed with the general happiness and well-being of the children. They were, however, concerned with the life of the women in the institution, who were, for practical purposes, completely

48 Irish Press 2 February 1940
confined to it for two years. The delegation suggested that, if the women were to be able to resume normal life at the end of this period, facilities should be available for personal interests and recreations while they were resident at Pelletstown. These should include, at very least, a free recreation period each day, a general library and an adequate recreation room with a radio. In addition, some increase of personal privacy would be very desirable if it could in any way be provided.

13.174 The dispute rumbled on for a time; the Dublin Board of Assistance considered asking the Minister for Local Government and Public Health to appoint an independent commission to investigate Pelletstown in view of the attacks on it. It is not clear if anything further was done.

13.175 The DLGPH reported that there were 135 women and 353 children in Pelletstown on 31 March 1940; 243 women were admitted during the year and 273 were discharged. Of those, 98 returned to relatives and 79 went to situations. There were 355 children admitted during the year and 335 discharged.

13.176 In April 1940, the Sister in charge told the Board of Assistance that there were 135 ‘girls’ in Pelletstown and a total of 353 children; 87 children were under one year; 153 children were aged between one and three and 113 children were aged between three and eight. The doctor reported that the general health was good, except for an outbreak of diphtheria and a mild outbreak of whopping cough.

13.177 In July, St Philomena’s reported that it now had 13 girls over the age of 14 who had completed primary education and it was not equipped to provide them with appropriate training. The Sister in charge had been in touch with some schools - probably industrial schools - who were willing to take the girls provided they received a maintenance payment of 12s 6d a week and that the travel expenses to the school would be paid by the board. The board approved this arrangement provided the minister agreed.

13.178 The Board of Assistance visiting committee visited Pelletstown in October 1940. They heard a report from the medical officer about the discharge of unmarried mothers from Pelletstown.

49 It is not clear why the delegation was under this impression; a two year stay was never the norm in Pelletstown; the average length of stay for women admitted in the 1940s was 315 days.
50 Irish Press 16 February 1940
The great majority of these women are domestic servants who on discharge from the Institution have no place in which they can mind and keep their children and also earn their own livelihood in the only occupation open to them. To refuse to discharge them without children consequently means permanently depriving these women of ordinary freedom. To discharge them without children would mean in many cases depriving the child for all time of care and interest of the mother, as on discharge the mother with a child is obviously unable to earn her own livelihood and that of her dependent. I suggest that she is entitled to outdoor relief and with such assistance she could take up a situation outside and provide for the child by placing it at nurse.

13.179 He went on to point out that the granting of outdoor relief would be dependent on the Board of Assistance approving the foster parents. Further, outdoor relief would be available only to women who had been resident in the Dublin Union area for at least two years. Women from outside Dublin would not qualify; they could be returned to their native areas.

13.180 In November 1940, the Sister in charge reported that she had lodged £33 11s to the credit of the Dublin Board of Assistance. This was the amount which she had received from mothers towards the maintenance of their children for the month of October. She reported that, on 31 October 1940, there were 137 ‘girls’ and 347 children in Pelletstown. There were 75 infants, 168 between one and three years old and 105 aged between three and eight. During the month, five children were boarded out and there were a further 16 available for boarding out.

13.181 At a meeting of the Rathdown Board of Assistance, the boarding out of a Catholic child who had been born in Pelletstown with a foster-mother of a different denomination was described as ‘a disgrace’. The child had been boarded out by the Irish Church Mission but the Catholic Protection and Rescue Society was willing to take over the child as soon as the mother could be traced. The board had made an order prohibiting the housing of children by foster-mothers of different denominations.\footnote{Under the \textit{Poor Relief (Dublin) Act} 1929} \footnote{Irish Press 14 November 1940}
In January 1941, the Sister in charge lodged £37 5s which was the amount received from mothers towards the maintenance of their children for the month of December 1940. On 31 January, there were 140 women and 361 children in Pelletstown. The doctor reported that the general health of the residents was satisfactory and there were no infectious cases during the month.

In March, children aged three and four were transferred to St Vincent’s Limerick, an industrial school. There were 22 deserted children in Pelletstown at this time.

The DLGPH reported that there were 282 women admitted to Pelletstown between 31 March 1940 and 31 March 1941; 265 were discharged. Of these, 70 went to employment, 92 to parents and four were married. There were no maternal deaths. There were 427 children admitted between 31 March 1940 and 31 March 1941; 345 children were discharged during the year and there were 393 remaining on 31 March 1941. There were 42 deaths during the year; 28 children were boarded out, 99 were taken by parents, 170 were sent to hospitals and 48 to schools.

In June 1941 there were 161 women and 402 children in Pelletstown. There were 135 infants, 167 aged between one and three and 100 aged between three and eight.

The Sister in charge had lodged £38 14s into the bank; this was the amount received from mothers towards the maintenance of their children in May.

It would appear that Archbishop McQuaid was concerned about the manner of women leaving Pelletstown. In July 1941, a member of the Daughters of Charity explained the position to him:

Further investigation into the organisation of Pelletstown reveals to me that I was left under a false impression regarding the discharge from the institution of unmarried mothers. The incident of a person waiting for a girl outside was an exceptional case and is not typical.

I find however, that the only girls to whom this can happen are those whose babies die. They are set free immediately. [The doctor] is most careful that all others who leave are either placed in situations, institutions, with relations, or take their babies home with them. There is one difficulty regarding those
placed in situations. They can accept the situation and, after a trial, leave it and return if they wish to their former surroundings. This is the cause of many relapses. As a rule those who fall a second and third time are not easily induced to return to the sisters and there is the danger that they may go to non-Catholic homes.

Besides the children born in Pelletstown, there are many others born in the union and other city hospitals. Some of these children are added to those born in Pelletstown and the over-crowding problem is mainly due to them at the moment.  

13.188 In November 1941, the DLGPH was asked to approve of the transfer of a number of children to other institutions because of overcrowding in Pelletstown. Five children aged between two and three and a half were to go to the Convent of Mercy, Longford; seven aged between three and a half and five and a half to Passage West industrial school; five aged between three and a half and four and a half years to Cappoquin industrial school and three to St Philomena’s.

13.189 The medical superintendent described Dublin’s epidemic of gastro-enteritis in autumn 1941 as the dominating event of the year from the medical standpoint. It had been responsible for 40% of the deaths in the Cork Street fever hospital in 1941. It attacked babies, and, of the 167 patients, 116 were under five years old. There were 68 deaths. The abnormal prevalence of flies was considered to have been the cause of the disease. Bottle-fed children were the greatest sufferers. There is no reference to this epidemic in the minutes of the Board of Assistance for this period. The Minister for Local Government and Public Health had set up an advisory committee to deal with the problem. The lower death rate from measles - 2.73% compared with 9.24% in 1939 - was recorded.

13.190 In April 1942, the members of the Dublin Board of Assistance were removed from office by the Minister for Local Government and Public Health. They were replaced by three Commissioners.

54 As there was no industrial school in Longford town, this was probably the Newtownforbes Industrial School: Ryan Report Volume 11: http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL2-10.PDF
56 The term ‘Board of Assistance’ is being retained.
13.191 The issue of inoculation against diphtheria arose again in 1942. The medical superintendent at Cork Street fever hospital stated that the death of a child from diphtheria ‘carries with it some implications of neglect on the part of the parents’. ‘If every infant in Dublin were inoculated against diphtheria between 9 and 12 months of age, Schick-tested before he went to school (if necessary re-inoculated), deaths would fall to negligible proportions. The authorities have provided the facilities. It is for the parents to use them’.  

13.192 In 1943, the DLGPH decided to open a hospital to deal with gastro-enteritis after one of the worst epidemics that had struck the city for years. St Clare’s hospital was established and many children were transferred to it from Pelletstown. (see Chapter 2)  

13.193 The Dublin Board of Assistance was engaged in reducing expenditure while also replacing ‘inmate labour’ in the hospital (St Kevin’s). The Irish Press reported in February 1944 that there was a decrease of £10,000 in the estimate of £446,389 adopted by the Board. This followed a decrease of £30,000 in the previous year.  

In addition to the decrease of £10,000, it is possible, by economies, to make provision of more than £10,000 for essential increases in the nursing staff and for paid ward attendants to replace inmate labour in the male and female chronic departments and the hospital.  

13.194 In November 1944, new terms of employment for nurses in Pelletstown and in St Kevin’s Institution were proposed by the Dublin Board of Assistance and approved by the Minister for Local Government and Public Health. From 1 January 1945, permanent, quasi-permanent and temporary elected nurses were paid £81 a year with annual increments of £3 to a maximum of £11 as well as the appropriate Emergency Bonus. Rations were valued at £52 and residence at £25 a year. There was an additional allowance of £9 a year for uniforms.  

13.195 In May 1945, the Assistant Master of Holles Street hospital was reported as telling the annual meeting of the Infant Aid Society that the infant and child death rate in Dublin compared very badly with other cities. He said that the society had realised the importance of pure milk supplies long before ‘the medical people’. The

59 This was an extra payment to take account of the rise in the cost of living during World War II.  
60 Irish Press, 30 November 1944
maternal mortality rate was very low. In 1944, there were 12,000 deliveries in the three city maternity hospitals; 600 mothers left the hospitals without their infants and 600 infants died within a month of being brought home. The home deaths were largely from gastro-enteritis, due mainly to a lack of breastfeeding.\textsuperscript{61}

13.196 One member of the Dublin Board of Assistance had been agitating for the introduction of adoption in Ireland for about 25 years. She was quoted as approving the Northern Ireland adoption arrangements. She said that, in Ireland, people were reluctant to adopt children as, in the absence of a protecting law, parents or a parent might later turn up and claim the child and perhaps ruin its future chances in life, while the love and care the adopters had expended on the child would go for nought. Another drawback she cited was that the foster parents could not legally give the child their name. She had come across tragic cases where the adopters of children had had them baptised in their own name, but when the necessity for a birth certificate occurred, the child became aware that he or she had no legal parents. She said that it was quite common for solicitors to arrange ‘adoptions’, and for both parties to repudiate them afterwards. She held strong views on the ‘evils of adoptions for lump sums’; this should be prohibited; ‘where money is in question, the children are often dumped on public authorities when it is exhausted’.\textsuperscript{62}

13.197 In September 1945, the Parliamentary Secretary to the Minister for Local Government and Public Health, Dr Ward, spoke of the need for a complete overhaul of the infant welfare and public health services. He was quoted as saying that the high number of child deaths in Dublin was ‘a blot on our public health record’. He appeared to support a suggestion that had been made that ‘pre-natal and infant health services could, with advantage, be more intimately linked up with and, in fact, based upon, the three maternity hospitals’. He said he would take this up with the hospitals concerned and with Dublin Corporation.

Our experience has been that the death rate during the first year of life has been particularly high. If a reorganisation of our services should help to solve this problem it would seem prudent to plan for a comprehensive expansion of child health and school medical services so that we can build up a healthy young population.\textsuperscript{63}

\textsuperscript{61} Irish Press, 31 May 1945
\textsuperscript{62} Irish Press, 31 May 1945
\textsuperscript{63} Irish Independent, 24 September 1945
On 14 December 1945, there were 219 mothers and 395 ‘illegitimate’ children in St Kevin’s institution and Pelletstown.\footnote{Department of Health file: HLTH/A8/61 BC}

In May 1946, the *Irish Press* reported that Dublin Corporation Public Health Committee would be discussing a letter from the DLGPH, suggesting a scheme for a more effective supervision of the first year of child life, with a view to reducing the rate of infant mortality in Dublin. This was a follow up from Dr Ward’s suggestions in 1945. The three maternity hospitals, in which 80% of Dublin births took place, were agreeable to the suggestion.

Although the infant mortality was low through the excellent services at present, the Parliamentary Secretary considers an elaboration of these services, to include care during the first year of life, would provide a comprehensive service which would give the necessary continuity and organisation likely to reduce infant mortality to a minimum. By the adoption of the proposals outlined, the Corporation would obtain for a relatively small additional expenditure a complete ante-natal, obstetric and infant welfare service. The services to be provided in the scheme include: (1) A domiciliary visiting service; (2) an emergency day and night service; (3) a clinic advisory and treatment service; (4) hospital accommodation.\footnote{Irish Press, 24 May 1946}

In May 1946, the *Irish Press* interviewed gynaecologists, specialists in infant ailments and welfare workers about a statement by a doctor that babies under a year were dying in Dublin at a rate of four a day, in a city which claimed to have the best maternity service in the world. All those questioned agreed that Dublin had the best gynaecological service in the world.\footnote{It is not clear what basis they had for this assertion.} They said it was the only city in the world in which 80% of the babies were either born in the lying-in maternity hospitals or in the mother’s home, attended by doctors and nurses from these hospitals.

The result was that, in 1944, of 12,000 babies born, only 11 died in the hospitals. This gynaecological service costs Dublin citizens almost nothing. The money comes from the Hospitals Commission, patients’ fees, and some old funds still available. In spite of Dublin’s claim, however, over 100 in every 1,000 infants die before they are a year old. Comparable figures for the great cities of the world are far lower. Those for New York and London are less
than 40 per 1,000 births. Dublin’s infant mortality rate is far higher than that in any part of Ireland.
During the ten days that mother and baby are in one of the Dublin lying-in hospitals - the Rotunda, National Maternity or the Coombe - they have at their disposal the greatest possible skill and attention’.67

13.201 An isolation unit was opened in Pelletstown in 1946/7. It was to house children who had infectious diseases, children of mothers who had TB, babies with disabilities and ‘legitimate’ children whose parents were unable to cope with them.

13.202 A Department of Health inspection in September 1947 was critical of a number of aspects of Pelletstown. The following were the main criticisms:

- The institution was overcrowded, especially in the infants and toddlers division.
- Four nurses shared one poorly lighted, common bedroom in an annexe at the back of the hospital. Each nurse should be provided with a separate room.
- The cost of medicines amounted to £421 13s 2d which appeared to be high and no samples had been sent recently.
- Internal painting was required for the nursery and main isolation buildings required external painting.
- The number of births had fallen since 1945 with an average of little more than one a week in 1946. This was due to women being retained at St. Kevin’s institution for delivery and then being sent onto Pelletstown. There was not sufficient work for the staff employed in the maternity hospital; only four of the 17 beds were occupied and the staff of four were looking after four patients. The maternity home had been built at great cost with the express intent of relieving pressure on St. Kevin’s; conditions in St Kevin’s were poor with no specialist obstetrician whereas Pelletstown’s temporary medical officer was a specialist obstetrician.

13.203 The inspector argued that the modern maternity hospital in Pelletstown should be utilised to its full capacity, especially in view of the shortage of maternity beds in Dublin.

---

67 Irish Press, 27 May 1946.
If it is the intention to continue deliveries of unmarried mothers in St Kevin’s institution, it is suggested that consideration be given to utilising the maternity hospital at St Patrick’s home for married as well as unmarried mothers. At present the retention period of patients in maternity hospitals in the city has been reduced to below the margin of safety to try and cope with the demand for accommodation.

13.204 The Dublin Board of Assistance was asked for its observations on this report and supplied these in November 1947. The board replied that it had been considering the over-crowding and was much concerned about it. It said that a large proportion of the unmarried mothers admitted to Pelletstown came from outside the Dublin Public Assistance District, had only brief or temporary residence in Dublin, (and had no home to which they could take their infants or very young children) and the Dublin Board of Assistance, consequently, had to bear to a large extent a responsibility that should be borne by other local authorities. Difficulty had been experienced in finding homes, private or institutional, for very young children.

13.205 The board said that the inadequacy of the accommodation for nurses had been under serious consideration for some time and proposals for a nurses home would be submitted to the minister as soon as possible.

13.206 The excessive cost of medicines during the year to March 1947 was being investigated. The cost to date for the current year was £132 12s 3d against an estimated cost of £400 for the year.

13.207 Tenders for the painting of St Mary’s nursery and other internal areas had been invited twice in the previous six months, without success. A further tendering process was under way. The current year’s estimates included provision for this. Other painting works would be considered in the context of the estimates for the year 1948/9.

13.208 The Board of Assistance had already given instructions for the ending of the practice of retaining pregnant women for delivery at St. Kevin’s. The suggestion for using Pelletstown for married as well as unmarried mothers was not favoured. The maternity hospital at St Kevin’s had a bed occupancy of 26; its equipment had been extended and was satisfactory and the attendance of a specialist obstetrician had been obtained when required.
13.209 In May 1949, the Department of Health made further inquiries about progress on overcrowding and on painting.

13.210 In March 1949 the Board of Assistance wrote to the Department of Health about the level of nursing staff in Pelletstown. The board said that there was constant change among the staff. There were 26 temporary nurses, three of whom were employed in connection with the Dublin Corporation BCG scheme. Of the remainder, there was only one State Registered General Trained Nurse (RGN), who was also a CMB (qualified midwife) and fever nurse; five State Registered Nursery Nurses (SRNN) and children’s nurses (CN); four CMB nurses, one of whom was also a CN; and 15 qualified only as nursery nurses. The majority of the nurses had less than two years’ service. The board wanted to appoint four nurses to the permanent staff without advertising.

1950s

13.211 The discussions about staffing which had been taking place in the late 1940s continued into the 1950s. Pelletstown was heavily reliant on temporary nursing staff. The Irish Nurses Organisation was trying to stop the practice of employing nurses on a temporary basis and not making them permanent; the organisation described this ‘temporary-permanent’ condition as the main defect of local authority nursing.

13.212 In April 1950, a Department of Health medical officer reported that he was impressed by the cleanliness of Pelletstown but there were a number of serious problems. The problems outlined were:

- Not enough lavatories; there were four for 140 mothers;
- Not enough accommodation for nurses;
- The floors in the mothers’ dining room, the kitchen and the children’s dormitory needed repair;
- Overcrowding in the No. 1 mothers’ dormitory and woodworm in the floors in this dormitory;
- The fire escape arrangements appeared to be inadequate and should be investigated as soon as possible by an expert;
- The ward where the babies were sleeping was much too large and could be divided; there was too much noise for babies to sleep and there was a danger of infection spreading;
- The toddlers’ wash room floor needed repair;
- Bathing accommodation in St. Bridget’s ward could be improved;
- External walls of St. Mary’s needed re-plastering;
- One mothers’ ward was overcrowded as was the toddlers’ ward;
- The boilerhouse was unsatisfactory. It needed to be ventilated, the flues needed to be renewed;
- A meat slicer could be provided for the kitchen; about 70 lbs of meat was carved daily and a large quantity of bread;
- There were no arrangements for sending samples of milk for examination.

13.213 In June 1950, the Department of Health approved the appointment of five temporary nurses until the end of the year when it would be reviewed. This was part of an effort to reduce nurses working hours to 96 hours a fortnight. The hours worked by the staff varied from 110.5 to 123 hours a fortnight and the medical superintendent had recommended that this be reduced to 96 a fortnight and five extra nurses be employed.

13.214 In February 1951, a DLGPH inspector, Miss Reidy, visited Pelletstown in order to assess the staffing situation. There were 129 women there. There was a total of 368 children of whom 160 were infants, 160 were aged between one and three and 48 were aged between three and four. There were six Sisters on the staff, two of whom were RGNs, one was a children’s nurse and two were nursery nurses.

13.215 There were 24 cots in the isolation unit for sick children. These children required skilled nursing care; they included acutely ill children transferred from within Pelletstown and infants from other institutions.

13.216 The infirmary had 12 cots, three children’s beds and two adult beds. The children in the infirmary were not acutely ill but were underdeveloped and physically below par. They were not all confined to their cots. The adult beds, which were in the same ward as the children’s beds, were reserved for ill mothers who had to be kept under observation. A doctor’s note from January 1951 stated that 104 of the 364 children who were then in residence were ill. There was a flu epidemic, and there were other ailments such as alimentary disturbances and ear infections.
The recommended number of State Certified Children’s Nurses was one for every three or four children; in Pelletstown, there was one for every 17 children. There was a difficulty in recruiting SCCNs.

It had been assessed that 26 RSCNs were needed but the breakdown of staff was actually:

- RGN, SCM 2
- RGN, RSCN, 1
- SCM, 4
- RGN, 2
- RSCN, 5
- CN, 20

There was also a need for more CNs to look after the healthy children.

A former Sister in charge was reappointed in September 1951. She was a trained nurse and had previously been Sister in charge in the period June 1937 to August 1948.

The proposed salary was £175 a year which was the recommended rate for the matron of a county home of 500 beds or less; there were also rations of £50 a year plus milk and vegetables valued at £20 - all Sisters in the house got these; there was a uniform allowance of £12; residence was valued at £30 a year and laundry at £5; the World War II bonus was still being paid.

In October 1951, there were two RGNs with sick children’s qualifications, three midwives, seven registered sick children’s nurses and 17 nursery nurses. There were six non-nursing Sisters. The assistant catering superintendent, permanent wardmistress and three temporary wardmistresses were lay women.

Miss Litster visited Pelletstown in October 1951 but the report which the Commission has seen deals only with her inspection of the records of births, admissions and deaths of infants there. (It is not clear if any other aspects of Pelletstown were actually inspected by Miss Litster on this occasion.)

This report gives details of the births, admissions and deaths of infants in the period 1 April 1950 to 26 October 1951. It notes that the infant mortality rate was
rising. The report suggested that a factor in the rise of infant mortality may have been that mothers and babies admitted to St Kevin’s were formerly not admitted to Pelletstown until the results for VD and TB were known and were not admitted unless there was a clean bill of health but that this was no longer the case. It acknowledged that there was provision for segregation before the newly admitted mixed with existing residents but suggested that a reversion to the former system might have a good effect.

13.224 In January 1952, having approved the establishment of a permanent nursing staff, the Minister for Health approved the staffing requirements for the sick departments of Pelletstown as follows:

- Isolation unit (28 beds): one Sister – General Trained; two Registered Sick Children’s Nurses; two Children’s Nurses
- Two infirmaries (37 beds): two Sisters – one a State Certified Midwife and one a Children’s Nurse; three Children’s Nurses

13.225 This meant that three additional nurses would be appointed to each of these departments. If there were difficulties recruiting qualified sick children’s nurses, the vacancies could be filled temporarily by general trained nurses.

13.226 In March 1952, there were 35 lay permanent nursing staff and ten Sisters held nursing posts; the Department of Health expressed concern about a Sister on clinical duties who was not a qualified nurse.

13.227 In 1952, the question of the Sisters being made permanent was considered. It seems that the Board of Assistance argued that they should not be made permanent because they could be withdrawn ‘at the will of the Mother General’. The Department of Health was not impressed by that argument and pointed out that ‘nursing sisters hold permanent appointments in local authority institutions throughout the country and the difficulty referred to by the board does not arise’. The Minister for Health told the Board of Assistance that he had no objection to their being granted permanent status.

13.228 In 1953, the pay scales for the Sisters who worked in Pelletstown were as follows:
• Sisters who were general trained nurses: £310 rising by annual increments of £10 to £350 a year with two long service increments of £10 to £370 a year, with deductions of £41 for residence and £5 for laundry.

• Sisters who were registered sick children’s nurses: £120 rising by increments of £10 to £140 a year plus appropriate temporary bonus with deductions of £30 for residence and £5 for laundry.

• Sisters who were state certified midwives: £60 rising by increments of £5 to £90 a year plus appropriate temporary bonus and similar deductions.

• Sisters who were performing the duties of children’s nurses: £50 rising by increments of £5 to £85 a year plus appropriate temporary bonus and similar deductions.

• Sisters in charge of stores, laundry, kitchens, workrooms: Scale as for permanent wardmistresses - £130 rising by increments of £4 to £170 and then rising by increments of £5 to £175 a year plus temporary bonus, with deduction of £18 for residence and £5 for laundry.

13.229 Miss Litster and Miss Reidy visited in June 1953. Miss Reidy reported that she felt the sleeping quarters were congested. She was told that there was great difficulty in getting the mothers to breastfeed and, if they started, to persist with it. The position as to deaths of infants had greatly improved from Miss Litster’s previous report which covered the period from 1 January 1950 to 30 September 1951; the situation now was ‘comparatively satisfactory’.

13.230 In 1954, Miss Reidy and Miss Litster visited Pelletstown and St Kevin’s. They discovered that they had made a minor error in their presentation of the infant mortality in Pelletstown - this arose because there was confusion about twins and where they were born.

13.231 After the introduction of adoption legislation and the consequent placement of a large number of children for adoption, women and children were remaining in Pelletstown for shorter periods. As a result, the occupancy rate fell. The numbers in Pelletstown had fallen from 525 (women and children) in 1949 to 229 in 1959. In 1959, the Department of Health suggested to the Board of Assistance that the unused accommodation in Pelletstown be used to accommodate some of the children with intellectual disabilities from St Vincent’s, Cabra. The average daily cost of maintenance in Pelletstown was 9s 11d in 1958-60.
13.232 There was discussion between all the relevant parties - the Daughters of Charity, the Department of Health and the Dublin Board of Assistance - about the future roles of Pelletstown, St Philomena’s and St Teresa’s Blackrock (all run by the Daughters of Charity). It was decided to use St Teresa’s exclusively for children with intellectual disabilities and move existing residents to St Philomena’s with no change at Pelletstown - see section dealing with St Philomena’s.

13.233 The question was raised about keeping all ‘mongols’ (children with Down’s Syndrome) in one institution, preferably Pelletstown. The medical officer said that:

   From a clinical point of view there would be no objection to bringing all mongols together in one institution for research purposes but it would be impracticable because of the present institutional arrangements.

13.234 Research was being conducted by the paediatrician, Dr Coffey, on behalf of the Medical Research Council.

1960s

13.235 The Dublin Health Authority (DHA) took over the functions of the Dublin Board of Assistance on 1 July 1960. Virtually none of the records of the DHA have survived. There is evidence from other sources that it had a visiting committee which visited Pelletstown but the Commission has not seen any minutes or reports.

13.236 In 1960, the Director of the Catholic Social Welfare Bureau, Fr Barrett, told Archbishop McQuaid that, in the past year, the Dublin Board of Assistance had decided that women would not remain in Pelletstown for more than six months. This was in the context of concern that Irish pregnant unmarried women were increasingly likely to go to England. One of the perceived causes of this was that Bessborough, Castlepollard and Sean Ross insisted that women must remain for two years.

13.237 Miss Reidy inspected Pelletstown on 25 February 1960. She visited on three subsequent occasions to examine the registers and record statistical data. It had last been inspected by Miss Litster on 25 October 1951.

---

68 This decision seems to have been largely driven by Archbishop McQuaid.
69 Health Authorities Act 1960 and SI 134/1960
70 Dublin Diocesan files: LII/A/40/9/(1)-(3)
13.238 The report stated that on the day of the inspection there were 87 women and 124 children (inclusive of six neo-natal infants) resident in the institution. The well-being of women and children was excellent. There were, however, some ‘puny’ children in the under-one age group, some were delicate from birth, some had contracted pneumonia and were slow in development and some were ‘coloured babies’. The report stated that the latter are difficult to rear and inclined to be bronchitic in the first year of life. The children’s play-rooms were bright, colourfully decorated and adequately heated and ventilated. They had a plentiful supply of suitable toys and communal play material.

13.239 There was no heating in the bathroom attached to St Mary’s nursery; this was a 45-cot unit of which 38 were occupied in February. During the three-week cold spell which lasted from the beginning of February until a few days before the inspection it had not been possible to use the bathroom and the children had to be washed in their cots. Infra-red heaters, however, had been provided, but were lying in the stores awaiting installation.

13.240 Miss Reidy commented that washing a large number of infants in their cots was time absorbing, arduous and unsatisfactory for the staff, and constituted a certain risk for the infants. The delay in heating the bathroom seemed quite unnecessary. Some windows in St Brigid’s nursery needed repair to exclude draught; this should have received prompt attention as there were a number of young infants exposed to the draughts. Since the last inspection on 25 October 1951 children were discharged as follows:

- Boarded-out: 95
- Irish adoptions: 184
- American adoptions: 185
- Placed for adoption through society: 137
- St. Philomena’s school: 326
- St. Vincent’s Cabra: 32
- Protestant Church Society: 1
- Foster parents through parent: 12
- Certified schools through the courts: 87
  (accommodated here instead of St Kevin’s)
- St. Patrick’s Guild: 9

71 The text of the report states 1960 but this is clearly a typographical error.
• Catholic Rescue and Protection Society 3
• Castlepollard for adoption 1
• I.S.P.C.C 1
• Other homes 4
• Lota Park 4
• Orthopaedic, Baldoyle 2
• Stewart’s hospital 2
• Total 1085

13.241 Between the 25 October 1951 inspection and 31 March 1960 there were 667 deliveries in the maternity unit; there were 17 stillbirths and 13 neo-natal infant deaths. The causes of the neo-natal deaths were recorded as: atelectasis (four); intra cranial haemorrhage (four); prematurity (three); congenital deformity (one) and inanition (one).

13.242 In that same period, 23 older children died in the institution; six had been born there and the others had been admitted to it. The age range was between six weeks and 16 months and the main causes of death were recorded as pneumonia and congenital debility or deformity.

13.243 Miss Reidy concluded that the ‘standard of care in this institution is excellent’. There was an awareness of the needs of both parents and children. The two and a half to four year age group compared very favourably with children raised in normal homes in normal circumstances.

    Indeed, standards generally are every bit as good as anything I have seen in Great Britain or the USA countries where capitation fees for mothers and children are far higher. In the event of St. Mary’s Tuam being closed I would strongly recommend that mothers and children be given priority placing in this institution.

13.244 The Department of Health subsequently sent a note saying that it assumed that something has been done about the windows in the bathroom attached to St Mary’s and that the windows of St Brigid’s would be fixed before the winter.

---

72 This was a school for children with intellectual disabilities. See Ryan Report: [http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL2-05.PDF](http://www.childabusecommission.ie/rpt/pdfs/CICA-VOL2-05.PDF)
13.245 In August 1961, the Department of Health recorded that there were 98 women and 150 children in Pelletstown. There was capacity for 150 women and 300 children.

13.246 There were further discussions about the organisation of services for children with disabilities and making places available for them in Pelletstown. In 1961, the Dublin Health Authority proposed to make accommodation available in Pelletstown for 60 or more children from Cabra mainly the most severely handicapped, bedridden children. It had also been suggested that St. Philomena’s (which was also run by the Daughters of Charity and to which children of school-going age went from Pelletstown - see Chapter 2) could cope with all unmarried mothers and children and Pelletstown could then be used exclusively for children with intellectual disabilities. The director of the Daughters of Charity, Fr Sheehy, discussed this with the Department of Health. He was opposed to the suggestion. Instead, he suggested that children from another of the Daughters of Charity institutions, St. Teresa’s Orphanage, Blackrock, should be moved to St. Philomena’s.

13.247 The Department of Health thought that Bessborough would be the geographically most suitable for conversion to a home for females with disabilities. The department proposed to discuss this with the Congregation of the Sacred Hearts of Jesus and Mary and with the Bishop of Cork, Dr Lucey. It was noted that Dr Lucey ‘…is most interested in the activities of the Cork Polio and General After-Care Association who have very ambitious plans for the care of the mentally handicapped children in the Cork area’ (see Chapter 18).

13.248 There seemed to be a lack of awareness among county councils of the status of Pelletstown and about whether or not it was available to its residents. For example, in 1961, Waterford county council asked the Department of Health about the admission to Pelletstown of a named individual. The department, in reply, said that letters like this should be addressed personally to its inspector or initials only should be used. Similar letters were sent to Wexford and Cavan county councils. Other councils wrote to ask if Pelletstown was an approved institution.

13.249 In January 1962, Clare county council was told that the rate for Pelletstown was 10s a day which was the average daily cost of maintenance.
A Department of Health memorandum in 1962 noted that the Dublin Health Authority had informed it that about half of the potential accommodation in Pelletstown was closed. There were 85 mothers and 154 children (98 ‘illegitimate’, 56 ‘legitimate’) there. They came mainly from the Dublin city area, a few from the county and some from England. It had a site of about 40 acres. The DHA had also provided other information about Pelletstown.

The memorandum said that women could be referred by clergymen or doctors, or sometimes they came directly. A large number were sent by the Catholic Protection and Rescue Society. There was no strict rule against second offenders but consistent offenders were discouraged. The average duration of stay of mothers was between seven and nine months; for children the average stay was about one year. There were very few children aged over two years there. A large number of the children were adopted; St Louise’s Adoption Society arranged adoptions at home and abroad, particularly in America. Some ‘backward or mentally handicapped children, not suitable for adoption’ could remain up to a maximum of seven years. There were 16 such children there at that time.

There was also a 30-bed isolation unit for ‘abnormal births’. The infants in this unit may come from the maternity hospitals. The unit was usually full. Pelletstown had another function as temporary accommodation for homeless families.

The DHA pointed out that there were very large waiting lists for people with intellectual disabilities. There were also 2000 people with intellectual disabilities unsuitably housed in mental hospitals. ‘While the waiting lists are not a fully reliable indication of the demand for accommodation, it would seem that it would be better to provide accommodation for girls than boys’.

Miss Reidy inspected Pelletstown on 22 July 1965. There were 191 children and 91 adults in residence. The child population was made up as follows:

- St Mary's; 0 to 6 months: 41
- St Mary's infirmary; 0 to 3 months: 19
- St Brigid's nursery; 4 months to 12 months: 37
- St Mary's lower hall; 12 months to 2 years: 25

The Commission on Mental Handicap was sitting at this time. Its report was published in 1965 and is available at: https://www.lenus.ie/handle/10147/243761
• Toddlers Montessori; 2 years to 4 years: 31
• Over fives: 2
• Special Unit; mental defectives and delicate Infants: 27
• Neo-natal Infants: 9

13.255 There were 45 women in St Mary’s dormitory which had capacity for 50 and 32 in St Brigid’s which had capacity for 33. There were 14 women in the maternity hospital which had capacity for 16. Miss Reidy noted that the general standard of care and appointments in the institution, with the exception of the women’s dormitories, was satisfactory. Neither of the adult dormitories afforded privacy of any kind. ‘The Sister-in-Charge considers, in this day and age, that this is retrograde and I agree with her wholeheartedly’.

13.256 The maternity unit was very clean and well kept. Records were available and properly posted. There were 787 deliveries (23 stillbirths) and 8 neo-natal infants’ deaths.

13.257 Children were reported to have been discharged as follows since the last inspection.
• Boarded-out 51
• Irish Adoptions 380
• USA 73
• German 1
• Through other societies 271
• Foster parents per mothers 8
• Certified schools through court (in transit) 168
• Special schools certified through D.H.A. 60
• Discharged to hospitals 16
• Discharged to relatives 709\(^{74}\)
• Discharged to L.C.C. 7

13.258 Nine ‘illegitimate’ infants, of whom eight had been born in the institution, had died since 25 February 1960. The causes of death were congenital deformity (four),

\(^{74}\) It seems highly likely that a significant number of these children were subsequently adopted as the vast majority of ‘illegitimate’ children born in the 1960s were adopted.
asphyxia and cardiac failure (two) cerebral haemorrhage (one), prematurity (one), lobar pneumonia (one).

13.259 In 1966, some of the Pelletstown lands were sold to Dublin County Council for housing.

13.260 In September 1966, the following description of ‘other children’ resident in Pelletstown was compiled:75

- Children from hospitals and health centres for convalescence; generally undernourished and delicate; looked after by the paediatrician, Dr Coffey, who decided the length of their stay;
- Deserted children whose parents could not be traced;
- Children from broken homes; often short term admissions due to illness or economic pressures; eviction for non-payment of rent was another factor; frequently the child of a very young married couple; ‘the child care officers of the Dublin Health Authority and a Sister Social Worker do valuable work so there are few long term admissions’.

13.261 There were 16 cots in a special unit for babies with severe deformities. There was accommodation for 100 unmarried mothers and there was 100% occupancy. In the year ended March 1966, 292 women were admitted; the age range was 14 to 40.

13.262 A member of the Daughters of Charity gave a talk about the history of Pelletstown in which she linked it back to the Foundling Hospital service for the unwanted children of Dublin. She said that there were few foundlings in the 1960s but there were rejected and deserted children. ‘Some parents are never traced. Others, usually of the itinerant class, turn up months later and can’t understand why we were looking for them’. They rarely returned for delicate or premature babies as they seem to reject them and be ashamed of them. She outlined other groups for whom Pelletstown catered: children from broken homes, children whose parents were ill (these were usually short-term), homeless children and children of very young couples who could not cope. She said that the 16 cots in a special unit for

---

75 Document supplied by the Daughters of Charity.
babies born with severe inoperable deformities were reserved for babies from Dublin city and county.\footnote{Document supplied by the Daughters of Charity.}

13.263 She said that the dormitories were in the process of being replaced by single units. There were two Sisters who acted as counsellors to the ‘girls’ and there were ‘two young ladies who act as Sisters’ Deputy and also give training in household duties, crafts and needlework’. There was a library, radio, TV and record player. There was the odd party on occasions such as bank holidays and birthdays ‘where being shut up is especially painful’. They got a dance band a few times a year and there was a weekly film show.

We do not believe in keeping a girl in the home indefinitely because she wishes to keep her baby or her baby is not suitable for adoption. In these circumstances we discharge the mother to a situation, encourage her to visit regularly and review the position with her at intervals. An unmarried mother needs sterling qualities of courage and devotion to bring up her child single-handed and unless her parents are willing to co-operate she will not succeed. The child will grow up without the affection and stability he needs. This must be pointed out to her.

We make every effort to place the babies who are unsuitable or unable to be placed for adoption in good Foster Homes. There is a shortage of suitable Foster Parents…. Our Adoption Society is in the happy position of having a waiting list for babies.

13.264 In February 1967, a Cavan woman who had been sent back from London was placed in Pelletstown by St Patrick’s Guild. Pelletstown contacted Dunboyne as it catered for Cavan residents. She spent three nights in Pelletstown. Cavan County Council had to pay for her three night stay and needed Department of Health approval for this payment. Another Cavan woman wanted admission as she knew people in some of the other homes and her sister lived in Dublin; she was 15.

13.265 In December 1965, the Dublin Health Authority wrote to the Department of Health to tell them that it was proposed to provide cubicles in a number of the dormitories in 1966/7. The work was to be carried out by the maintenance staff in stages and completed over a number of years.
13.266 In February 1967, the Minister for Health wrote to the DHA giving approval for the payment of an allowance of not more than £1 a week to ‘patients’ who were engaged in performing useful tasks in the institution.

1967 survey of Pelletstown residents

13.267 In 1967, interviews were conducted with the residents of Pelletstown by a social scientist for a master’s degree. The objective was to obtain facts about the social background and characteristics of a group of unmarried mothers and to describe the type of situation that arose when a woman discovered she was pregnant.

13.268 By way of background, the thesis outlined the general situation of unmarried mothers and mother and baby homes. At this time, mother and baby homes were having financial problems. The proportion of unmarried mothers had not changed; it was between 1.5% and 3% since the beginning of the century. The main factor was that mothers were staying in the institutions for considerably shorter periods, mainly because the children were being placed for adoption when about eight weeks old. As a result, the institutions were not full.

13.269 At the time, Regina Coeli was the only facility providing hostel facilities for mothers and children in spite of the poor quality of the buildings.

13.270 There were 1,403 ‘illegitimate’ births registered in 1965; 628 were registered in Dublin; large numbers were also registered in Cork (201), Westmeath (141), Tipperary (176) (reflecting the presence of mother and baby homes); Dunboyne residents gave birth in Dublin.

13.271 The author recognised that ‘illegitimate’ pregnancy was likely to be a source of great tension and emotional stress; no matter what plan was made, unmarried motherhood involved suffering for the mother. There was no equivalent organisation in Ireland to the National Council for the Unmarried Mother and her Child which had been set up in the UK in 1918. It was noted that, in the previous year, Pelletstown had been allocated a full time social worker and a psychiatrist visited weekly.

---

13.272 This survey covered the 136 mothers in Pelletstown whose babies were born between 1 December 1966 and 1 July 1967.

13.273 The vast majority - 84.6% - of the Pelletstown residents surveyed were from Dublin; this was defined as where they lived for the year before admission; 10.2% were from other parts of Leinster and 1.5% each from Connaught and Ulster. At the same time, Dunboyne, which had a total of 32 women resident, had no residents from Dublin; 26.9% were from the rest of Leinster; 21.9% each from Munster and Connaught and 9.3% from Ulster.

13.274 About 300 women were admitted to Pelletstown each year. The length of stay varied from a few days to 12 months; some were admitted from hospital after the birth; some were admitted while pregnant but left before the birth. There were about 100 women resident at any one time.

13.275 The interviews were conducted after the birth. The author commented that some of those who gave birth in hospitals and were newly admitted to Pelletstown at the time of the interview were so bewildered and confused that they were unable to answer even the simplest questions. Those who had been there a number of weeks were much more relaxed and willing to talk about themselves and their experiences. Six refused to be interviewed and two more refused to answer questions about the putative father; a total of 100 were interviewed; they were in the home between mid February and the beginning of May 1967.

13.276 The author pointed out that women in mother and baby homes were not necessarily representative of all unmarried mothers as the mother and baby home was a shelter from society.

13.277 The following were the main findings of the survey:

**Age:** Of the 100, four were under 18 (one under 16); 25 were aged between 18 and 20; 61 were in their 20s and 10 were in their 30s. The age distribution was similar to the age distribution for unmarried mothers generally but different to that for all mothers: 2.7% of all mothers (in 1965) were aged under 20; 31.3% of unmarried mothers were aged under 20 (29% in the sample surveyed). This was complicated by the fact that 90% of ‘illegitimate’ births were first births and this was not true for the ‘legitimate’ births, nevertheless unmarried mothers tended to be
younger than married mothers. Mothers aged 15 and under were 1.6% of the total of unmarried mothers in Ireland in 1965.

**Education**: None of the mothers in this survey was school going. About one third had not progressed to secondary education (free secondary education was announced in 1966); 58 had primary education only; eight had primary education and two years of technical school; 16 had more than two years technical school; three had less than two years secondary schooling; five had more than two years secondary and ten had four or more years at secondary school. Six had left school before the then minimum school leaving age. About one third had received no explicit sex education.

**Occupation**: 39 were domestics in institutions or private homes; seven were on home duties; ten were waitresses/barmaids, there were nine shop assistants, seven factory workers and 11 clerical workers. This meant that 49% were employed in domestic work or as waitresses and barmaids; 15% of the general female population in the 1961 census were employed as shop assistants, barmaids, waitresses, cooks and maids. In 15 cases - nine private houses and six in institutions - the employer knew of the pregnancy and made arrangements for admission to Pelletstown.

**Family circumstances**: 70 were reared in two parent families; 57 were from families of six children or more; 42 were living at home with parents when they became pregnant; 42 were resident in their domestic jobs. The parent(s) knew of the pregnancy in 43 cases and the mother but not the father knew in 10 more; 36 parents did not know; the parents were dead or out of touch in the other cases. In 22 of the cases where a parent knew, they had been told by someone else; the parents were more likely to know if the woman was living at home. None of the parents who knew refused to take the woman back but it is not clear that they were prepared to take the baby as well.

On discovering that they were pregnant, 37 of the surveyed group moved away from their homes or jobs; 30 were already away from home and five had no homes; 18 went to England, four had gone to England not realising they were pregnant and nine were living in England when they became pregnant; 26 of the 31 women who came to Pelletstown from England had been repatriated, that is
they were advised by a welfare agency and in some cases financially assisted to do so. The author questioned the policy of repatriation - one woman had lived in England since the age of eight and knew no one in Ireland.

Of the 100 in this survey, 23 had had at least one other ‘illegitimate’ child (the majority of whom were born in Pelletstown); this was more than three times greater than the official statistics; it seems that unmarried mothers expecting a second or subsequent child made greater use of the mother and baby homes than first time mothers; almost all of them had been in a mother and baby home before; the tendency for unmarried mothers as a group to be less well educated than a cross section of the community was noted to be much stronger in women with more than one ‘illegitimate’ child.

**Putative father:** while the putative fathers tended to be older than the women, there was not a wide age disparity; it was noted that this did not confirm the view that unmarried mothers were frequently seduced by older and more experienced men. While all the women were Irish (some had been living in the UK), 84 of the fathers were Irish; the rest came from a range of other countries; five were foreign students in Ireland.

There was a great variety of occupations among the fathers. The vast majority (93) were single.

About half of the women had known the putative father for at least a year. Most had been in steady relationships with the fathers and the majority of fathers (62) were aware of the pregnancy; 38 women did not tell the father; a high proportion of the fathers offered no help. The author points out that the women in mother and baby homes would probably not have been there if help had been forthcoming. It was also noted that information about the putative father was affected by the mother’s view of him and there was a need for objective research into unmarried fathers and their attitudes.

**Referrals:** It seems that many of the women had not been aware of the existence of services such as mother and baby homes; a few had heard rumours of prison like institutions where unmarried mothers were kept for a number of years. The largest number of referrals (31) were from a doctor or medical social worker; ten
were from an employer, 11 from a welfare agency in Ireland, 28 from a welfare agency in the UK, 11 were self referrals and there were three from a priest, three from friends and one from a parent.

**Length of stay:** 59 were admitted six weeks or more before the birth; 44 of these were there for at least two months before the birth; the practice in English mother and baby homes was not to admit until six weeks before the birth.

**Infant mortality:** In Ireland in 1965 the infant mortality for children under 1 was 25 per 1000 births but was 29 per thousand for 'illegitimate births'. In this survey, four of the 100 children were either stillborn or died within the first few weeks.

**Plans for the baby:** Preference for speedy adoption was given to mothers who did not already have a child; this meant that mothers of more than one child had to stay longer in the institution unless they could afford to pay for fostering; 67 of the mothers planned to have the baby adopted and not get married; nine planned to keep the baby and marry the putative father; two planned to have the baby adopted and marry the putative father; three intended to bring the baby to the parental home; eight intended to keep the baby but did not know how. Social pressures and practical difficulties were the main obstacles to keeping the baby.

The thesis concluded: ‘The problem of the unmarried mother is the problem of society’s attitude to her’.

In February 1968, the Dublin Health Authority (DHA) proposed to appoint a new Sister in charge to Pelletstown. The Department of Health refused to approve the appointment because she was not a qualified nurse. In September 1968, the department asked the DHA to appoint a person with suitable nursing qualifications and wanted a general review of staffing in Pelletstown. There does not seem to have been a formal reply from the DHA. The proposed appointee took up the position. It seems that the CEO of the DHA considered that, in general, the Sister in charge should be a qualified nurse but would make an exception in this instance; this appointee had extensive experience running a mother and baby home in England.
1969 inspection

13.280 Miss Reidy inspected on 3 September 1969. There were 119 children (including 24 ‘legitimate’ children) and 68 adults (including 14 in the maternity hospital) in residence. The report provides a description of how the institution was organised.

13.281 St Michael’s unit was generally known as the mother and baby unit. It housed 31 infants aged under 11 weeks and their mothers. Mothers and babies were sent to this unit from the maternity hospital. It was a large spacious area with two isolation cubicles for infants. The milk kitchen, which had facilities for bottle sterilisation by the Milton method, was equipped with a gas cooker and refrigerator. Adequate cupboard accommodation for infants’ clothing was provided. The unit and all special areas were clean and well kept.

13.282 The Holy Angels unit, previously St Mary’s infirmary, had 17 infants between the ages of six weeks and nine months. It catered mainly for healthy children. There were two ‘legitimate’ children there on the day of the visit. They were described as ‘social cases’. One child was a member of the Traveller community (described at the time as ‘itinerant’); both mothers were in psychiatric hospitals. The unit had a kitchenette, washing and ironing room and a bathroom with two baths. There were three infant toilets which, Miss Reidy remarked unsurprisingly, were seldom used because of the age of the children.

13.283 Our Lady’s unit (was St Brigid’s) housed 30 infants aged from one year to 18 months. This unit which had been ‘tastefully decorated’ in December 1968, was bright and cheerful. There was a kitchenette with a cooker, refrigerator and Milton sterilisation. There were units providing bathing facilities for nine, toilet facilities for five, a washing and ironing room as well as an office and stores for linen. Individual clothes lockers were also provided.

13.284 St Vincent’s unit (which had previously been Sacred Heart) had 17 children of various ages ranging from 11 months to five years and three months. These children were in the care of a qualified Montessori teacher. They had adequate communal and individual play material including swings. There was a kitchenette equipped with a cooker and refrigerator. The children's play area, when weather prohibited the use of an outside verandah, was a large room in which the children could eat and sleep. It had 20 children's beds and five cots.
13.285 The Lourdes unit was, strictly speaking, a sick children’s unit but it housed other children as well. Children who were admitted for custodial care were housed there until they were medically cleared to live in one of the other units. ‘Severely mentally handicapped’ children were also accommodated here.

13.286 St Mary’s and St Brigid’s dormitories were the adult accommodation. At this stage, 26 cubicles fitted with a bed, a chair, a wardrobe and general purpose cupboard with mirror and over bed light, had been provided. A bed area for the accommodation of 50 was awaiting reconstruction into cubicles.

13.287 There was a dining and sitting room for mothers. A reconstruction scheme to bring the dining room nearer the kitchen was in hand. Home crafts were encouraged. The ‘girls’ knit for their infants and themselves and made ‘bath mats, etc. from nylon waste’.

13.288 Miss Reidy interviewed four mothers individually. One mother said that she had been ‘most difficult and recalcitrant’ for the first few weeks of her stay. She had no fault to find with the institution itself - ‘food was excellent and the nuns kind and understanding’. Her complaint was with society and social taboos. She felt that every mother should be encouraged to keep her child. This mother was well educated and, while she had a good job in Ireland, was going to emigrate in order to keep her child.

13.289 Another mother had to sleep in the dormitory when first admitted. She was shocked by the ‘types - they were so mixed’. After being a patient in St. Kevin’s, she got cubicle accommodation on her return to Pelletstown and she was much happier about that. A friend of hers was admitted and they had, between them, to arrange visitors at different times. She felt that accommodation for visitors was wholly inadequate. ‘The nuns were most kind’. She intended to keep her child.

13.290 Another mother thought that the ‘rules were getting too lax’. The practice of encouraging visitors to come to the institution and encouraging relatives to come to take the girls out for drives, was making things very difficult for some. She lived in constant dread of running into someone she knew. She had no fault to find with the institution itself.
13.291 The fourth mother interviewed gave ‘great praise’ to the institution and the Sisters. She said that some girls were ‘narkie’ and ‘one got fed up listening to their groupes and grumbles’. This mother had herself been raised by guardians both of whom were aware of where she was. In the other three cases only the mother was aware of her daughter’s whereabouts.

13.292 Children had been discharged from Pelletstown between 1 May 1965 and 31 July 1969 as follows:

- Adopted 534
- Special schools 63
- Boarded-out 58
- Other homes 8
- Foster parents (per relatives) 10
- To relatives 581
- Certified schools through the courts 22

13.293 The report noted that children used to be placed in Pelletstown while awaiting a place in a certified school; this practice had ceased sometime between 1965 and 1969.

13.294 Miss Reidy concluded that she was generally satisfied with what she found. The conversion of the open dormitory accommodation to cubicles was very necessary but the matron and the Dublin Health Authority were very aware of this and every effort was being made to expedite completion of this work.

The 1970s

13.295 In 1970, a Department of Health official was surprised to discover that Pelletstown was not simply a home for unmarried mothers and their children. He noted that almost half of the children discharged in the five-year period 1965-69 were discharged to relatives. When Miss Reidy visited in September 1969, about 20% of the children resident in Pelletstown were ‘legitimate’. The official wanted further information on why the legitimate children were there and how many ‘illegitimate’ children went home with their mothers. The Dublin Health Authority explained that the children who went home to relatives mainly went to parents; the ‘legitimate’ children were mainly there because of parental illness and those who were there

78 Again, it is highly likely that a significant number of these children were subsequently adopted.
for a long stay were mainly the children of parents with a psychiatric illness. The DHA did not follow up the children after they left because they did not have the staff.

13.296 The Eastern Health Board (EHB) took over the functions of the Dublin Health Authority in 1970. It first met in November 1970.\textsuperscript{79} At its meeting of 4 February 1971, it was agreed to establish visiting committees composed of board members. These committees were to visit the major hospitals once a month and the smaller centres at least once a year. Pelletstown (which was categorised as a hospital) was allocated to the No 1 visiting committee for ‘periodic visits’. At least two committee members had to be involved in each visit and the committees would report to the board at each meeting. This seems to have been a continuation of the practice of the Dublin Health Authority but the Commission has no documentary evidence from the DHA. In practice, the EHB’s Pelletstown visiting committee visited there about twice every year until it closed.

13.297 The EHB took over the administration of the health services within its functional area from 1 April 1971. On 30 March 1971, the Dublin, Cork, Limerick and Waterford Health Authorities were dissolved.\textsuperscript{80}

13.298 At its meeting on 1 April 1971, the EHB decided to rename St Kevin’s. St James’ Hospital was established.\textsuperscript{81}

13.299 In September 1971, there was one Senior Social Worker, three Children’s Officers and six social workers in the Welfare Services Department of the EHB and the board was looking for approval for the appointment of five more social workers. There were also social workers in hospitals.\textsuperscript{82}

13.300 In November 1971, the estimates of expenditure for 1972/3 were discussed by the EHB. These showed that Pelletstown was being allocated £189,000. The allocation for the boarding out of children was £257,000.

\textsuperscript{79} The minutes of the EHB meetings are available online at www.lenus.ie
\textsuperscript{80} SI 117/1971
\textsuperscript{81} SI 187/1971
\textsuperscript{82} They were known as Almoners.
13.301 The minutes of the EHB meeting of 6 January 1972 include the report of the visiting committee to Pelletstown.\(^8^3\) The visit had taken place on 25 October 1971; three members of the committee attended and four sent apologies. Dr Coffey, visiting paediatrician was in attendance (among others). The committee members were met by the Sister in charge and other members of the community.

13.302 The Sister in charge told the committee about the type of services provided. She said that unmarried mothers were usually admitted about six weeks before confinement and were ‘encouraged to leave as soon as it was practicable for them to do so’. Approximately 50% were from outside the Dublin area. She said that, in her opinion, the standard of the service was unequalled by comparison with similar institutions elsewhere. The committee ‘indicated that this should be particularly emphasised in view of the unfounded and adverse comments published regarding the adequacy of services available for unmarried mothers in the Country’.

13.303 The visiting committee was told that accommodation was available for 92 ‘girls’ and 146 babies; there were 23 babies in isolation. Due to adaptation work in progress in St Vincent’s nursery, the accommodation for babies was curtailed and there were actually 75 mothers and 112 babies in residence on the day of the visit; admissions had increased in recent years. Births at the home were:

- 183 in 1969/70
- 211 in 1970/71
- 141 in 1971 (half year)

13.304 Adoptions were arranged by St Louise’s Adoption Society. Dr Coffey said that a considerable number of children could not be put up for adoption because of congenital abnormality. Some were placed with foster parents but there were problems placing children with long term disability. The visiting committee recommended that the allowances paid in respect of boarded out children should be substantially increased and special consideration was merited in the case of foster parents who took children with disabilities. The committee indicated that some of the provisions of the adoption legislation were inadequate or

\(^8^3\) The minutes of the EHB included reports of visiting committees in its first few years of existence. The existence of visiting committee reports was referred to in subsequent EHB minutes and sometimes a discussion was held. The Daughters of Charity provided the Commission with some visiting committee reports. The HSE has not been able to provide the Commission with the other visiting committee reports.
unnecessarily restrictive and the views of the health board and its officers should be put forward while the legislation was being amended.

13.305 The visiting committee inspected Holy Angels’ and Our Lady’s nurseries and some of the dormitory and dining room accommodation. They commented favourably on the structural and mechanical maintenance of the accommodation and facilities and, in particular, on the decorative condition of the institution. The members praised the work and dedication of the community and expressed their appreciation of the assistance and hospitality they had received.

13.306 It is notable that virtually all visiting committee reports from other hospitals and institutions at this time record that the members of the committee spoke to some of the residents but there is no such suggestion in this report.

13.307 The visiting committee paid another visit to Pelletstown on 2 November 1972. Five members of the committee were present. They were met by the Sister in charge and four other members of the community, the medical administrator and architects and structural engineers. The members were informed that foster parents who took children with disabilities did get higher payments.

The Committee reviewed the service being provided at the Home and noted that the general public still seemed not fully aware of the kindness and solicitude of Health Boards for unmarried mothers. The public image of the service appeared to be drawn by those who did not avail of it while the confidential nature of the service precluded those who benefitted from publicising it.

13.308 It was noted that the services were provided free of charge while the mothers also retained their health and social welfare benefits ‘… this compared favourably with similar services in other countries’. There was liaison with two other similar institutions - Bessborough and Dunboyne. Accommodation in Pelletstown was sufficient to cover current needs. It was strictly non-sectarian and the staff were conscious that their duty was to help and advise. ‘At all times the wishes of those availing of the service are respected particularly in regard to anonymity’.

13.309 The committee noted that staff were employed to carry out domestic duties; there was no rigid programme for the residents and ‘they are free to go shopping etc.'
and to have visitors if they wish’. The majority ‘undertake light domestic work which is valuable therapy and also engage in occupational therapy’. Only a small percentage were employed and the majority return to work when discharged. Two social workers were employed to help the residents who could also avail of the health board social worker service; there were 14 social workers in the EHB children’s section at this stage. The service included a visiting psychiatrist; most did not need a psychiatric service but some needed support to cope with bereft feelings following the adoption of the baby. The committee also noted that there was not a problem with drug addiction.

13.310 The Sister in charge told the committee that in her five years there she had come across only one instance where parents did not support their daughter. However, some residents did not want their parents to know of their admission and their view was respected.

13.311 In the year to 31 March 1972, there were 264 adoptions from the institution and 132 from 1 April to 30 September 1972. Children were not placed for adoption until at least six weeks after birth. This was to enable medical screening and to give the mothers sufficient time to consider carefully whether they wished to rear their children rather than have them adopted.

13.312 The visiting committee was told that there were 72 adults and 92 children in Pelletstown on 31 October 1972. In the 10 months to 31 October 1972, there were 884 admissions (including readmissions) and 234 births. The figures for 1971 were 1,071 admissions and 254 births and for 1970, there were 788 admissions and 179 births.

13.313 The medical administrator suggested that the committee might consider recommending legislation to require the putative father to contribute to the cost of the service; he mentioned that in Denmark and Sweden the courts had power to levy charges on more than one person if necessary.

13.314 The committee considered that adoption legislation would be improved by reducing the statutory period of placement before adoption from six months to three months and accepting a mother’s general consent to adoption given three months after the
birth rather than requiring her final consent to a specific placement not earlier than six months after the birth.

13.315 The committee noted that, in the interest of the children, their stay in Pelletstown should be as short as possible. It also suggested that the fact that larger allowances were payable to foster parents who took children with disabilities should be more widely publicised. The chair asked the members to consider before the next meeting how greater public awareness of the need for good foster parents could be generated.

13.316 The fire officer reported that he had completed a course of lectures in June on fire precautions in Pelletstown; with the movement of patients, refresher courses were necessary. A consulting engineer submitted plans for a new 30 point automatic telephone system with break-glass fire alarms sited at strategic points. The existing telephone system was a weak link in fire prevention and control and general communications within the institution needed improvement.

13.317 Plans for re-siting the altar in accordance with liturgical requirements had been prepared and awaited the approval of the Department of Health.

13.318 The committee praised the unselfish work of all the staff and paid particular tribute to the Senior Administrative Officer, Welfare Department, for his great personal interest and dedication in all matters relating to Pelletstown. The report of the Sister in charge on the very satisfactory maintenance service which had been provided was noted and the members complimented the engineering staff.

13.319 The estimates for 1973/4 included a proposal for an extra £5,000 to cover an administrator, upgrade of staff of religious sisters and a part time paediatrician.

13.320 In February 1973, the EHB approved a capital grant of £2,700 for kitchen equipment and rewiring. The visiting committee visited in May. There were five members present. Also present were the medical officer, the Sister in charge and four members of the community as well as EHB staff including engineering staff.

13.321 The report of the visiting committee shows that there were 83 women and 105 children resident on 1 April 1972 and 83 women and 97 children on 31 March
1973. During the year ended 31 March 1973, there were 391 women admitted and 399 children of whom 255 were born in the home. Of the women discharged, six left to marry, 255 went to parents or relatives, 20 to friends, 21 to flat accommodation, four to hostels, 84 to situations, nine to other homes, 75 to hospitals; 94 were described as ‘temporary discharges’ and four left without notice.

13.322 Of the children, 274 were adopted, 59 went to mothers, seven went to parents, 18 were boarded out by health boards, 34 went to schools or other institutions, one went on holiday and 75 went to hospitals. St Louise Adoption Society arranged 103 of the adoptions; 92 were arranged through CPRS with smaller numbers through other adoption societies.

13.323 Two children died as a result of congenital ailments. The medical officer said that they had epidemics of diseases such as gastroenteritis from time to time but they had the facilities to deal with these; alternatively, the children could be sent to Cherry Orchard Hospital if necessary. They also had the services of Dr Coffey, the visiting paediatrician to advise as required.

13.324 The committee members expressed the view that all steps possible should be taken to ensure that any mother who wanted to keep her baby would not be prevented from doing so through lack of financial assistance. It was noted that the tendency to exclude the putative father from all arrangements concerning the mother and the child may be unfair to some of the fathers and also to the mother and the baby; the committee thought that, if it were possible, the fathers should be encouraged to take an active interest in the babies' future and in the mothers' general welfare. It was explained that where an unmarried mother could return to her family there appeared to be a reasonable hope of her rearing her baby, but where she had to fend for herself in flat accommodation there were many problems not the least of which was her own loneliness and isolation. The medical officer told the committee that recently she had visited the community care centre in Crumlin and she was impressed by their approach and hoped to arrange close liaison with the centre in any future cases (from the Crumlin area) where an unmarried mother wished to rear her baby.

13.325 It was noted that the contract documents for the new telephone installation and fire alarm system, to which reference had been made at the last visiting committee
meeting, were being prepared and would be processed through the Department of Health as speedily as possible.

13.326 The chief executive officers of the other health boards who maintained women in Pelletstown had been circularised about the importance of preserving anonymity. The women were now given a code number on admission and this code number, rather than the name, was used in any further correspondence.

13.327 The medical officer told the committee that all babies adopted from Pelletstown received any necessary medical care there during the first month of adoption and that they were then referred to the child welfare clinic in their district or to the family doctor.

13.328 The committee noted that there were six beds for babies born in the institution who required long-term care. This number had been sufficient in the past but there was currently pressure on space because there were no alternative places for children who could no longer be helped in Pelletstown, for example ‘spastics’.

13.329 The committee members complimented all the staff ‘on their excellent work’. The chairman said that he appreciated all that the community in the home was doing for unmarried mothers and he was sure the EHB would make available adequate supporting staff as required. ‘It was known that many members of the Community devote their off-duty time to helping the many cases of hardship which come their way’. The committee also paid special tribute to the doctors who provided the maternity and paediatric services and the visiting psychiatrist from St. Loman's Hospital who visited once each week or on request.

13.330 The committee inspected the following units:
- Holy Angels (babies from six weeks to one year old);
- Our Lady's nursery (babies up to one year);
- St Michael's nursery (babies under two months);
- St Vincent's nursery with playing area (for children up to four years);
- Cubicle accommodation for ‘girls’;
- Sitting room and dining room accommodation.
13.331 The committee members were very favourably impressed by the very high standard of maintenance and equipment in the units they visited. They spoke with members of the staff in the units and the doctor gave a brief history of several of the babies and spoke on some of the problems that arose. The members were most appreciative of the way the doctor assisted them on their inspections.

13.332 In August 1973, there were 14 social workers and one senior social worker employed by the EHB in the Children’s Section. They were responsible for care and counselling of unmarried mothers; assessment of prospective adopters and foster parents; supervision of boarded out children, children at nurse and children placed for adoption; and pre-placement assessment and follow up of children in residential care. There were four social workers in Ballyfermot, Killester, Rathmines and Bray/Wicklow. There was approval for a senior social worker for Wicklow but no appointment had yet been made. There were one senior social worker and 15 psychiatric social workers and the EHB was providing assistance to voluntary bodies who employed 22 social workers in the community. The board wanted to expand the numbers with a senior social worker in each community care area (there were ten such areas within the EHB which covered Dublin, Kildare and Wicklow) and it proposed to create nine new senior posts and ten social worker posts.

13.333 Sometime in the 1970s, a list of rules about admission to Pelletstown was drawn up. No pregnant girl should be refused admission except for some specific reason; they could be from any of the 32 counties. All ‘illegitimate’ children from the EHB area were to be admitted (accompanied by mothers, if possible); those from other counties were to be admitted only if accompanied by the mother; these children must have a negative stool test report (in writing); if not, the baby must be isolated until this had been obtained.

13.334 The admission of ‘legitimate’ handicapped babies was to be arranged through the consultant paediatrician, Dr Coffey, or the resident medical superintendent.

13.335 The social worker’s job was to interview all ‘girls’ after admission except for those sent by the CPRSI and the Rotunda Girls Aid Society as they were interviewed

---

84 Undated document supplied by the Daughters of Charity.
weekly by their own social workers. Those from the country or other societies were to be interviewed once and then on demand. The St Louise’s Adoption Society ‘girls’ were to be interviewed regularly.

13.336 There was quite a bit of interaction between the EHB and the Department of Health about staffing in Pelletstown. In February 1974, following a review of staffing, the EHB sought approval from the Minister for Health for the creation of one additional post of ward sister and two extra night superintendents. The department’s chief medical officer visited in April 1974 to discuss this with the matron. He had no objection to the proposed increase. At that stage, there were nine Sisters, 49 nurses, 28 attendants, two domestics and one teacher employed in Pelletstown.

13.337 The need for more social workers throughout the EHB was also recognised and, in May 1974, it was noted that recruitment was proceeding. A number of the social workers employed by the voluntary agencies were applying for the posts and the EHB thought it unlikely that they would then be replaced so they wanted to recruit a further 16 social workers to ensure that there was a net increase.

13.338 In March 1975, the estimated cost of the proposed capital expenditure on a fire alarm and telephone system for Pelletstown was £25,000.

13.339 In April 1975, the visiting committee discussed aspects of the adoption legislation, the position of children with disabilities and the question of hostels for single mothers and their babies. There were difficulties in getting foster parents for children with disabilities and there were not enough suitable places for them. It was suggested that this was a housing issue and not a health board issue.

13.340 In 1976, the general hospital services division of the Department of Health rang the Sister in charge of Pelletstown to find out what they did. The department was told that there were 16 maternity beds, ten cots, 130 beds for babies; the babies included the children of the residents, abandoned babies and babies awaiting adoption. They had accommodation for 100 women but generally there were only about 60 at any one time. The Sisters provided care for these babies until they were adopted but they also had many babies who could not be adopted, for example, some hydrocephalic children, some ‘spastics’, some who were ‘mentally handicapped’, some who were the children of mothers with a record of psychiatric
illness and some whose mothers have left them in the institution promising to return for them. The oldest toddlers for whom they were caring at this time were a mentally-handicapped boy of four whom they hoped to get into a home for children with mental disabilities in a few months and a five-year-old girl who had a congenital heart problem; the Sisters hoped that she would be admitted soon to one of their other institutions. The Sisters also looked after some toddlers who were sent to them by the EHB when they required a spell of convalescence and they also received some very sick children from St James's who required to be placed in isolation. They also looked after some young ‘itinerant’ children who, because of their home environment, regularly developed chest infections in winter time.

13.341 They had four Sisters, 49 nurses, 13 attendants and one domestic staff. The number of births was 240 in 1973; 236 in 1974 and 213 in 1975.

13.342 The visiting committee visited again in November 1976. They were told that there had been 186 confinements in Pelletstown in the period 1 January - 31 October 1975 and 49 women had been sent to St James's: a total of 235. In the same period in 1976 there had been 152 confinements in Pelletstown and 93 in St James's: a total of 245.

13.343 The staff consisted of the Sister in charge, two night superintendents, one ward sister, 48 nurses and 22 attendants. The Daughters of Charity expressed their disappointment that they had not been given extra nurses for feeding the babies. The mothers were leaving earlier than before and extra help was needed. The Sisters were not keen on asking expectant mothers to feed the unaccompanied babies. The visiting committee had recommended extra staff at previous meetings; the EHB said there was a bar on increasing staff over the numbers employed in December 1975. The Sister in charge wanted St Michael's ward converted to cubicles. The visiting committee inspected the maternity unit and the grounds.

13.344 The Pelletstown physician raised the issue of putting cubicles into one of the babies’ wards to cut down on cross infection. A proposal to put 25 cubicles at a

---

85 The list does not include the domestic and catering staff
cost of £3,500 had been agreed the previous year by the EHB but had not been carried out.

13.345 A new telephone and alarm system was completed in October 1977. The cost was £29,660; £4,660 was paid by the Hospitals Trust Fund; £25,000 was a loan from the local loans fund, repayable over 35 years.

13.346 A social worker report compiled in September 1978 said there were approximately 400 admissions of pregnant women annually with 40–60 resident at any one time.\textsuperscript{86} There was one social worker there and one who divided her time between Pelletstown and the community. All the residents were interviewed and some were worked with more intensively than others, depending on their individual needs and whether or not they had had contact with a social worker from their local area. There were approximately 100 children in the nurseries. These included children awaiting adoption, foster care or residential care and children whose mothers were ‘not yet in a position to provide a home for them’. The high number of mothers and children created a lot of administrative work for the social work department with endless queries coming from all health board areas.

13.347 The Department of Health inspector, Miss Clandillon, visited Pelletstown in December 1978. She reported that the reasons for the retention of the children were valid - they were children with disabilities. The standard of care and accommodation was high; cubicles for new born infants were being introduced into one ward; these included a work table with infant bath.

13.348 In December 1978, the EHB heard that the work on cubicles and installation of baths was complete except for the connection of the baths. In May 1979, it was noted that work on the cubicles and bathrooms should be completed by the end of June. In December it was noted that work was almost complete on the provision of cubicles.

13.349 In 1979, the EHB agreed to sell\textsuperscript{87} 3.6 acres of land at Pelletstown to Dublin County Council for use as playing facilities subject to the provision of adequate boundary walls and restricted access to preserve the privacy of the institution.

\textsuperscript{86} This report was about a social worker who did a placement in Pelletstown in 1978 and was compiled by her supervisor who worked there.

\textsuperscript{87} The sale was subject to the approval of the Department of Health.
CHAPTER 13 PELLETSTOWN

Closure of maternity unit

13.350 The closure of the maternity unit was being considered in the early to mid-1970s. It was on the agenda of the EHB’s visiting committee, for example, in October 1975. The matron told the committee that, in the year to 31 August 1975, there were 1,128 births to unmarried mothers in the four Dublin maternity hospitals\(^88\) plus St Colmcille’s (24,000 births in total); there were 200 births in Pelletstown (140 from outside the EHB area) so it was catering for one sixth of the total births to unmarried mothers. There was a GP service in conjunction with the obstetrician/gynaecologist in St James’s.

13.351 At the time, the Eastern Health Board was keen to get hospital/institutional space for other groups, in particular for long stay geriatric patients, people in need of terminal care and people with intellectual disabilities. It was pointed out that the Daughters of Charity were already catering for 1,000 handicapped children in four centres.

13.352 Pelletstown was inspected by a Department of Health doctor in 1976. In his report to the chief medical officer, he said that it consisted of a home for unmarried mothers who usually came in about two months before delivery and left when their babies were at least a fortnight old. The average number of ‘girls’ was about 60. There were also about 60 babies, most of whom were awaiting adoption. The institution was used by a number of adoption societies some of which took the babies at two weeks but St Louise’s Adoption Society insisted that the baby was examined at six weeks before adoption was permitted. The institution was ‘inclined to collect infants for various reasons unsuitable for adoption e.g. children with Spina Bifida, Hydrocephalus, Tumors, etc.’ It also provided a ‘sanctuary for some chronically ill or congenitally abnormal legitimate infants’ who would otherwise have to be kept in the children’s hospitals.

13.353 On the day of his visit, there were eight patients in the ante-natal ward but only two in the post-natal ward and two babies in the nursery. The unit had 215 deliveries and had two early neo-natal deaths in the previous year. A GP provided ante-natal care and was available if required at delivery.

---

\(^88\) St James’s, Holles Street, the Coombe, the Rotunda.
13.354 The inspecting doctor was of the view that the women in Pelletstown were at greater risk than the average obstetrical patient because:

- they were mostly first time mothers;
- they often had not had ante-natal care;
- they were more likely to come from deprived homes;
- they may feel antagonistic to the establishment in their circumstances.

13.355 As a result, they needed greater than usual care. He had inspected the delivery room records and noted that about 10% had a forceps delivery; there were also some breach deliveries. The institution did not keep a supply of blood and the usual anaesthetic was chloroform. The nursing staff required was nine nurses with midwifery qualifications; two nurses were on duty each night although there was a mean of four deliveries a week.

13.356 He agreed with the Eastern Health Board that they would be better off delivered in St James's. He suggested that the GP continue to provide ante-natal care in Pelletstown but that the women should attend at St James's Hospital at least on one occasion before delivery.

13.357 He did not think the maternity unit was suitable for geriatric care. It was too small and the location in close proximity to where there were 60 infants including some sick infants might be a source of infection. In March 1976, the EHB decided to keep the maternity unit open mainly because of the confidentiality it provided to the mothers.

13.358 In May 1976, Comhairle na n-Ospidéal issued a discussion document on the Development of Hospital Maternity Services. This recommended that in-patient maternity services should be concentrated in hospitals catering for 1,500 to 2,000 deliveries a year. This meant that there should be no more births in Pelletstown.

13.359 The issue of closure was raised a number of times by the medical members of the EHB and by the deputy CEO. The deputy CEO pointed out that ‘the retention of the costly staff-intensive, under-used unit’ meant that £30,000 would have to be cut from some other service. The deputy CEO suggested that the members should re-

---

89 www.lenus.ie
90 The report also recommended the closure of St James’s maternity unit. It was considered entirely satisfactory from a medical point of view but the Coombe had the capacity to provide the service.
examine their decision of March 1976 to keep the maternity unit open. A doctor member of the board welcomed the fact that more women were opting to have their babies in St James's; he thought it was vitally important that the delivery take place in a first class maternity unit; some members agreed while others thought that confidentiality remained a major consideration.

13.360 At this time, the EHB was considering building a welfare home\(^9\) in the grounds of Pelletstown and making the maternity unit available for a 25 bed geriatric unit.

13.361 The CPRSI, which was responsible for approximately 40% of the admissions to Pelletstown, was not happy with the proposal to turn the maternity unit into a welfare home because of concerns about confidentiality, the need for medical treatment in some cases and the need not to reduce facilities for unmarried mothers in light of the abortion situation. It was also concerned that a welfare home would be a return to the old county home image.

13.362 In November 1976, a meeting was held between Pelletstown staff, the EHB, the Department of Health and St James's obstetrician/gynaecologist about the closure of the maternity ward. The EHB said there were nine nurses for a total of about 200 births, each cost £150 in nurse cover alone; a substantial number were going to St James's already. The department wanted to close it for safety reasons if arrangements for preservation of privacy could be made in the main maternity hospitals. The obstetrician said facilities were available in St James's; over half had gone there in the past year anyway; a six-bed ward could be set aside for women from Pelletstown and a single room made available when necessary.

13.363 In July 1977, a member of the visiting committee objected to meetings with representatives of Department of Health about Pelletstown being held without members of the visiting committee present. He argued that babies should continue to be delivered there in order to preserve confidentiality; there should be no policy change. In November a doctor member wanted deliveries to cease because of the risks. In general, the medical members of the EHB wanted to close the maternity ward and the other members did not.

---

\(^9\) Public nursing home for older people.
The question of using the maternity unit for the young chronic sick was raised. The EHB had no beds for young chronic sick in its own institutions. The department was opposed to using the maternity unit for the young chronic sick for a number of reasons including the undesirability of having young chronic sick and unmarried mothers sharing the same campus.

In December 1978, the EHB had a lengthy discussion about the decision not to close the maternity unit despite medical objections. In February 1979, the visiting committee finally agreed that medical opinion must be accepted and the maternity unit should close as soon as practicable.

The issue was raised again at the EHB meeting in May 1979. It was argued that considerations of anonymity and confidentiality were as important as the medical considerations but it was decided to close. The CEO agreed to notify the various referral agencies. It was noted that the obstetrician/gynaecologist from St James’s Hospital had given assurances about confidentiality there - including the provision of a private room if required; it was also noted that the Daughters of Charity were happy with the proposed change. The maternity unit closed in May 1980.

1980s

Discussions about the future of Pelletstown began in earnest in about 1980. The Daughters of Charity had been making representations about its unsuitability. There were problems because of costs and the shortage of Sisters to provide the services. It was estimated that it would cost £750,000 to maintain in 1981; this was between £6,000 and £7,000 for each mother and child maintained; about 90 staff were allocated to it and it was very difficult to make any staffing changes.

The Department of Health was closely involved in the decision making about the future of mother and baby homes generally. It is clear from the files seen by the Commission that the department’s knowledge of the various institutions was quite limited even though it was responsible for approving many of them. In particular, it seems that there was no clarity about what section of the department should be involved with these institutions. The lack of knowledge extended to children’s homes for which the department was directly responsible. There was also uncertainty within the EHB about which section should be responsible for Pelletstown. It came under the hospitals section and the issue arose as to whether
or not the community care section should have been involved in the discussions about its future.

13.369 In August 1980, a social worker member of the EHB noted that a number of children were over a year in Pelletstown and that they were reported to be unsuitable for placement. She said that professional opinion indicated that any child was suitable for placement if the proper foster parents could be found. She also commented on the lack of activities for the children and on the apparently high nursing staffing in the home although there were normally no ill patients there. She referred to the alternative of accommodating mothers and children in small group homes.

13.370 In October 1980, the Sister in charge reported to the St Louise Adoption Society that 280 mothers had been admitted to Pelletstown in 1979 and 282 in the nine months to September 1980; about a quarter of the mothers came from the EHB area. There was a discussion about the ‘general unsuitability’ of Pelletstown for accommodating unmarried mothers.

13.371 In November 1980, officials from the Department of Health visited Pelletstown to consider its possible future use. The officials noted that it had a total of 98 staff. It was difficult to heat and costly to run; the estimated running costs for 1981 were £750,000.

13.372 In November 1980, there was a meeting between the EHB, the Department of Health and the Daughters of Charity. The Daughters of Charity and the EHB were keen to continue a service for unmarried mothers but not in the existing building. The health board wanted to provide a purpose built unit for unmarried mothers and babies in self-contained units.

13.373 In December 1980, the EHB was in touch with the Daughters of Charity about setting up one or more mother and baby homes where the mother would be more involved in looking after the baby. The EHB wanted small units which would be under the control of one or two Sisters with the mother taking a very active part in looking after the baby and in the running of the unit. The length of stay was to be

---

92 It is not clear to the Commission that the social worker was correct. It may have been that there were no children there with acute illnesses but there were a number of severely disabled children and children with chronic conditions.
limited but should be of such duration as to provide for the rehabilitation of the mother. It would also afford the mother the opportunity to find out whether she would be in a position to care for the baby or to consider the alternative - adoption or otherwise. The mother would also be expected to contribute towards her own and the baby's maintenance in the institution.

13.374 After the closure of the maternity unit in May 1980, deliveries were mostly in St James’s but some were in the main maternity hospitals. Some women stayed about five days in hospital while others came back to Pelletstown within 24 hours.93

13.375 In January 1981, the matron wrote to the EHB outlining what would be required if the institution was phased out. She wanted a purpose built building for 35-40 women in single rooms; ten of these rooms should be large enough to have a cot for those who intended to keep the baby; the women should also have separate cooking and laundry facilities. Facilities for 30-40 babies in two nurseries would be required together with nursing staff to look after the babies. There would also be a need for some ante-natal and post-natal facilities in order to preserve confidentiality. In her letter she mentioned that they were running a ‘Personal and Clerical Development’ course for the residents.

13.376 In February 1981, a meeting of all the Daughters of Charity members working in Pelletstown was held in Crumlin Children’s Hospital.94 The Sisters were concerned about the future as rumours were circulating and there were frequent visits from the department without much explanation. They had been told that the cost of running Pelletstown was £90 a week for each girl.

13.377 The Sisters made the following observations:

- Pelletstown provided a national service with a certain degree of anonymity; if babies were transferred back to the mother’s home place, anonymity would be lost and this could result in more abortions
- Many of the girls were disadvantaged and inadequate; the type of system proposed would not be suitable for mentally handicapped girls and psychiatric patients.

---

93 Minutes of St Louise Adoption Society 10 April 1981. St Louise’s Adoption Society met in Pelletstown. Its chair was the CEO of the EHB. The other members were health board employees, including social workers, and members of the Daughters of Charity.
94 Document provided by the Daughters of Charity.
St Louise's Adoption Society was also discussing a replacement premises. In April 1981, about one quarter of the mothers were from the EHB area. The numbers had gone up again. It was noted that there was a general improvement in the health quality of babies and ‘there is no waiting list at present for the admission of deformed babies’.  

The adoption society was concerned about the care for ‘inadequate girls’; it was considered that sheltered accommodation was not always best for the child; foster care might be preferable. It was noted that unmarried women were being housed in Ballymun and ‘so received little support from the settled community’. The ‘girls’ in the hostel in Belmont Avenue (see Chapter 14) ‘are moving on to alternative accommodation. They are not being rehoused’.

In May 1981, there was a meeting in the Department of Health to decide which division of the department should take responsibility for the four mother and baby homes then in existence - Pelletstown, Bessborough, Denny House and Dunboyne. In June 1981, there was a meeting in the department to consider alternative accommodation for babies and children in Pelletstown. Information about the conditions in Pelletstown was provided at both meetings.

The main building at Pelletstown was described as ‘an old 3 story (sic) building, without a lift, difficult to heat and considered a fire hazard’. It was an old rambling building with accommodation for about 100 mothers. It was considered to be too big for the then current needs - there were only 37 mothers in residence in November 1980. There were 74 children resident at the time, 40 of whom were considered suitable for adoption.

The isolation unit was separate from the main building and was described as ‘a fairly modern building in good condition with accommodation for 20 chronically ill children’. The separate maternity unit (which was not being used for confinements at this stage) was described as being ‘in good order’ and had accommodation for 18 people.

The EHB had proposed that the vacated maternity unit be adapted to accommodate 18 ‘young chronic sick’ but the Department of Health did not agree.
as it did not have appropriate ancillary services. The board also proposed that the isolation unit could be vacated by placing the children in it elsewhere and the building then used for older people.

13.384 The EHB proposed replacing the main Pelletstown building with a 40-bed purpose built unit on the same site but a departmental official questioned the need for such a building. It was pointed out that none of the existing buildings at Pelletstown - the main building, isolation unit or maternity unit - was considered suitable for the accommodation of either geriatric or young chronic sick/incapacitated patients. A further problem in relation to this institution was ‘the numbers of physically, mentally and multiply handicapped children being maintained there’. They included about six with physical handicap such as hydrocephalus and spina bifida, fibro cystic disease or heart condition and about 18 with intellectual disabilities ranging from mild to severe.

13.385 Children with intellectual disabilities were not accepted into the homes for the intellectually disabled until they were at least four years old and the Daughters of Charity had been pressurised into keeping them in Pelletstown until they were accepted elsewhere.

13.386 It had been suggested that, as Bessborough (see Chapter 18) was also underutilised, people who would normally go to Pelletstown could go to Bessborough instead. Other possibilities for the housing of the children with disabilities were discussed. This discussion showed that there was very limited knowledge in the department about the services provided in Temple Hill (see Chapter 2).

13.387 In 1982, the EHB established a board committee on support services for unwanted pregnancies. The board had allocated £23,000 in 1981 to extern institutions for unmarried mothers and proposed to allocate £28,000 for 1982. The extern institutions in existence at the time were Bessborough, Dunboyne and Denny House.

13.388 In January 1983, the Daughters of Charity met the EHB to discuss the future. At this stage, the numbers had dropped dramatically - there were only 25 women in residence. The Daughters of Charity were prepared to withdraw as they regarded
the service as 'too institutionalised'. They asked if the EHB could provide one or
two houses for the 'inadequate girls'. They said that about five of the women in the
institution at the time would be regarded as inadequate. The EHB asked if the
Daughters of Charity could provide the accommodation but they said that they had
already bought two houses on Belmont Avenue (see Chapter 14) and could not
afford any more. They also pointed out the difficulties of finding places for the
disabled babies as St Vincent’s was full and no existing institution would take
babies. It was agreed that there would be further analysis of the current residents
and how closure would affect Dunboyne. It was also agreed to consult CURA and
Ally.

13.389 In February 1984, the EHB looked again at support systems for unwanted
pregnancies. It was noted that there had been an increase in the numbers of
'illegitimate' births.

13.390 A survey of single pregnant women attending St James’s hospital had been
conducted. This showed that:

- large numbers did not present for ante-natal services until very late in
  pregnancy;
- there was a considerable lack of knowledge regarding contraception,
  menstrual cycle and sex education in general;
- infant mortality figures were high for young mothers.

13.391 One member of the board drew attention to the need to ensure that the provision of
services for unmarried mothers and their children did not create anomalies for
other parents and their children in similar circumstances.

13.392 During 1984 there were further discussions about the closure of Pelletstown, in
particular about what was to happen to the staff.

13.393 In August 1984, the consultant paediatrician at Pelletstown, Dr Coffey, wrote to the
Minister for Health about the proposed closure. She said she had been a
consultant there for some 50 years; she wanted the isolation unit maintained as a
children’s hospice which was sorely needed. She made reference to such
hospices in the UK and the US.
Pelletstown was closed in 1985.

**Eglinton House**

In October 1985, the EHB bought a large house at 75 Eglinton Road in which to provide a service for a small number of unmarried mothers as an alternative to Pelletstown. The plan was that it would be run by two of the three Sisters who were then in Pelletstown. The Sisters would provide day care but would not live in the house; instead, lay nurses would provide the night services. Eglinton House opened in January 1986 as a mother and baby home but it was a very different institution than Pelletstown. It provided places for up to 13 expectant and new mothers and five nursery places for unaccompanied babies. It was owned by the Eastern Health Board and managed by the Daughters of Charity until 1997. It was a three-storey semi-detached house on a road of expensive houses in what was then and remains an upmarket suburb. It seems there was some initial concern among the neighbours about its use as a mother and baby home but this does not seem to have lasted. A subsequent review noted that the entrance was not particularly suitable for prams and buggies.

In April 1986, the EHB told one of its members that:

As a result of careful planning, the co-operation of staff and staff representatives and the sisters in charge, the transfer of our service for unmarried mothers from the large institutional setting in St Patrick’s to a community base on the south side of the city has been quietly achieved taking account of all of the interests involved. The new service is 'settling in' at present and arrangements, some of which involve a consideration of the residents and others and our obligations to staff, are in a transition phase. The position at present is that a total of eleven staff plus a sister-in-charge and her assistant are employed. They include general trained nurses, midwives, nursery nurses and unqualified but experienced attendant staff. The service can cater for up to 15 mothers, expectant and with babies. At present an additional number of babies are being cared for without their mothers pending placement although it is not intended that this service will continue.

The estimated running cost of the service for 1986 is £80,000 and the pay costs an additional £130,000 for the initial year.

---

96 The house had once been the residence of the then Taoiseach, Dr Garret Fitzgerald.
13.397 It was decided to pay £10 a week to residents who had no other income. Effectively this was a payment to expectant women and probably mainly to younger expectant women. All mothers would have been eligible for the Unmarried Mother's Allowance and expectant women who had been at work would likely have been entitled to a social insurance payment such as Disability Benefit (which was a short-term payment and which is now called Illness Benefit) or Maternity Benefit.

13.398 Unlike Pelletstown, Eglinton House was not regarded as a hospital but was within the remit of the community care section of the EHB.

13.399 In 1987, the EHB told one of its members that Eglinton House catered for up to 15 mothers, expectant and with babies. It also had a small number of babies without their mothers. It provided sheltered emergency accommodation for inadequate mothers of young infants until they could be accommodated satisfactorily with their children or until they had made decisions otherwise regarding the future placement of their children. Its residents included mothers who were ‘mentally handicapped’ or who had severe mental or physical ailments. It was frequently full and at the time concerned, there were seven people waiting admission, including two with severe psychiatric problems.

13.400 As already stated, the staff who transferred from Pelletstown to Eglinton House in January 1986 included general trained nurses, nursery nurses, midwives and untrained but experienced attendants. There were 12 staff plus the Sister-in-charge and her assistant who were both members of the Daughters of Charity. The service cost £194,000 in 1986; £171,000 of this was pay costs. It was expected that the costs would reduce in 1987 as it was not proposed to replace a retiring member of staff.

13.401 The EHB said that practical training, including training in domestic economy, was provided for mothers resident in the home. Those with no income of their own were paid pocket money of £10 per week.

13.402 A review of Eglinton House was carried out in late 1998/1999 on behalf of the Eastern Health Board.97

---

13.403 The review stated that the idea behind its establishment was to accommodate a small number of mothers and babies in a community based setting where the residents and staff shared the running of the house. When the review was carried out it was noted that the requirements of the residents had changed over the years. Only a minority wanted to conceal the pregnancy while a majority had serious social difficulties and/or psychiatric and addiction problems.

13.404 The mothers came to Eglinton House in the final three months of pregnancy and then generally stayed for about six weeks after the birth although there were exceptions to this. They cared for their own babies.

13.405 Eglinton House received state funding of £190,000 in 1986.

13.406 The records from Pelletstown were stored in Eglinton House and a tracing service was operated from there on behalf of the Eastern Health Board. A service was also provided for the Archbishop of Dublin in respect of children born in Pelletstown and subsequently adopted who needed baptismal certificates prior to marrying in a Roman Catholic church.

13.407 The reviewer considered that there were security risks in this and it was not suitable work for the staff involved. She recommended that the records be removed to a secure place and work on the records should be carried out by dedicated trained staff.

13.408 Records of the residents were kept in Eglinton Road. All staff recorded their observations of the mothers and babies before they finished their shift. The reviewer noted that these records reflected the training and background of the staff - they were mainly nursing notes. There was little information on the reasons for referral or the planned purpose of the stay. The records on the unaccompanied babies were also mainly nursing notes. The reviewer noted that the records did not include photographs or any other mementos of the baby.

13.409 The residents were not all unmarried mothers. Some were homeless married women and some were deserted or separated wives. The reviewer considered that there were issues about doing too much for the mothers but had little doubt that it was a ‘kind place’.
13.410 The reviewer concluded that there was a continuing need for a service such as that provided in Eglinton House as the majority using the service had serious social and health difficulties. Nevertheless, it was closed in the early 2000s.

13.411 The review includes vignettes of some of the residents. It is clear that the mothers had particular needs; some had had other children for whom they were unable to care and they were trying to ensure that they could care for the latest child. Some of the unaccompanied babies had special needs and the reviewer was concerned about their future.

13.412 In 1998, six women lived in Eglinton House because they wanted to conceal their pregnancies; seven wanted accommodation and the other 36 women had serious social or health problems.

13.413 It could not accommodate women who already had a child as the house was not suitable. There were no statistics kept of the number of requests for admission or the reasons for referrals or on why one person rather than another was admitted. There was generally a waiting list of four to five referrals.

13.414 The reviewer concluded, having interviewed residents and staff and other people involved in the area, that there was an ethos of kindness, acceptance and care in Eglinton House. Some, including former residents, expressed concern that the high level of care could generate a high level of dependence.

13.415 Residents paid a small contribution towards their keep in Eglinton Road. This was £13 a week in 1999 at a time when the One Parent Family Payment was £73.50 plus £15.20 for each child. Expectant women also had to pay £13 a week.

Evidence from former residents and workers

There were no surviving Daughters of Charity members who had worked in Pelletstown. Former residents, a nurse and a number of social workers gave evidence to the Commission about their experiences of Pelletstown. The accounts given below are largely in the words of the former residents and workers but the Commission has not included information which might cause the individuals concerned to be identified; this is particularly the case for recent residents.
The main complaints of the mothers who had been residents were:

- Pelletstown was highly institutionalised and there was no privacy;
- The Sisters were emotionally cold especially during the births and there was no or inadequate pain relief available;
- They had no choice but to place their children for adoption

There were a few complaints about the food and about having to work in Pelletstown. There were also mothers who expressed the view that the food was good. The main complaint of the children who had been residents related to inadequate tracing services. A small number of mixed race residents complained of what they considered to be institutional racism - see Chapter 31. The social workers also talked about the institutional nature of Pelletstown and about the cold atmosphere.

**Mother, early 1950s**

This woman was first in Regina Coeli which she described as ‘a dirty smelly place with about 40 women’. She described Pelletstown as a workhouse where she had to work. After the birth, she said she was sent to work in a Donnybrook laundry for three days a week and to doctors’ houses on the other two days. She was not paid; she thinks that the nuns in Pelletstown were paid and this went towards the upkeep of the baby.

**Mother, early 1960s**

This woman’s abiding memory was the unkindness during the birth. She said there was no pain relief and no doctor. ‘There was no compassion. A nun would be walking around your bed with the rosary beads praying’.

She herself had been born in Pelletstown and spent three years there before spending the rest of her childhood in institutional care. She then had a baby there when she was about 18. She said it had not changed between the time her mother was there and her time. She spent the day knitting or sewing or making rugs; she acknowledged that she did learn some skills but had very little memory of the routine.

Her baby was adopted; she had no choice, she did not remember much about her time there and did not remember signing the adoption papers.
This woman told the Commission that she was 18 years old and a third level student when she became pregnant. She was terrified. She expected to be disowned by her family because that is what she heard happened in other families. She went to the family doctor. He suggested adoption and she thought that:

  the only thing you could do, if you had a baby, was to have them adopted. It never occurred to me I could keep the baby because I thought I committed a terrible sin and I had to be punished for it and the punishment was adoption.

The doctor also suggested that she go to the Catholic Protection and Rescue Society. She did and they also suggested adoption. They did not suggest any other options. They also suggested a mother and baby home. When she was six months pregnant, the doctor told her parents (it is not clear if this was on her instructions). Her mother nearly died of shock and her father was much better than she thought he would be. She thought she would ‘save them the awful shame of having neighbours know about me and the stress of looking at me pregnant…’ so she went into Pelletstown. She made the decision; there was no discussion about it. They were met by a nun ‘…she didn’t seem the warmest person in the world’. She had been so terrified that she was actually relieved when she went there. ‘It’s only now looking back I realise it was a very unattractive place. I don’t remember any much interaction with nuns, they were kind of just there’.

She said the food was very good but the sleeping place was very basic. It was a dormitory with very little privacy. Her parents came to visit. She did not make any friends there. When she was first there she cleaned the chapel every day. This did not take long because it was a small chapel and it was spotless. After the baby was born, she worked in the nursery and she loved that.

She said that she gave birth in the little annex hospital. A lay nurse attended and she ‘…was perfunctory and definitely not like they were in Holles Street for my subsequent children’. She stayed for seven weeks. Her mother came to see the child but her father could not face it. Her mother then suggested to her father that they keep the baby but he refused. The adoption was arranged by the CPRSI. She met the priest in charge, Fr Colleran. He spoke to her ‘like he was giving a public lecture’.
She met her son. He has had a good life but she feels that being adopted has had an effect on him even if he does not recognise it himself.

She said that she had been brought up to believe that people who adopted children had some kind of extra love or extra saintliness.

There was no overt abuse. I didn't have a bad experience except with the nurse I think when I was giving birth was a bit off. But there was no actual humanity that I remember, or anyone talking to us. In fact, I remember very little interaction with nuns, or mention of why we were there. I don't think it was much mentioned why we were there.

She was not working in the nursery where her son was but in the nursery for children who were left behind, some with disabilities; there were 15 or 20 cots in that nursery.

**Child resident, 1950s**

13.423 This witness spent the first four years of her life in Pelletstown and then spent the rest of her childhood in institutional care. Her mother was in Pelletstown with her. Her mother worked in the kitchen and was paid. The witness spent her time in the kitchen with her mother:

I was just this perfect nuisance. I was in and out of everything but it was very happy for my mother. There I was with her. Then the decision to remove me was very shocking in the way in which it was done. It was like overnight this little four year old who was with my mother for the whole time gets to be just removed but, trying to be fair to the people who cared for me, yes, they did do it and it was very shocking to have done it overnight and not give her any notice but they did every year, there was a transfer of children every year from St. Patrick’s to St. Philomena's and for them it was probably routine. It was probably something they did every year …

She said that her mother shared a room with other long term mothers; four mothers to each room. Her mother described how cruel the mothers were to each other and how spiteful and awful they were to each other.
Mixed race child resident, 1960s

13.424 This resident’s father was African. He complained that his mother had put him up for adoption after about six months but he was never adopted. His mother was discharged the day after signing the consent to adoption. Four years later he was discharged to an industrial school which was also run by the Daughters of Charity. The witness considers that the health board was negligent in not arranging an adoption; this resulted in his being in institutions for 18 years. He considers that racial prejudice was a factor in his case.

13.425 He got some documentation from the Daughters of Charity; he remarked that they were more forthcoming with information than he had expected. Some was redacted but it did include various references to his mixed race parentage. His foster mother had also collected some information for him. The psychiatric report referred to him as ‘coloured’ and ‘dark skinned’; he suggested that this indicated an attitude to his ethnicity that warranted noting as if it were an insurmountable problem. Other records described him as ‘illegitimate’, ‘half caste’.

13.426 It seems that the consent to adoption form was set aside. The form is among his records but he became aware of this only when he sought those records. His foster mother was told that he was not available for adoption. The foster mother told the Commission that she wanted to adopt him but she had been told that his mother had not consented.

13.427 There were three other mixed race boys in the industrial school. He was separated from another boy from Pelletstown who went with him (a white boy). While in Pelletstown, he went on holidays to three different families. One family had a mixed race girl. He argued that there was no strategy to organise adoption for the mixed race children.

Adoptive parents and mixed race child, 1970s

13.428 A woman told the Commission that she was rejected as a prospective adoptive mother by a Catholic adoption agency in the early 1970s because she already had children and she told the agency that she was using contraception. She then discovered that it might be possible to adopt a mixed race child as there were advertisements in the papers looking for people to adopt mixed race children. She did adopt a mixed race child from Pelletstown. She, her husband and their
adopted daughter all gave evidence to the Commission. The adoptive parents said that the social workers were very keen to find adoptive parents for mixed race children.

**Child resident, late 1950s/early 1960s**

A former resident told the Commission that he vaguely remembers putting his hands through railings in a cot asking to be picked up - he was about two at the time. He alleges that he suffered various forms of abuse including systematic neglect leading to malnutrition and severe emotional damage. He described a collection of symptoms unique to adoptees: the primal wound. He was anointed four days after he got the BCG vaccine (he thinks he should not have been vaccinated because he was sick). He was adopted at age four; he said Dr Coffey came to visit him in his adopted parents’ home where she administered additional medical tests and treatment.

His mother had been with him in Pelletstown for two years. He had been convinced that he was part of a vaccine trial but was told by the Commission to Inquire into Child Abuse (the Ryan Commission) that he was not.

**Staff nurse 1969-1981**

A former staff nurse in Pelletstown gave evidence to the Commission. She had been interviewed on the Pat Kenny Show on RTE in 1992. At the time, she had contacted RTE to object to the portrayal of Pelletstown given by a former resident. In her radio interview, she said that the account was ‘riddled with inaccuracies’.

She described the conditions in the home as ‘absolutely superior’. She said they could not have been better. The first thing she noticed was that the nursery was a big bright ward, daffodil coloured walls with green lino: ‘Not black and white tiles’ as portrayed in the account of the former resident.

There were about 50 cots in the ward; there was a happy atmosphere, friendlier than in a maternity hospital. There were four nurseries. There were two wards - one for the pregnant women and one for the women who had given birth. The witness denied that the women were doing tough manual work. There were attendants paid by the EHB to clean the floors. The women did some light work, for example, dusting; some were allocated to the baby nursery, washing bottles
and preparing them for the sterilising unit. This was done in the mornings. In the
afternoons, they had access to the craft room where there were two qualified
people teaching them the different arts of rug making, embroidery, knitting, sewing,
the use of sewing machines. She named a number of well-known entertainers,
(including the Garda Band) who gave concerts in the home.

13.434 She said that there was no pressure to place the babies for adoption. The nuns
would put all the pros and cons very gently. There were about 120 women there
when she started there and about 40 when she left.

13.435 The witness told the Commission that doctors were in Pelletstown every morning;
Dr Coffey came one morning a week. Some of the women did AnCo courses
outside and got a training allowance for this. The women had cubicles; they were
not allowed smoke in the cubicles but they could in the bathrooms. There was a
small number of mixed race children; she remembered one in particular. There
were quite a few children with disabilities there; the prisoners from Mountjoy built
an indoor swing for them.

13.436 If the mother was taking the baby home, she would be given a supply of food, baby
formula and bedding for the cot and baby clothes. She remembered one mother
who had a number of children. Her boyfriend would not allow her keep the children
so they all went for adoption.

13.437 The food was good although the women did complain; it seems the complaints
were more about the monotony of the food rather than its quality.

13.438 There were two trained nurses in all departments. Pain relief was provided during
labour - Pethidine and gas and air. The witness was not generally assigned to the
maternity ward. There were 30 cots in the ward she was in. Two rows of small
cots and two rows of big cots. They had colourful counterpanes. Everything was
gleaming. The bathroom was shining.

13.439 Pressure for adoption came from the parents. She described how three women
decided to set up in a flat together; two went out to work and the third cared for all
the babies. The nuns helped them set up but then the neighbours complained and
they were evicted by the landlord.
Social workers

13.440 One social worker described the residents of Pelletstown in the 1960s as abandoned by their families. She considered that they were extremely lonely and isolated. She worked in St Kevin’s. Most of the unmarried mothers from Dublin went home to their families. She visited those who went to Pelletstown. She never saw their living areas; she met them in the parlour. The building was huge and, she felt, oppressive.

13.441 In relation to false registration of births, one social worker described how a woman would explain that her husband was serving abroad with the Irish army and could not visit her; the baby would then be registered as the child of the adoptive parents.

13.442 The 1983 referendum raised awareness of abortion so women spoke of three options after that - have an abortion, keep the baby or place for adoption. Previously there were only two options.

13.443 A social worker who worked in Pelletstown in the 1970s told the Commission that the Sister in charge at the time was kindly but was very concerned to ensure the privacy and confidentiality of the residents. She said that most of the women had already decided on adoption; they may have decided to go to a mother and baby home because they did not want their pregnancy known and adoption was the solution. Her recollection was that the place smelled of cabbage. There was a lot of sitting around but she did not witness any mother being forced to work. It was highly institutionalised. The Sisters were not warm but she did not witness any harshness.

13.444 She said that the medical threshold for adoption was very high. The paediatrician, Dr Coffey, would allow only perfect babies to be placed for adoption.

13.445 This social worker subsequently worked in a rural county in the early 1980s. She described how she was the only person who knew the mother’s name; the mother was assigned a number so that when the county council staff were paying the bills for Pelletstown or the other institutions, the mother’s name would not be known to them. She described other subterfuges she used to facilitate pregnant unmarried
women get away to Dublin for a week or so without families being aware of the situation.

13.446 A social worker who worked in Pelletstown in the 1980s told the Commission that, in her opinion, the mothers who kept their babies were the stronger, more able women. There was a sort of assumption that, if a woman was in Pelletstown, she was going to have the baby adopted.

13.447 She said that the address used by the women was 381 Navan Road; St Patrick’s or Pelletstown was not mentioned.

13.448 The social workers were not involved with the living arrangements. Their office was separate from the main living areas.

13.449 They tried to arrange alternative places for some of the children with disabilities who were regarded as unsuitable for adoption. In a number of cases they found suitable foster or adoptive parents.

13.450 Two social workers said that they had learned nothing about unmarried mothers during their training and that they were too young and inexperienced for the job. Their main role was to help the women make their plans including discussions about adoption. The prevailing view was that adoption was the best option for the baby and probably for the mother as well. The adoptions were not ‘forced’ but the whole ethos supported adoption. One social worker said that ‘while I wouldn’t have any experience or direct evidence of what I would call enforced or forced adoption, I think the whole ethos and everything around it supported it’.

13.451 They commented on the ‘huge role of secrecy’ in dealing with unmarried mothers in the 1970s.

13.452 The social workers said that it was very ‘institutional’ and a ‘very unstimulating environment’. There was little privacy. The mothers engaged in what the social workers called occupational therapy, for example, knitting.

13.453 The social workers said that some mothers were glad to be there because they had nowhere else to go while others did not want to be there. Some wanted to
move on quickly while others were very sad about giving up the baby for adoption. Some did not want to see the baby; one social worker said she was very concerned about them. She visited the women who gave birth in St James’s. They were not treated any differently there from other mothers.

13.454 The social workers said that there was a lack of warmth on the part of many of the staff but the Sister in charge in the 1970s was a kind and compassionate person. Some of the staff resented the social workers but this was not true of the Sister in charge.

13.455 Very minor ailments resulted in the children being regarded as ‘not fit for adoption’. The assessment of fitness for adoption was carried out by the paediatrician, Dr Coffey.

**Affidavits received by the Commission**

*The Commission received a number of affidavits from former residents. These are sworn statements and are reported largely in the words used by the former residents. Unlike those who gave direct evidence, the Commission did not ask any questions of these former residents.*

**Mother, mid 1950s**

13.456 This woman was born in a workhouse. She then lived in industrial schools and a Magdalen laundry. She was raped by a priest. Her baby was born in Pelletstown in 1956 when she was aged 25. She said that she was fed properly but there was not much of it. She did not have to do physical work but did do sewing. She had monthly medical examinations. The regime was nothing like it had been in the Magdalen laundry. She fed the baby until she was 9 months old and was then told that the baby was leaving; a nurse took a photo of the two which she has. She was not told where the baby went; she then was sent back to the laundry and she stayed there for about five more years. She went to Pelletstown to enquire about the baby. She was told that she had signed adoption papers but she says she had not. She subsequently gave birth to twins in Holles Street - they were taken away immediately and she assumed they were dead; she has no records of their births. All three children subsequently found her.
Mother, mid 1970s

13.457 This woman only recently told her family about the baby. She subsequently married the child’s father but the marriage did not last. She described life in Pelletstown as very disciplined; the whole institution was spotless; everyone had different jobs to do and there was no opportunity to engage in any recreation, exercise or education. She was allocated work in the nursery looking after babies and feeding them a few times a day; there were six women working in the nursery and about 20 babies and the nuns also helped. The oldest child she remembers was eight or nine months. Mass every day was compulsory. She remembers being very cold. All the women lived in cubicles which were just big enough to dry their clothes. They were given just about enough basic food; there was a shop where you could buy things but she did not have any money. Washing facilities were very poor; clothes were handwashed; there was no laundry equipment except for a very small spinner. She did not feel free to come and go but does remember going to the city centre with other residents. The doors were locked day and night; the windows in the cubicles were so high up that they could not see out. Some had family visits but she did not.

13.458 She said that she received very little ante-natal care. Her blood pressure was not monitored. She saw a doctor once a month. She was told nothing about giving birth. Labour was ‘horrendous’; she was left alone for most of the time. She was not given any pain relief or medical treatment. Eventually a doctor from another hospital was brought in and gave her an anaesthetic. She said she had a symphysiotomy but did not know this at the time. She bottle-fed the baby every four hours but not during the night; she left five days after the baby was born.

13.459 She said that no one ever discussed the adoption process with her. (The records show that there is a social report of a discussion of the pros and cons of adoption and of a discussion of adoption and keeping the baby; this notes that the social worker thinks she had made up her mind even though she felt distress at parting with the child.)

Children

13.460 A woman born in 1974 was very unhappy about the tracing service provided by the HSE when she went searching in 2006. Another woman who was mixed race was.

98 This is highly unlikely; she may have had an episiotomy.
born in the early 1970s. Her adoptive parents were told the wrong country of origin of her father and her parents taught her about the country they thought he was from. She also was very critical of the tracing process.

13.461 A man who was in Pelletstown in 1969 was adopted but did not find out about this until 1988. He asked the adoption society for information in the 1990s but they said they could not examine all the paper files.

13.462 One woman said that her mother told her that the food was terrible and the mothers were starving; her mother had to work in order to pay the £100 to allow her to leave. After her adoption, she said that she was inspected by people claiming to be nurses from Pelletstown until she was about eight. They took blood tests on each visit; she presumes this was part of vaccine trials.

13.463 One woman who was born in Pelletstown in 1962 and lived there for two years was adopted to the USA. She said that her parents made donations to the nuns but does not know how much. She said that she spoke only Gaelic when she arrived in the USA but quickly picked up English.

**Workman**

13.464 A man who visited Pelletstown to fix a telephone around 1974 when he was aged 20 remembers hearing blood curdling screaming. He saw young women with their heads down and not looking happy.

**A foster mother**

13.465 A woman who fostered a boy from Pelletstown said that the nun described him as being from the ‘reject’ ward. A pregnant girl was polishing the floor when she visited. The boy was two years and two months when she first met him and he was still in his cot; he was very sickly. It transpired that he was an undiagnosed coeliac; she felt he was being left to die in the reject ward.

---

99 This is the only reference the Commission has seen to the payment of money to leave.
Chapter 13 A: Pelletstown Statistical Analysis

The statistical analysis provided here is based on the institutional records provided to the Commission. The Commission compiled a database from the institutional records and analysed the information on a calendar year basis. In the narrative chapter, statistical information from other sources is described. These other sources are not directly comparable with the Commission’s analysis. For example, almost all the statistical information available from official publications is on an administrative year basis, that is, from 1 April to 31 March. This was the case until about 1980. However, as is clear from the analysis below, the statistical returns made to the Department of Health by the institution are broadly in line with the Commission’s analysis. Statistics from other reports, for example, inspection reports, often relate to a specific day or a non-standard period and so are not directly comparable. In general, the Commission is satisfied that there are no significant differences between its analysis and information from other sources. In a few cases where there are differences, attention is drawn to this in the narrative chapter.

Admissions

Pelletstown Total Mothers Admitted per Year
The Commission identified 15,382 women who were admitted to Pelletstown between 1920 and 1998 from the institutional records. Information relating to date of admission to Pelletstown was available for 15,303 women (99.5% of admissions). In the years 1922-42, between 200 and 253 women were admitted to the home each year. Annual admissions were below 200 on just two occasions in this period, in 1924 (178) and in 1932 (185). Admissions fluctuated between 186 in 1943 to 91 in 1957 but began to increase again from 1958. The period 1960-83 was the busiest period; 45.3% of all admissions were recorded in those years. In the 1970s, 356 women on average were admitted annually; numbers peaked in 1971 when 415 women were admitted. The number of women entering the home fell dramatically in 1984, from 197 to 109, and remained relatively low until 1998; 68 women on average were admitted annually in that period.

Analysis of admissions by decade shows that more women (23.3%) were admitted to Pelletstown in the 1970s than in any other decade. This was followed by the 1960s (15%); 1930s (14.6%); 1920s (14.1%); 1940s (11.4%); 1980s (10%); 1950s (7.9%) and the 1990s (3.7%). Over 48% of admissions were recorded in the three decades spanning 1960-89 and a little over 40% were admitted in the three decades spanning 1920-49.
Age on admission

Information on age on admission was available for 15,190 women (98.8% of admissions).

Ages ranged from 12 to 55 years; the mode of age on admission was 20 years. Average age on admission was 23 years. Average age on admission in the years 1920-50 was 24 years and decreased to 22 in 1960 and to 21 in 1970. This increased to 22 years in 1980 and to 23 in 1990. Most women (80.1%) were aged between 18 and 29 years on admission; 10.6% were aged 30 years and older and 9.3% were aged between 12 and 17 years.
Previous pregnancy

Information relating to previous pregnancy was available for 9,622 women (62.6% of admissions). The institutional records show that 71.68% of women were admitted on their first pregnancy; 20.87% on their second pregnancy and 7.45% were admitted on their third or subsequent pregnancy.

Birth details

Information relating to birth details was available for 14,673 women (95.4%) of admissions. The institutional records show that 70% of women admitted to Pelletstown gave birth during their stay; 12% were admitted pregnant but left before giving birth and 18% were admitted with their babies having given birth elsewhere.
Occupations

Information relating to occupations was available for 13,263 women (86.2% of admissions). The institutional registers recorded most women (73%) as a domestic servant or other unskilled worker; 14% as teacher/civil servant/nurse or other trained worker; 7% as unemployed or receiving state assistance; 3% were in full time education and 2.9% were working in the family home or on the family farm. The prevalence of occupation categories altered over the period of Pelletstown’s operation. For instance, in the 1930s, over 76% of all women were recorded as being domestic servants. This occupation category represented 81% of all admissions in the 1950s, but just 7.5% in the 1990s. Teachers/civil servants and other skilled workers accounted for 2.7% of all admissions in the 1930s, 22.7% in the 1970s and 9.4% in the 1990s. The numbers of women recorded as being unemployed or in receipt of state assistance increased steadily from 2.3% in the 1920s to over 23% in the 1990s. Similarly, the numbers of women recorded as being in full time education increased from 0.04% in the 1930s to 9.8% in the 1980s. Most admissions (291) recorded as being in full time education related to secondary school students. The remaining 130 women were third level students.
Address prior to admission

Information on address prior to admission was available for 13,574 women (88.2% of admissions). The institutional records show that women were admitted to Pelletstown from all 32 counties. Most women (63.43%) gave Dublin as their address prior to entry, followed by Galway, 2.92%; Wicklow, 2.48%; Cork, 2.45%; Kildare, 2.22%; Wexford, 2.03%; Mayo, 1.94%; Meath, 1.77%; Westmeath, 1.72%; Donegal, 1.69%; Tipperary, 1.55%; Cavan, 1.45%; Limerick, 1.4%; Offaly, 1.35%; Kilkenny, 1.12%; Louth, 1.08%; Laois, 1.04% and Sligo, 1%. The remaining 14 counties combined accounted for 7.37% of admissions.
Information relating to occupancy was available for 14,923 women (97% of admissions). The institutional records show that average occupancy in Pelletstown was highest in the period 1934-49. In 1934, 144 women on average were living there. Occupancy peaked in 1937 when 176 women on average were living in the home but by 1949 this had fallen back to 138 and decreased even further in 1956 when 82 women on average were living in the home (this was over half the average occupancy recorded in 1937). Average occupancy began to increase again from 1959 and continued at between 80 and 100 on average until 1973; for the remainder of the 1970s, 63 women on average were living in Pelletstown at any one time. Average occupancy decreased steadily in the 1980s and by 1988 just seven women on average were living in the home. Average occupancy in the 1990s was 11 women.

\[^1\] Occupancy is the number of mothers present on any given day in the institution.
Occupancy by decade

Analysis by decade shows that average occupancy was highest in the 1940s (154) followed by the 1930s (140) and the 1920s (131). Average occupancy decreased steadily from the 1950s. A woman admitted to Pelletstown in the 1940s could expect to be living in Pelletstown with another 153 women on average, whereas a woman admitted in the 1970s could expect to be living with another 70 women on average.
A set of annual statistical returns sent by Pelletstown to the Department of Health for the years 1950-1972 (excluding 1968 and 1969) allowed for a comparison between occupancy rates notified by the Daughters of Charity and occupancy rates independently calculated by the Commission from the institutional records. Temporary absences from the home, such as cases where women were temporarily in another hospital, are excluded from the Commission’s calculations and may inflate the Commission’s numbers slightly. Notwithstanding this, it is clear that the occupation rates notified by Pelletstown are broadly in line with the Commission’s calculations.
Admissions/Occupancy

In the years 1920-41, average occupancy in Pelletstown appears to rise and fall in line with the number of admissions for any given year in that period. Although admissions to the home decreased between 1942 and 1946, average occupancy did not decrease correspondingly. In 1944, 1946 and 1947 average occupancy was greater than the number of admissions. This suggests that women were staying in Pelletstown longer in this period.

In the period 1948-57 average occupancy remained relatively high and was almost on a par with admissions in some years during this period. Admissions began to increase again in 1958, but average occupancy remained fairly stable until 1971 and then began a steady decline until 1998. This decline in average occupancy occurred in a period when admissions to the home had increased substantially, indicating that women were staying in Pelletstown for considerably shorter periods.
Information relating to referral pathways was available for 7,792 women (50.7% of admissions). The institutional records show that most women (32.6%) were referred to Pelletstown by an adoption society (mostly the CPRSI) or by a Board of Public Assistance/health board (21.3%). Women were also referred by a social worker (12.6%); other institutions under the Commission’s remit (6%); a voluntary organisation (5.6%); a nun or priest (2.5%); self-referred (2.1%); family or friend (1.8%); Magdalen laundry/Good Shepherd Convent (0.6%) and by a matron of a county home (0.1%). A further 14.7% of women were referred by a host of disparate institutions including hospitals, children’s homes, industrial schools, sheltered accommodation and the courts and by named individuals such as employers, guards, solicitors, probation workers and nurses.

From the 1920s to the 1950s most women were referred to Pelletstown by hospitals or through the other homes under the Commission’s remit. Subsequent to the introduction of legal adoption, referral by an adoption society became the most cited referral pathway in the 1960s. Also, in the 1960s, more women were referred directly by a board of assistance in the first instance rather than admission from a hospital or other institution. In the 1970s, social workers appear as one of the leading referral pathways; they were the second most cited in the 1980s and the main referral pathway in the 1990s.
Accommodation type prior to entry

Information relating to accommodation prior to entry was available for 14,295 women (92.9% of admissions). The institutional records show that most women (31.7%) were admitted to Pelletstown directly from their family home and a further 29.5% from a private address. Over 15.3% of women were admitted from a domestic situation (presumably live-in employment); 6.3% transferred from a maternity hospital; 3.7% transferred from other hospitals; 3.4% travelled from the UK prior to admission; 2.8% transferred from Regina Coeli; 2.7% were admitted from their place of work; 2.5% from a hotel or hostel; 0.8% had no fixed abode; 0.4% transferred from another mother and baby home (29 women transferred from another institution under the Commissions remit and 23 transferred from private mother and baby homes); 0.3% transferred from a Magdalen laundry; 0.3% from supported accommodation; 0.3% from a convent and 0.1% were admitted from prison. Small numbers of women were admitted from a range of others addresses including children’s homes, halting sites and a boarding school.
Information relating to length of stay was available for 14,918 women (96.98% of admissions). In the period 1920-42 the average length of stay fluctuated between 188 and 311 days. However, for women admitted in 1943 the average length of stay increased sharply to 368 days and increased even further to 429 days for those admitted in 1946. The increased length of stay recorded in this period parallels periods of high average occupancy as noted above. The average length of stay decreased to 291 days for women admitted in 1949 and remained at an average of 307 days for those admitted from 1949 until 1958. A sharp decrease was recorded in 1961; 158 days was the average length of stay for women admitted that year. Average length of stay declined steadily until 1991 when a stay of 53 days was the norm for women admitted that year; 73 days was the average stay for women admitted throughout the remainder of the 1990s.
Analysis by decade shows that the average length of stay in Pelletstown was longest in the 1940s when a stay of 315 days was the norm. Women admitted to the home in the 1960s spent less than half that time in the institution (137 days). Women admitted in the 1970s spent around half as long in the home (74 days) as women admitted in the previous decade.
Length of stay after birth

Analysis of length of stay in Pelletstown after birth shows that, in the 1920s, 37.68% of women left within 50 days of giving birth; 56% left within six months and 4.2% spent over 700 days in the home. By the 1950s the length of stay had increased significantly - most women (46.65%) spent between 12 and 24 months in Pelletstown; 20.69% left within 50 days and less than 1% remained there for over 700 days. In the 1970s, 87.8% of women left within 50 days of giving birth and 99.97% left within six months. By this time just one woman remained in the home for longer than six months after giving birth. A similar trend pertained in the 1980s and 1990s.
Mothers exit pathways

Information relating to exit pathways from Pelletstown was available for 12,755 women (82.9% of admissions). The institutional records show that most women (59%) left the institution and returned to the family home or other private address; 26.3% were discharged to employment; 5.8% transferred to hospital; 5.1% transferred to one of the other institutions under the Commission's remit; 0.9% 'absconded' without their baby; 0.8% were discharged to a Magdalen laundry; 0.6% transferred to St Kevin’s institution; 0.6% were discharged to supported accommodation and 0.26% were discharged to other mother and baby homes. Small numbers of women were discharged to a voluntary organisation (20), priest or nun (17), children’s home or industrial school (13), social worker (6), prison or court (1) or to no fixed address (11). There was little deviation in the main exit pathways over the duration of the home’s operation. Discharge to the family home/private address and to employment accounted for 82.3% of exit pathways in the 1920s and 84.4% of exit pathways in the 1980s.
