Cases, numbers in hospital and intensive care

Case counts have increased very significantly in recent weeks; the number of people in hospital has increased six-fold since the end of June, as has the number of new admissions per day; numbers in ICU have increased after a delay.

Data are 7-day averages (the indicated day and the preceding 6 days, rounded to the nearest whole number) with the exception of 14 day cumulative incidence, which is the total number of cases in the preceding 14 days per 100,000 population. The highest and lowest values of each indicator are given for each wave of the pandemic, along with the date on which that value was recorded, as well as the data for recent weeks. The historic incidence data may change due to denotification of cases. Case data from 13 May 2021 onward are estimates based on the number of positive tests reported. Data on deaths is incomplete and not reported.
Cases & Incidence Rates
Confirmed cases each day

Daily count and 7-day rolling average in recent weeks. There was a long period in April and May where case counts were stable or decreasing, reaching a low of approximately 300 per day in the week beginning 13 June 2021; incidence increased rapidly in July with an unusual pattern: the 7-day average is now 1822, up from 1759 seven days ago, 1574 two weeks ago, and 1277 three weeks ago.
Confirmed cases each day

The population dynamics of infection are hard to discern at present, with step changes in early July and again in early August and very strong weekend effects: the average growth rate in cases since late June is 3-4% per day, the current estimate of growth rate is 0-2% per day.

Daily count (bars) and 7-day average (line) of the number of laboratory confirmed new cases by date on which they were notified HPSC. Case counts may change due to denotification of cases. Case data from 13 May 2021 onward are provisional based on the number of positive tests reported through the HSE contact management programme.
Young unvaccinated adults dominate case counts

Incidence is very high in those aged 19-24 years and 13-18 years; until recently most of the cases in this group were in 16-18 year olds, but incidence has also start to increase in those aged 13-15 years. Incidence may be plateauing or starting to decrease in these groups, though this is complicated by very strong weekend effects. Incidence in children and older adults is increasing as force of infection increases; incidence in children under 12 has been lower than other unvaccinated groups, comparable with incidence in vaccinated adults aged 35-64 years.

Age-specific incidence (cases per day per 100,000 population). 7-day moving average.
Incidence by county

Incidence is very high in border counties. 14-day cumulative incidence is greater than 200 per 100,000 in all counties, greater than 500 per 100,000 in 14, and greater than 1000 per 100,000 (1%) in 3.
7-day incidence as a % of 14-day incidence

An Roinn Sláinte | Department of Health

Updated 24/08/2021. Source: CRM data, HSE Contact and Tracing Team.

Acute=Swabs taken in acute hospitals;
Community=Swabs taken in Community Test Centres for walk-in, online self-referral, GP and CMP referrals (symptomatic, close contact etc);
Serial=Swabs taken under the Serial Testing Programme in Nursing Homes, Food Production, Mental Health and Disability;
Other Mass=Swabs taken in response to an outbreak/case in facilities including workplaces, schools, nursing homes (ex. acute hospitals)

Data from Acute Hospital testing limited since cyber-attack on 14/05/2021, gradual restoration from 06/07/2021
Break in series 29/07/2021 (walk-in /self-referral to Community)
Cases by self-reported vaccination status

The proportion of cases in people with two doses of vaccine has, as expected, increased over time as the proportion of the population vaccinated has increased; currently approximately 30% of cases, where their self-reported vaccination status is recorded, say they have received two doses.

Percentage of daily cases by self-reported vaccination status excluding cases where vaccination status is not known.
CCT data from Thu 13 May 2021 to midnight Mon 23 Aug 2021. Cases dated by case creation date.
The majority of cases reported in recent weeks are in younger people who are not yet protected by vaccination; in older groups with higher vaccination rates the absolute number of cases is much lower, but a high proportion of those cases occur in vaccinated people.
Hospitals & ICU
Confirmed cases in acute hospitals

The number of people in hospital with confirmed SARS-CoV-2 infection. The number of people in hospital is 307. The number of admissions and newly confirmed cases in hospital per day has increased to an average of 41 per day.

HSE PMIU-SDU data to Tue 24 Aug 2021. Number of in-patients with COVID-19 (blue line) and number of newly admitted or newly confirmed cases per day (columns, with 7-day moving average, black line, secondary y-axis) on HSE acute hospital sites.
Confirmed cases in intensive care

The number of people in ICU with confirmed SARS-CoV-2 infection and the number requiring mechanical ventilation remain low but have started to trend upward. 55 people in ICU, 25 mechanically ventilated, average 5 admissions per day.
Vaccination status of COVID-19 cases admitted to ICU*

Between April 1st and August 14th 2021:

• 195 adults (aged 15 + years) were reported as admitted to ICU with confirmed COVID-19 infection
• 185 of these ICU admissions had vaccination data available
• 45 cases were recorded as having received a COVID-19 vaccine (one or two doses)
• 18 had received all recommended doses of vaccine before admission to ICU
• 10 had an epidemiological date 14 days or more after receiving all recommended doses of vaccine (i.e. 5% of ICU cases where vaccination status known)

*Data were extracted from CIDR on 17.08.2021 at 09:30

Deaths
Total deaths by month (by date of death)

Source: HPSC Daily Deaths Report. Updated 18/08/2021
Vaccination status amongst COVID-19 deaths
(with date of death 1st April 2021 - 14th August 2021)*

- 165 laboratory confirmed COVID-19 deaths were notified to HPSC with a date of death between 1st April 2021 and 14th August 2021
- 158 of these deaths had COVID-19 vaccination data reported
- 69 deaths were reported in persons having being vaccinated
- 68 deaths were reported in persons having received at least one dose of COVID-19 vaccine prior to death.
- 30 deaths were reported in persons having received all recommended doses of COVID-19 vaccine prior to death.
- 13 COVID-19 deaths were reported in persons with an epidemiological date 14 days or more after receiving all recommended doses of vaccine (i.e. 8% of deaths where vaccination status known)

Outbreaks & Clusters
Outbreak Key Points (Week 33 2021 – to 21st August 2021):

Aggregate data on 105 outbreaks were reported to HPSC by regional Departments of Public Health for week 33 2021 – data are provisional.

- Eleven new nursing home outbreaks were reported with 56 confirmed linked cases
- Two new community hospital/long-term care facility outbreaks were reported with fifteen confirmed linked cases
- Five new acute hospital outbreaks reported with 13 confirmed linked cases
- Six new residential institution outbreaks reported with 15 confirmed linked cases, two in centres for disabilities, one in a prison, and three in nonspecified residential facilities
- One new outbreak in other healthcare services with two confirmed linked cases
- Sixteen workplace outbreaks were reported with 48 confirmed linked cases; including two in the meat/poultry processing sector, two in other food production and processing, five in construction sector and seven in ‘other’ workplaces
- Fourteen outbreaks were reported in childcare facilities with 47 confirmed linked cases
- Four travel-related (three flights and one ferry associated) outbreaks were reported with 14 confirmed linked cases
- Two outbreaks associated with social gatherings were reported with ten confirmed linked cases
- Four religious/other ceremony associated outbreaks with 13 confirmed linked cases
- Three new community outbreaks reported with 24 confirmed linked cases
- Five outbreaks related to retail outlets with 13 confirmed linked cases
- Eight outbreaks related to hotels with 20 confirmed linked cases
- Ten restaurant/café outbreaks with 33 confirmed linked cases
- Three outbreaks related to public houses with 16 confirmed linked cases
- The remaining eleven outbreaks were across other locations: other recreation activity (n=1); extended family (n=4); private houses (n=5) and other locations (n=1)
- Nine reported outbreaks (extended family=4, private house=2, community, outbreak=3) involved Irish Travellers with 47 confirmed cases.

Source: HPSC
Acute operations

For the week ending 8\textsuperscript{th} August there were 16 open outbreaks and 122 new laboratory confirmed cases in acute hospital staff.

Test & Trace Update
Test and Trace update

• From 17th-23rd August, there were approximately 131,893 lab tests reported in community, private and acute labs. This remains a partial view until both acute and private lab data flows are fully reinstated.

• From the 17th-23rd August, there were c. 103,806 community referrals. Overall, total referrals have remained stable in comparison to the same time period last week (0.38% increase)

• Over the past week, c. 90.5% of people received a swabbing appointment in less than 24 hours. The median time to get access to swabbing is 0.2 days.

In the community, over the last 7 days (17th-23rd Aug), the median end-to-end turnaround time from referral to:

• SMS for not detected and detected tests was 1 day
• Communication of a detected result by call was 1.7 days
• Contact tracing completed, for detected results was 2 days

Sources: HSE – COVID-19 Contact Management Programme Weekly report and HSE Test and Trace Reports
CMP update – 16th -22nd August

- The **total number of close contacts** reported by the CMP was **29,375**, a decrease of 6% from 30,987 the previous week. The average number of close contacts reported per day was 4,196, down from 4,427 the previous week.

- Of the 20,181 close contacts with self-reported vaccination status recorded, 43.1% (n=8,695) were fully vaccinated, 10.5% (n=2,129) had received the full schedule of vaccines but were not fully protected due to insufficient time post-vaccination or because of a medical reason, and 5.5% (n=1,107) were partially vaccinated.

- The mean number of close contacts per case (including cases with zero close contacts) was 2.3, a decrease from 2.4 the previous week.

- When close contacts categorised as fully vaccinated with significant protection were excluded, the mean number of close contacts per case was 1.4.
Variants update

Total confirmed variants of concern cases:
- P.1 (Gamma): 30
- B.1.351 (Beta): 77
- B1.617.2 (Delta): 6496

Source: HPSC
7 and 14 day incidence rates for Ireland and Northern Ireland

Due to the cyber attack on the HSE’s IT systems, daily case numbers from 14 May onwards are based on a data extract from the Covid Care Tracker. Source: health-ni.gov.uk daily data 22/08/21. Incidence calculated using the 2016 population estimates for both ROI and NI.
Growth rate has been unstable during the summer, and exceeded 5% per day (doubling time 14 days) in July; growth rate is currently estimated at 0.7% (-0.2 – 1.7) per day.
Situation analysis 24 August 2021

• Incidence high
  Cases (7-day average) **1822 cases per day**; **14-day incidence 526 per 100,000**
  • ≈ 20 admissions to hospital per 1000 cases

• Growth rate uncertain
  • Cases 0-2% per day (doubling time 35-100 days)
  • Numbers in hospital 2-4% per day (doubling time 19-33 days)

• High and increasing levels of protection by vaccination
  • 4-6 weeks to reach maximum population protection
  • > 80% of the adult population vaccinated, 70-75% protected
  • 53% of the population aged 16-29 years are vaccinated, with 40-45% protected

• Incidence may start to plateau in coming weeks
  • though we should expect at least transient increases in incidence with the with increased mobility and mixing associated with the reopening of schools and higher education

• The trajectory over the next period remains uncertain
  • any further increase in social mixing or potential for super-spreading is a significant risk
